Children, as Iona and Peter Opie have pointed out (in *The Lore and Language of Schoolchildren*), have retained the magical attitude to names. 'Children attach an almost primitive significance to people's names, always wanting to find out a stranger's name, yet being correspondingly reluctant to reveal their own. They have ways of avoiding telling their name. They answer, "Haven't got a name, only got a number." They say, "Same name as me Dad." "What's your Dad's then?" "Same as mine."'

It is not only children who preserve this feeling. The questions 'What is his name?' and 'Who is he?' generally mean the same thing and if you are asked 'Who are you?', you usually reply simply by stating your name: with the buried implication that the name and the identity are the same thing. There is still sometimes a feeling of resentment when an acquaintance uses your first name too soon, an uneasy sense that he is invading your privacy and claiming to know the real you when he does not.

People take far more trouble about choosing names for their children than would seem to be needed, because of the deep belief that the name chosen will affect the child's character. Few parents go so far in selecting names to mould a child's personality as Aleister Crowley, who named his first daughter Nuit Ma Ahathoor Hecate Sappho Jezebel Lilith (the little girl died young, 'of acute nomenclature', it was unkindly said) but names of saints and churchmen, statesmen, film stars and other heroes and heroines are bestowed on babies by parents who feel that the name will carry its owner's admired characteristics with it. The custom of naming a child for a well-loved relative used to be based on the same principle and, at a buried level, perhaps still often is.

Seamen tend to be particularly superstitious about names. Death, the Devil, witches and drowning are among the things which should never be named at sea. It is unlucky to change the name of a ship, and ships whose names end in 'a' are ill-omened, a belief confirmed for some by the sinking of the *Lusitania* in 1915.

The Secret Name

The fact that the naming of a person is so often done with solemn ceremony is an indication of its importance. Sometimes a child is not felt to be a person at all until it has been formally named. In some primitive societies the name is not given until quite some time after birth. Some other designation is used meanwhile but this is not the 'real' name. Very often, the 'real' name has to be kept secret because an enemy who knew it would gain power over its owner, and sometimes it is so secret that even its owner does not know it – it was whispered into his ear by his mother when he was a baby. It used to be quite common in Europe for a child's name to be kept secret until he was christened. In extreme cases, even the mother would not know the name in advance: the father would choose it and whisper it to the godparents at the last moment.

The concept of the 'real' name is needed because if anyone's ordinary everyday name could be used to work magic against him, the situation would be intolerably dangerous. So people, animals, gods, spirits, sacred places and objects, have secret 'real' names which, if discovered, put them in the power of the discoverer. Plutarch (d 120 AD) remarked that nobody knew the real name of the guardian deity of Rome and that it was forbidden to ask anything about it, even whether it was male or female, because it was feared that enemies might charm it away. The rider on a white horse of the book of Revelation (chapter 19) was called Faithful and True but he had another, secret name: 'he has a name inscribed which no one knows but himself.' Pseudonyms and titles were used for the gods of antiquity and even these were chanted in incantations, to snare a god in the net of his own nature and subject him to the will of priest or magician.

Another custom of many simpler societies which has partially survived in more sophisticated ones is the change of name which marks a change of status. When a boy is initiated as a man, he takes a new name, when a man becomes a king or a priest or a magician, he is given a new name, which is frequently conferred in a ritual and which makes him a new and different person. Similarly, a modern monarch may use an official name as king which differs from the name he uses in his family circle. Those who join religious orders take a new name, and so do those who join magical societies. A woman takes a new name on marriage, using her husband's surname because she has left her family and joined his. The American custom of continuing to use the maiden name as well as the husband's surname is a sign of the greater emancipation of American women. In European folk belief it would not be regarded as a good omen for the success of the marriage.

A Good Name

The use of 'theophoric' names, which contain the name of a god to attract his beneficent influence, is known from many societies. The Assyrian name Ashurbanipal means 'Ashur is creating a son', the Egyptian Ptahmiri means 'the beloved of Ptah', the Indian name Devadatta means 'God-given',

European magic, whether white or black, makes great use of the names of gods and spirits in order to tap their inherent power *Left* Various names of God are inscribed within the rim of a magic circle, in order to keep evil forces from breaking into it *Right* A figure from *The Key of Solomon*, a book of magic rituals, containing the names of a number of demons: in magical theory to know the name of a spirit is to have power over it

British Museum

Christopher means 'Christ-bearing'. Jewish names ending in -el or -iah are theophoric: Nathaniel means 'God has given', Obadiah means 'servant of Yah (weh)'.

Early Christians, born into a pagan environment, often bore pagan theophoric names. Origen means 'born of Horus' and the roll of early martyrs includes such names as Aphrodisius, Apollonius, Ares, Bacchus, Ceres, Hermes, Mercuria. But the names Peter and Paul soon became popular with Christian parents and an author of the 4th century said that Christians often named their children for martyrs, 'thus securing protection and guardian care for them.'

In the 17th century an English Puritan named William Jenkyn wrote that, 'A good name is as a thread tied about the finger, to make us mindful of the errand we came into the world to do for our Master.' Some Puritan enthusiasts adopted curious names of this uplifting sort: Fly-Fornication Andrews, for instance, God-Reward Smart, Hope-for Bending, Kill-Sin Pimple.

Names of Power

European magic frequently makes use of 'words of power' which are the names of gods and spirits (although some of them are gibberish words whose original meaning has been lost). The power of a supernatural being is tapped by the use of his name as automatically as an electric light is turned on by pressing the switch. But it is not enough merely to say a name of power. It must be correctly pronounced, and chanted or declaimed in such a way as to create the vibrations of sound which carry the energy of the being whose name is used. 'Correct' pronunciation means the one which causes the incantation to work, and a magician may experiment with different names and pronunciations until he hits on those which work best for him, though reverence is also paid to traditional formulas.

This practice stems largely from ancient Egyptian magic, in which words of power, properly pronounced and declaimed, were believed to coerce gods and spirits, to kill the living or revivify the dead, to cure or inflict diseases, and to master all the forces of Nature. One of the best-known examples of the belief in the secret 'real' name of a god is the story that the goddess Isis stole the power of the sun god Re by discovering his real name. She bullied him into agreeing 'that Isis shall search into me and that my name shall pass from me into her' (for he evidently did not consciously know the name himself). In taking Re's name, Isis took his identity and so assumed his power.

An Egyptian creation myth says that when nothing existed except the Creator, he felt a desire to make the universe, which he did by pronouncing his own name and immediately everything came into being. In effect, he contained the potential existence of all things, and when he spoke his name he and all things with him came into objective existence.

There are other ancient traditions of the supreme magical name which controls the entire universe. According to an Assyrian inscription, the god Ea alone knew this name: 'When it is uttered everything bows down in heaven, on earth and in the infernal regions . . . The gods themselves are bound by this name and obey it.' A Greek magical papyrus calls upon an almighty god, 'whose hidden name is unspeakable, which when the daimones (spirits) hear they cower, which when the sun and the earth hear they turn about, which when Hades hears he is troubled, rivers, the sea, lakes and springs when they hear it are frozen, rocks when they hear it are broken.'

In the Cabala the creation of the universe was regarded as the unfolding of God's name (see CABALA). The *Sefer Yetsirah* says that what God did in making the universe was to 'engrave his name' and the *Zohar* says that the ten sefiroth, being aspects of God's identity, 'constitute the sacred name of God'. The letters of the Hebrew alphabet, in all their combinations and permutations, came to be regarded as supremely powerful objects of meditation and magical instruments, 'through which the whole universe had been created and which contained the secret of the structure of all things' (see ALPHABET), and the great divine name became a major preoccupation of Jewish mysticism and cabalistic magic. Writing about the mystical system of Abraham Abulafia, a Spanish Jew of the 13th century, G. G. Scholem says (in *Major Trends in Jewish Mysticism*): 'For this is the real and, if I may say so, the peculiarly Jewish object of mystical contemplation: the Name of God, which is something absolute, because it reflects the hidden meaning and

totality of existence; the Name through which everything else acquires its meaning and which yet to the human mind has no concrete particular meaning of its own. In short, Abulafia believes that whoever succeeds in making this great Name of God, the least concrete and perceptible thing in the world, the object of his meditation, is on the way to true mystical ecstasy.' Meditation on the divine name also plays an important role in Mohammedan mysticism (see MEDITATION).

The Tetragrammaton

To tap divine power, magicians used various biblical names and titles of God in their incantations, including El, Elohim and Eloa ('the god'), Adonai ('the Lord'), Sabaoth ('Lord of Hosts') and Shaddai ('the Almighty'). But the name which is closer to the inner reality of the god of the Old Testament is the Tetragrammaton, or name of four letters (transliterated YHWH or JHVH), which means 'he is' and which used to be rendered Jehovah and is now usually spelled Yahweh. Yah or Jah, and Ehyeh ('I am'), are variants of it.

The Tetragrammaton was held in such profound awe that it was rarely pronounced, to avoid profaning it and possibly for fear of the magic of enemies. By the time of Christ it was spoken aloud only once a year, by the High Priest when he entered the Holy of Holies, the home of God in the Temple at Jerusalem, on the Day of Atonement. It was not pronounced in the ordinary services in the synagogue, Adonai or Elohim being substituted for it in readings from the Bible. As a result, the true pronunciation was lost.

In the centuries after Christ longer names of God were discovered, including names of 12, 22, 42, 60 and 72 letters or syllables. The name of 22 letters, which first appears in the 13th century *Sefer Raziel*, may have been read as Anaktam Pastam Paspasim Dionsim and is probably a permutation of letters from the Priestly Blessing (Numbers 6.24-27). It has no known meaning, nor does the name of 42 letters, which is probably a permutation of the first 42 letters of Genesis.

The name of 72 syllables is the Ineffable Name or *Shem Hameforash* (originally a title of the Tetragrammaton), said by some to be the most powerful of all the divine names, revealed to Moses at the burning bush and used by him to part the waters of the Red Sea and allow the Israelites to escape from the pursuing Egyptians. In fact, it is constructed of three verses in Exodus (14.19-21) describing this episode. The first syllable contains the first letter of verse 19, the last letter of verse 20 and the first letter of verse 21, the second syllable contains the second letter of verse 19, the penultimate letter of verse 20 and the second letter of verse 21, and so on. According to the *Sefer Raziel*: 'Whoever pronounces this name against a demon, it will vanish; at a conflagration, it will be quenched; over an invalid, he will be healed; against impure thoughts, they will be expelled; if it is directed against an enemy, he will die, and if it is uttered before a ruler, his favour will be won.' A caution is added, however: 'But whoever pronounces this name while he is in a state of uncleanliness and impurity will surely be struck dead.'

Jewish teachers were confronted by the problem that if God can be coerced by using his name, he can scarcely be considered omnipotent. In resolving this difficulty the *Sefer Hasidim* gives an interestingly magical explanation of the automatic working of a name of power. 'One may not say that the invocation of God's name obliges him to do the will of the invoker, that God himself is coerced by the recital of his name; but the name itself is invested with the power to fulfill the desire of the man who utters it.'

John Reuchlin (d 1522), one of the first Christian Cabalists, maintained that the name of Jesus (the Pentagrammaton) exceeds the Tetragrammaton in power by adding the letter S to it (JHVH becomes JHSVH). The letter S is particularly powerful because the number values of the Hebrew letters in *Ruach Elohim*, 'the Spirit of God', total 300, and the Hebrew letter *shin* (S) also has the number value 300, so that S encapsulates the Holy Spirit.

A Great Amen

Since names of power were believed to work automatically, they could be used regardless of the magician's motives. The golem was brought to life, or reduced to clay again, through the power of words (see GOLEM). *The Sword of Moses*, a 13th or 14th century copy of a much older text, contains a vast battery of names for all sorts of magical uses: to cure diseases, to unite a woman with a man, to grow hair on a bald head, to summon up spirits, to free prisoners, to know whether a journey will be lucky, to send dreams to your neighbours, to speak with the dead (in this case the names of power must be whispered), to catch a lion by the ear, to walk on water without wetting the feet, to kill a man, and many more.

Nature in Bondage

From the religious books of ancient Egypt we learn that the power possessed by a priest or man who was skilled in the knowledge and working of magic was believed to be almost boundless. By pronouncing certain words or names of power in the proper manner and in the proper tone of voice he could heal the sick, and cast out the evil spirits which caused pain and suffering in those who were diseased, and restore the dead to life, and bestow upon the dead man the power to transform the corruptible into an incorruptible body, wherein the soul might live to all eternity. His words enabled human beings to assume divers forms at will, and to project their souls into animals and other creatures; and in obedience to his commands, inanimate figures and pictures became living beings and things which hastened to perform his behests. The powers of nature acknowledged his might, and wind and rain, storm and tempest, river and sea, and disease and death worked evil and ruin upon his foes, and upon the enemies of those who were provided with the knowledge of the words which he had wrested from the gods of heaven, and earth, and the underworld. Inanimate nature likewise obeyed such words of power, and even the world itself came into existence through the utterance of a word by Thoth . . .

E. A. W. Budge *Egyptian Magic*

The heroine of the German folktale *Rumpelstiltskin* could only escape from the power of the deformed dwarf by discovering his name: by chance the dwarf was overheard chanting the name as he danced gleefully round his fire: illustration by Arthur Rackham

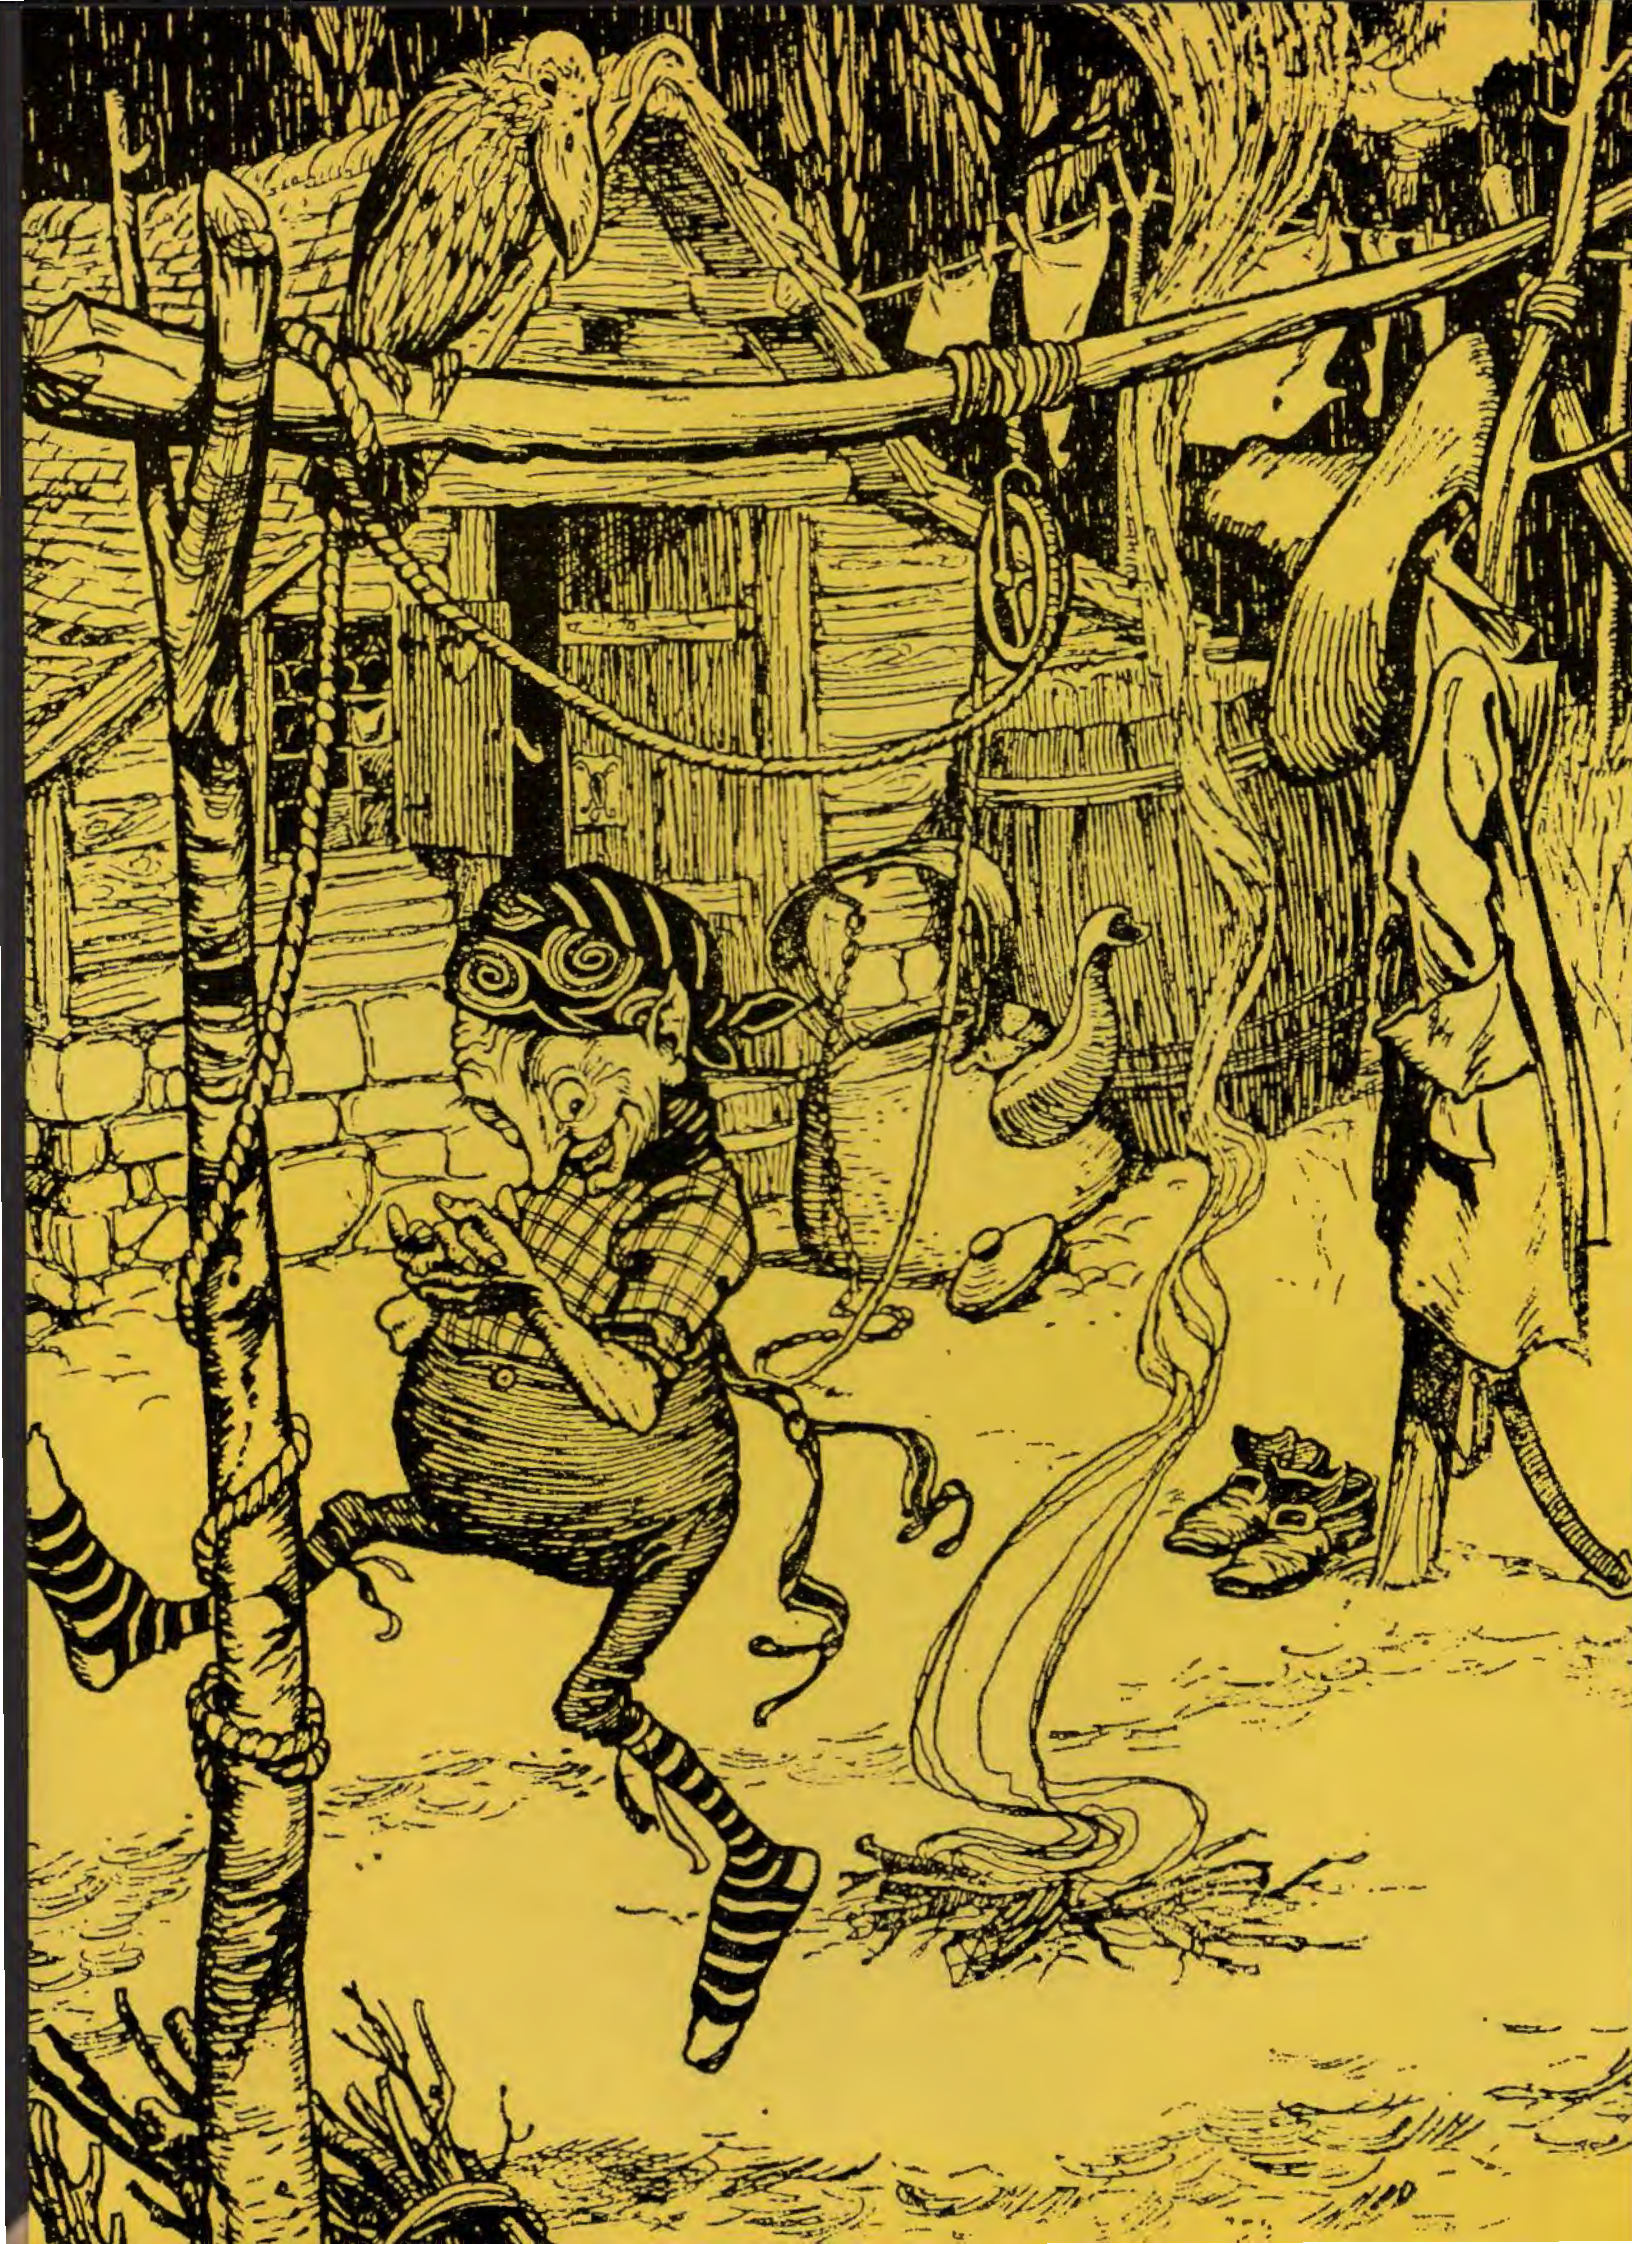
Similarly, in later magical textbooks names of power are used for every conceivable purpose, from something as trivial as keeping evil influences away from the magician's inkwell to the conjuring up of powerful demons. The *Grimorium Verum* says that the Tetragrammaton should be inscribed on the inkwell, and also the names Metatron (the angel who guided the Israelites through the wilderness), Yod (the first letter of the Tetragrammaton), Cados (Hebrew *Kadosh*, 'Holy One'), Elohim and Sabaoth.

An incantation in the *Lemegeton* employs a formidable armoury of names of power to force a demon to appear, including Joth, which Jacob learned from the angel with whom he wrestled; Agla, which Lot heard and was saved from the destruction of Sodom; Emmanuel, which Shadrach, Meshach and Abednego cried out in the burning fiery furnace; Alpha and Omega; Sabaoth with which Moses brought the plague of frogs upon the Egyptians; Escerchie Ariston, with which he turned the rivers of Egypt into blood; Elion, which brought the plague of hail; Hagios, Jetros and Paracletus; and the three holy and secret names Agla, On and Tetragrammaton.

Joth is a variant of Yod, and Agla consists of the initial letters of a Hebrew phrase meaning 'Thou art mighty for ever, O Lord'. Emmanuel, 'God with us', was a title applied to Christ. Alpha and Omega, as the first and last letters of the Greek alphabet, mean 'everything' and 'God' because they contain the whole alphabet between them. Escerchie Ariston is from Greek words meaning 'mighty' and 'noblest'. Elion comes from a Hebrew title of God, 'Most High'. Hagios and Jetros are from the Greek for 'holy' and 'the healer', and Paracletus is the Holy Ghost (John 14.16). On is another name of Heliopolis, the Egyptian city of the sun, whose priests claimed it stood at the centre of the earth.

Many magical incantations end with Amen ('so be it'), which is a name of power in itself, because its Hebrew letters add to 91, which is also the total of Yahweh Adonai. In Greek letters Amen adds to 99 and in some early Christian manuscripts 99 is put at the end of prayers.

Not only do the names of power contain superhuman energy, in theory at least, but declaiming them helps the magician to put himself into the abnormal state of mind which is needed for successful operations of magic. He works himself into a state of ecstatic frenzy by chanting words which swell and beat and reverberate. This applies just as much to the gibberish words which appear in spells and incantations, and which have no known meaning. Some of these may have been altered out of all recognition in transmission from one



magician to another, others may be the result of experiments with different pronunciations, but many of them probably never had a meaning and were created simply for the sake of rhythm, rhyme or assonance, to produce the impressive and poetic sound which is an essential ingredient of magical incantation. Many of the mantras or 'mystic syllables' of the East also appear to be meaningless gibberish but chanting or meditating on unintelligible words helps to remove the mystic or magician from his normal frame of reference, his ordinary daily world, and to convey him into a supernormal one (see MANTRA).

Modern magicians have frequently looked back to the magical texts of the eastern Mediterranean area in the early centuries after Christ, which inherited the traditions of ancient Egyptian magic and some of which were concerned with the passwords that the soul would need for protection against the terrors to be faced after death. A gnostic work called *Pistis Sophia*, for instance, referring to the supremely powerful name which contains 'all Names and all Lights and all Powers', says: 'If anyone knows that Name when he goes out of the material body, neither smoke nor darkness, neither Archon, angel or archangel, would be able to hurt the soul which knows that Name.' If it is spoken by the soul after death to the fire, it will be extinguished, to the darkness, it will disappear, to the demons and the lords of darkness, they will perish, to the judges of the wicked, they will be destroyed.

The Graeco-Egyptian magical texts (see MAGICAL PAPYRI) contain extraordinary, tongue-twisting jumbles of words and letters, and the names or titles of gods and spirits from Egyptian, Greek, Jewish, Christian, gnostic and other sources.

Iao, a variant of the Tetragrammaton, was applied to the Graeco-Egyptian god Harpocrates (Horus the Child – see HORUS). Aleister Crowley's comments on it (in *Magick in Theory and Practice*) provide a good example of the modern magical theory of names of power as keys to, and containers of, the central processes of the universe (though in his opinion this particular formula is incomplete). He takes the letters as the initials of the names of Egyptian deities: 'I is Isis, Nature ruined by A, Apophis the Destroyer, and restored to life by the Redeemer Osiris.' In meditation, he says, there is first, 'a quiet pleasure, a gentle natural growth', which is the stage of Isis. This is followed by a stage of depression, impotence, weariness and loathing which is Apophis, and then by a 'new and superior' condition created by the uprising of Osiris (all this has a sexual connotation for Crowley, as almost everything did). The formula is that of life-death-rebirth, and he sees in it a summary of the Great Work of alchemy: first the operations on some natural material, then the black stage of *nigredo* or spiritual death, and finally the achievement of pure gold (see ALCHEMY). 'The magician who employs it is conscious of himself as a man liable to suffering, and anxious to transcend that state by becoming one with God.' (See also ABRACADABRA; INCANTATION; MAGIC SQUARES; NUMEROLOGY; RITUAL MAGIC; VIBRATION.)

NATIONAL SOCIALISM

WHEN HITLER became Reich Chancellor on 30 January 1933 there was no easily identifiable German occultist movement. There were, however, countless different groups concerned with esoteric traditions and theories, some of them large, such as the Theosophical and Anthroposophical Societies, and a great many small or even very small ones. It is evident that there were many more such groups in Germany than elsewhere in Europe.

Hitler himself, in spite of many rumours to the contrary, had no use for occultists in general or for astrologers in particular. Rudolf Hess, at that time Deputy Fuehrer, was inclined to be interested in 'fringe' subjects and especially in neo-Paracelsian medical theories. Unlike Hitler he was not completely sceptical as far as astrology was concerned. Heinrich Himmler had not yet begun to rely upon astrological advice, but had at least a superficial interest in Germanic or 'Nordic' occult subjects, such as the *Edda* sagas and rune symbolism. Finally, since the Nazi Party by now included a wide cross-section of the German population, most occultist groups must have included some Party members.

The Germans now encountered the new phenomenon of *Gleichschaltung*, meaning the purposeful integration of every conceivable organized activity according to the National Socialist philosophy of life. In some cases this meant no more than the immediate exclusion of Jews or individuals who were thought to be unsympathetic to National Socialist ideology. In the case of other organizations, where recognition by the authorities was thought desirable, the situation could become complicated.

Harassment of Occultists

The Freemasons were immediate candidates for official harassment. There had always been the supposition that Masonry was in some way a department of occultism, but the major reason for its suppression was the belief that it represented a Jewish-dominated international conspiracy. Previous membership of a Masonic Lodge now prevented any former Mason from holding rank

in the Party. This also applied to former members of the pseudo-masonic and violently antisemitic Germanen Order, founded in 1912, some of whom had been among Hitler's earliest supporters in 1920–1 (see GERMANEN ORDER).

The astrologers were the first to have trouble with the authorities, who equated their art of science with vulgar fortune telling. During the months before January 1933 there had been a spate of ill-informed and inaccurate political speculation and prognostication in the popular astrological weeklies, and a lot of incredible nonsense had been printed about Hitler and his astral prospects. The leaders of the two most important astrological associations, both of which had large memberships, were soon actively taking steps to find a suitable Party umbrella. The astrologers' representatives supposed, and probably not without reason, that without protection the whole astrological movement might be in jeopardy, because an unrecognized science of this kind could soon find itself in an anomalous position in a totalitarian state. It is indicative that very few references to Hitler's horoscope were published after the summer of 1933 and none at all after the spring of 1934. Public speculations of this kind had become altogether too dangerous.

Astrology's Nordic Origins

Rival claims to represent the astrological movement led to an immediate and unseemly quarrel. The principal contenders were the Astrological Society in Germany, whose headquarters were at Leipzig, and the Central Astrological Office at Düsseldorf. The Leipzig group was controlled, more or less, by Hugo Vollrath, a bogus commercial occultist who owned the Theosophical Publishing House. Vollrath had been making a living out of occult literature since about 1908 and had a vested interest in astrological books. He quickly joined the Party and with the help of a few members who were Nazis reconstituted the Society on approved National Socialist lines. Dr Hubert Korsch, the President of the Central Astrological Office at Düsseldorf, hastily joined the Party as a protective measure. During the summer of 1933 both groups were busy lobbying Party offices such as the League for Protection of German Culture in order to obtain official Nazi patronage, but without success.

In the meantime Vollrath's monthly *Astrologische Rundschau* began to publish articles that refuted astrology's Babylonian and hence Semitic origins and asserted that it was an ancient Nordic science. Furthermore, *Mensch im All* (Man in the Universe), an independent astrological monthly, as a matter of political expedience effected a temporary merger with 'Professor' Ernst Issberner-Haldane's *Die Chiromantie* (Cheiromancy). Issberner-Haldane (1886–1966) was a well-known Berlin palmist. He was, too, a pathological antisemite and a prominent member of Jörg Lanz von Liebenfels' racialist and occult Ariosophical movement and his highly esoteric Order of New Templars (see NEW TEMPLARS).

In the autumn of 1933 the police presidents at Berlin, Hanover and Cologne instructed the local newspapers to refuse all advertisements from professional astrologers and during the spring of 1934 the Berlin police president banned all forms of professional fortune telling. Even the most cautious professional was now equated with any vulgar charlatan.

At Berlin and elsewhere the police began to confiscate booksellers' stocks of occult and astrological literature, although on an uninformed and haphazard basis. These measures affected the economic well-being of a number of specialist publishers and it was they, rather than the disorganized astrologers, who persuaded the Reich Chamber for Authors and Publishers to appoint an official censor for astrological books. Serious textbooks could still be published but the trash disappeared.

At the end of 1938 *Zenit* and *Astrologische Rundschau*, the two leading serious astrological monthlies, ceased publication. No explanation was offered to their readers. Furthermore the Theosophical Society, with which the *Astrologische Rundschau* was linked, was banned. After the annexation of Austria in 1938 Jörg Lanz von Liebenfels, the racial occultist and founder of the Ariosophical movement, was forbidden to write for publication. Lanz considered himself to be one of National Socialism's spiritual fathers. When the Second World War began on 1 September 1939 the German occultist movement had already been driven more or less underground.

Assassination Predicted

During the autumn of 1939 Dr Goebbels' Propaganda Ministry was keeping a close watch on the two surviving astrological periodicals, *Stern und Mensch* and *Mensch im All*, since it was suspected that they might be the source of undesirable rumours. On 10 November Dr Goebbels ordered that the few surviving astrological almanacs be carefully scrutinized for anything that could be construed as a prediction of the mysterious attempt to assassinate Hitler at the Munich Bürgerbräu beer cellar on 8 November.

An astonishing prophecy in this connection made by Karl Ernst Krafft, a Swiss astrologer who was living in south Germany, had aroused considerable interest in exalted circles in Berlin. Krafft had written on 2 November to his friend Dr Heinrich Fesel, who was employed in Himmler's department, to suggest that Hitler's life would be in danger between 7–10 November. Dr Fesel, unwilling to become personally involved, filed the letter and kept quiet. When on 9 November the newspapers and radio reported the assassination attempt, Krafft despatched a telegram to Rudolf Hess at the Reich Chancellery in Berlin and drew attention to his prediction. Fesel was now obliged to produce the letter. Krafft was immediately arrested at Urberg, a remote Black Forest village, and brought to Berlin for cross-examination. He was released a few days later. In the meantime the credulous Heinrich Himmler was unsuccessfully trying to establish the identity of the would-be assassin by consulting a Viennese trance medium, who had been summoned to his Berlin headquarters.

Krafft's involuntary visit to Berlin coincided with Goebbels' new interest in the 16th century prophetic verse quatrains of Nostradamus (see NOSTRADAMUS) as a source for psychological warfare purposes. It was necessary to find a Nostradamus expert who could supply the Propaganda Ministry with appropriate material for processing. Krafft's name was first mentioned in this connection early in December 1939 and this led to an invitation to move to Berlin. He began work there during the first week of January 1940.

Prophecy as Propaganda

Although Krafft ostensibly worked for the Propaganda Ministry, his pay came from Hitler's department. Dr Goebbels and his people were completely cynical as far as Nostradamus was concerned. Not so Krafft, who sincerely believed that prophecies concerning Germany's victory over all enemies, present and future, could be decoded from Nostradamus's obscure quatrains. Tens of thousands of pamphlets based upon Krafft's 'discoveries' were circulated in French, Dutch, Italian, Serbo-Croat, Rumanian, Swedish and English by the middle of 1940.

A letter of Krafft's, written and mailed at Berlin in February 1940, was sent by order of Himmler's department to M. Virgil Tilea, the Rumanian Minister in London. Rumania was still neutral but M. Tilea's anti-German sentiments were well known in Berlin. The letter itself was nothing less than a crass exercise in psychological warfare. In that respect it failed to influence M. Tilea, but it nevertheless had one unexpected result. M. Tilea, who already had a slight acquaintance with Krafft and somewhat grudgingly respected his prophetic abilities, concluded that since Krafft now, unexpectedly, wrote from Berlin, he must be advising Hitler or other highly placed Nazis.

M. Tilea showed Krafft's letter to a number of eminent gentlemen in London and suggested that since Hitler was undoubtedly employing Krafft, it would be reasonable to engage a highly skilled astrologer whose task would be to deduce, from astrological evidence, the nature of the advice that Krafft was presumably giving to the Fuehrer. Various departments of British Intelligence became involved and this led to the appointment, around September 1940, of Louis de Wohl as the British 'Secret Service' astrologer. In London it was soon realized that this was a waste of time and de Wohl was quietly dropped. He was, however, later employed on a casual basis in London and the United States on psychological warfare projects that involved faked astrological predictions and bogus Nostradamus prophecies.

Krafft's own employment in Berlin did not last much beyond the spring of 1940, although he subsequently wrote on a freelance basis a Nostradamus book that was published in French, Portuguese and Danish. Its purpose was to demonstrate that Nostradamus had predicted an inevitable

victory for Germany and the consolidation of Hitler's 'New Order' in Europe.

Rudolf Hess's sudden flight to Scotland on 10 May 1941 had disastrous results for hundreds of Germans who were known to be identified with one or other department of occultism, and with astrology in particular. Hess's disappearance greatly embarrassed the Nazi bosses, the more so since it had somehow to be explained to the German general public. A solution was quickly found. It was proclaimed that Hess had been in poor health for many years and had latterly had increasing resource to hypnotists and astrologers. The decision to involve the occultists and astrologers was undoubtedly made by Martin Bormann and it was warmly supported by Reinhard Heydrich, who was Himmler's deputy. Their reason was that these people could never be regarded as ideologically sound.

'Aktion Hess'

Time was required to plan the 'Aktion Hess', which led to the arrest on 9 June 1941 of hundreds of occultists, with the astrologers at the top of the list. There were reasons for suspecting that the date of Hess's flight had been fixed on the basis of astrological considerations. Ernst Schulte-Strathaus, who was a member of Hess's personal staff at Munich, was an enthusiastic amateur astrologer and was his local expert on occult subjects. Schulte-Strathaus was arrested immediately but denied that he was aware of Hess's plans or that he had given Hess any advice, astrological or otherwise.

Far left Guido von List, founder of the occult German nationalist sect of the Armanen *Left* Delegates at an astrological congress held at Leipzig in 1923; second from the right is Hugo Volrath *Above left* Karl Krafft, shown as a youth, was later to produce Nazi propaganda based on Nostradamus prophecies *Above right* Louis de Wohl was employed by the British to deduce what astrological advice Krafft was giving to Hitler *Below* A magazine of bogus astrological predictions prepared by de Wohl

The 'Aktion Hess' was organized on a nation-wide basis and practically all the arrests were made early on 9 June 1941. The victims included many Party members. Apart from the astrologers the Gestapo arrested a wide range of occultists: alleged clairvoyants, radiesthetic (pendulum) practitioners, faith healers and Nature cure pundits, Ariosophists of the Lanz von Liebenfels school, members of the Christian Community (an Anthroposophical sect), antisemite Ariosophical Cabalists, and so on. The Gestapo's main attention was focused upon the astrologers, to identify whoever might have been in touch with Hess. It is unlikely that the 'missing astrologer' was ever found, if only because he or she probably never existed.

In the majority of cases those arrested were released within a few days or weeks, although there were a few important exceptions. Before being set free all were required to sign a declaration that they would neither practise astrology or any other occult science, nor discuss the subject with anyone. All publishers' and booksellers' stocks of astrological and occult literature were seized and many private collections were confiscated. Any public identification with the occult now became extremely dangerous.

Among those arrested and never released were Dr Hubert Korsch and Karl Krafft. Although the two men were acquainted there was no connection between their respective cases. The Gestapo suspected Dr Korsch on account of some anonymous articles that he had published about Hitler's horoscope

long before the latter came to power, and their main concern was to discover who had written them. The author's identity was never revealed and Dr Korsch was probably murdered at the Oranienberg concentration camp near Berlin on 24 April 1942.

Tracking Convoys by Pendulum

However, even after the 'Aktion Hess', the Nazis were apt to use astrology and other occult procedures when it suited them. There was, for instance, the organization of the 'Pendulum Institute' at Berlin during the spring of 1942. It was directed by Captain Hans Roeder, of the German navy. The British had begun to destroy an increasing number of U-boats, and it was supposed that they must be using a completely new detection technique. Roeder had proposed that the British were identifying the positions of U-boats by employing pendulum experts. The pendulum operator, it was suggested, sat with a chart of the Atlantic ocean in front of him. He would then 'search' the map with his pendulum. When the position of a German submarine had been located the pendulum would begin to swing in the prescribed manner.

Captain Roeder hoped to counter this by employing German naval personnel in the same way. The purpose of the Institute was to discover the correct techniques so that naval pendulum swingers could be trained to locate British convoys. A number of German radiesthetic practitioners and some alleged 'sensitives' with no previous pendulum experience were recruited under conditions of the strictest secrecy. For days on end they untiringly swung their pendulums but apparently to no very useful purpose. With few exceptions they had previously been arrested in the course of the 'Aktion Hess' and had been released. Some had nervous breakdowns and others managed to make their escape upon one pretext or another. The experiment was a complete failure.

The assistance of the occultists was again recruited after Mussolini was arrested by the Badoglio government on 25 July 1943. Hitler had peremptorily demanded that the Duce should be found and brought back to Germany. The problem was, however, that the Germans did not know where Mussolini was and when their military intelligence service failed to produce any useful information the occultists were again called in to help – not by the military but by Himmler personally.

Once again previous victims of the 'Aktion Hess' were assembled; their number included Herr Wilhelm Wulff, a Hamburg astrologer, who had spent a brief and disagreeable period at the 'Pendulum Institute'. According to Walter Schellenberg, the sceptical head of Himmler's foreign intelligence department, a pendulum expert correctly suggested that Mussolini would be found on an island to the west of Naples. The Duce had, in fact, first been taken to one of the small Ponza islands that he indicated. A little later he was transferred to the mainland and a small airborne force eventually abducted him from a mountain eyrie.

Himmler's major personal involvement with astrology began in 1943 when the renowned Felix Kersten, who gave him remedial massage for stomach cramps and other ailments, steered Wilhelm Wulff in his direction. Herr Wulff, who had enjoyed an extensive private astrological practice at Hamburg in the old days, had already suffered at the hands of the Gestapo and had no desire to become involved with Himmler. But during 1944–5 Herr Wulff had frequent meetings with the Reichsfuehrer and was still being consulted by him when the Third Reich was on the verge of defeat in April 1945. Herr Wulff's reminiscences of this period will be found in his book *Zodiac and Swastika*.

After 1945 the German astrological movement slowly revived and many of the pre-war occult groups were in evidence again. However, with the new feeling of security engendered by the German 'economic miracle' after 1948, there has been a considerable diminution of interest in the stars and other occult territories.

Every routine activity undertaken by the Navaho Indians is accompanied by some ritual or magical element. The magnificent curing ceremonies, preceded by purification, songs and exorcism, culminate in inteasive concentration to bring the power of the gods to bear

NAVAHO

AMERICA'S LARGEST Indian tribe today, the Navaho live on a sizeable reservation that sprawls across the Arizona-New Mexico border. It is poor, eroded, infertile land but like so much of the south-west of the United States it is an area of spectacular natural beauty – magnificently coloured sand and stone, wind-sculpted rock formations, towering hills and high rocky tableland. This visual splendour might be economically useless to an agricultural people but it is fundamentally important to the Navaho. Their religion and their ordinary way of life, which are in any case interrelated, are remarkably attuned to Nature, to the environment. It is hardly surprising that their religious belief and practice should contain much that is extremely beautiful: the poetry and music of the great ritual chants, the glorious 'sand paintings', the eternal, renewable beauty of Changing Woman, their chief deity.

Changing Woman is an Earth Mother figure, aging with the seasons, who is restored to girlhood each spring. From her union with the sun, also a major deity, sprang the Twins, hero figures and models of virile warriors. Changing Woman was the Creator who gave life to First Man and First Woman, and taught them all their wisdom and lore, including magic; they in turn created the universe and the Earth Surface People who are mankind.

Apart from these major figures, who have wide-ranging powers that involve them in the most important myths, the Navaho

Navaho sand paintings play a central role in the great curing ceremonies during which the supernatural powers who feature in the myths are summoned to the aid of the petitioner; the patient, a young girl, is seated within the painting, while the chanting medicine-man waves eagles' feathers to drive illness away

Allen C. Reed/Aldus Books

mythology includes an immense array of supernatural beings. Some of these, like Changing Woman and the sun, are included among the 'Holy People'. Others are personalized natural forces – Thunder People, Wind People and so on. Several are supernatural helpers, teachers and intermediaries between men and the Holy People.

All the Navaho gods, except Changing Woman, exhibit a share of unpredictability: they are highly humanized, containing elements of both good and evil, although there are a few demonic figures who are almost wholly evil. Hence the gods are accessible to human propitiation and prayer, capable of kindly and protective acts but at other times capable of wilful destruction.

In a sense it is almost wrong to describe these figures as gods. More accurately, they are supernatural beings and powers who exist quite separately from human existence except when summoned by prayer and magic. The myths in which they appear are immensely rich, highly sophisticated in their symbolism and complex interrelationships. But the beings tend generally to be left in the myths, except when called upon to exert their powers for some special purpose, either curative or protective. Moreover, the Navaho have no concept of a life after death in which the dead join the gods in a happy hunting ground. Their afterworld has nothing to do with the Holy People: it is a vaguely defined semi-limbo, far from pleasant. Little attention is given to death in Navaho belief: theirs is a religion of life.

Yet they have some firm beliefs concerning ghosts, who are invariably malefic. Those who have died in great old age or early infancy have no ghosts but any and every other kind of death breeds ghosts. They return in human or animal form, in weird supernatural shapes, or merely as the sound of a whistling from the darkness. They attack people, send illness; and to see a ghost is an omen of death.

Equally evil are the Navaho witches, who have magical and shape-changing powers, and are devoted to harming other Indians, mainly by sending disease. Most diseases, according to the Navaho, come from supernatural causes. If the cause is witchcraft, the old remedy used to be simply killing the suspected witch. Otherwise, only ceremonial

Taylor Museum/Colorado Springs Fine Art Center

counter-magic could possibly work a cure.

Navaho ritual is a complicated and colourful world. The tribe's life seems saturated with ceremony, but of such grace and delicacy that it elevates rather than restricts everyday existence. Clearly the Navaho religion is centred much more on ritual than on the man-to-god relationship of active worship. The gods are persuaded or coerced through the ceremonies to expend some of their power for human benefit; but in the rites, no one god is necessarily more important than another, and certainly nothing is more important than the actual ritual.

Every routine activity is accompanied by some ritual element, if only a goodluck song, a chant to ensure good hunting or a specially-placed amulet to protect the craftsmanship of weaver or potter. So travellers perform ceremonies before setting out; and the farmers work ceremonial magic to ward off drought, insects, plant disease and other threats to agriculture. The Navaho have a lengthy and beautiful initiation ceremony, without any of the terror and pain so often involved in such rites, to bring young men and women into full adulthood. There is also a potent ceremony before war, usually called 'Enemy Way', which protects warriors against harm in battle and also against the vengeful ghosts of slain enemies.

Curing by Conjuration

But by far the bulk of the Navaho's ceremonial life is tied up in magnificent curing ceremonies. Illness and injury are usually ascribed to supernatural causes, perhaps a taboo has been infringed angering one of the Holy People or some spirit of Nature, but more often ill-fortune is ascribed to witchcraft. Often the whole tribe assemble for the cure, to partake of the general blessing, as they also do for the 'good-fortune' ceremony called 'Blessing Way'.

In all these rites, the medicine-man who officiates seems more like a priest, in Western terms, than a true primitive shaman, for he does not become possessed but merely serves as the authority on ceremonial knowledge and the director of the proceedings. His knowledge earns him immense prestige, and rightly so: as one writer has put it, knowing and directing one of the major curing ceremonies requires an effort equivalent to memorizing an entire Wagnerian opera, music, words, sets, costumes, lighting and all.

The ceremonies differ in many ways. Some are short, lasting only one or two nights, while others extend up to nine nights. Different songs and paraphernalia are used but they all share some general characteristics. All the main participants must undergo extensive purification—sexual abstinence, sweat baths and soap baths,

Navaho myths are illustrated by their sand-paintings; the paintings are done to the accompaniment of sacred chants which express the relationship between the spirits and medicine-men *Left* Spirits from the 'Shooting Chant' holding sacred objects *Right* From the 'Mountain Chant' group (*above*) Dsilyi Neyani visits the home of the snakes and (*below*) visits the 'Lodge of Dew'

special times and places for eating and sleeping and excreting. During the early stages of the ceremony the medicine-man and assistants prepare herbal medicines, magical objects and amulets, musical instruments, rattles and 'bull-roarers'. Above all, the medicine-man must oversee the creation of one or more of the gorgeous sand paintings (properly called 'dry paintings'), often elaborate enough to keep 20 or more people at work for many hours.

Prayer-sticks, vital to the ceremony, are made from special wood, with feathers, shells and similar sacred or magical objects attached according to the ritual prescription. The sticks are placed around the site of the ceremony, to serve as invitations to the Holy People or other beings. The power of the sticks, and of the magical objects placed on an altar before the house where the ceremony will take place, is then reinforced with special songs and prayers. If everything is done according to custom the gods have no choice but to come: it is not so much a request as a conjuration.

The preparation of sticks, paintings and the rest, along with the special songs, purifications and exorcism of evil presences, may fill the first two or three nights of one of the major ceremonies. Then the patient is taken to sit within the main sand painting, and some of the sand is applied to his body to direct the gods' attention to his illness. Purification and singing or chanting continues throughout the ceremony; the chants are long, ornate symbolic poems which must be rendered faultlessly from memory. On the final night the medicine-man sings from late evening until dawn without stopping. During this process, all the power gathered during the previous stages is concentrated onto the patient, and some of it 'overflows' onto the onlookers and other participants.

Such concentration makes it hardly surprising that the ceremonies so often work. The purifications and herbal remedies may have some therapeutic effect on some ailments. But most effective is the absolute faith that still today tends to keep a sick Navaho away from the white man's hospital.

Magic in a Trembling Hand

Confidence and the strong Navaho respect for tradition has kept the everyday magic very much alive. This magic is not wholly separate from the ceremonies, for much of it finds its way into specific rituals as secondary ways of tapping spirit power or purifying the patient; but it can be separated out of the ceremonial context and used on its own. So, while the dreams of the patient during a curing ceremony are vastly important, ordinary dreams are also considered significant for divination.

One of the most unusual divination techniques is called 'hand-trembling'. It is a complex ceremony in its own right, requiring the magic use of pollen on the diviner's hand which, with the use of requisite songs, induces a semi-trance state that causes the hand to temble violently. The hand then operates independently to point out a wrongdoer, to dowse for water or lost property, or to indicate some future event.

Amulets, protective magic and taboos are highly important to the Navaho. 'Gall medicine' (from animal gall) protects the wearer against witchcraft, as does a wide variety of herbs, shells, carved images of animals and the ever-present pollen, always very powerful to the Navaho. A white shell bead protects the work of a tanner from going wrong; a squirrel's tail tied to a cradle protects a baby.

Finally, there are the taboos which are usually intended to prevent offences against supernatural beings. The Navaho never intentionally kill coyotes, snakes, bears or certain other animals; special rituals must be performed to cleanse someone who has killed one of these creatures by accident. A Navaho will never comb his hair at night, or step over someone sleeping, or go near a tree that has been struck by lightning.

These beliefs and the many other Navaho taboos seem to parallel closely our own society's ancient taboos, which we call superstitions. But for the Navaho, with his all-pervasive religious awareness, they are closely connected with the 'proper way of doing things' – respect for the Holy People, the ceremonies, the natural environment and the rest of the tribe. The Navaho's religious life and worldly life are one and the same. At its best, this unity brings with it an impressive serenity and stability. Perhaps this quality above all has enabled these Indians to grow, expand, to come in some ways to terms with modern America, and yet lose little of their tribal identity.

DOUGLAS HILL

Many cities and shrines have been believed to stand at the navel of the world, the place where different levels of existence – the worlds of men and gods, the living and the dead – connect

NAVEL

G. L. Carlisle

The most famous of the navel-shaped stones worshipped throughout the Mediterranean was the white marble Omphalos from the temple of Apollo at Delphi, which marked the centre of the earth

THERE IS a Turkish story that when Allah created the first man, the Devil saw him and in disgust spat on his stomach. Allah promptly ripped out the polluted spot, which is why human beings have navels. The navel-string and the afterbirth are widely believed to retain a connection with their owner all through life. In Bavaria, for instance, the navel-string of a newly-born girl used to be pricked, in order to give her skill with the needle.

The principal symbolism of the navel, resulting from its central position in the human body and the fact that the umbilical cord is connected to it, is as an emblem of 'the centre', the place where there is a connection between different spheres or levels of existence, between men and the gods, the living and the dead, the unborn and the born. (The notion that babies are born through the navel is common among children.)

The Sacred Stone

Navel-shaped stones were reverenced from very early times in Greece, the most famous being the *omphalos* (Greek for 'navel') which stood in the temple of Apollo at Delphi. Apollo is sometimes depicted sitting on it. In the 2nd century AD the traveller Pausanias saw an omphalos at Delphi, made of white marble and claimed to be the centre of the earth. If the Delphic oracle had belonged to the earth goddess before Apollo made it his own, there could scarcely have been a more suitable place at which she communicated with mortal beings than her own centre.

Later writers said that the omphalos was the tomb of Dionysus or of Python, the giant snake or dragon which Apollo killed at Delphi (see APOLLO). The omphaloi which have been found there are apparently copies of the true, original one. Bands of wool were wound round it, represented in the copies by a carved network. The figures of two golden eagles were placed beside the omphalos, because of the story that when Zeus wanted to discover where the centre of the earth was, he caused two eagles to fly towards each other at equal speed from the eastern and western rims of the earth, and they met at Delphi.

An omphalos looks like half an egg standing on a low quadrangular base. Its phallic shape has been remarked on, and it also resembles a mountain and recalls the primeval hill of the Egyptian creation myth of Heliopolis (see CREATION MYTHS). The Heliopolitan priests claimed that their temple of Atum stood on the site of this hill and was at the centre of the world. Many other shrines and cities besides Delphi and Heliopolis have been believed to stand at the navel or centre of the world, including Delhi, Peking and the Inca city of Cuzco (see INCAS). The earth's navel is also sometimes connected with the holy mountain, on which the gods live and which reaches from the centre of the earth to the centre of the sky.

(For 'the centre', see also SYMBOLISM.)

To protect themselves from the anger of disturbed spirits, sorcerers used to enact elaborate rituals before summoning the dead. This black art was suppressed by the Witchcraft Act of 1735 but churchyard desecrations still occur

NECROMANCY

THE BLACKEST of all the black arts is undoubtedly necromancy (from Greek words meaning 'dead' and 'divination'), the ancient method of communication with the dead. Necromancy, a word corrupted by medieval Latin writers into *nigromantia*, can be divided into two main branches: divination by means of ghosts, and divination from corpses, both of which represent related forms of forbidden knowledge. The second method led to the disinterment of corpses and rifling of graves for the grisly charms which magicians and witches considered necessary for the effective performance of the magical arts.

It is not possible to understand the mysteries of necromancy without some knowledge of an attitude towards the souls of the dead which prevailed until comparatively modern times. It was taken for granted that under normal circumstances the dead did not return as ghosts, and that if they did so it must have been for some special reason. It follows that if a living person desired to establish communication with the dead on his own terms – in other words, to summon the spirits from their last resting places in defiance of their wishes – it would be necessary to institute the most elaborate precautions that magic could provide as insurance against becoming the victims of their righteous anger.

The motives of those who sought communication with the dead were largely of a mercenary character. Because of the prevailing assumption that the dead, unrestricted by human limitations, were all-knowing and all-seeing, they were usually consulted by magicians or their clients wanting to know the whereabouts of buried treasure. These enquiries were generally restricted to the 12 months following death that folklore had decreed to be the statutory period during which the shade lingered in the vicinity of its grave.

The subordination of the will of the dead to the whims of the living demanded a specialized technique known only to the most highly-skilled magicians. The annals of sorcery in the British Isles include innumerable references to 'nigramauncers', as they were called, 'who by figures and markings upon the dead body of beast or man operate to get knowledge'. In 1371 a wizard of Southwark in London was caught in

According to the famous story of Saul and the 'witch' of Endor, the king failed to obtain an omen of the future from God by dreams or by lots or by prophets, and consulted a medium who summoned up for him the shade of the prophet Samuel. The ghost appeared as an old man dressed in a robe, and foretold Saul's imminent death and the defeat of Israel (1 Samuel, chapter 28)

possession of 'the head and face of a dead man', and these grim tokens of necromancy, together with his book of magic, were consigned to the flames.

Evidence suggests that there was some confusion between the spirit of the dead, or ghost, and the elemental spirit or familiar which was one of the lesser demons. It was perhaps for this reason that the Statute of 1542 against witchcraft covered the situation with a blanket condemnation of those 'divers and sundry persons (who) unlawfully have devised and practised invocations and conjurations of spirits pretending by such means to get knowledge for their own lucre in what places treasure of gold or silver should or might be found.'

In actual practice the punishment administered by the courts was comparatively light. In 1598 a Cunning Man named Robert Browning was merely placed in the pillory after being found guilty of fraudulently persuading the 'King's subjects' that by conjuration of 'evil spirits they might discover hidden hoards of gold and silver and regain lost goods.'

To evoke the dead the magician needed to obtain the help of powerful spirits, both for his own protection and to compel the corpse or ghost to submit to his will. A spell from ancient Greece calls upon the powers of the mighty Kore, Persephone, Ereshkigal, Adonis, Hermes and Thoth, to bind the dead. According to a ritual described by Seneca, the Roman dramatist, the summoning of the dead involved not only a burnt sacrifice but a blood-drenched altar.

Powerful Circles

In European necromancy, the methods employed for the raising of the dead, whether in body or spirit, demanded rigid compliance with the accepted laws of magic. The site for the operation had to be chosen with care, the most favourable being some lonely crossroads, a vault, a ruin, an unfrequented forest, or a blasted heath. Once a time had been decided upon for the seance, a series of concentric circles of power would be drawn on the ground within which were inscribed crosses and other symbols, together with holy names of God. The circle would be blessed and consecrated, with the magician and his assistant standing at its centre, protected by the holy names from all danger. Then, wand in hand, the magician summoned the dead to rise.

Eliphas Levi (see LEVI) and other magicians have suggested the need for some attempt at identification between the living and the dead, as for example the presence of a portrait, and a portion of bread which the ghost would be invited to consume. In his evocation, the magician summoned the dead by name and, if he were successful, he would then have to face the frightening ordeal of a phantom screaming and gibbering with rage at having been compelled against its will to return to the realms of the living. Sometimes the dead were known to appear in the shapes of furious beasts raging about the circle and threatening to tear the sorcerer to pieces. When the dead finally decided to submit to the magician's will they would often become transformed into one or more naked men who would then be willing to answer the questions put to them.

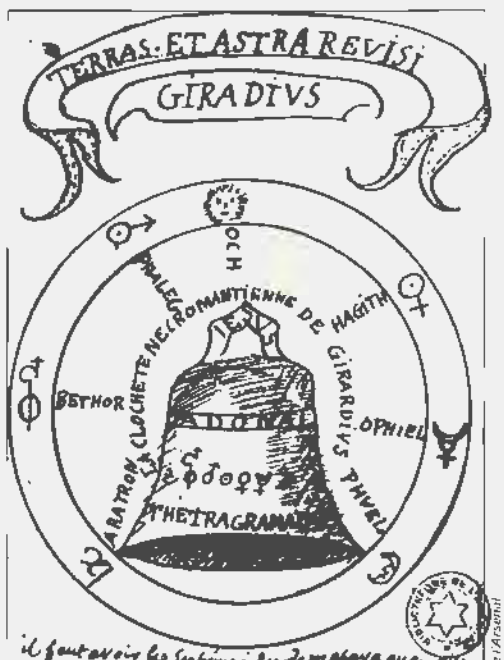
After the seance it was necessary to dismiss the dead, who usually vanished amid clouds of sulphur. Under no circumstances was the magician to leave the protection of the magic circle before this, and even so he might not leave until he had performed certain prescribed rituals. He also had to remove all flowers from the place and after burning them, to bury the ashes deeply in the earth.

The whole operation was fraught with terrible dangers, for the slightest departure from the rites could involve the destruction of the operator and even inflict injuries upon his soul. In the 17th century a popular Egyptian fortune teller named Chiancungi, who quitted the magic circle too hurriedly, was crushed to death by an enraged ghost.

Summoned from the Tomb

Churchyard necromancy, a specialized branch of the art, required a rather different technique. As the hour of midnight struck, the magician, having undertaken the preliminary rites, would intone in a sepulchral voice: 'The dead rise and come to me', and then he advanced into the churchyard scattering graveyard earth about him. In summoning the dead from the tomb he cried: '*Ego sum te peto et videre queo*'. To dismiss the dead he commanded: 'Return to the Kingdom of the Chosen'.

There is an old print depicting Dr John Dee's assistant, Edward Kelley, standing in a churchyard, holding a magic wand and reading from a book of spells, while his assistant illuminates the macabre midnight scene with a flaming torch (see DEE). In the light can be seen a newly-resurrected corpse rigid in its shroud. The two sorcerers have taken the precaution of placing themselves at the centre of a magic circle inscribed with the names of certain protective angels, 'Raphael, Rael, Miraton, Tarmiel and Rex'.



Bibliothèque de l'Arsenal

Above **Drawing of the necromantic bell of Giradius: in order to summon up the dead with ease, the bell, made from a mixture of special metals, should be buried in a churchyard grave for seven days** ***Right*** **17th century German engraving of the 'witch' of Endor summoning Samuel; holding a vervain twig, the emaciated hag and Saul are shielded by a magic circle**

The use of corpses as ingredients of charms and philtres was closely associated with necromancy, and is one of the best known techniques of witchcraft. Death by violence, or any premature termination of life, enhanced the magical value of human flesh, since it could then be assumed to contain some element of unconsumed vitality within it. The old Norse wizards were said to know spells that could compel even a corpse on a gallows to speak. As Paolus Grillandus, a judge in witch trials at Rome in the early 16th century, wrote: 'Some take a small piece of buried corpse, especially the corpse of anyone who has been hanged or otherwise suffered a shameful death . . . the nails or teeth . . . the hair, ears or eyes . . . sinews, bones or flesh.' The demand for similar ghoulish remains, particularly the flesh of unbaptized babies, was responsible for many graves being rifled. Among the best-known cases involving human flesh in magic was that of the Irish witch, Alice Kyteler (see KYTELER), who was accused of using the hair of a corpse and the skull of a thief in one of her formulas. A moss that grew on the skull of a hanged man was always in considerable demand.

The attitude of the Church towards all forms of communication with the dead was, in the past at least, one of unremitting hostility. Such practices are prohibited in the Bible and this condemnation is further emphasized in the story of Saul who consulted the dead Samuel through the agency of the Witch of Endor (1 Samuel, chapter 28). In the 3rd century Tertullian, the theologian, condemned those magicians who defiled the graves of the dead and counterfeited oracles, but witch-fearing clerics of the 16th and 17th centuries went further and refused to admit the possibility of a ghost being anything other than a demon in disguise. In his *Discourse of the Damned Art of Witchcraft* William Perkins, writing in 1608, observed: 'The Devil being sought unto by witches appears to them in the likeness of a dead body.' John Cotta ventured further still in his *Trial of Witchcraft* (1616) by declaring clairvoyance to be no more than one of the forms of diabolic possession. It is not surprising then that Shakespeare's Hamlet, when confronted with the ghost of his father, should have asked: 'Be thou a spirit of health or goblin damned? Bring with thee airs from heaven or blasts from hell?'

The complete separation of the concept of the ghost from that of the demon did not take place until much later, not until the problem of witchcraft had largely disappeared from the theological concern. The confusion between ghost and devil is apparent in an account of a seance conducted by Parson Rudall in Cornwall in 1665, when the clergyman, having drawn

the customary magic circle into which he conjured the ghost, demanded a sign from the shade 'that it was a true spirit and not a false fiend'.

It was some years after this, at the close of the 17th century, that ancient necromancy began gradually to develop into modern spiritism. There is no record of prosecution for necromancy in the whole of the 17th century, and with the decline in the practice of utilizing the bodies of the dead for magical purposes greater emphasis was put upon what was later known as mediumship. For example, Joseph Glanvill (1636–80) who has been called the Father of Psychical Research, with Dr Francis van Helmont, Dr Henry More, and Robert Boyle, conducted seances at Ragley Castle at which early mediums demonstrated the art of communication with the world of spirits.

Later still the curious incident of the Cock Lane ghost, even if it served no other purpose, did at least indicate the growth of the belief that the dead and living could communicate by means of a series of knocks. This ghost, which haunted a London house in Cock Lane, Smithfields, was that of a woman who had lived there with her dead sister's husband. Her hauntings provoked two people to hold a seance to discover the reason for her return.

Illustration from Guazzo's *Compendium Maleficarum*, showing witches exhuming a corpse while others feast on the body of a baby: witches were often accused of cannibalism and of using the organs of dead bodies in their spells

True and False Spirits

The whole question of raising the dead, even when it ceased to concern the guardians of the public conscience, was too deeply rooted in folk culture to be legislated out of existence. Nevertheless the revised Witchcraft Act of 1735, in imposing imprisonment and pillory for all pretence at communication with spirits, must have successfully suppressed most aspiring witches and necromancers, for after that date there is no evidence of any prosecution under this Act until the present century, when several fraudulent mediums were charged with counterfeiting spirit manifestations. In 1944 two women, Jane Yorke and Helen Duncan, both Spiritualists, were brought before the courts under the terms of this Act, although the latter maintained that her spirits were good ones and not evil. As the result of these prosecutions and the subsequent struggle of the English Spiritualists to remove from their activities any suggestion of necromancy, in 1951 Parliament replaced the old Witchcraft Act with the Fraudulent Mediums Act.

To declare that necromancy of the old type is quite dead would perhaps be premature. Innumerable churchyard desecrations still take place, some of which involve the actual disturbance of the corpse. The most famous case of this character in recent times was the exhumation of a woman's skeleton at Clophill in Bedfordshire in 1963 and its subsequent use in the rites of black magic (see CLOPHILL). Even more macabre was the disinterment of a man's body in a North London cemetery in the autumn of 1968, when the corpse was discovered pierced with a wooden stake close to a huge circle of flowers taken from nearby graves.

Among the most cherished anecdotes of the more sophisticated type of magician is the amazing 19th century seance conducted by Eliphas Levi the French occultist who attempted to raise the shade of the pagan magician Apollonius of Tyana in London in 1854. The room in which the seance was conducted contained mirrors, a pentagram and, for the protection of the wizard, a magic circle of magnetized iron. The materialization of a shrouded spectre, 'lean, melancholy and beardless', robbed the magician, temporarily at least, of his powers of speech.

Current occult theory indicates that the departing soul, in ascending to a higher plane, leaves behind it a secondary human body, known as the astral corpse, which contains some vestiges of life and which, because of its intense desire to live again, can sometimes be lured back to the physical world by the power of magic. It has even been suggested that the astral corpse has the power to absorb life from human beings rather in the manner of a psychic vampire. Some occultists are of the opinion that the medium, in calling upon the spirits of the dead, in reality summons not the ghost but the astral corpse, and if this is so it could perhaps be said that necromancy has never truly died.

NEGROES

David Redfern

'Soul' music has developed from the old spirituals, themselves a characteristic expression of the Christianity of slaves in the American South: one of the 'Stars of Faith' group

The Negroes have been described as 'the world's most religious people'. But the black man's way of worship is alien to that of the West; the frenzy of a revivalist meeting in the Southern states of America has more in common with an African ceremony than with the controlled sobriety of most Western church services

THE NEGROES' contribution to religion and magic comes from two different cultural backgrounds, from Africa and from the Americas. But from a closer examination of Negro attitudes and ideas, we see how ancient tribal beliefs and customs, born in the forests of Central Africa, have influenced the development of religion in both continents. Many Christian converts in both Africa and the Americas are still attached to some of the old pagan concepts of the supernatural, most notably in the cult of Voodoo, originally the specific religion of Dahomey (see DAHOMEY; VOODOO).

White Christians have never really been able to understand the traditional pagan religions of Africa, for a number of reasons. Firstly, Africans have kept their rites secret from invaders and occupiers; secondly, there are literally hundreds of cults which vary from country to country and even from village to village; and thirdly, these cults have never been institutionalized or written down like Christian and Islamic theologies.

The first European explorers, the Portuguese, in search of trade and riches rather than scientific knowledge of the black man's social and religious institutions, mistook the simple paraphernalia of the African cults – little statues of wood and stone – as idols or fetishes. They dismissed the Negroes as ignorant heathens. an attitude which still survives.

From the 16th century onwards, European missionaries sought to destroy these idols, to discredit the local gods and their priests, and to substitute the worship of the Christian Jehovah. What the missionaries overlooked in their ignorance of African psychology was the fact that all the

Jeffrey Blankfort/Transworld Features

Jack Kaufman/Transworld Features

inhabitants of the 'Dark Continent', from the Mediterranean to the Cape, from the Atlantic to the Indian Ocean, recognized a supreme deity who was the creator of the world and the lord of the universe.

Destroying Pagan Gods

In order to convert the Africans to Christianity, the missionaries had to discredit nearly all the local beliefs, especially in minor deities, spirits and supernatural forces of one sort or another. Deeply entrenched in all African cults was reverence for ancestors who after death remained in the vicinity of their homes and villages to watch over their descendants. The ancestors, and the godlings and spirits to whom the Negroes sacrificed, were important because although there was a Supreme God, he was far too powerful and remote to have any interest in a particular person. A dead father, on the other hand, who had taken up his residence in a tree, was much more likely to take an interest in his family's fortunes (see CULT OF THE DEAD).

The missionaries were also determined to suppress other myths and superstitions, especially what was called totemism, or the cult of animal worship. All primitive people have a special relationship with animals which urbanized people cannot begin to understand (see ANIMALS). African tribes invariably had one or several animals with whom they had a special alliance, probably because at some time in their history, their lives had been saved through the assistance of an animal at a moment of danger or deprivation. Then, the animal would become the tribal 'mascot', venerated more and more as time went by.

But the chief enemies of the Christian missionaries were undoubtedly the priests of the African religions: in other words, the witch-doctors who have often been figures of fun or derision in the West. Yet the witch-doctors were, in actual fact, the pastors of the tribe, with many social as well as religious functions, all designed for the well-being of the people. Indeed, without the witch-doctor and his various skills, including his psychiatric and medical methods, life would have been intolerable among primitive African communities.

This is important in the context of the fundamental differences between the black and the white man's religious concepts and attitudes. First of all, Negro religion is basically a social affair, whether it is pagan or Christian. The only comparable example in the Christian world is the total integration of the spiritual and social life found during the first three or four centuries AD and then primarily among small semi-monastic communities. As soon as the Church became institutionalized, attitudes changed, and religion either became a strictly formalized type of worship, or a purely personal belief.

Negroes, by contrast, have never lost their sense of clan involvement in whatever faith they hold, an involvement which in primitive groups controls almost every act of their lives. A French anthropologist sums up African paganism like this: 'No institution exists, whether social or political or even economic, which does not stand on a religious concept. The Negroes of whom it has been said that they have no spiritual awareness are, in fact, the most religious people in the world.'

This religiosity, then, influences the African's whole life, with rituals and ceremonies from the cradle to the grave. Many Christian Negroes of the Americas are similarly influenced. The effect is seen in the wholehearted participation of the congregation in singing and shouting and sometimes dancing during the service.

Unfortunately for the Negro 'image', these manifestations of fervour are among the very things that white people tend to frown upon as childish or uncivilized. The first Christian missionaries certainly condemned in no uncertain terms the African's clothing or lack of it, his ornaments, dances, music, marriage customs and initiation rites, nearly all of which were none the less an integral part of the alien religion. The natives were exhorted to cover up their bodies and tone down their fervour in deference to the new cult.

An even graver example of interference in traditional society was the Christian prohibition of polygamy, even though this system had worked satisfactorily for thousands of years and had become in many areas one of the corner-stones of African culture. This system worked because it meant in practice that no woman lacked a male provider; no wife had trouble in finding a baby-sitter; and no spouse was without a proper status with a home of

Black Star/Transworld Features

Africans exported to the New World were both Christianized and enslaved (*near left* and *centre, above*). In the days of slavery, the church or chapel was 'the one place where the Negro was outside the control or observation of his white masters'. One result was a type of religious expression blending Christian doctrine with pagan African feeling and characterized by emotional involvement. Another was that a black church could be a centre of political activity, and black ministers have played leading roles in the freedom movement. More recently, with the decline of membership in the Churches and impatience with all things white, black political activity (*far left* and *centre, below*) has moved away from its earlier religious background

her own. At the same time, all the women belonged to a large family unit which gave them entertainment in their youth and security in their old age. The alternative is liable to be prostitution, which in Africa is already a result of progress towards a European life-style.

White interference in the original African cults may well have done more harm than good, especially since it is now recognized that the Negro had a positive spiritual awareness of his own long before the arrival of Christian missionaries. Certainly, he had an intense and exuberant sense of participation in his religious ceremonies, which contrasts most strikingly with the polite form of worship favoured by most white people. Even in a Negro church, the old pagan beliefs and behaviour are obviously not very far below the surface. The preacher, if he is a genuine product of his own racial group and not a sophisticated product of white theological colleges, is, in a sense, as much a witch-doctor as is his colleague in the forests of the Congo.

Echoes of Jungle Drums

The preacher in a Negro church is the leader, orator, politician and father-confessor of his flock, particularly in the Southern states of the United States. The church or Baptist chapel was the one place where the Negro was outside the control or observation of his white masters, and under the guise of religion it could become a meeting place for various kinds of secret societies, as well as for women's groups, Sunday school classes and more orthodox religious activities. It was, and is, a vital social institution.

So, too, the music produced in Negro chapels has very little in common with *Hymns Ancient and Modern*. No one who has heard it can fail to detect in the rhythms, hand clapping and foot stamping the jungle drums and incantations of tribal ceremonies. It is music, incidentally, that represents one of the Negroes' great contributions to world culture, for from this singing, first in the old plantations of Virginia, then in the Negro chapels, came a whole new style of musical invention – the 'spirituals', minstrel songs, and jazz in its multifarious varieties.

The Negro historian W. E. B. Du Bois has called the spirituals – or 'sorrow songs' as he terms them – 'the greatest gift of the Negro people to the world'. Nobody can say to what extent these deeply religious folk hymns have influenced modern music, both classical and popular. Certainly such spirituals as *Nobody knows the trouble I've seen* and *Swing low, sweet chariot* are corner-stones in the development of modern music, as was the first jazz heard in New Orleans and Memphis, Tennessee.

The third striking characteristic of Negro religion, whether pagan or Christian, is the frenzy, that uncontrolled and uncontrollable fervour which seizes some or all of a congregation 'when the spirit moves'. Observers who describe the frenzy of a black revivalist meeting in the Southern states of America are, in effect, describing a ceremony presided over by a witch-doctor in the heart of Africa. In both cases the common elements are stamping, shrieking, rushing to and fro, waving the arms, weeping, laughing, dancing, and finally falling into a trance.

This method of worship is no tame or formalized expression of faith. It contrasts strikingly with the service favoured by the majority of white Christians who have come to associate religion with an established Church which they visit once a week for a solemn and rather grave ceremony. The Negro is not attuned to this method of worship, either historically or temperamentally. He is conscious of the supernatural in one form or another every hour of the day, on rising in the morning, going out to the fields, crossing a river, and watching the movement of animals and the flight of birds.

In other words, the Negro feels surrounded by spirits and ghosts, and it would seem that no matter how Christianized or sophisticated he becomes, he is still conscious in some atavistic fashion of both the good and the evil forces outside the visible world. Hence many superstitions, particularly those concerned with the magical properties of certain animals, are taken much more seriously by black than by white men – or by those white men, at least, who have lost touch with the world of the wild beasts.

The basis of many of these superstitions, folktales and beliefs lies in the African's conviction that a man does not die as we believe he dies, but that he is 'done away with' by some malign power or person. And even though he appears to be 'dead', he survives not just as a 'soul', but as a real

Above left David Livingstone (1813–73), the Scots missionary, explorer and opponent of the slave trade, whose exploits in Africa made him one of the great heroes of Victorian Britain. Christianity was taken to Africa by white missionaries, many of whom were men of courage and dedication, but their tendency to regard white religion and culture as superior and African paganism, which they often failed to understand, as inferior contributed to the myth of the African as a childish savage which has influenced white views of the Negro ever since

Voodooism satisfies the black man's need for an intensely personal relationship with the otherworld, through the medium of the saints or the sainted dead

person, even if invisible; for no living thing dies of itself, it is always killed. Consequently, there is no such thing as extinction: there is, rather, the withdrawal of the living form into another element, or what the oriental philosophers call transmigration.

Placating Death

This belief that the cessation of life can only be the result of a malign force explains why, in general, it is the vengeful gods or spirits who receive most attention from Africans. If death has been cause by one of these forces – storms, lightning, floods – the spirit must be placated by some sort of sacrifice. Alternatively, if it has been caused by another human being – in other words, a wizard or witch – the guilty party must be smelt out (see FINDING OF WITCHES). This is one of the functions of the witch-doctor or medicine-man who is on the side of good and whose magic is therefore 'white'. It is for this reason that the witch-doctor is the most valued member of the community. Yet within the context of paganism, he is just as much a medium between God and man as a priest of the Christian religion.

Sensational and biased reports have tended to discredit the witch-doctor and, even more, the cult known as Voodoo. Voodoo originated in Dahomey, West Africa, whence it was brought by slaves to the New World during the 18th and 19th centuries. The term *vudu* means the worship of a group of gods who govern the universe, each with his own special function.

This pantheistic concept of the other world, so characteristic of Black Africa, has never been wholly eradicated by Negro acceptance of alien religions such as Christianity and Mohammedanism. Voodooism is found wherever the descendants of West African slaves live in close communities. American journalists, however, have sensationalized Voodoo out of all proportion to its actual significance. Human sacrifice, the raising of the dead, the appearance of zombies and so forth, are figments of the popular press and have very little to do with the essence of Voodoo, even as it is practised in Haiti, the principal centre of the cult.

The essence of Voodooism (or Hoodooism as it is sometimes called in the United States) is the personalization of the worshippers' relationship with the supernatural. This is achieved by means of communication with a variety of demigods and spirits, as well as the ghosts of the dead. The medium is the trance or frenzy in which the worshipper becomes the instrument (called in Haitian Voodoo *le cheval*, 'the horse') of a god who mounts and rides him. The resultant gyrations of the 'horse' are naturally of the weirdest type and are characterized by the critics of Voodoo as pure hysteria. On the other hand, the possession of a subject by a spirit is a phenomenon found in all religions and is certainly not unique to Voodooism.

Voodooism satisfies the black man's need for an intensely personal relationship with the otherworld: hence the Haitian emphasis on the saints whom they refer to as the *anges* or the *mystères*. The idea is to make contact with the supernatural through the medium of the saints or the sainted dead. And though basically pagan, Caribbean and South American Voodooism includes in its pantheon a great many Christian saints, notably St Patrick, St Anthony and St Michael. It is not known how 'Baron Samedi' got into the Voodoo calendar, but he is a powerful spirit since he presides over death and graveyards.

A Western Delusion

The influence of Voodoo has been profound throughout the West Indies, South America and the United States – in fact, wherever Negroes live in isolated or semi-segregated colonies. It has its own priests called *hungans*, priestesses or *mambos*, witches, wizards and saints, all somehow interconnected with Christian doctrines and ritual. Its detractors claim that it is the breeding-ground of secret societies and of tricksters who extract money from poor and ignorant people in order to perpetuate the superstitions of West African pagans. Other observers, including some Catholic priests with an inside knowledge of the cult, state that Voodoo is a truly social form of Christianity adapted to the needs and psychology of Negroes and providing them with the songs, dances and feasts which are as vital to them as their faith in a happier place after death.

Perhaps the nearest the white man can get to a genuine picture of Voodooism (as opposed to the reports of journalists who neither speak the patois of Haiti nor obtain the confidence of the Voodoo leaders) is the description given by the Haitian sociologist Dr Arthur C. Holly who writes about it as follows:

> A patient study of Voodoo shows that its origin was the result, as in other religions, of the personification of supernatural beings or spiritual forces which control and direct our lives here on earth.
>
> All such religions carry with them certain rites, ceremonies, appropriate symbols, and pageantry calculated to captivate the imagination of the greatest number of worshippers.
>
> I can assert that the Negro initiated into the real Voodoo cult in conformity with the pure tradition entertains no relations with Satan. The devils to whom he is accused of sacrificing are not spirits of darkness, that is to say, the malevolent. They are *daimons*, similar to the Greek conception, 'luminous spirits'. Criminal sorcery, black magic, are incompatible with the spirit of Voodoo as a ritual religion.

Despite these assertions by a specialist on the subject, the conviction remains among white people that Voodoo and the other Negro religions consist of mumbo-jumbo, fetishism and black magic. To Western man, magic is delusion and trickery to be relegated to the music hall and not to be taken seriously.

This is not so in the world of tropical forests. Here magic is the most important factor in the black man's life, for it underlies all the manifold terrors and disasters which beset him. Consequently magic is never practised for entertainment or effect. It is purposeful, and is studied in precisely the same way that a theology student studies divinity or the graduate of a business school prepares for a career in commerce. Amateurs and dilettantes are not encouraged. Nor are wicked or anti-social people, for they become the practitioners of black magic.

As anthropologists study the Negroes' religions in greater depth, the conclusion is that white men can learn a great deal from them. African paganism, for instance, is by no means an unsuccessful attempt to reconcile man to the invisible world around him. Negro Christianity, on the other hand, is a truly dynamic faith which deeply involves the individual in the act of worship and allows him to express his spiritual longings without inhibitions.

Born out of obsessive nationalism and German Romanticism, the neo-pagan sects looked back to old Germanic religious beliefs; all that was Aryan was sanctified in ceremony and worship

NEO-PAGAN GERMAN CULTS

THE FIRST NEO-PAGAN German religious sects emerged at the beginning of the 20th century. All of them were by-products of the German *völkisch* movement, a confused and complicated ideological phenomenon, stemming from the ideas of the late Romantic movement and German nationalism. As a social group, the *Völkischen* were mainly middle class, and identified with a passionate and, indeed, irrational belief in the sanctity of everything that was specifically German or 'Germanic'; they reflected the most extreme and chauvinistic form of German nationalism. The Völkischen, with their countless leagues and associations, were politically ineffective but nevertheless constituted an active and often vociferous pressure group.

The Völkischen were universally antisemitic. They believed that the Jews, whether of German or any other nationality, represented dishonest, decadent and racially inferior qualities. In contrast, the Germanic race was noble, heroic, honest and possessed of all the attributes proper to a *Herrenvolk* or master race.

Germany was ostensibly a Christian country, predominantly Protestant in the north and largely Catholic in the Rhineland and south. Only a small proportion of the population can have been identified with neo-pagan beliefs, but the phenomenon is of historical and sociological interest because of the Nazis' ambivalent attitude to Christianity after their rise to power in 1933. Their antisemitism was directly inherited from the pre-1914 generation of Völkischen.

Many members of the various völkisch groups were opposed to conventional Christian beliefs. A major reason for their hostility to Christianity was that Jesus himself was a Jew; so they put forward the hypothesis that since he was a great spiritual teacher he *must* have been an Aryan. The Old Testament was dismissed out of hand as Jewish folklore and therefore contemptible nonsense. And so, there were people who wanted to create a Germanic form of Christianity, from which all Jewish elements were eliminated, and others who completely rejected Christianity in favour of a wholly Germanic religion.

A number of widely-read 19th century German writers had paved the way for the first German neo-pagan sects. The philosopher Schopenhauer, who was sympathetic to Buddhism, had protested against Christianity's 'optimistic Jewish tendencies'. The philosopher Nietzsche had asked why 'the strong races in northern Europe had not rejected the Jewish god and created a new one.' Felix Dahn, a popular historical novelist of the 1870s, proclaimed that 'whatever is Christian is not Germanic, and whatever is Germanic is not Christian . . . there is also an ethical ideal in the old pagan morality; rough and manly, but by no means barbaric.' Dahn's enthusiasm for his Germanic ancestors and their virtues led the Roman Catholic Church to accuse him of fostering the revival of a Wotan cult. In his book *The Jewish Question* (1880) a well-known sociologist, Eugen Dühring, suggested that the ancient Nordic gods were still alive, and had remained so during the long period when they had been driven underground by Christianity.

Houston Stewart Chamberlain (1855–1926), British by birth but German by choice and Wagner's son-in-law, was without any doubt the most influential of the anti-Christian publicists. In *Foundations of the 19th Century* (1899) he categorically stated that Christ could not have been a Jew. He suggested that the Germans would only find salvation in a religion corresponding to their essential nature. And the latter could only be Germanic.

Wiener Library

Passionate belief in the sanctity of everything Germanic was the basic ideology of German neo-paganism *Left* Swedish rock-carving from O. S. Reuter's book *The Mystery of the Edda*: Reuter founded a rural settlement named for the Germanic god of thunder *Right* Book cover by Ludwig Fahrenkrog, founder of the Community for Germanic Beliefs: the swastika was exalted as an 'Aryan' symbol

Hence the ancient Germans represented something closer to the roots of what was morally and ethically desirable than did their early 20th century successors. Old Germanic religious beliefs, in so far as they could be identified, reflected a source of primeval strength. It followed, then, that ancient symbolism, such as the runes and swastika (see RUNE OCCULTISM; SWASTIKA), and old legends, such as the one surrounding Mittgart, said to be the home of the original Nordic gods, had an immediate significance. The *Edda*, a collection of 9th–11th century Scandinavian sagas, became the equivalent of Holy Writ for the völkisch neo-pagans.

Splits and Schisms

The internal history of the German neo-pagan sects is extremely complicated because of their continual fissions and regroupings. Membership statistics were almost invariably for private circulation only. It is possible, however, to distinguish three main groups.

The first was the loosely-organized *Germanische Glaubensgemeinschaft* (Community for Germanic Beliefs), which was founded in 1907 by Professor Ludwig Fahrenkrog (1867–1952) of Barmen. In 1911 Fahrenkrog and his followers joined forces with O. S. Reuter (b 1876), the author of *The Mystery of the Edda*, and his German Religious Fellowship. Dr Ernst Wachler, a well-known figure in völkisch circles, and his Wotan Society also became affiliated with the Fahrenkrog group in 1913. At about this time Fahrenkrog's sect changed its title and became the Germanic Belief Fellowship. Meanwhile, Reuter and his followers broke

Wiener Library

away, and founded yet another sect. This group became the esoteric 'inner circle' of Reuter's *Deutsche Orden*, the German Order, which later organized a völkisch rural settlement called 'Donnershag', after the Germanic god Donar.

A third group, the *Volkschaft der Nordungen*, or 'Nordungen Fraternity', originated in German youth movement circles, c 1913. Here again there was an eventual affiliation with the *Deutsche Orden*. The emphasis was on the revival of the values supposed to be inherent in the ancient Germanic civilization. 'The aim and significance of our every action is Nordland' (the North-land or Nordic-land). Apart from these three major groups there were a fair number of very small ones, none of them well documented.

Neo-pagan 'Christening'

Candidates for admission to Fahrenkrog's sect had to attest that they had no non-Aryan blood in their veins: 'In marriage I will keep my blood pure and educate my children in this sense.' In the household, the father was to assume the role of priest and to officiate at 'Germanic' christenings, confirmations, marriages and funerals. Local groups met annually to celebrate the summer solstice (which was always an important festivity in völkisch circles). The sect had no religious system; there was merely a mystical identification with a whole series of very hazy concepts – blood, race, Germanic virtues, and so on. All this applied equally to Reuter's 'Fellowship', whose members were required to 'strive for the Völkisch and moral rebirth of the German *volk* (race) in a Germanic spirit, namely on the basis of German godliness.'

These people did not merely study the *Edda*. Their literary canon included the writings of Meister Eckhart (see ECKHART), one of the profoundest speculative thinkers among the German mystics, Paracelsus and Jacob Boehme (see BOEHME; PARACELSUS), and also Johann Fichte (1762–1814) and Paul de Lagarde (1827–81), whose intellectual influence on the Völkischen was profound. Readings from these and other acceptable, that is Germanic, authors were common to the meetings of all the sects.

The same 'festivals' were celebrated by the various neo-pagan fellowships. The principal ones were the *Oster* (Easter) feast, named after the Anglo-Saxon goddess Eostre, followed by High May (observed at Whitsun), the feast of the May Queen or May Bride and her partner. The *Jul* (Yule) feast was held at Christmas. The Christian Good Friday was observed as a day of remembrance for the 4500 Saxons said to have been slaughtered by Charlemagne at Verden an der Aller in 772. The Christian Feast of the Ascension was replaced with one associated with the myth of Thor's hammer.

The völkisch periodical *Rig* contains an account of a 'christening' ceremony held in the Forstenrieder Park near Munich. 'In the centre of five old oak trees we made a table from boulders. On the table is placed a bronze hammer and a bowl of water from the pond close to the beech trees. A tune played on a Waldhorn forms a prelude to our modest celebration . . . The mother lays the child at

March of the Atlantic People

It may still be uncertain where the original home of the *Nordic* race lies . . . many details are still doubtful . . . but whatever may be the result of further investigations *one* great fact cannot be challenged: the fact that the race which provides the 'meaning of world history' is found to originate in the North and has spread from the North over the whole earth; that it was a blue-eyed fair-haired race which in several great waves formed the spiritual features of the world – even where the race itself was bound to perish. These migration periods we call: the march of the Atlantic people – round which so many legends sprang up – through North Africa; the migration of the Aryans to Persia and India; followed by Dorics, Macedonians, Latins; the migration of the Germanic peoples; the colonisation of the world by the West under dominant Germanic influence.

A. Rosenberg *The Myth of the 20th Century*

Although the neo-pagan sects were antisemitic, Hitler discouraged their activities for they were politically ineffective; this cartoon of a Jew attempting to seduce the ideal Germanic woman is dated 1936, some years after the rise of Hitler and the decline of the 'völkisch' sects

the father's feet. The father bows and takes the child in his arms, saying: "I recognize you as my own, take you into our kindred and give you a name. I sprinkle you with the pure water of the German spring. May all that is un-German be alien to you". . .'

Fahrenkrog's plan to build a cathedral for neo-pagan services was never fulfilled. There were to be three aisles and where they met an altar of stone; behind it a table on which were to be placed a copy of the *Edda*, Thor's hammer and a ring upon which solemn oaths were to be sworn. The walls were to be decorated with murals depicting scenes from the *Edda*. The sermon was to be based upon a suitable text from the same work. At the end of the service a small pile of wood, previously placed upon the altar, was to be ignited with a tinder and flint.

In 1931–32 these major groups united as the Nordic Religious Working Community. They do not appear to have been either encouraged or attacked by the Nazis after 1933.

While there were undoubtedly some Germans who actually indulged in a form of Wotan worship, most authorities are inclined to believe that the groups in question were both few and small. A lengthy search by the present writer has failed to produce any documents. There are stray allusions to a Germanic Sun Religion sect that existed during the early 1900s, but once again it cannot be adequately documented.

Fahrenkrog revived his sect, although on a very small scale, after 1945, but it must be remembered that the old pre-1914 völkisch movement was already in a state of decline by 1933, when the Nazis came to power. Hitler himself despised these sects because they were politically ineffective; and of the major Nazi leaders, only Himmler appears to have been vaguely influenced by the völkisch tradition. Fahrenkrog died in 1952 and his sect with him; and there is no evidence that there are any neo-pagan religious sects in Western Germany today. (See also LIST; NATIONAL SOCIALISM; NEW TEMPLARS.)

ELLIC HOWE

For Plotinus, 'the only way to God is through philosophy', the only way to reach union with the divine is 'by living the philosophical life and thinking philosophy through to the end'

NEOPLATONISM

THE RELIGIOUS PHILOSOPHY which modern scholars call Neoplatonism is the final stage in the long development of the revived Platonism of the Roman Imperial period. It was a very long development. After a period of scepticism, Antiochus of Ascalon revived dogmatic, positive philosophical teaching in Plato's school at Athens, the Academy, in the 1st century BC. Later Platonism continued as a distinct philosophy, taught by its own pagan professors, till well after the official closing of the pagan schools at Athens by Justinian in 529 AD and therefore had a history of over 600 years, a period as long as that which separates philosophers of our own time from 14th century scholastics.

In the 3rd century AD, perhaps the most decisive phase in the transition from the classical to the Byzantine and medieval world, later Platonism was re-thought and given a new coherence, strength and vitality by a great philosophical and religious genius, Plotinus (205–270 AD). It is the philosophy of Plotinus and his successors which is nowadays called Neoplatonism. But no one at the time was conscious of any break in the development of Platonic philosophy, and Plotinus was by no means regarded as a second founder of the school. Nor would he, or any of the philosophers who came after him, have been at all pleased to be called Neoplatonists. They claimed to be expounding the authentic teaching of Plato, and to say that their philosophy was in any sense 'new' would have seemed to them an insult. The more ancient a doctrine was, to men of that period, the more likely it was to be true.

The Platonism which Plotinus took over and transformed was already a strongly religious philosophy. Most Greek philosophers (though not all, for there were sceptics, agnostics and materialists of quite a modern

type among them) were much concerned with religion and morality. An essential task of philosophy was to lead and help men to live as well as possible on the basis of a knowledge of the truth about the gods, the universe and their own natures. And this is particularly true of the great majority of philosophers of the Roman Imperial period, Stoics, Epicureans and Platonists alike. A strong religious and moral concern is already apparent in the works of Plato. But the Platonism of the Roman Empire, when its main outlines begin to become clear to us in the 1st century AD, is more obviously and exclusively a religious and moral philosophy, and its religious concepts are closer to those we have ourselves inherited, and less ambiguous and baffling to our minds than those of Plato himself. There is now unmistakeably one God at the head of the system (as there is not in Plato), a divine Intelligence of perfect wisdom and goodness. The Platonic Ideas or Forms (the eternal objects of true knowledge and patterns according to which material things are made) are generally held by the later Platonists to be the thoughts of this supreme God, existing eternally in his mind. He makes the material world (directly or through an intermediary) on their pattern, generally from an eternally pre-existing matter. Sometimes this is thought of as evil and the cause of evil, sometimes there is an evil, disorderly soul which opposes and tries to thwart the efforts of the Maker to keep the universe in order. A hierarchy of gods and spirits depends on the supreme God.

In some systems the distinction between the First God or intelligence and a second God or intelligence, the active cause of the universe, becomes important and is linked with a stressing of the absolute transcendence and mysteriousness of the supreme God, and sometimes with the assertion that he is unknowable because he is infinite: he is not a 'this' or 'that' and has no definable nature which we can comprehend. This is something new in Greek philosophy. The idea of God as infinite and so unknowable is already to be found in Philo the Jew of Alexandria, an older contemporary of St Paul who was the first to use Greek philosophy in an attempt to give a reasonable account of a revealed religion: it appears in the Gnosticism of Basileides in the 2nd century AD. But its presence in later Platonism is unlikely to be simply due to the influence of Philo or the Gnostics. There are reasons in earlier Greek philosophy which could have led to this development.

An important feature of later Platonic religion, as of most religion in later antiquity, is that the physical universe as a whole is alive and divine (as it was for Plato) and so are its most important parts, the earth, and above all the sun, moon and stars, the visible, embodied divinities in the visible heaven. Man's soul too is divine in a very subordinate degree, a being quite distinct from and greatly superior to the body which it temporarily inhabits, and the object of the good and wise man is to escape, by the study of philosophy and the practice of an austere morality, from incarnation in an earthly body and either to become a star or to leave the visible universe altogether.

The Higher Self

This 'Middle' Platonism, as it is generally called by modern scholars, was developed into what we call Neoplatonism, as far as we know, by Plotinus. He had been the pupil in Alexandria of a mysterious, self-taught and entirely unofficial philosopher called Ammonius, who also taught the great Christian thinker Origen. But Ammonius wrote nothing, and we really know next to nothing about his thought, so his contribution to the development of Neoplatonism must remain problematical. The first and greatest collection of Neoplatonic writings is the set of treatises written by Plotinus in his later life when he was teaching at Rome. These were arranged by his pupil and editor Porphyry (died c 305) into six volumes, each containing nine treatises, the *Enneads*. It is impossible here to give more than the barest outline of the rich, profound and many-sided philosophy which is expressed in them in very difficult, but sometimes magnificent Greek. The first thing which it is necessary to understand is that philosophy is for Plotinus, even more than for the Middle Platonists, a religious way of life demanding total commitment and the most intense effort not only to think well but to live well. It is not the detached observation, dispassionately and from outside, of a reality distinct from ourselves, or the construction of a coherent theory, but a process of waking ourselves up and discovering who we really are. What we discover is that we are souls who have an eternal existence, different from and higher than that of which we are aware in ordinary experience, in a divine world of living intelligence. If we are prepared to make the tremendous effort required we can be aware of that world and live our lives in it even when we are still in the body and necessarily to some extent preoccupied with its affairs. Our higher soul never 'comes down', is not really united with body nor integrated into the life of the sensible world. Animation of the body, sense-perception, desire and emotion belong to lower phases of soul.

When we have become aware of the higher self and are living its life on the level of divine intellect, we can share, occasionally, in the eternal mystical union by which this divine intellect is united to its source, the One or Good. Plotinus distinguishes much more sharply than any of his predecessors (as far as we know) between the first real being, the divine intellect which is also the Platonic World of Forms, and its transcendent and mysterious source. The One or Good is beyond being; it or he (Plotinus generally uses neuter substantives and masculine pronouns in speaking of this supreme origin of all things – occasionally he calls it God) is not any one definite particular thing which can be named or described. We cannot really talk about him except in an inadequate way, pointing towards him, not saying that he is anything. He is beyond intelligence: he is so perfectly one, so utterly himself that he does not need to take possession of himself in thought. And he does not need anything below himself: he is in his infinite goodness sufficient for himself and everything else. He eternally brings into being, spontaneously but also inevitably, without deliberation or desire to do so, by a free giving which cannot be otherwise and leaves him unchanged and undiminished, the Divine Intellect. This is the world of the Platonic Forms, which in Plotinus is a world in which each of the Forms is a living intelligence, which knows and so in a sense is the whole; all are transparent to each other and interpenetrate, and so form the most perfect unity possible below the One.

Divine Intellect in its turn produces, with the same inevitable spontaneity, the great world of Soul, extending down from the universal soul which inhabits the world of Intellect, and forms and orders the material world on the model of the Forms (without planning or choosing to do so or sinking into it and becoming involved) to the life-principle in the earth and in plants. The material world, as the work of divine Soul, is good in its degree; but the matter which underlies it is evil, though inevitably produced by Soul, a principle of negation and corruption.

We are souls, and can live on any level of Soul we choose, and the whole object of the philosophical religion of Plotinus is to bring us to live on the highest, in the world of Intellect in which we can return to union with the One. This for Plotinus is not a matter of theoretical aspiration but of experience. He seems to have had not only the experience of mystical union with the One but the other experience, an indispensable preliminary to it in his way of thinking, of finding himself a part of the divine All, the world of Intellect which he describes in some wonderful passages of the *Enneads* as a world eternal but 'boiling with life', full of movement, light and colour, in which everything is one with everything else. Of the ultimate union with the One he says little, but he seems to have experienced it as more like a union of lovers than as realization of a pre-existing identity or as absorption into something blank and impersonal.

Porphyry's Trinity

An important, and very unusual, feature of the religion of Plotinus is that the only way to God is through philosophy. The only way to reach our goal of union is by living the philosophical life and thinking philosophy through to the end, and then, and only then, passing beyond it. This, he knows, is a way which very few can or will follow. It is, from a conventional point of view, a very irreligious religion. Prayer was not important for Plotinus: his attitude to the religious beliefs and practices of his time was detached (except for a healthy hatred of Gnosticism). He was not deeply interested in or influenced by the Mystery religions, and external rites and sacraments did not play any part in his religious life. True religion for him was inward, spiritual, solitary and intensely intellectual.

The later developments of Neoplatonism in some ways began in the thought of Porphyry, though in other ways Porphyry remains very close to his master, and even develops his thought in ways opposed to the mainstream of later Platonism. Porphyry was much more

scholarly than Plotinus, a man of immense learning, who studied deeply. He was an enthusiastic vegetarian (Plotinus had practised vegetarianism without apparently being very interested in it) and, like his master, was concerned to defend the true Greek tradition of philosophical religion against barbarian religious innovations. This led him to write what seems to have been the most powerful and intelligent of all ancient pagan attacks on Christianity. A way in which his influence on later Neoplatonism was unfortunate was that he was the first philosopher to pay any serious attention to the Chaldaean Oracles. These were published, probably in the later 2nd century AD, by two persons called Julian, father and son, who claimed that they were divine revelations. The fragments which survive show them to have been a theosophical hotch-potch of ideas taken from contemporary popular philosophy, in obscure and pretentious verse. Porphyry was still rather dubious about their philosophical and religious value, but for the later Neoplatonists they were inspired scripture, a primary source of religious knowledge.

The most distinctive feature of Porphyry's thought seems to have been its ultra-spiritual and monistic tendency. He tends to 'telescope' together the three levels of being in Plotinus, the One, Intellect and Soul. Soul is in its true nature practically identical with Intellect (this is already true in some of the writings of Plotinus), and Intellect is much more on a level with the One than it is in the thought of Plotinus. For Porphyry, the One is unknowable, infinite pure Being from which springs a Life which determines itself as Intellect. This triad of Being, Life and Intellect, which has its origins in the thought of Plotinus, played a very important part in the systems of the later Neoplatonists. So we find in this fiercely pagan philosopher both the idea of God as pure and absolute Being and the horizontal trinitarian structuring of the divinity which were so important for contemporary and later Christian thought. There are, of course, important differences between Porphyry's trinity and the Christian one, though a good deal of Porphyry's philosophy was taken over by some Christian theologians in the effort to explain their doctrine. Porphyry stresses the divinity of our souls even more than Plotinus, and is still more insistent than his master on the absolute necessity of transcending the body and the senses, and escaping from all contact with the physical.

Lonely, Pious Pagans

The originator of the type of Neoplatonism which came to dominate the Platonic schools in the 5th and 6th centuries AD was the Syrian Iamblichus (c 250–326). We know it best from the works of Proclus (410–485), who became head of the school of Athens, and of Damascius, who was head of the school when it was closed by Justinian in 529. These latest Neoplatonists were pious and determined pagans in a world which had become officially Christian. This is equally true of the school of Alexandria, where later Neoplatonism was introduced in the 5th century, though at Alexandria the attitude to Christianity was less outspokenly hostile than at Athens. The teaching of philosophy at Alexandria eventually passed into Christian hands in the late 6th century and it was as a result of this that Greek philosophy continued to be studied in the Byzantine world throughout the Middle Ages, and the ancient texts survived.

The successors of Iamblichus formed a closed group, often closely related by intermarriage, of serious and intelligent men, intensely devout, sometimes in rather odd ways, but no more superstitious or credulous than their Christian neighbours. Their defence of paganism was not very effective. Their great moment came under their one notable convert, the Emperor Julian (332–363), but his attempted revival of pagan Greek religion was not a success. After him they had nothing to do but to cling to, elaborate and discuss within their own circle, a religion from which the rest of the world had turned away, which they did with an admirable and pathetic loyalty for another two centuries.

There is a story told of Proclus which gives something of the atmosphere of their piety: it might have been told of some Catholic in England when the great shrines of Our Lady were being destroyed during the Reformation. When the Christians removed the statue of Athene from the Parthenon, the goddess appeared in a vision to him and told him that she was coming to live in his house. Proclus was an expert in the most secret rites of theurgy (see THEURGY), a diviner and a rain maker. An enthusiastic hearer once saw a halo round his head when he was lecturing.

All this sort of thing was very much in the tradition of Iamblichus but these oddly devout men were also in their own way learned, acute and precise philosophers. They were attempting both to produce a completely coherent philosophy, which was intended to be the fully authoritative and exhaustive exposition of what Plato really meant, and to give a complete and coherent interpretation of all the revelations which they accepted, the Chaldaean Oracles and the Orphic poems, and of all the myths and rites of the paganism of the later Roman Empire. Their theological concerns were obviously very much in the forefront of their minds. But they did try to solve philosophical questions in a philosophical way and to argue logically and consistently. They were in fact much more concerned with logical validity, clarity, precision and consistency than Plotinus: it is largely this, on a basis of extreme philosophical realism (there must be a distinct intelligible reality corresponding to every distinction which can be made in thought) which makes their system so complicated.

Their version of Platonism is based on Plotinus, but freely corrected and much elaborated, with elements taken over from Porphyry and through him from earlier Platonism, though they criticize Porphyry severely for 'telescoping' the levels of being and confusing Intellect and Soul. The ineffable first principle was removed to a still greater height of transcendence, and the possibility of knowledge of it more strenuously denied than by Plotinus. Below it is a second One, of which we at least know that it is One. There is a whole class of forms of the One in which things below them participate, divine unities called 'henads' which are identified with the gods of paganism. These are rather mysteriously present directly to everything, even to matter. They are accessible immediately at all levels of the hierarchy of being, a regular skyscraper of triads with their members interrelated horizontally and vertically in a very complex way, which extends from the top of the intelligible world down into the physical universe.

Philosophy and Magic

The object of human life, for these philosophers as for Plotinus, is to return to the divine. But they did not think, as Plotinus thought, that the return could be accomplished by philosophy alone, through the natural love and intelligence which we receive in our origin from the One as rightful inhabitants of the intelligible world. Iamblichus and his successors take a humbler view of man, as a soul of low rank which has descended altogether into the material world. But the gods and even, through them, the One itself, are intimately and immediately present to us here below, and return to and union with the divine is possible, to those who turn to the gods in prayer, through the gracious operation of a divine *eros*, by means of the secret magical rites revealed by the gods and handed down through a succession of initiates; rites which are based on the magical sympathies and correspondences with the divine which the gods have caused to exist in the material world. Theurgy was taken very seriously indeed by men like Iamblichus, Syrianus and Proclus. But they did not confuse it with philosophy, though they regarded the two as fully compatible and complementary. And there always seem to have been some Neoplatonist philosophers who were not very interested in theurgy. Even in the 6th century we can still find men among them whose prayer and mysticism were purely inward and spiritual, like that of Plotinus.

The influence of later Platonic philosophy in its successive phases was very wide and lasting. It influenced both Christian and Moslem thought, the latter through the medium of Syriac and Arabic translations, and had a considerable influence on the Jewish mysticism of the Cabala through the great 11th century Jewish thinker Ibn Gebirol. Its influence on Christian thought in both East and West down to our own times has been so great that one of the most distinguished of modern English theologians, Austin Farrer, has spoken of 'the overwhelming commitment of Christian orthodoxy to Neoplatonic metaphysics.' But Neoplatonism has also inspired a good deal of unorthodox and independent religious thinking in the Christian world. Even in our own time poets, mystics and thinkers sometimes turn to it for inspiration, in spite of (or perhaps because of) its unfashionable preoccupation with immaterial good.

A. H. ARMSTRONG

NEPTUNE

AT FIRST Neptune had no connection with the sea. His origins remain in doubt because the equivocal evidence points to both an Indo-European derivation like Jupiter's and to a purely Italian derivation like Mars'. Some would relate his name to that of an ancient Vedic water god and a shared linguistic root for 'moisture', while others draw attention to the Italian commonness of such compound names in *-nus* and to a possible equation with *nethunsl*, an incomprehensible word found in a single Etruscan liturgical text.

In Rome's oldest civil calendar the feast of Neptune was observed on 23 July in the interval between two distinct festivals of sacred groves. The *Neptunalia* may be linked to the grove observances because the single known detail of the ceremony is the construction of shacks from tree boughs that were ritually called 'shades'. Often, Neptune's summer veneration is explained by a desire to increase the water supply. Indeed, his only really old shrine was situated by the Tiber River. When his altar sweated water in 206 BC, the occurrence was duly recorded in the priestly chronicles. Such sweating, by no means unusual in the annals of Roman religion, conforms to the god's power. The Romans had regularly prayed to Neptune for his *salacia*, which later they believed to be the name of his wife. The word refers to the water's power to leap or spring (*salire*) from a fresh source. Thus it seems that Neptune caused fresh water to flow.

In 399 BC the Romans first introduced the Greek ceremony of a banquet (*lectisternium*) for the Twelve Gods of Olympus. Then Neptune was paired with Mercury, whereas in 217 BC Minerva was his partner at the feast. Presumably the first occasion saw Neptune as master of maritime trade and the second in relation to the importation of foreign crafts (see MERCURY). However the banquets may be interpreted, Neptune never fully became a sea god. At

Originally Neptune was the Roman god of fresh water with a shrine near the Tiber River; it was only in historical times that, identified with the Greek god Poseidon, he became a sea god

Roger Wood Studio

Rome his cult partners were sometimes the freshwater sprites called Nymphs. At Comum on Lake Como where a local Neptunalia was celebrated, Neptune was joined by the anonymous Gods of the Water (*Di Aquatiles*) who must have belonged to the great lake. Elsewhere in Italy a ferryman would make an offering to Neptune. On the Danube he was coupled with the deity of that great river. There were also maritime shrines to the god. For instance, a few miles north of Rome at Anzio a row of matched altars was dedicated to the Winds, to Calm and to Neptune. A final example may illustrate the adaptation of the Latin Neptune to a great variety of circumstances. In 209 BC Cornelius Scipio successfully assaulted New Carthage by taking advantage of his knowledge of tidal ponds and marching from the coast. This prompted one historian to make Scipio invoke Neptune 'leader of the march'.

The decline of Neptune's actual Roman cult cannot he easily explained because fresh water was always needed in ancient Rome and was venerated in the popular form of many nameless deities called *Fontes*, 'springs'. The state cult may have shrunk into insignificance with the vast water supply, made available by the aqueducts.

In historical times Neptune possessed almost no personality of his own because the Romans had long since made him over in the image of the Greek Poseidon (see POSEIDON), chiefly a maritime god.

Neptune commanding a quadriga rises up out of the ocean: in astrology, Neptune has been called the planet of 'exaggeration'

Roger Wood Studio

Neptune in Astrology

Discovered in 1846, the planet Neptune was named after the Roman god. Astrologers once supposed that events strongly influenced by Neptune would have something to do with the sea, but this is now thought to be untrue.

Although the influence of Saturn is supposed to be the most unpleasant of any of the planets, that of Neptune can be equally bad or even worse, in an entirely different way. Saturn's unfortunate influence only demands infinite patience until it passes away; on the other hand, Neptune's influence causes violent emotional storms and disturbances, perhaps harder to bear. In marriage, if Neptune is strongly influenced by one of the malefic planets – Mars or Saturn – the couple will be unable to continue living together.

Yet the general influence of Neptune is not necessarily bad, provided one enjoys uncertainty: for instance, Neptune combined with Venus would provoke perpetual excitement about love affairs, with constant vulnerability to the attractions of novelty. Neptune with Jupiter would provoke worries about financial or other success.

If Neptune is in conjunction with the Sun, there is a danger of excessive self-interest or narcissism; the same may be true if Neptune is in close aspect to the ascendant or midheaven. If Neptune, in close aspect to Jupiter, is conspicuous in the horoscope, imprudent or exaggerated optimism may result; but with Saturn the opposite – exaggerated pessimism – may occur. When Neptune dominates the horoscope, everything, whether good or bad, becomes exaggerated; in fact Neptune may be called the 'planet of exaggeration'.

Neptune in conjunction with Mercury would make a good but sensational journalist, quick to see opportunities for exaggeration. Neptune with the Moon, however, is easily alarmed by 'scare' stories. The most famous Neptunian was Horatio Bottomley the financier, who rarely drank anything humbler than champagne, and who ruined thousands of small investors after the First World War by wasting their savings on a fraudulent get-rich-quick scheme.

Net

Symbol of a snare or trap, of entanglement and involvement; Aphrodite and Ares were caught in guilty passion in the net of Hephaestus; in the Old Testament, frequently a symbol of difficulties in which man is canght; the kingdom of heaven is likened to a net in which men are gathered in like fish and the good separated from the bad (Matthew, chapter 13); there are many allusions to nets and fishing in connection with Christ and his disciples, the 'fishers of men'.

See APHRODITE; SYMBOLISM.

Scala

Were the stigmata of Teresa Neumann the true preternatural experiences of a modern mystic or the visible symptoms of a hysterical personality? Athough many received her phenomena uncritically, the Church and the medical profession have remained doubtful

TERESA NEUMANN

A VISIONARY and bearer of the stigmata, Teresa Neumann was born in 1898 and lived all her life at her birth-place, Konnersreuth, a village in Bavaria not far from the Czechoslovakian border. After leaving school she worked at the local inn and during the First World War helped on a farm. On 10 March 1918 during a fire at a neighbouring farm she injured her back; this was the prelude to a complicated medical history. After her return from hospital, uncured, there was a progressive deterioration in her health and she became bedridden, suffering from temporary blindness and deafness, appendicitis, convulsions, paralysis of the legs and purulent sores on the back and feet. In 1923 she regained her sight on praying to St Teresa of Lisieux (whose beatification occurred on the same day that year). In 1925 she renewed her prayers to the saint on the day of her canonization, and recovered the use of her legs; her other ailments also disappeared. She now enjoyed some semblance of health, though the original medical diagnosis, made before there was any question of preternatural phenomena, suggested that the illness was largely hysterical; this introduces a doubt into the whole affair.

Wounds of the Passion

In mid-Lent, 1926, she began to exhibit the phenomenon of stigmatization: the reproduction on the body of the wounds of the Passion of Christ, particularly (but not exclusively) the wounds on hands, feet and side (see STIGMATA). In Teresa Neumann's case, as with others in the past, it was accompanied by other manifestations, including abstinence from food, precognition and visions of the Passion.

On her bed, in her peasant home in Konnersreuth, she appeared to witness and to some extent to re-enact the various scenes of the passion of Christ. For some years this was a weekly occurrence when, beginning on Thursday night, her stigmata would start to bleed, she would pass into a state of trance, and utter cries as if suffering pain or witnessing distressing events. The bleeding appeared to be profuse and occurred not only from hands, feet, and side, but also from her forehead, as if from a crown of thorns. She seemed to exist on a spoonful of water daily; after September 1927 she gave this up also, and her only sustenance was the daily reception of Holy Communion.

In the late '20s and '30s, despite the reserved attitude of the Church authorities, Konnersreuth became a place of pilgrimage; crowds flocked there at all seasons of the year, and especially at Eastertide. Immediately after the Second World War many American soldiers found their way there. The phenomena were received quite uncritically and to question their supernatural origin was to surely invite obloquy from the very active 'Friends of Konnersreuth' who bitterly opposed those who, in their view, wrote against Teresa Neumann. Towards the end of her life Teresa's phenomena seem to have diminished – certainly in 1951 some who made the journey to Konnersreuth were disappointed on at least one occasion – and in the last five years of her life little was heard of her. She died in 1962.

She was not of course by any means the only example of such phenomena. There are upwards of 300 recorded cases of stigmatization, beginning with Francis of Assisi in the 13th century (see FRANCIS OF ASSISI), and continuing in every century since then down to Padre Pio who died in 1968. By far the greater majority of them have been women, and the only two cases of complete stigmatization in men are the two just mentioned, St Francis and Padre Pio. Father Herbert Thurston, who made a lifelong study of these phenomena, wrote:

> The impression left upon me has been that the subjects who were so favoured or afflicted were all suffering from pronounced and often hysterical neuroses. Many of them were intensely devout (of course it is only in the case of people whose thoughts were concentrated on religious motives that one would expect to find this type of manifestation) but in others piety was combined with eccentricities and with apparent dissociations of personality which were very strange and not exactly edifying. I find it difficult to believe that God could have worked miracles to accredit such people as his chosen friends and representatives.

How are we to judge Teresa Neumann and account for her strange phenomena? When Louise Lateau, the stigmatist of Bois d' Haine, in Belgium, died in 1883, the prevailing opinion among her co-religionists was that the extraordinary phenomena in her case were marks of divine favour, and that to doubt their preternatural character was to display a lack of faith. Nowadays with the greater resources of modern medicine and, perhaps, with a clearer notion of all the implications, a more cautious attitude is commoner.

Analysis of Blood

In the case of Teresa Neumann, there were too many unanswered questions for a categorical assertion that all the phenomena really occurred as they were usually reported. Teresa's fast was never rigorously controlled to the satisfaction of the Church authorities or the medical men that they called in to advise on the case; too many of the allied phenomena resembled too closely those that have been observed to occur in other paranormal but non-religious contexts; the blood observed on the stigmata by one expert witness was never seen to flow from them but appeared on the wounds after Teresa had escaped observation beneath the bedclothes, or when the witnesses had been sent out of the room (it was the same observer, Dr Martin, who alleged that some of the blood proved when subjected to analysis to be of menstrual origin).

University of London/Harry Price Library

The validity of the stigmata of Teresa Neumann has never been established; but for some 20 years she appeared to witness and to some extent re-enact the passion of Christ

Whatever the truth of these matters, it seems certain that, to the Church authorities, to postulate a supernatural origin for these phenomena, when the possibilities of a natural explanation have not been exhausted, is to go far beyond the available evidence. What matters is the life of the subject under examination.

In Gemma Galgani's case (she died in 1903), the Roman Catholic Congregation of Rites, which deals with canonizations, declaring her to be a saint, explicitly refrained from giving any verdict on the preternatural character of her stigmata and allied phenomena, saying that it was a matter 'upon which no decision is ever given'. In other words, the stigmata and allied phenomena are unimportant and we should look to the teaching and lives of the mystics and leave on one side what on a last analysis is their occupational disease or at least their occupational hazard.

NEW GUINEA

Keeping the Balance of Creation

The spirits of New Guinea delight in ostentation of every sort, and the men stage extravagant and beautiful ceremonies to please them

NEW GUINEA and the Amazon basin have been the last regions of the world in which societies of very simple technology have remained intact. New Guinea is an immense island, exceeded in size only by Greenland, which on the map of Europe would stretch from London to Moscow. The spine of high mountains running down its length rises to 15,000 feet in places, and on each side of the spine are broad, densely populated valleys. This highland area was first explored in the 1930s and has only been brought under administrative control since the Second World War. Throughout the island the terrain is very difficult, being either mountainous broken country devoid of roads, or great river flood plains consisting mainly of swamp. Even the coast is in many places very difficult and dangerous for small craft. It is not surprising that although the rest of the huge Pacific region became known in the 18th and early 19th centuries, it was not until the beginning of the 20th century that any serious attempts at exploration, let alone administration, of New Guinea occurred.

The same geographical features that protected New Guinea from the outside world were responsible for the vast number of very small, relatively isolated communities into which the population is divided. The small villages are the political groups, each a tiny republic, making war on its neighbours and often unaware of anything more than about ten miles from its boundaries. Just as there was no political authority that stretched further than a village, so within the village, except in a handful of cases, there were no chiefs, priests or men of inherited rank of any sort. Leadership was exercised by men who could influence others by their personalities and achievements. Under these circumstances it is not surprising that New Guinea societies show enormous diversity in culture and religion. Indeed more than 800 different languages have been reported from various parts of the island, and even within the larger language groups, customs and dialect frequently vary from village to village.

Axel Poignant

The principle leisure activities of New Guinea were warfare and the performance of religious and magical ceremonies *Left* Men in masks made of mud on cane frames mime the story of ancestors who disguised themselves as evil spirits *Above* Women mourners coat themselves with mud for protection against ghosts: relatives who have recently died may return with unfriendly intentions

The traditional tools and means of subsistence were of the simplest; no metals were known, and polished stone axes, bamboo knives, chisels of animal teeth, digging sticks, spears and bows and arrows of palm or other hard wood formed the basic equipment. Except in the swampy areas where sago and fish were the basis of the diet, roots, yams, taro and sweet potato were cultivated in gardens cut from the bush and abandoned after a year to regenerate. Pigs were also kept throughout the island. These very simple and easily understandable technological processes provided an ample subsistence and a good deal of leisure, except when extraordinary weather or other natural disasters ruined the crops and produced real famine. This leisure was mainly taken up by two related activities: war and other forms of aggressive competition, and the performance of various forms of ceremonial in which the elements of competitive display and demonstrations of wealth and magnificence always formed parts.

With such great diversity of culture and language few common religious features are to be found and they are mainly negative. It is indeed very difficult to say what is religious in New Guinea. Transcendental elements are completely missing; the aim of rituals, communal or individual, is to obtain prosperity for oneself and the opposite for one's enemies. Most societies have some sort of belief in an afterlife but it is usually conceived of as being the same as life on earth with the absence of death. Even those groups which believe in what might be called gods or 'sky people', believe that they live lives essentially the same as that of man. In egalitarian societies such as New Guinea, where influence over one's fellows can only be obtained through personal prestige, competition with rivals dominates every activity of the ambitious man and he looks to the supernatural to help him. Similarly the villages and their component segments compete not just in war, but in the magnificence of their rituals and in giving gifts which must be exactly reciprocated. Here, too, magic and religion are expected to serve the materialistic aims of the competitors. Black magic in the form of sorcery and witchcraft is also found in much of the island although it has rarely been reported from the populations of the highlands. As well as expressing personal malevolence, these techniques are used in the never-ending struggles for prestige between individuals and groups.

Revenge Before Peace

Despite the very obvious political element in New Guinea religion, each society has its own deeply-held system of beliefs which were never questioned before the arrival of Europeans and Christian missionaries. Most New Guineans are master story-tellers, and complex mythologies explaining not only the creation of Nature and man but also the social system as it now exists are common. These cosmologies not only account for what is, they often indicate how the system is to be maintained. In general, everyone believes that ritual is essential for success and that to keep Nature and the cosmos as they are and should be, to preserve the stability of creation, important ritual must be regularly performed. The idea of balance is usually a feature of such cosmologies and indeed is a concept that suffuses every aspect of life. This comes out very clearly in warfare. Only in a very few parts of the island where the population density was very high was warfare waged to obtain any material end, that is extra land. Elsewhere it was pursued basically for its own sake and was closely bound in with religious beliefs. The killing of an enemy of the village was in itself good, as well as giving prestige to the killer. But the shedding of blood was dangerous and the often very elaborate triumph ceremonies that centred on successful killings usually included rituals of purification.

But although each individual killing was good for the victor, it imposed a duty of revenge on the victim's group, who remained in a state of impurity until they had obtained it. Since both sides believed that balance was inevitable and certainly necessary before peace could be made, revenge was usually obtained, sometimes even by a

Cannibalism in New Guinea was not simply a matter of eating enemies; many cultures... eat only their own dead and leave enemies where they have fallen

specifically engineered betrayal of a member of one's own group, so that vengeance could be achieved. On days of battle between whole villages, more like sporting occasions than war as we know it, everyone wore their most magnificent decorations, and although skirmishing took place, deaths were rare; the occasion serving more as an expression of hostility than its consummation. In many areas at such 'battles', when a man had been wounded on one side, the fight would continue until a man on the other had received a similar wound and then stop, both sides being satisfied and balance being preserved.

Most deaths by violence occurred not in pitched battle but through raids and ambushes undertaken by much smaller parties, whose members had often undergone elaborate strengthening rituals before setting out. Trophies were frequently taken, often the head of the victim, and in the lowlands where every village had at least one men's cult house, skull racks and similar displays were a common part of its decoration. In some areas the whole body of the victim was brought back and eaten under ceremonial conditions, or the victim might be simply killed at a ceremonial site to do honour to spirits and ancestors. But cannibalism in New Guinea was not simply a matter of eating enemies; many cultures, particularly in the highlands, eat only their own dead and leave enemies where they have fallen. In such cases it is a pious duty for all the relatives and friends of the deceased solemnly to eat the sometimes already decomposing body at the funeral.

In both sorts of cannibalism, ideas of incorporation and benefit to the living by the absorption of the dead are common. If warfare and cannibalism, where it occurred, were pleasing to the spirits, they were also expected to aid by promoting fierceness in their adherents and terror in their enemies; but again, not to an unlimited extent, for only if the balance of kills was and remained obstinately uneven was supernatural disfavour thought to be the cause.

The dead are everywhere of some importance but their role varies. The recently dead are usually considered reluctant to leave their earthly homes and may as ghosts watch the doings of their survivors, sometimes with an unfriendly eye. In some areas attack by the ghosts of recently dead kinsmen is a frequent explanation of misfortune, in others ghosts frighten people in the night but are otherwise harmless. The more distant dead, the ancestors, are usually friendly but so remote that they can only exercise the most vague beneficence. The creating spirits exhibit a similar variability; in some areas they may still be approachable and honoured in ritual, in others they have no powers for good or ill and are ignored. Nevertheless, whenever a harvest is displayed or a pig presented to a rival or received and slaughtered, its spirit will be offered to the relevant ancestors or spirits; such a sacrifice costs nothing and serves to keep the spirit world happy.

Spirit intervention is sought in a wide range of activities, food production, pig raising, curing sickness and fertility in general. Not that technical skills are disregarded; it is the combination of practical skill with knowledge of the right spells and invocations that are considered the basis of success in most activities. With the notable exception of Manus, a small island in the Bismarck Archipelago, where the ancestral spirits were believed to enforce a commercial and sexual morality strikingly similar to that of Victorian England, spirits are not concerned with morality. They both help and are attracted by success, no matter how obtained, and most highly successful men are believed not only to be blessed by spirits but to have special access to supernatural ways of harming their rivals.

Axel Poignant

Luxury-loving Spirits

The natural differences between the sexes are culturally emphasized throughout New Guinea; even the way men and women carry burdens or paddle canoes are usually sharply opposed. This distinction is carried over into religion which is the exclusive property of men. Women are often believed to be intrinsically powerful and to have their own innate ways of helping and harming others, whereas men can only acquire this sort of mystical power through the spirits. The spirits are pleased by the same things that please men, plenty of food, especially meat, large audiences filled with admiration at parades of beautifully decorated men or of masks, great displays of wealth, or of carvings and paintings. Indeed spirits are pleased by ostentation of every sort.

The over-emphasized segregation of the sexes is achieved by various forms of male cult, into which boys are introduced by successive initiations. These cults are the occasions for parade and decoration and their ceremonies are the most impressive manifestations of the various New Guinea cultures. Such cults centre on the men's ceremonial houses in the lowlands; these huge and beautifully decorated structures can be seen for miles around and form a constant focus of the men's values. In the highlands where such houses are absent or small, special dancing grounds are set aside for ceremonial purposes. These ceremonials have two strands, the initiation of the boys and young men and the display of wealth and magnificence by the men of the group holding the ceremony. In many regions the latter dominates the former and such

Eric Cross

ceremonies become moves in the game of inter-village prestige, with presentations of wealth and food given to spectators as a complement to the ritual performances.

Inititations of young men, especially those that take place at puberty, often involve violence. The change of status from that of child, associated with the woman, to that of man, separate from woman, is often symbolized by the letting of blood from genitals or nose, or by the cutting of extensive scarifications on the body. Periods of isolation and rigorous taboo are also usual. The removal of the boys and their return as men is often regarded as death and rebirth. The return of the young men to the village, gorgeously decorated, is often hailed by the women as the entry of handsome strangers to whom they show the greatest honour. These ritual re-entries are often spectacular, but it is usually the preceding ceremonies, which form the subject of the initiation, that are the most important and magnificent.

Re-enacting the Creation

Despite their somewhat precarious existence, the simple communities of New Guinea (or, at any rate, their male members) seem able to take months off normal productive work to stage ceremonial; and the peace imposed by colonial administrations has released even more time for such activities. These great festivals may take months of preparation, and extra gardens must be made so that there is plenty of food for the guests. Huge head-dresses, often of feathers, are prepared, masks, carvings and paintings made, great quantities of pigs and valuables of all sorts made ready. These great spectacular cults, which are at their most complete only in the lowlands, are called by the pidgin English name of *tambaran*.

The tambaran is a class of spirit, neither a creator nor an ancestor, whom the men call to the village and who lives there while the ceremony lasts; in fact the men impersonate the tambaran, playing music which is said to be its voice and appearing in masks or with beautifully painted faces and head-dresses, either as the tambaran itself or as associated spirits. The women loyally pretend to believe, and provide food for the spirit, although in fact they know that it is the men who eat it. These ceremonies are exciting and happy times, with plenty of the finest food, dancing all

Axel Poignant

night and great parades of decorated men watched by visitors from the whole neighbourhood. For such ceremonies truces are arranged with all enemies and indeed in some areas, enemies must participate since they have an essential role in the ceremonial. These ceremonials have all the appearance of a great secular occasion, and specifically religious elements are often hard to discern. Yet the whole thing is pleasing to the spirits, and the more spectacular, the more visitors who come, the better the spirits are pleased. Further, the whole form of the ceremonial, the decorations, the style of the works of art, indeed every detail, are all believed to have been laid down by the spirits themselves and it is by re-creating their original creation that their beneficence is assured and with it prosperity and success for the performers.

The withdrawal of men into their ceremonial houses and their fear of female contamination, particularly of menstrual blood, provides the basic division in the egalitarian New Guinea societies that are otherwise undivided by differences of class, rank or occupation. In many parts of the island the sex division is accepted as being complementary, but in others real sexual antagonism is aroused; parts of the ritual may give expression to this conflict in attacks by the women on the men at certain stages of the preparations for initiation. Women, too, often have their own rituals, from which men are excluded, particularly at first menstruation, although these are very modest and unspectacular compared to those of the men.

The old beliefs and the new: a painted cult figure (*below*) and worshippers at a Roman Catholic church (*above*). Serious attempts at exploration and administration of New Guinea did not occur until the 20th century

Axel Poignant

The men sometimes go to extraordinary lengths in their withdrawal to their ceremonial houses. The Marind-Anim tribe, for instance, obsessed with male purity, used to take the boys into the men's house where they served as wives in a sort of homosexual re-creation of human society without women. The attempt to exclude women was never totally successful, and children went on being born, while the men continued to parade in their masks, some of the most beautiful and fantastic of all New Guinea. Nor did such behaviour inhibit other masculine qualities, for the Marind-Anim were among the fiercest fighters in the area and their raids deep into the British-controlled territory from the Dutch side of the border caused a diplomatic incident at the turn of the century.

Religion in New Guinea is essentially practical and its interests mundane; the spirits are certainly no better than men, only more powerful and sometimes more capricious, but if they play their part in competition, war and sorcery, they are also responsible for some of the most beautiful and magnificent works of art and architecture, and some of the most gorgeous spectacles of the primitive world.

The robes of these priests are black because that is the colour their black god prefers: new religions in underdeveloped countries tend to combine Christian and pagan elements, and illustrate 'the problems of people dramatically strung between two cultures'

As the old order changes in emergent countries, men need a fresh orientation of religious attitude to incorporate new elements which are foreign to traditional culture; but at the same time new religious movements must satisfy emotional needs which remain relatively unchanged

NEW RELIGIOUS MOVEMENTS

AN ALMOST INVARIABLE accompaniment of processes of rapid and intense social change is the emergence of new religious movements. They are particularly conspicuous in periods of urbanization and industrialization in advancing countries, but are perhaps most spectacular and prolific at times of sudden and disruptive cultural contact between advanced and primitive societies. In such circumstances the clash of cultures gives rise to profound disorientation of the lives, customs and comprehension of simpler peoples. Since it is usually a principal function of religion to interpret the world, in both the cosmological and moral sense, for its followers it is understandable, when a particular view of the world is disrupted, that new attempts to make sense of things should occur.

It is sometimes the existing religious specialists in a society who offer these new religious orientations, but more usually it comes from new prophets. Inevitably what they offer is not entirely new. It tends to be an amalgam of many old ideas and some new ones, a syncretic system of myths, procedures and rituals. Because the disruptions of social life often produce intense anxiety, particularly when they are sudden, new movements frequently manifest patterns of behaviour that approximate to anxiety symptoms. Delusions, institutionalized obsessions, fantasy and escape from reality into a dream world of wish-fulfillments, are frequently found in new movements, particularly at their beginnings. Visions, shaking, hysteria and orgies of sexual indulgence sometimes occur. In some cases they have arisen in close association with military activity against the colonial settlers or the colonial government, and sometimes against the governments of newly independent nation-states in underdeveloped territories. In such circumstances they have often been short lived or sporadically recrudescent. In other cases, we find movements that offer new prescriptions for purely personal anxieties, and sometimes there is a succession of such movements, each of which differs in specific cultural content and in intrinsic myth and ritual, but the goals of which are precisely the same.

Broadly two types of response to disturbed social conditions can be discerned among these movements. Some are militant and revolutionist, providing religious justification for resistance to the intruders who bring a new culture. Others, and there is some reason to suppose that these tend to arise earlier in the process of cultural contact, are basically concerned with providing better magical means to meet the needs of their followers. These latter movements are usually more emotionally and expressively oriented: they are less explicitly concerned with the preservation of the tribe or its culture. Movements also differ in the direction of their concern. Some arise in the name of the preservation or restoration of traditional ways of life. They resist the attrition of native values, and often the ancestors are invoked as the guardians of past culture. Whatever is new, whatever the white man has introduced, are rejected. Other new religions promise their adherents exactly the opposite: the full benefits of modern civilization, the power of the white man's knowledge, and enjoyment of his luxuries, and sometimes they envisage a reversal of roles – a millennial society in which black men are clever and commanding, and white men are ignorant workers. These movements sometimes avowedly reject the culture of the native past, and their leaders promote the imitation of European practices.

New religious movements necessarily exhibit the cultural preoccupations of the particular societies in which they arise. Thus African movements are frequently concerned with the elimination of witches: whilst movements in Melanesia, on the other hand, reveal the preoccupation of tribal

cultures in that part of the world with the acquisition of trade goods. Some movements function particularly as agencies of cultural identification for groups whose traditional way of life is in decay, and whose position is acutely uncertain in a rapidly changing social situation, and this has been very much the case with the peyote cult among North American Indians (see PEYOTE CULTS) and some Maori religious movements in New Zealand.

Similar cultural continuities are to be observed in the new religious movements in contexts other than purely tribal societies. The cults that flourish among Negroes in Haiti and Brazil bear very evident traces of their antique African origin. The Negro populations of the Brazilian coastal cities such as Recife, Bahia and Rio, maintain shrines in which the deities who are worshipped are, despite the Christianization of their names, readily identifiable as gods worshipped by their ancestors in Nigeria and Dahomey (see DAHOMEY). Even in movements that have developed considerable sophistication, such as the new Christian denominations in West Africa, traditional cultural concerns are recognizable behind the organizational forms that have been acquired from Western Christianity and modern styles of denominational structure.

Some of the most dramatic new religious movements have arisen in the Congo, where prophetism had flourished from the very early days of European contact. Most outbursts have been of limited duration until recent times. The prophet whose name is associated with the most important group of movements is Simon Kimbangu, who had been a catechist (trainee member) with a Baptist mission, later claiming to have been called to prophesy, and in particular to undertake healing work. In the prevailing conditions of a society disrupted by the collapse of markets following the end of the First World War, there were many who were ready for some new dramatic development. People travelled long distances to listen to Kimbangu preaching, and although there is no reliable evidence that healings actually occurred, his reputation spread rapidly. Hospitals were deserted, and although he preached against *minkisi* (spirits) and fetishes, and as a consequence of his exhortations the demand for Bibles grew, nonetheless Kimbangu quickly fell foul of the Belgian colonial authorities and of the Roman Catholic missionaries. Natives were leaving their work and journeying to see him, and this excitement was enough to convince the authorities that Kimbangu was a threat to public order. To the natives he was a powerful destroyer of witches: among those who set out to hear him some died on the way, and this was taken as sure evidence that these people were involuntary witches who had died as they approached the counter-witchcraft influence of Kimbangu.

As the authorities became more alarmed, Kimbangu was arrested, but escaped and thereby established even more prestige with his fellow natives. The movement now acquired a strong anti-white impulse which had not been part of its original character. His village was plundered and Kimbangu preached in the bush. The idea of this new folk-hero as a ruler now took root, and what had been an essentially magic, miracle-working movement became a millennialist and revolutionist one. Some of his followers were arrested and in a dramatic gesture, Kimbangu returned to his own village in the fashion of Christ entering Jerusalem, to face arrest, trial and condemnation to death. The death penalty was commuted to life imprisonment, and Kimbangu remained in prison until his death in 1950.

The movement to which he gave his name had only just begun at the time of his arrest, however. Thereafter it thrived on recurrent rumours and expectations of the return of Kimbangu, which was now awaited, much as second adventists await the return of Christ. Indeed Simon Kimbangu became identified with Christ and was regarded by many as the third member of the Trinity. Periodic outbreaks of enthusiasm occurred. Kimbanguists began to celebrate the third day of the week as their special day of religious observance. In some places the movement remained avowedly anti-white and adventist: in other places sympathetic Lutheran missionaries directed it into a more conventional type of revivalism. But periodic government repression and the influence of local prophets in many districts led the more extreme groups to take refuge in the bush where some of them engaged in new and bizarre rites directed towards the eradication of witchcraft. Missionaries reported that at some of these ceremonies, shaking, frenzied dancing and ordeals of lying down in the fire occurred. In response to government action against them, the various local groups tended to become more anti-Christian and pagan. Attempts were made to resuscitate the dead and some of the dances were lecherous and orgiastic. Such practices reverted to traditional preoccupations – healing and the purging of witches and concern with the ancestors – and represent an alternative response to the millennialist expectations of other branches or phases of the movement.

Two prominent prophets arose in the 1930s claiming to have inherited the mantle of Kimbangu. They were Andrew Matswa, who was active in the (then French) Congo, and Simon Mpadi. Matswa served in the French army in Morocco and later lived in Paris where he moved in left-wing circles. There he was successful in getting a government subsidy for a welfare organization to help Africans in Paris, and through this association, Matswa sent agents to collect funds in the Boko district of French Equatorial Africa, although those who contributed had widely divergent ideas of the purpose of their donations. Matswa may have been a crook, a political agitator or even a religious leader. He was prosecuted and this was enough to make him a martyr, and his movement, variously known as 'the religion of the candle' and 'the religion of the sacred wood' flourished after his death after a few years of imprisonment. It remained a potent force in the French Congo, and the Matswaists were an important group in the period leading to independence in the late 1950s.

Mpadi rose into prominence largely

Many new sects in Africa link Christian doctrines with African beliefs in witchcraft, magical healing and direct contact with a god through spirit-possession. The wife (*above*) and the chief acolyte (*below*) of the Rhodesian prophet Muchetera, who becomes possessed by the spirit of the god Chaminuka and transmits through his acolytes the words of the god to the worshippers *Right* Alice Lenshina, who was originally a member of a Church of Scotland mission in Rhodesia: people flocked to her to be baptized after she claimed to have met Jesus during a period of three deys and three nights when she was 'dead', and she founded her own Lumpa Church

through his association with the Salvation Army. The Salvationists arrived in the Congo in 1934–5 and had immediate success with the natives. Unfortunately, what the Salvationists took to be Christ touching the hearts of savages, was an experience with quite a different interpretation for the natives. The Salvation Army taught religion in a context of emotional freedom and joyousness; they wore a uniform; and they were prepared to shake hands with natives. They offered them a new flag. Above all, on the lapels of their coats they wore the significant letter 'S' for 'salvation', which the half-literate natives took to be a symbol for the sacred name, Simon. To the natives, the Salvationists were the new whites, the army which would lead to salvation and the return of Simon Kimbangu.

Once the natives were disillusioned about the Army, a separatist movement grew up from among those who had joined it. It now provided the model for a new style of religious movement. Simon Mpadi had been a regular Salvationist sergeant for about a year, and the movement which he founded during the intervals between periods of imprisonment, was known as the Khakists, from the uniform it adopted. Later other leaders took over, but not before, in his own area, Mpadi had established a reputation as a prophet whose return, during his imprisonment, was awaited like the advent of a new age.

In 1951 the Belgian authorities granted greater freedom to natives to establish religious organizations, and in 1956 one of Kimbangu's sons established the *Eglise de Jesus Christ sur la terre par le prophète Simon Kimbangou* (the Church of Jesus Christ on Earth through the Prophet Simon Kimbangu). The movement has many Protestant elements, including baptism by immersion, use of the Bible, public confession and a Protestant type hymnology. A few years later Simon Mpadi was released from prison and returned to lead what continued as a more exotic adaptation of Christianity to African conditions.

Clash with Authority

More recent religious movements, whilst continuing to manifest concern with witchcraft, have tended to espouse the organizational forms of the Christian missions and churches. They have thus persisted better, and have been more immediately visible than were the older cults that centred on the self-claimed power over witchcraft of one prophet. Among the most dramatic of anti-witchcraft movements has been the Lumpa Church of Alice Lenshina in Zambia.

Alice Lenshina was a simple tribeswoman who belonged to the Church of Scotland Lubwa Mission in (then) Northern Rhodesia. In 1953, Lenshina claimed to have received visions, to have entertained angels, and to have met Jesus during a period of three nights and three days when she was 'dead'. Initially she remained in the mission where a wise missionary sought to use, rather than to suppress, her religious impulses. She testified against hatred, stealing, swearing, lying, adultery and other sins, and she soon acquired a name as a prophetess among the natives. After a little time she began to baptize people, and called them to surrender to her their horns, charms and other implements of witchcraft. Her fame spread, and pilgrims came from as far away as Lake Tanganyika and Nyasaland. She taught the pilgrims songs, and after a time began to authorize teachers. Up to this point her message was by no means out of harmony with Christian teachings – despite her dramatic visionary claims.

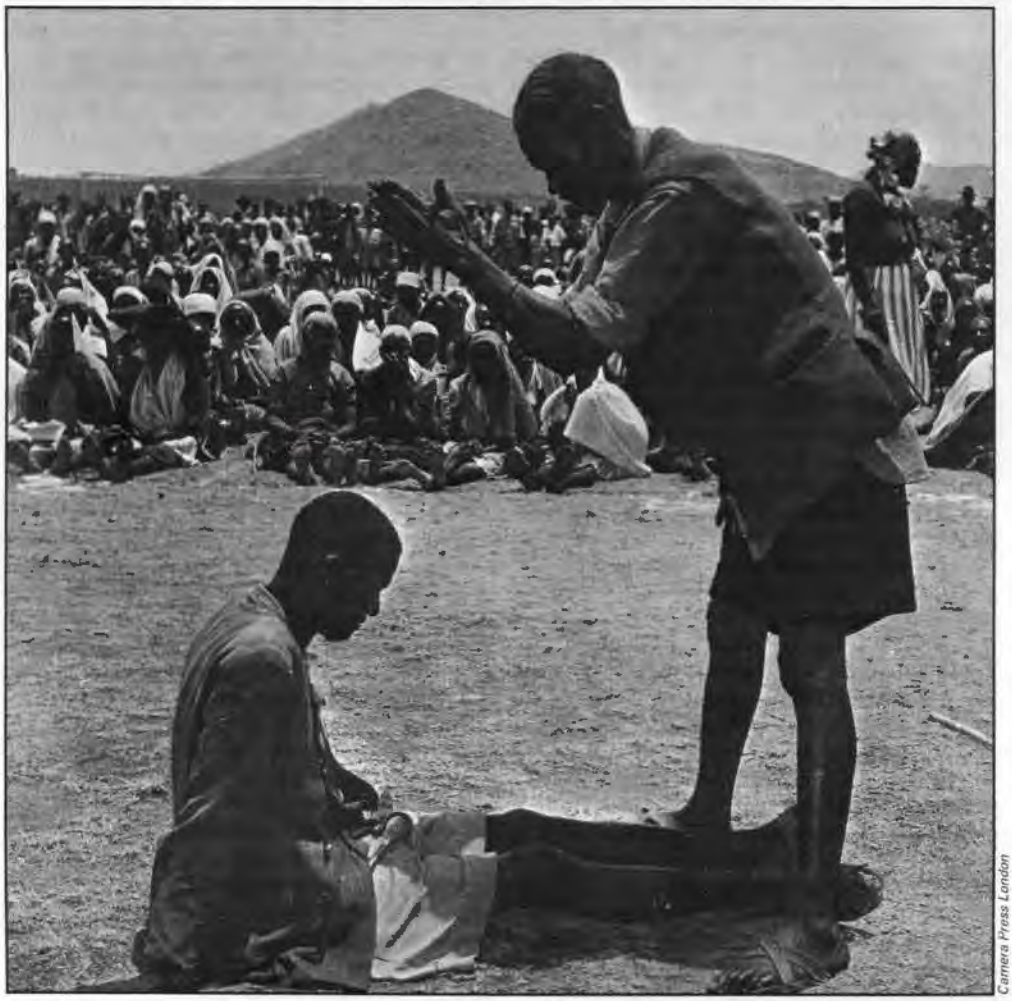
But the accommodation of such a powerful teacher to mission Christianity proved difficult. In particular, the Roman Catholic missions in the area were denuded of their following and Lenshina began to incur the hostility of the missionaries. Some declared that she had been given to spirit-possession when young, and others asserted that the new movement was an African nationalist and racist organization. There is, however, no evidence that Lenshina taught anything about an impending cataclysm which would overtake the government or the whites, even though – in common with Christian Churches – she had some teachings about the millennium. The central concern of the Lumpa Church was the elimination of witchcraft, but even this was misrepresented. Press reports by journalists, who understood little of African cultures, mistook witchcraft-elimination for witchcraft itself.

Inevitably, a quickly-growing movement of this kind met antagonism; her popular strength was great, and this emboldened her followers to defy the government on certain issues. She held court rather in the traditional style of a chief; thus prophetism here, as elsewhere in Africa, was an avenue of social mobility. Nonetheless, district officers conceded that in the Chinsali district where the Lumpa Church was strongest, morality had greatly improved. In 1963 the followers of Lenshina became involved in politics, despite her exhortations, and in the last days before complete independence a clash occurred between Lumpa churchmen and the authorities in which some hundreds of her followers were killed. Alice Lenshina, although perhaps not responsible for this conflict, was arrested and for some years the government prohibited the movement.

Cult of the Tigari

One of the most celebrated of anti-witchcraft movements was the Tigari cult which spread throughout Ghana and neighbouring territories in the 1940s, and which was directed to the elimination of witches, the procuring of health, fortune and children. Tigari ceremonial was enacted for 'clients' who had particular requests to make at the shrine, and Tigari priests manipulated their equipment to bring the semi-magical forces that they claimed to command into operation. To the accompaniment of drums, sacrifices were performed by which the priest claimed to exorcize witches or the effect of witchcraft. Malefactors were condemned and fines were levied against them: the system worked because those condemned feared the power of the Tigari priest and his medicine, and so yielded up whatever was demanded of them.

Salvation Army Information Services



Camera Press London

Above **The Salvation Army's S symbol aroused enthusiasm among Africans who mistook it for an emblem of the prophet Simon Kimbangu** ***Left*** **Mock magical rite performed before an audience of 'witches' in Kenya**

As long as the cult was popular, Tigari provided a swifter avenue of social mobility than had the older religious system. In a society where men were just beginning to recognize the possibilities of 'getting on in the world', of leaving tribal and village associations and traditionally ascribed roles, it is not surprising that religion should become a field of endeavour both for those seeking wealth and success and those attempting to exercise power.

A decline in the Tigari cult occurred in the 1950s, because changing circumstances demand new magical responses. What followed Tigari was an interesting development which illustrated a continuance of traditional preoccupations, the intensification of demand for reassurance from the insecurities with which Tigari had sought to cope, and the growing capacity to adopt Western forms of organization. The new movements resembled very much more the mission churches and, increasingly, the more modern among the denominational organizations in Western countries that supported missions. They also incorporated, along with these forms of organization, an explicit commitment to Christianity. The origin of these movements was the Christian missions, and their leaders were all men trained in, and often occupying minor ecclesiastical

roles within, the mission churches.

Characteristic were the group of revivalistic movements that sprang up in Nigeria just after the First World War. In some respects the leaders of these movements were looking for a more emphatic, more compelling and more powerful religion than the missions offered, and they became the native equivalents of fundamentalist revivalists in 19th century America. African movements necessarily embraced concerns and preoccupations that were of distinctly African provenance and they wanted a religion that could deal with the magical and evil power which Africans almost all believed in. The Churches that were spawned by these revivals were avowedly committed to faith-healing, to a generally Christian standard of morals, but also to the reassurance of individuals about their most compelling concerns – health, fertility and worldly success. The ecstatic character of services, with drumming, dancing, revelations and the outbreak of inspired utterance, reflects the intensity of concern.

Aladura and the Cherubim

Typical of these movements is the Aladura Church of the Lord, founded by J. A. Ositelu, a disappointed Nigerian catechist in an Anglican mission, who in 1926 received divine inspiration to set up his own Church in Western Nigeria. Today that Church has branches in various West African countries, working under an elaborate written constitution, with a well-regulated hierarchy of officials from its Primate down to local 'Captains' and ministers. The insistence on prophecy is underlined by the institution of the office of 'Prophet' and 'Assistant Prophet'. The thousands who attend Aladura services regard themselves as Christians, but emphasize that they belong to 'spiritual Churches'. The term spiritual refers to the belief in the continued operation of spiritual power in the Church, and the expectation of revelations to the congregation at large through its inspired agents. Among bodies which prefer to be collectively known by this term is the Church of the Lord, the Cherubim and Seraphim movement, which is also found in other West African countries besides Nigeria, where it originated.

The spiritual Churches draw in large numbers of West Africans, mainly from the new lower middle classes in rapidly growing cities such as Lagos, Accra and Freetown. The services have the form of Christian worship, with hymns and choruses borrowed from the missions. In the Church of the Lord, hymnology is evangelical, liturgy is closer to that of the Roman Church, whilst the central preoccupations are emphatically African. Drumming, dancing and repetitive choruses continue for three or more hours at Sunday and week-night 'watch services'. Members of the congregations are exhorted to dress in white. Like Moslems they are barefoot, and for their prayer exercises they also adopt the Moslem practice of kneeling and bowing to the ground. Occasionally an individual becomes possessed during the dancing, or is afflicted by strong pangs of conscience; in writhing agony he is taken out to the 'mercy ground' – a sandy enclosure – outside the church to wrestle in the Spirit, shouting and rolling in the sand, until, calm again, he rejoins the congregation.

During the principal services individuals will sometimes announce visions they have seen during the period of collective prayer, and these are usually interpreted by the officiating minister. Even more important, however, are the institutionalized revelatory interviews between (in the Church of the Lord) the lay officials known as 'the Army of Jesus' and congregational participants. The officials move about among the crowd, halting in front of an individual who then goes down on his knees whilst the official intones. 'Oh Brother, the Lord has revealed unto me . . .' and then continues to indicate what is likely to befall the particular member and how he might ward off evil, induce goodwill from God and protect himself and his family from illness and witches.

New religious movements in Africa illustrate the problems of people dramatically strung between two cultures and two sets of assumptions about the world and its religious interpretation. The same is true, in even stronger measure, of the less developed tribal peoples of Melanesia. But such movements there reflect distinctive cultural concerns which differ significantly from those to be found in Africa. The common element is the demand for prosperity, but in Melanesia there is a much more emphatic demand for power which will bring the benefits of white technology and white material equipment to natives (see CARGO CULTS).

Brazilian Movements

Even among peoples much more used to the facilities of modern life than the Melanesians, as for example in Brazil, the problem of interpreting social experience persists. Insecurity in the cities and ignorance in rural areas give rise to strong desires to manipulate spiritual forces and wrest some good from a recalcitrant world. Brazil is a country of dramatic religious expression and a wide variety of movements exist side-by-side there, representing completely unreconciled conceptions of the supernatural. There has been, for example, a rapid growth in Brazil of modern Pentecostal movements, both in consequence of the work of the missionaries of such sects flourishing in the United States (see PENTECOSTALIST MOVEMENT), and as a local spontaneous development among some groups of Brazilians, particularly Italian immigrants. Apart from growing branches of other American sects, such as Jehovah's Witnesses (see JEHOVAH'S WITNESSES), who are active in many parts of the world and particularly in underdeveloped countries, there is also a stronger body of Spiritualists in Brazil than anywhere else in the world. There have been several vigorous millennial movements.

Brazilian Spiritualists are of two principal kinds, those known as Kardecists, so called because their religious views derive from the writings of Alain Kardec, a French 19th century Spiritualist who acquired a significant following in Brazil; and those known as Umbandists. The Umbandists represent a more primitive type of Spiritualism, the inspiration for which is originally African, and which in some respects is rather closer as a religious phenomenon to the beliefs and practices of the *candomblés* of Bahía and Recife than to the more sophisticated, metaphysical system espoused by the Kardecists. The Kardecists believe in reincarnation, the remoteness of God and therefore the necessity of appealing to lesser spirits for assistance in one's worldly concerns. There is some emphasis among them on general ethical principles and they have also steadily developed a programme of social service. Some of the more intellectual among the Kardecists are openly contemptuous of the crude performances, spirit-possession and the search for spectacular manifestations among the Umbandists.

The candomblés are in themselves not an organized religious movement, but rather a collection of independent shrines presided over by a priest or priestess, upon whom wait a group of acolytes, usually women. At services in the candomblés the young women, most of whom are dedicated to a particular god, dance until they become possessed by the deity, in whose special robes they are then dressed. They then dance and behave entirely according to the character of the deity to whom they are dedicated. They may act quite licentiously and impertinently to those who come seeking their aid, but they also provide advice, inspiration and evoke faith among the crowds of believers who flock into the candomblés every night. The clientele is largely Negro, but in recent years the spectacular performances of some priestesses whilst possessed have begun to command the attendance of more sophisticated Brazilians, and perhaps also their belief. The deities, although taking Christian names, are the gods of West African religions, or, in some cases, combine attributes of the gods of the indigenous Indian population of Brazil.

Many hundreds of new religious movements, some of very brief duration, have been recorded in underdeveloped countries. As the peoples of such countries acquire greater organizing ability, learn to imitate the forms and systems of white men, and benefit from education, so their indigenous religious movements can acquire, as among the Aladura Churches of West Africa, the necessary structure for more permanent operation. Inevitably, as this process of learning occurs, so too the intrinsic religious conceptions of a people steadily undergoes transformation and increasingly such new movements as persist come to show closer approximations to the religious forms common in the Western world.

Among the lunatic fringe of German racial theorists was the founder of this esoteric Order; although Hitler despised him and those like him as 'politically ineffective', many of von Liebenfels's theories were later put into practice by the Nazis

NEW TEMPLARS

VIENNESE OCCULTIST, racial theorist and founder of the Order of New Templars, Dr Jörg Lanz von Liebenfels was a representative member of what has aptly been described as the European 'intellectual underground'. The son of middle class but apparently well-to-do parents, he was born at Vienna on 19 July 1874 as Adolf Lanz. Nevertheless, he claimed that his father was Baron Johannes Lancz de Liebenfels and that he was born at Messina, Italy, on 1 May 1872. The incorrect birth date was intended to mislead astrologers who might be interested in his horoscope. His doctorate, however, existed only in his own imagination.

In 1893, at the age of 19, he became a novice at a Cistercian monastery at Heiligenkreuz (on the present Austro-Hungarian border) but was expelled six years later for 'worldly and carnal desires'. Shortly afterwards he founded his Order of New Templars, which had a strongly 'racial-religious' emphasis. In 1934, a year after Hitler came to power, he wrote that the Order was 'the first manifestation of the Movement (i.e. Hitler's) which now, in accordance with the law of God, is most powerful in history and unrestrainedly sweeping over the world.' Lanz was not the only founder of a Central European sect to claim that he had anticipated Hitler's racial and other theories.

Montage combining a Nazi flag – the swastika was an important 'Ario-heroic' symbol – with a statue which was a favourite with Lanz von Liebenfels because it expressed his fears of the degradation of the 'superior' races by the inferior. Lanz suggested the establishment of special colonies for the breeding of 'Germanic' children, and many of his racial theories anticipated the later beliefs and policies of the Nazis

The Master Race

The largest and the most persistent bee in Lanz's muddled bonnet was the necessity to defend the purity of the 'Ario-heroic' white master race. This could only be achieved by the maintenance of strict eugenic standards. Lanz was not exclusively antisemitic and was equally apprehensive about the supposedly baneful effects of 'Germanic' intermarriage with people of Slav or non-white descent. Thus candidates for admission to his Order ideally had golden hair, blue or grey-blue eyes, a rosy complexion, a narrow skull and face, a high-bridged and narrow nose, and slim hands and feet.

Since this was the racial type that Lanz wished to perpetuate, it was necessary to breed such people. Hence his advocacy of the establishment of breeding colonies where one man might, if necessary, inseminate several women. Since he was eternally a theorist rather than a man of action he never personally implemented this design, but one or two somewhat similar experiments were made in Germany before 1933, although not under Lanz's auspices. Heinrich Himmler later proposed something of the kind for his S.S.

At least theoretically, Lanz anticipated all or most of the Nazis' repressive racial measures, such as the eradication of 'unsatisfactory' racial types or groups by castration or sterilization, starvation, forced labour and other means. Nevertheless, it is unlikely that he would have countenanced the 'gas chamber' solution if he had been in a position to implement it. Lanz and his followers belonged to the absolutely lunatic fringe sector of the pre-Nazi Pan German movement.

The Order of New Templars represented the most esoteric of Lanz's multifarious activities as a racial publicist and 'authority', and membership of its inner circle was limited to carefully selected initiates. The Order acquired its first Temple in 1907 when Lanz purchased and equipped Burg Werfenstein, a romantic ruin high above the River Danube. It is recorded that he hoisted a flag incorporating a swastika there in that year, when Hitler himself was only 18 years old. Lanz was an early user of the swastika symbol, which was soon to become associated with a score or more of *völkisch* or German nationalist groups in both Austria and the Reich (see NATIONAL SOCIALISM). Other Temples were consecrated later at Marienkamp, close to the Plattensee, at Staufen near Ulm, and at Rügen on the Baltic coast. The Order also had cells at Salzburg and in Hungary.

Secret Bible

The New Templars never represented a mass movement and its existence probably remained unknown to all except an enthusiastic minority. With the exception of the dramatist August Strindberg, with whom Lanz was on friendly terms, no widely-known personalities were members.

The Order's initiates held 'Grail Celebrations' at Burg Werfenstein and elsewhere, and in duly impressive surroundings, garbed in white robes, practised the

Order's rituals, all of which were written by Lanz.

He himself created a vast ceremonial and pseudo-liturgical literature. This included *The Psalms in German, The New Templars' Breviary* in 2 volumes (1915–16) and selections of historical, moral and mystical readings for members of the Order, all taken from the literature of 'Ario-heroic' peoples of all eras. The *Hebdomadarium*, a collection of week-day prayers, was intended for use with the readings. Finally there was Lanz's *Bibliomystikon*, or 'secret bible for the initiated' in 10 volumes. It has been estimated that Lanz's published works, largely forgotten today, amount to more than 15,000 printed pages.

Lanz was also the creator of an esoteric system known as Ariosophie, to which almost everything could be referred, particularly racial hygiene. There were a fair number of Ariosophists in Germany and Austria after 1918 and some of them were also members of the New Templars. An Ariosophical monthly published in Germany by Herbert Reichstein, one of Lanz's most devoted supporters, reflects the sect's interest in most branches of occultism or pseudo-science: astrology, phrenology, the Cabala, fringe medicine, diet reform and so on. Lanz himself wrote untiringly on all these subjects although 'race' was always his major preoccupation. By this he meant the superiority of the 'blond' race and its eternal battle with inferior races, which represented the powers of evil.

'The World Will Tremble'

In 1958 W. Daim, a Viennese psychologist, published a study of Lanz with the intriguing title *Der Mann, der Hitler die Ideen gab* (The man who gave Hitler the ideas). Daim tried to establish that Lanz's influence on Hitler was a substantial one. Hitler had one brief meeting with Lanz at Vienna in 1909, when he called at his office to collect some back numbers of the latter's periodical *Ostara*. Hitler was then about 20 years old. In a letter written to a member of the New Templars in February 1932 Lanz proposed that 'Hitler is one of our pupils . . . you will one day experience that he, and through him we, will one day be victorious and develop a movement that makes the world tremble.'

However, when the Nazis finally came to power in 1933, Lanz supposed that his work as a pioneer racial eugenist and early protagonist of National Socialist ideology would be acclaimed in Germany, but this never happened. He was forbidden to write for publication when the Germans invaded Austria in 1938 and the Order went underground.

Hitler had realized as early as 1924, when he was writing the first volume of *Mein Kampf*, that men like Lanz were politically ineffective. In *Mein Kampf* he summarily dismissed them as *völkisch* wandering scholars, absurd figures without any positive influence, who had fought for 40 years for a so-called idea without achieving the slightest success.

It would therefore be a mistake to overestimate Lanz's influence on Hitler or, indeed, his later genocidal policies. Lanz was but one of scores of Austrian and German writers and publicists who concerned themselves with the concept of 'race'. But none of them, not even Heinrich Himmler, could match Lanz's obsessional identification with crackpot eugenic theories and racial mysticism.

Lanz died at Vienna on 22 April 1954. His wish to be buried at the monastery at Heiligenkreuz was refused. However, a rumour was current in New Templar circles that the monks were so anxious to have the mortal remains of their 'greatest son' that they secretly disinterred the body and removed it to the monastery at Heiligenkreuz for reburial.

NEW TESTAMENT APOCRYPHA

1984

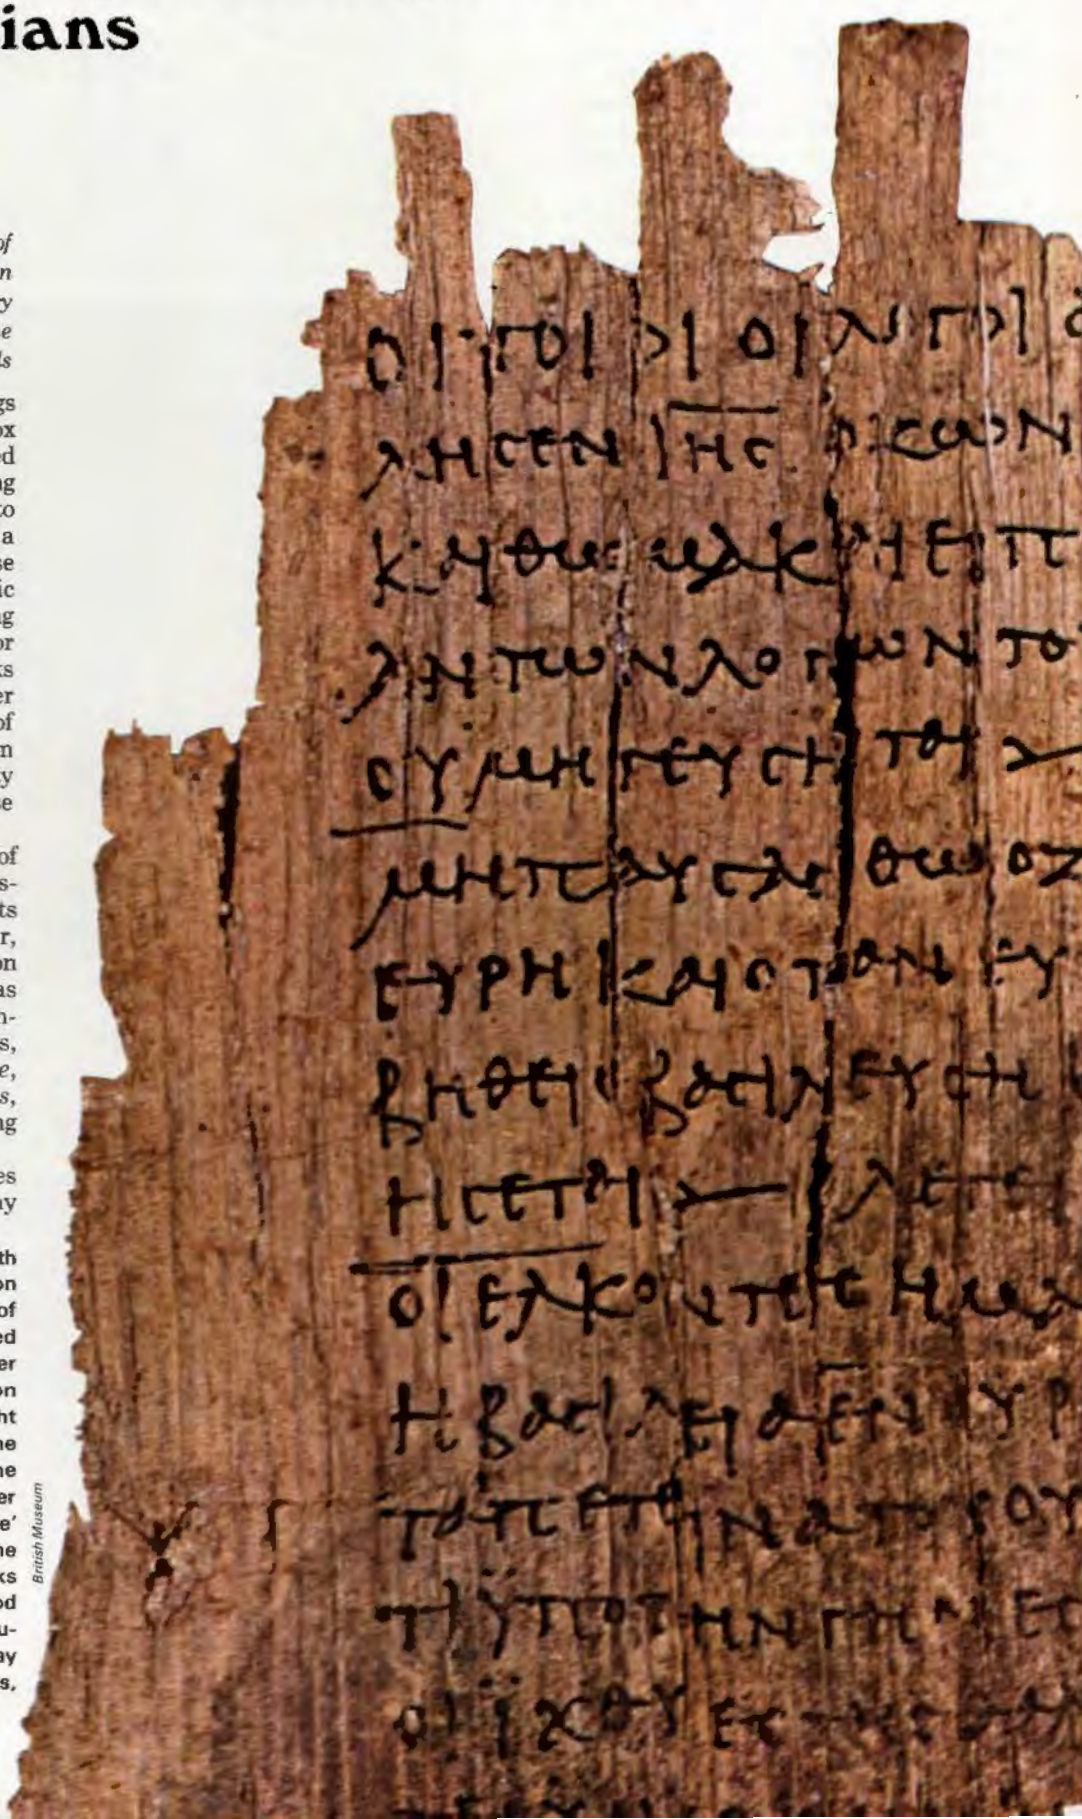
These writings are of the greatest importance for understanding the thought and outlook of early Christians

Touching and curious stories of the boyhood of Jesus are to be found in these little-known works, written partly to satisfy the ordinary Christian's need for more information about the holy family than is given in the canonical gospels

A NUMBER of ancient Christian writings that were not included in the orthodox canon of the New Testament are designated 'apocryphal', a word originally meaning 'hidden' or 'secret', which was applied to books written specially for the initiates of a distinctive sect or cult. Since many of these writings belonged to Christian Gnostic sects, the term gradually assumed among orthodox Churchmen the sense of 'false' or 'spurious'. The fact that most of the books are fictitiously ascribed to apostles and other notable characters of the first years of Christianity does not, however, render them 'spurious'; for the authorship of the majority of the orthodox scriptures is likewise suppositious.

The writings grouped under the title of New Testament Apocrypha are to be distinguished from another set of documents entitled the 'Apostolic Fathers'. The latter, although they were excluded from the canon of the New Testament, are regarded as orthodox and greatly esteemed. They comprise the epistles of Clement, Barnabas, Ignatius and Polycarp, the *Didache*, writings of Papias, the *Shepherd of Hermas*, and the *Epistle to Diognetus*, all dating from the 2nd century AD.

The Apocryphal New Testament includes many different kinds of writings; they may



Left The Virgin Mary with the infant Jesus, 16th century: the Virgin wears a crown and stands on a crescent moon in front of a circle of rays of light, to identify her with 'the woman clothed with the sun' of the book of Revelation (chapter 11), who had 'the moon under her feet, and on her head a crown of twelve stars . . . she brought forth a male child, one who is to rule all the nations with a rod of iron 'but, menaced by the Devil in the form of a great red dragon, 'her child was caught up to God and to his throne' *Right* Fragment of a Greek version of the Gospel of Thomas, one of the apocryphal works which contained stories about the childhood of Jesus, including what became a very popular legend that he made 12 sparrows of clay and brought them to life by clapping his hands, when they flew away, chirping merrily

British Museum

In the early Christian centuries, apocryphal writings fed the appetite to know more about the lives of Jesus, the Virgin Mary and the apostles than the New Testament itself provided, and many of these writings contained stories which became popular themes of art and literature

be conveniently grouped in four categories: gospels, acts, apocalypses and epistles. The motives that prompted the creation of this apocryphal literature were various. In some instances a particular doctrinal interest can be discerned, usually of a heretical kind; the writing concerned was evidently designed to promote this interest by representing its endorsement by Christ or an apostle. The Gospel of Thomas, discovered together with other ancient apocryphal documents in 1945 at Nag Hammadi, in Upper Egypt, is a notable example of this tendency.

Another very evident motive was the popular desire to know more about Jesus, the Virgin Mary and other gospel figures than the New Testament writings record; in particular the 'hidden years' of Jesus's boyhood naturally provoked curiosity. Apocryphal writings met this need with vivid detailed narratives, replete with notable miracles. Whether such writings were of heretical origin or not, their intrinsic interest made them widely popular among orthodox Christians. Thus, despite their lack of authority as canonical books, they are of the greatest importance for understanding the thought and outlook of ordinary Christians during the early centuries of Christianity. Moreover, they were a source of inspiration to Christian artists, and the interpretation of much medieval art depends upon a knowledge of them.

Among the apocryphal gospels mention must first be made of the Gospel according to the Hebrews. This writing, which is known only by quotations and references of other writers, was originally composed in Hebrew or Aramaic and incorporated early Jewish Christian tradition. One of its most interesting passages, quoted by Jerome (c 340–420), records an incident not related in the canonical gospels. James, the brother of Jesus, vowed that he would not eat until he had seen Jesus risen from the dead. The risen Jesus brought bread to James, saying: 'My brother, eat thy bread, for the Son of Man is risen from them that sleep.' There is reason for thinking that the recently diseovered Coptic Gospel of Thomas, already mentioned, preserves sayings of Jesus that were originally recorded in the gospel according to the Hebrews.

Fragments survive of a Gospel of Peter, which was probably written about 150 AD. It purports to give a detailed account of the

Scala

resurrection of Jesus as reported by the Roman guard at his tomb. It tells how the soldiers heard a great sound and saw the heavens open and two men, resplendent in light, descend and draw near to the sepulchre. At their approach, the stone that sealed the entrance rolled back of its own accord, and the men entered. When they emerged, they were sustaining a third man, and a cross followed them. The heads of the two reached to heaven, and that of the third was even higher. The soldiers then heard a voice coming out of the heavens, saying: 'Hast thou preached unto them that sleep?' And answer came from the cross: 'Yea'. After this, another man descended from heaven and entered the tomb and remained there. When they had witnessed these marvels, the soldiers went to Pilate and reported what they had seen, being convinced thereby that Jesus was the son of God. Pilate ordered them to keep silent about the matter.

Jesus's Childhood Miracles

Of the so-called infancy gospels, that known as the Book of James or Protoevangelium concerns the infancy and early life of the Virgin Mary until the birth of Jesus (see MARY). The childhood of Jesus was described in a number of writings, of which the oldest is the Gospel of Thomas (which is to be differentiated from the recently found Coptic gospel of the same name). Greek, Latin and Syriac versions of its text exist. The Greek version announces itself as: 'The stories of Thomas the Israelite, the Philosopher, concerning the works of the childhood of the Lord'. The narrative that follows recounts a number of miracles performed by Jesus as a child, attesting his divine character and power.

It relates, for example, how at the age of five years, Jesus made twelve clay sparrows, when playing with other children on the sabbath. A passing Jew informed Joseph that his son had profaned the sabbath. When reprimanded, Jesus clapped his hands and the clay sparrows took flight, chirping together, to the amazement of the Jews, who are characteristically represented as the enemies of Jesus. On another occasion a child, running through the village, collided with Jesus, who angrily exclaimed: 'Thou shalt not finish thy course'. Immediately the offending child fell to the ground dead. Its parents, who complained to Joseph, were then struck blind by Jesus. When Joseph saw what his son had done, he 'arose and took hold upon his ear and wrung it sore'. After this unedifying episode, the young Jesus displays his miraculous powers in more congenial ways: he raises a child, killed by falling from a roof; he heals the severed foot of a young man who had been cleaving wood. When six years old, sent to draw water for his mother, he accidentally breaks his pitcher and brings back the water in his garment. He helps his carpenter father by miraculously extending a beam that was too short for its purpose. And so the marvels continue throughout the 'hidden years', until the visit of Jesus and his parents, Mary and Joseph, to Jerusalem, as recorded in the gospel of Luke (2.41–52).

Speculation on the home life of Jesus, before his public ministry, also provided another topic of great interest to Christians. The gospels tacitly suggest that Joseph, the father or foster-father of Jesus, had died sometime during those 'hidden years' in the home at Nazareth. To the pious imagination it was accordingly apparent that Joseph died an 'ideal death'; for both Jesus and Mary were present to ease his last moments. The theme found dramatic expression in a 4th century writing, which was composed in Egypt, and exists now in Coptic and Arabic versions. It is known as the History of Joseph the Carpenter or the Death of Joseph. Its introductory statement announces that the account had been given by Jesus, on the Mount of Olives, to his apostles, who recorded it in writing, and deposited the document in the library at Jerusalem. Joseph is reported to have been 111 years old at his death, which occurred on the 26th day of the month Epep.

The description of Joseph's last moments deserves mention, both for the curious personification of death and for the imagery of the soul's departure. Jesus is represented as telling how, as the fatal hour drew nigh, he saw Death, with a demonic company, approaching the house to torment the dying Joseph as they did all men. Jesus puts these grisly beings to flight. But Death has a necessary office to perform; frightened by Jesus, it hides behind the door. When the last moment comes, Jesus summons the awful being from its refuge and bids it

The lives of the Virgin Mary and St Joseph, the father or foster-father of Jesus, early attracted apocryphal treatment and in the 2nd century the Book of James gave an account of Mary's early life. Her parents, Joachim and Anna, were divinely informed of her coming birth; at the age of three she was taken to the Temple at Jerusalem, where she spent her girlhood; Joseph, a widower, was selected by God to be her husband. Great emphasis was already being placed on her stainless purity

separate Joseph's soul gently from his body. The angels Michael and Gabriel then receive the soul in a costly silken napkin and bear it away to heaven, amid songs of praise. After watching the safe ascent of Joseph's soul, which was unseen by the others at the death-bed, Jesus then turns to perform the last offices for the body of Joseph, and to comfort Mary and his brothers and sisters.

Obedient Insects

The canonical Acts of the Apostles whetted the appetite of later generations of Christians for more information about the apostles. The need was met by the production in the 2nd century of the Acts of John and the Acts of Paul. Other apocryphal Acts of Peter, Andrew, Thomas, Philip and other apostles duly followed. A collection of five of these acts was used by the Manicheans in place of the canonical Acts of the Apostles. The apocryphal acts included many fantastic stories; but they had a wide appeal and provided many dramatic subjects for medieval Christian art.

The Acts of John relates this quaint incident as proof of the efficacy of the apostle's prayers. Journeying from Laodicea to Ephesus, John and his companions rest for the night at a deserted inn, but sleep becomes impossible owing to the activity of bugs. John eventually commands the tormentors to leave the place and no longer disturb the servants of God. The next morning the bugs are found waiting obediently at the door of the inn until John gives them permission to return to their home in the bed. The episode closes with a pious reflection by John on the ready obedience of the insects to the voice of a man, contrasted with human heedlessness of the voice of God.

A case of necrophilia, which throws interesting light on the sexual asceticism of the early Christians is also described in the Acts of John. Drusiana, a devout Christian whose piety caused her to abstain from cohabiting with her husband Andronicus, also a Christian, involuntarily excites the passions of Callimachus, a young pagan. Profoundly grieved by the situation, Drusiana dies. But Callimachus, though repulsed by the living woman, seeks to satisfy himself on her dead body. He bribes her husband's steward to give him access to her tomb. But while Callimachus is carrying

Scala

With mounting veneration of the Virgin, it came to be accepted that at her death she had been taken up bodily into heaven, a belief which apparently originated in heretical circles in the 4th century but was later adopted by orthodox Christians

out his intention, a huge snake emerges, which kills the steward and coils itself about the young man. On the third day after Drusiana's death, the apostle John, with Andronicus and other brethren, visit the tomb 'to break bread'. On learning what had happened, John raises Drusiana and Callimachus from the dead; the latter repents of his wickedness and becomes a Christian. The perfidious steward is also raised, but does not repent and dies horribly a second time.

The Acts of Paul is particularly notable for its account of Paul and Thecla, a betrothed virgin of Iconium. Paul's preaching and personality fascinate Thecla, and despite persecution, she repudiates marriage and follows Paul, cutting her hair and wearing man's attire. She endures further persecution, including being thrown to wild animals which refuse to molest her. Paul eventually sends her back to preach the faith in Iconium, which she does effectively there and in Seleucia. The Acts of Paul also includes a description of the physical appearance of Paul. Paul is described as short of stature, with bow legs; his hair was thin, eyebrows joining and nose hooked – this unflattering portrait suggests that it may be derived from some actual reminiscence of the apostle.

The popular desire to know more about heaven and hell than could be learned from the canonical scriptures led to the production of apocryphal apocalypses, which were attributed to various apostles. They generally have the form of detailed revelations, made to the apostle concerned, of the joys of heaven and the torments of hell. The descriptions of the latter are, significantly, the fuller and more vivid – a similar difference is found in the medieval depictions of heaven and hell. It is likely that some of the accounts of the sufferings of the damned were derived from ancient Orphic eschatologies (see ORPHEUS); the account of the infernal city of Dis in Virgil's *Aeneid* doubtless also had its influence. These apocryphal apocalypses are characterized by their attempts to make the punishment fit the crime. Thus, in the Apocalypse of Peter: 'And over against these were yet others, men and women, gnawing their tongues and having flaming fire in their mouths. And these were the false witnesses'. The oldest of these writings, the Apocalypse of Peter, dates from the 2nd century. The very popular Apocalypse of Paul was a 4th century composition: it claims to be an actual revelation that Paul had recorded, and which was found centuries later hidden in his house at Tarsus.

The oldest of the apocryphal epistles (probably 3rd century) purports to be letters exchanged between Christ and Abgarus, ruler of the district of Edessa. The Letter of Lentulus, a 13th century fabrication, is presented as a report addressed to the Roman Senate by an official, Lentulus, who had seen Jesus. It gives a patently idealized description of his physical appearance, and was doubtless calculated to appeal to Christian devotion. From the 4th century comes a collection of letters allegedly exchanged between St Paul and the famous Roman philosopher, Seneca.

Much of this apocryphal literature is too obviously fanciful, and much of it is very tedious to read. For this reason it has been comparatively neglected by scholars. However, its careful investigation would probably throw much light on aspects of early Christian folklore that are ignored in the writings of the Church Fathers.

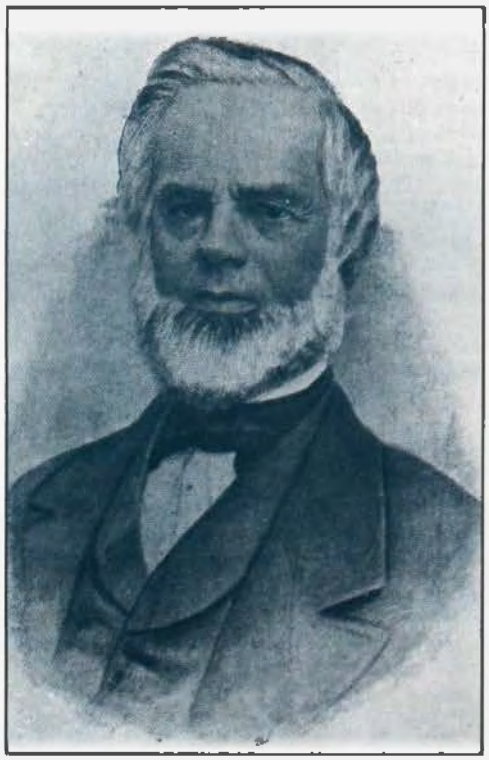
'As a man thinks, so is he': movements belonging to the New Thought school believe in the tremendous potentialities of thought for constructive or destructive ends, particularly in relation to healing

NEW THOUGHT



Culver Pictures Inc.

Phineas P. Quimby, who is generally regarded as the founder of New Thought, and whose principle of healing by suggestion also influenced the Christian Science movement

THE TERM New Thought, over the course of a hundred years or so, has come to describe a world-wide alliance of groups with similar ideas about man and his relation to an ultimate universal power. It is necessarily a loose association, for New Thought is neither Church, cult, nor sect, has no creed or dugma, is non-racial, requires no commitment and sets forth no rules of convention.

It is, rather, an attempt to identify a change of belief that began to take shape around the middle of the 19th century in the New England states of America, a belief that broke away from the traditional concept of a deity who sat in judgement, above or outside man, to the idea that God dwelled in man, that man was a spiritual being who could apply the divinity within him to discover and use its infallible laws, generally for good and enlightenment, and specifically for the healing of the sick, in the manner of Jesus.

Not in essence new at all, New Thought was really a gradually evolving compound of mesmerism and hypnosis, as they were currently revealing man's susceptibility to suggestion (see MESMER); idealistic philosophy, with its heavy accent on oriental thought now infiltrating the West; emergent science and psychology, and many of the major ideas of Christianity and other world religions. Even its identifying singularity, mental healing by means of changing the sick person's belief about himself and thus curing the sickness, was but the rediscovery of techniques used earlier by Jesus.

Initially New Thought was, probably, an American phenomenon, for this was a land where all was change and growth, where all old orders, no matter how historical or sacred, could be and were questioned.

One long-entrenched target of dissent was the religion of the majority, orthodox Christianity in its Calvinistic interpretation: a strong reaction to its authoritarian rigidity had been in progress from about the beginning of the 19th century. Another was the Congregational Church, which had already split, with a more liberal concept of its Protestantism having emerged as the new Unitarian Church, appealing to intellectuals and attracting exceptional preachers.

Yet another rebellion was afoot. Though the Unitarians had resisted unreasoning acceptance of the Bible in all its parts, they yet remained fundamentally Protestant. This did not satisfy a third group, which came to be known as the Transcendentalists.

The nature of this group's protest was that they did not hold at all with the precept of revelation by sense, but were convinced that true revelation was by intuition. Within his own mind man had the ability to unfold 'an order of truths', and these absolutes of goodness, wisdom, justice, brotherhood and love were thus available to any and every man who would foster them in himself, in his perceptions. Because this philosophy gathered such eminent and articulate devotees, the most influential of whom was Ralph Waldo Emerson, the New England philosopher and poet, it had an impact far outreaching its numbers. The simplified leading tenet of the Transcendentalists, 'the supremacy of mind over matter', came to be, consciously or unconsciously, the root from which New Thought developed.

What New Thought did with the basic idea was to extend it from mere alert receptivity to the revelations of man's indwelling divinity, which brought about tranquillity but seldom wrought healing, and to put it to work as a practical, logical means of cleansing the mind of error and leading it to the truth, which in turn freed and cured.

Cured by a Bolting Horse

Such was the practice, in particular, of the man who is regarded as the founder of New Thought, Phineas P. Quimby. Born in Lebanon, New Hampshire, in 1802, he spent the greater part of his life in Belfast, Maine, from where, as his ideas evolved, he went forth to lecture and demonstrate in surrounding towns. Eventually he opened an office in Portland, Maine, cured many hundreds of people of varied ailments and diseases, and gained a wide reputation as 'the Portland healer'.

In his early 30s Quimby fell ill, was diagnosed as suffering from tuberculosis, and was treated by a physician with great quantities of calomel, a purgative which weakened him so severely that he gave up his business and prepared to die.

Instead, an unusual event set up a train of thought that not only led to his being cured but provided a life's commitment. One day, the horse pulling the carriage in which he was riding, suddenly bolted. By now but a frail shadow of a man, he yet managed to leap into action, control the horse and drive it home. Astonishingly, when he stepped out of the carriage, he felt restored to his former health.

After this experience, he resumed work, but questions continued to nag at him. How, why, had he been able to do this 'impossible' thing? His thoughts turned to 'the supremacy of mind over matter', and thence to the subject of mesmerism. By chance, a demonstration was given in Belfast, and Quimby attended. Deeply impressed, he began experiments of his own with an assistant who was said to be clairvoyant. Although Quimby himself was soon an able mesmerist and hypnotist, and effected many healings by the power of suggestion, it was when his own kidney disease was cured, after it had been pronounced incurable, that he began to speculate further. Had there really been a kidney condition, he asked himself. Was it possible the physician had been guessing, and that his own lively imagination had obliged with the appropriate symptoms? Was it actually necessary to use hypnotic techniques to persuade patients they were well? It occurred to him to wonder whether it could be done by simply talking with them until the trouble was uncovered, then helping them to believe they were healed.

Quimby had not read a great deal, but now he studied the Bible and paid close attention to the words and methods used by Jesus to heal the sick. He began to link the mechanism of suggestion to a system of faith.

Spiritual Science

Dedicated as he had always been, he was now satisfied that he had arrived at an understanding of what he was doing, of the nature of the power he was using: 'it is done unto you as you believe . . .' meant that the same power of belief that made a person sick, could make him well. Quimby, putting into practice teachings that seemed to have lain dormant through the ages, kept on attempting to clarify verbally what he saw as a spiritual science, but did not have the time to spare for much writing. In 1866, at the age of 64, he died of what amounted to overwork.

His ideas were not lost, however, for a number of his pupils and patients carried on his work. Among these was Mary Baker Patterson, who had been healed of a crippling ailment; as Mary Baker Eddy she founded her own Church, though later she broke away from the flexible base of Quimby's thought by compelling total allegiance to her own Christian Science as the ultimate revelation of truth (see CHRISTIAN SCIENCE: EDDY).

In 1921, the few definitions of P. P. Quimby's beliefs that he had put on paper were set in order by Horatio W. Dresser, and were published as *The Quimby Manuscripts*. The long controversy as to whether

or not Mrs Eddy's Christian Science was based on Quimby's (he had even applied the same term to it), while settling the issue of his initial influence on her thinking, did not disprove that she had developed it along different lines.

Many groups have since grown up and proliferated throughout America, as well as Great Britain, Germany, France, Japan, Africa and elsewhere, some short-lived, some permanent and flourishing, which are based on a common philosophical core. Alike as they appear to the uninitiated, the metaphysical variations between, for instance, Divine Science, the Unity School of Christianity, Religious Science (to name a few of the main groups), elude superficial definition and require careful study.

One of the primary reasons why New Thought, as a movement, can well form an alliance (and in fact does so, as the International New Thought Alliance) but cannot so easily become an organization, is that its interpretations around a central theme are apt to be as individual as individuality itself. Groups form ceaselessly around the preferred ideas of a particular leader, and leaders constantly emerge, and probably always will, for the very character of New Thought is that it is always new, advancing as man's mind, science and enlightenment move closer together.

There have been many attempts to define New Thought in its essential points. Charles Brodie Patterson, in his book, *What is New Thought?*, says that it 'has for its foundation Eternal Law – the One-ness of Life-God-Universal Life-Love-Intelligence in all, through all, and above all . . . The truth regarding life and its laws is to be found in man's inner consciousness rather than in the study of phenomena . . . Man's real search is the discovery of his own soul.' Elmer Gifford, a New Thought minister, defined it as 'a theory and a method of mental life with special reference to healing . . .' He asserts that all defect and disorder is of the spirit, and that we are spiritual beings. New Thought does not deny the body but regards it as an instrument of the spirit

Thought is God in Action

A statement included in the original Constitution and By-Laws of the International New Thought Alliance summarizes its aims as: 'To teach the Infinitude of the Supreme One; the Divinity of man and his infinite possibilities through the creative power of constructive thinking and obedience to the voice of the indwelling Presence, which is our source of Inspiration, Power, Health and Prosperity.' 'It practises in the twentieth century what Jesus taught in the first,' says an article published in the Alliance's *Bulletin* in 1916.

Such statements of belief tend to be generalized and in the various constituent bodies far more explicit descriptions are to be found of how man actually goes about achieving these results by means of a universal law of Cause and Effect. Each leading exponent contributes a share of clarification, new aspects of the way it works and how to apply it exactly and specifically. Since 'as a man thinks, so is he' is the substance of New Thought prayer (often called 'Treatment'), the main objective is to 'pray scientifically'; this is performed by consciously directing thought to create experience, to change belief, to heal, to release love, joy, harmony or peace.

In New Thought, the thinking process is the Creator in action. It is creating even if it is not directed, therefore to avoid negative experience, negativity manifested as bodily or other disorder, it is necessary to eliminate negative or destructive thoughts and replace them with positive constructive ones. Thoughts not desired as experience, old or mistaken beliefs about the self, are dissolved by 'denial'.

As well as meetings, lectures and classes, New Thought depends heavily on reading material to lead questioning minds to conviction. For this reason the literature, books and periodicals are abundant. Reading and practice, until a follower is extremely advanced in its methods, are synonymous. Repetition is essential until there is no further sense of separation between the idea and its use, until 'my yoke is light – the Father in me doeth the work – I, and my Father are one', are Reality.

A paradoxical day, the first day of the year combines sorrow for the passing of the old year and joy at the birth of the new. Because beginnings are always significant, the actions performed on New Year's Day are a portent of fortune to come

NEW YEAR

Mary Evans Picture Library

RITES IN CELEBRATION of the New Year take place the world over, irrespective of differing systems of computing time. Among many nomadic and agricultural communities it was customary to calculate the year on a lunar basis and most modern calendars continue to show this influence. Sometimes, as in the case of the Jews, New Year is a moveable feast. In ancient Babylon it was celebrated in what is now March and April, and in Egypt it was linked with the annual flooding of the Nile. In Europe the New Year was celebrated at different times varying from Christmas to March, and its official celebration on 1 January is a comparatively modern innovation. Until the introduction of the Gregorian Calendar in 1752 the official New Year in the British Isles began in March, but as far as the common people were concerned, it has always been celebrated on 1 January.

Many of the ceremonies associated with this turning point combine the elements of a funeral ceremony and a birth, of death and sorrow on the one hand, and on the other hope and joy. The first is represented by an old man often depicted with a scythe, and the second by a male child, the symbol of the infant year. The completion of one phase of existence and its re-emergence into another has always been an occasion of ceremonial importance in human affairs, and in many ways the rites of the New Year correspond to the rites of passage of individual life. The sense of continuity is still further emphasized in the role of the Roman god Janus (see JANUS) guardian of the gateway of the year, who faces both ways, looking backwards into the past and forwards into the future.

In keeping with the mourning element which underlies many of the rituals, obsequies for the dying year were once celebrated by English mummers who went from house to house, collecting tribute. The custom of tolling bells to mark its passing was quite literally a funeral dirge for the death of the old year. Originally, muffled bells were rung till just before midnight, and as the clock struck twelve the wrappings were removed to permit a loud clear chime. This was to indicate that, although the old year might be weak and feeble, the new one was strong and powerful in full voice.

Time of Joy and Rebirth

The occasional appearance of a headless spectre in many places in Europe at the New Year suggests another funereal association, although whether this points to some long-forgotten sacrificial custom carried out in furtherance of the rites of seasonal death and resurrection is uncertain. It is interesting to note in this context that during Babylonian New Year ceremonies it was customary for heads to be severed from statues and that in England there is a winter solstice superstition that if the shadow of any individual sitting by the Yule fire appears without a head, it means that he or she will die before the year is out.

Left **In the English countryside it is the custom to toll a muffled peal of funeral bells until midnight on New Year's Eve, for New Year is a turning point which combines the death of the old year, often represented by an old man with a scythe, and the birth of the new, symbolized by a child: advertisement for Roland's Macassar Oil, 'the best known promoter of the human hair', 1881** ***Right*** **Mexican New Year dancers**

It is the happier and more hopeful aspects, however, which predominate throughout the world. Everywhere, East or West, the New Year is the occasion for greater rejoicing. In China the house windows are decorated with texts in honour of the most important annual festival in the Chinese calendar, a time when the gods of wealth and procreation are encouraged to visit the home, while at the same time the devils of bad luck are warned to stay away. The Japanese celebrate the day with specially baked cakes which they offer to the sun and moon. In India it is customary for new foods to be eaten and in some places for new clothes to be worn; cattle are gaily decked with flowers, and in Bengal the River Ganges is worshipped. The modern Mexican ends his five days of ritual lamentation with wild rejoicings. North American Indians at New Year extinguish the tribal fires, scatter the ashes, and then ceremoniously relight them. There are also sacrifices and offerings to the gods and sometimes water is sprinkled on the passer-by.

In Northern Europe boar-shaped cakes were baked, and in France pancakes tossed on a griddle to bring good fortune. The European festival reveals little influence of the Christian heritage, for the introduction of the Julian Calendar in 46 BC placed the New Year in close proximity to the licentious Roman feast of Saturnalia (see CHRISTMAS). This gave grave offence to the Fathers of the Church who condemned it as diabolical, an attitude that received further emphasis in a decree of the Council of Auxerre.

The superstitious aspects of the New Year festival have maintained their long hold on the imaginations of people in Europe, despite religious strictures and social change. In Wales today children still maintain the quaint old custom of going from door to door asking for New Year's water to scatter on the houses. A song sung by children in South Wales on New Year's morning many years ago began:

Here we bring new water
From the well so clear
For to worship God with
This happy New Year.

The superstition that water drawn from the

well on New Year's Eve turned into wine long survived in this part of the British Isles. In some places such water was drunk in the New Year as a charm against the attacks of evil spirits.

In Scotland the last day of the year is known as Hogmanay and is traditionally celebrated with cakes and ale. Fires are lit and in Galloway, Wigtownshire, there is a ceremony known as 'taking the cream off the water'. Good fortune is believed to be the lot of anyone who drinks the water on that day.

The chief feature of New Year celebrations in Scotland, however, is the custom known as 'first footing' (see FIRST), which is based on the principle that whatever happens in the first moments of the New Year will have a profound influence upon the events of the 12 months ahead. For this reason the first person to step over the threshold must represent good fortune and it is most dangerous should there be anything ominous about him. 'First Foot' must be male, tall and dark-haired, hair of this colour being equated with good fortune. Red-haired men are for some reason unlucky, while women threaten the New Year prospects to an alarming degree, possibly because of the age-old fear of letting a witch into the home. In Montgomeryshire in the last century, if a woman happened to gain entry into the house on that day, boys were immediately paraded through the rooms in a special purificatory ceremony called 'breaking the witch'.

First Foot, when admitted to the house, brings with him special presents which symbolize the basic needs of the household during the ensuing year, and consist of coal, bread and money. In parts of Wales, where a similar custom prevails, even the initials of the one selected to play the part of First Foot were considered significant. Those whose names began with an H, a J or an R were always welcome since these initials represented health, joy and riches; on the other hand, individuals whose initials were T, W or S were considered dangerous since they represented trouble, worry and sorrow.

Begin As You Mean To Go On

The same type of reasoning which lies behind first footing can be detected in many other superstitions associated with the New Year: whatever one did on this day, the most critical day of all the days in the year, continued to influence events for the whole of the succeeding 12 months. For this reason New Year is considered to be a most auspicious time for making good resolutions, since any seriously intended effort on an occasion so highly charged with magic offers the greatest hope of success. Wishes are infinitely more potent at New Year than at the beginning of any ordinary month.

Because of the tradition that actions taken on the first day of the year determined the character of the ones that followed, the Roman tradesman of old was careful to perform a little token work on that day, since this ensured sufficient work throughout the year. The same principle appears in the old English superstition that it was extremely ominous to be unemployed on New Year's Day. Some people still believe that you must be careful to keep a piece of money in pocket or purse at this time if you hope to be assured of funds for the rest of the year. Similarly, you should always try to dine well on this day if you look forward to eating well in the months ahead.

Because of its magical character, New Year was peculiarly favourable for divinations, sometimes by picking a verse in the Bible at random, with the eyes lightly closed.

A very ancient custom, now almost extinct, involved the giving and receiving of New Year presents which were intended to insure that the year started on an auspicious footing. Some have ascribed this to a practice current among the Druids of distributing mistletoe to the people on this day, and gift-giving at this time was common in ancient Rome. English royalty were among the principal beneficiaries of this rite for they received presents of gold from the nobility; among the most valuable of these gifts was a gold cup presented by Cardinal Wolsey to Henry VIII. Queen Elizabeth I received a present not only from the Archbishop of Canterbury but from Mr Smyth, the royal dustman. The most historically important of these presents, however, must have been the gift of a pair of silk stockings from Mrs Montague, her silk-woman, said to have been the first pair to be worn in England. The Puritans were inclined to regard New Year gifts with a particularly jaundiced eye since to their eyes the custom reeked of paganism, even the innocent phrase 'Happy New Year' being frowned upon.

The one gift that nobody in his right mind would have made in the past would have been a flame for a household fire, or even a light from a candle, since this symbolized giving away the household luck, and it was supposed also to bring about a death in the family. There was even a prohibition against washing clothes on that day since, according to superstition, this was likely to wash away a life, and it was equally dangerous to part with any iron object. In the United States nothing whatsoever might be taken out of the house on New Year's Day and the chimneys had to be swept clean if the luck of the home was to be maintained, since it was taken for granted that good luck always entered the house by way of the flue.

Among the New Year customs which have survived into modern times, the most interesting is that known as 'Burning the Clavie', which takes place at the village of Burghead at Moray Firth in Scotland, on 12 January. The 'clavie' is a bonfire made of split casks, one of which is split into two parts of different sizes, probably symbolizing the unequal parts of the old and new year. An important part of the ceremony is to join the two parts together with a huge nail made for this purpose. The ceremony takes its name from the Latin word for a nail, *clavus*.

More recent is the ceremony at Queen's College, Oxford, when a needle and thread is presented to the Fellows with the injunction, 'Take it and be thrifty', no doubt a very salutary method of introducing a New Year resolution. 1 January is also one of the 30 or so 'Collar' days when the knights of the various orders of chivalry put on their ceremonial collars.

NIBELUNGENLIED

A LONG AND SAVAGE epic poem, the *Nibelungenlied* was written for an unidentified courtly patron, by an unknown poet around the year 1200, the period of a truly remarkable flowering of Middle High German literature. Before the story begins, Siegfried, the heroic son of Siegmund and Sieglinde, king and queen of the Netherlands, has had many adventures. He has slain a dragon, mastered the Nibelungs, a mountain folk with a vast hoard of treasure, acquired a magic invulnerability except for a small area between the shoulders, and owns a cloak which makes him invisible.

With the intention of gaining the beautiful Kriemhild for his wife, Siegfried travels to Worms, the capital of the three kings of Burgundy, her brothers Gunther, Gernot and Giselher. He succeeds in gaining Gunther's gratitude by impersonating him by means of his magic cloak, in order to win Brunhild, the amazon princess of Iceland, on Gunther's behalf. Deceiving Brunhild a second time, when Gunther is unable to subdue her, Siegfried takes Gunther's place in the marriage bed, quells the rebellious princess and hands her over to her husband. In return Gunther finally gives Siegfried his sister Kriemhild.

Siegfried returns home, assumes the Netherlands crown from his aged father and lives happily with Kriemhild who bears him a son. After some years, the Netherlands royal family are invited to Worms for a festival and it is here that the trouble begins. Brunhild is (and always has been) puzzled by her husband's obvious dependence on Siegfried, who, she has been told, is Gunther's vassal and, although he is king of the Netherlands, not his equal. In a very remarkable chapter ('How the queens railed at each other'), Kriemhild and Brunhild quarrel in public over matters of courtly precedence; and when they have both lost their tempers Kriemhild blurts out that it was Siegfried, her husband, who first lay with Brunhild. This scene, which occurs on the steps of the cathedral, naturally causes a

great scandal. Hagen, the Burgundian kings' kinsman and chief officer of state, declares that Brunhild's honour can be saved only by the death of Siegfried, whom he has always distrusted, and he persuades Gunther and his brothers that this must be done. Hagen cunningly discovers from Kriemhild the site of Siegfried's vulnerable spot and during an arranged hunt plunges a spear between the shoulders of the hitherto invincible hero as he is drinking from a stream. He flings the corpse against the door of Kriemhild's bedroom as she rises before dawn to go to church. Kriemhild breaks out in a paroxysm of rage and woe. Hagen's responsibility for Siegfried's death becomes public knowledge but, for political reasons, it is given out that the hero was slain by robbers.

Costly Vengeance

Siegmund and Sieglinde sadly go home, taking with them their grandson, Kriemhild's little boy. But Kriemhild decides to stay at her brothers' court, slowly nursing plots of revenge against her kin and especially Hagen, her arch-enemy. For years she does nothing but mourn in solitude until she at length consents to go to Hungary to marry Etzel, king of the Huns. Again after some years and after she has born Etzel a son, she persuades the Hun to invite her brothers and kinsmen to a festivity – with the intention, now implacably resolved, of wreaking vengeance upon them. Hagen suspects a trap from the start and advises the Burgundians to refuse. He is overruled and, despite grim portents on the way, the entire Burgundian court and army complete the long journey to Hungary

The dramatic and poignant final part of the poem describes the fighting that breaks out between the two sides. Neither really wishes to harm the other but the killing begins when Etzel's brother, urged and bribed by Kriemhild, slaughters the young Burgundian squires. From then on the catastrophe is inevitable. In a series of fierce encounters, all the warriors perish save Gunther and Hagen and, on the Hunnish side, Dietrich (an exiled king at Etzel's court) and his older companion Hildebrand. Etzel himself plays no part in the fray. Dietrich succeeds in subduing the exhausted Gunther and Hagen and leads them in bonds to Kriemhild. She commands that Gunther's head be struck off and carries it to her last encounter with Hagen. Then she herself, drawing Siegfried's own great sword which Hagen had taken so many years before, decapitates Hagen. Her vengeance is complete but at a terrible cost – the entire ruin of the chivalry of both Burgundy and Hungary. But that is not the end. Etzel and Dietrich are appalled at the slaughter and, moreover, scandalized that a mere woman should slay, in bonds, such a great and noble warrior as Hagen. Hildebrand leaps at Kriemhild and kills her with a fearful blow. As the poet says: 'The king's high festival had ended in sorrow, as joy must ever turn to sorrow in the end.'

The *Nibelungenlied* appeals because it is a story of high adventure and passionate and destructive love very dramatically told. But it also fascinates because it is set in the unfamiliar world of the graces and violence of medieval chivalry. Yet this world is quite different from the Middle Ages as we often think of them, influenced as we still are by the romantic distortions of the 19th century. In both these poems there is, for instance, little or no reference to religion or the Church, except as simple events such as attending Mass. When Kriemhild marries Etzel, the poet approvingly remarks on the tolerance of the times when Christian and heathen could live in peace and intermarry. There are also countless examples of what may surprise the reader as a very zestful attitude towards material things and the pleasures of the flesh. So it is that as well as enjoying an exciting story we are continually astonished by attitudes that are sometimes very alien and sometimes very similar to our own. Above all, the strong and psychologically complex characterization of the protagonists (and not infrequently that of the minor players) involves the reader in the hectic course of events to a truly remarkable degree. It is this 'real life' quality, this psychological insight into human motivations and actions, that makes the nearly 800 years old epic

The *Nibelungenlied* is the story of the murder of the great hero Siegfried and the terrible revenge that was exacted for it: Siegmund and Sieglinde (*left*); Siegfried and the Rhine Maidens (*right*), by Fantin Latour

poem the work of genius it is.

Like the *Iliad* of Homer and many other epics, the *Nibelungenlied* is the culmination of a long tradition of earlier poems. These were of Norse as well as German origin and were concerned with two themes: the exploits of Siegfried, his marriage and his murder; and the massacre of the Burgundians and their vassals by the Huns. The link between these two themes is provided by Kriemhild's slow but implacable resolve to avenge her beloved Siegfried, even though by doing so she must shed the blood of her brothers and her people.

The chief contrast between the two strands of the story is that the first, to do with Siegfried, dragon-slayer and master of the Nibelungs, derives from myth and fairytale, whereas the second, which concerns the destruction of the Burgundians by the Huns of Etzel (who is none other than the real Attila), is based on historical fact.

The world of the *Nibelungenlied*, it must be stressed, is totally unlike that created by Wagner in his opera cycle, *The Ring of the Nibelungs*. Wagner, like our poet, was concerned with people and his own psychological insight was perhaps equal to his musical and dramatic genius.' But his attitude and purpose in dealing with the same material was quite different. Wagner wove a vast tapestry of events involving gods and men, and propounded a fundamentally 'optimistic' philosophy of life couched in the romantic terms of his age. Our poet had simpler goals: to retell old stories in an entertaining way and explore the motives of ordinary, though exalted, human beings. There is little or no philosophy in his treatment, except perhaps (as Professor Hatto suggests) the moral that pride is the root of all evil. At any rate, in contrast to Wagner, he is a 'pessimist'. The difference between these two works, six centuries apart, has been mentioned because if people have heard of the *Nibelungenlied*, they often think of Wagner. If they do, they will have a totally erroneous impression of the original.

NIGHT

FEAR OF THE DARK is one of the universal human terrors. Night is 'the witching time', 'the black bat', and its alien realms are infested by horrors and evil dreams, by spectres and goblins, by uncanny sounds in the house and unearthly things that stalk the darkness and gather at crossroads. Day is the time when all God's creations are up and doing, and things which are active at night reverse the normal and proper order of things, like witches and demons, or the owl and the nightjar, sinister birds with uncanny cries. At sunrise the cock crows and the power of the creatures of night fades.

There is a famous passage in Bede's *History of the English Church and People* (written in the 8th century) in which a pagan Northumbrian thane likens the life of man to the flight of a sparrow across a banqueting hall in the gloom of a winter's day. Inside the hall there is warmth and firelight, outside darkness and storm. 'This sparrow flies swiftly in through one door of the hall, and out through another. While he is inside he is safe from the winter storms; but after a few moments of comfort, he vanishes from sight into the wintry world from which he came. Even so, man appears on earth for a little while; but of what went before this life or of what follows we know nothing.' The contrast between the warm, firelit hall and the threatening darkness which hems it round is powerfully drawn in the great Anglo-Saxon poem *Beowulf* which has been described as in part 'an expression of the fear of the dark'. It is at night that the monster Grendel, 'a black shadow of death', prowls the misty moors and steals in to attack the Danes in the King's hall (see BEOWULF).

Night is darkness, and darkness is linked with death, the valley of the shadow, the sleep of death, the suffocating blackness of the grave, the pall which drops when the sun 'dies' in the west in the evening. Most people do not think of darkness as the mere absence of light but as something positive and almost palpable. In Homer, when a man dies we are told that 'black darkness veiled his eyes' or that 'night descended on his eyes' or that he has been 'engulfed by the unlovely dark'. The Anglo-Saxons spoke of a 'death-mist'. The idea of the darkness of death covering a man's head seems to account for the dogskin head-dress of the Greek god of death, Hades, which made anyone on whom it was placed invisible.

Like death, night is inescapable. In the *Iliad* she 'dictates to gods and men alike'. Michelangelo said of his famous statue of Night (in the Medici Chapel, Florence) that she was mourning the work of Time, the destroyer, and lamenting her own part in it. In Hesiod's *Theogony* Erebos (darkness) and Night are among the earliest cosmic powers to come into existence, and it was they who gave birth to Day. Night is also the mother of a litter of horrors – Fate, Death, the Furies, Pain, Nemesis, Deceit, Old Age, Strife – as well as of Sleep, the tribe of Dreams, and Pleasure of Love. Her home is deep in the underworld, wrapped in dark clouds, and with her there are her twin children, Sleep who roams peacefully over land and sea, and is kindly to men, and Death, the iron-hearted, whose spirit is pitiless as bronze and who is hated even by the undying gods. Visiting Olympia in the 2nd century AD, Pausanias saw in the temple of Hera a chest decorated with scenes. One of them showed 'a woman holding on her right arm a child asleep, and on her left she has a black child like one who is asleep... the figures are Death and Sleep, with Night the nurse of both.'

Terror in the darkness of night: *The Nightmare*, by Fuseli

Aldus Books

In many mythologies, in the beginning all was dark and chaotic, and light and order were created out of this primeval night. In Genesis there was darkness until God created light. In an Orphic creation myth (see ORPHEUS AND ORPHISM) Chaos, Night and Erebos existed in the beginning. Night laid an egg from which Eros hatched, and from him came the later generations of gods. Pico della Mirandola, the 15th century Italian philosopher, identified the Night of this myth with the En Sof of the Cabala (see CABALA) as 'the solitary cloud of the Father', the first cause of the universe.

For although night is mysterious and ominous, it is also the time of love-making in which children are conceived and so it has symbolic connotations of potential fruitfulness, the darkness of earth in which the seeds ripen, the darkness of the womb in which the foetus grows. Night is the time of both death and conception. It is the name of a state of spiritual blindness and desolation, 'the Dark Night of the Soul', regarded by some mystics as an essential stage in the progress of the soul towards God. This is a condition of inner darkness, weariness, lethargy, indecision and misery, a condition of being far from the saving light of God which may last for months or even years. But on the other hand, the night of love can be an image of the soul's union with God, as in one of the poems of St John of the Cross, where it is the 'night that joined the lover to the beloved bride', transfiguring each of them into the other. Again, initiation is sometimes described in terms of a journey through the terrors of the dark, at the end of which the initiate reaches the sublime light (see INITIATION).

Terror and love-making are combined in a different way in the nightmare, a word which used to be applied particularly to dreams which were erotic as well as frightening, and to the demon that caused them. The 'mare' is not a female horse but an incubus, a spirit which makes fierce love to sleepers at night, 'riding' them, weighing heavily on them and causing them feelings of suffocation and evil dreams.

NIGHTINGALE

Bodleian Library Filmstrip

THE SONG of the nightingale has been more generally admired and praised than the song of any other European bird. The male sings by night as well as by day, so that even those with little interest in birds cannot fail to notice and appreciate its characteristic song.

Among Greek and Roman writers who commented on the bird's song were Aristophanes, who tried to reproduce the sound verbally in his play *The Birds*, and Phiny, who departed from his usual matter-of-fact style to describe it enthusiastically. It was the Greek myth of Philomela, however, which was responsible for the prominence of the bird in Latin literature and eventually in our own. According to the story, Procne, the wife of Tereus, king of Thrace, asked him to bring her sister Philomela to stay with her but when Tereus laid eyes on his sister-in-law, he fell violently in love with her. On the journey home, he ravished her and cut out her tongue so that his crime might not be known. He kept her hidden but Philomela was able to inform her sister by weaving an account of what had happened into a cloak which she sent to her. Procne took terrible revenge on Tereus, killing their son Itys, and serving him to her husband for dinner. The sisters fled from the tyrant king, and when he pursued them, Zeus turned Procne into a nightingale, Philomela into a swallow and Tereus into a hoopoe. Latin poets misread the story and made Philomela the nightingale, so that English poets, following them, wrote of Philomel as the nightingale.

This tragic myth was mainly responsible for the bird's song being interpreted by many poets as melancholy. In Shakespeare's *Rape of Lucrece* he wrote:

> Come Philomel, that sing'st of ravishment
> Make thy sad grove in my dishevell'd hair.

Keats, in the most famous tribute of all, *To a Nightingale*, refers to its 'plaintive anthem', and suggests that it is the 'self-same song that found a path through the sad heart of Ruth, when sick for home'. Chaucer, however, had referred to the 'merry nightingale' and Coleridge denied in verse that the song was melancholy.

According to a belief which can be traced back to the 16th century the nightingale sings with its breast pressed against a thorn. Shakespeare, again in *Lucrece*, wrote:

> And whiles against a thorn thou bear'st thy part
> To keep thy sharp woes waking.

It is said that the thorn was a protection against the snake and served to keep the bird awake and alert.

Singing Praise to God

The nightingale's song has not always been admired. A hermit in a Sussex forest was so disturbed by their singing that, so it was said, he laid a curse upon them so that they never again appeared in the neighbourhood. St Francis, on the other hand, is said to have competed with a nightingale in singing praise to God – and to have admitted himself defeated.

A nightingale in full song can indeed sing around the clock with a few intermissions. Country people, noticing this, associated the bird with insomnia and drew the conclusion that organs of the nightingale could be used to produce sleeplessness, on the magical principle of 'like producing like'. The eyes and heart, if placed close to a person in bed, would keep him awake – and if they were dissolved surreptitiously in his drink he would certainly die of insomnia.

In England rustic rhymes commented on the date of the bird's arrival in spring and it was believed to be a good omen if the nightingale's song was heard before the cuckoo called.

The marked preoccupation with sky gods and river spirits among the peoples of the Upper Nile reflects the dominating features of the environment on which their well-being depends

NILOTES

THE NILOTES or Nilotic peoples of Africa consist of several culturally related tribes and nations. They live south of the Sahara, stretching from the Nile valley of the southern Sudan and Ethiopia, down to Uganda, where some extend west into the Congo, and eastwards into Kenya. The best-known are the Nuer (see NUER), Dinka, Shillnk, and the Anuak of the Sudan, most of whom, however, are in Ethiopia; the Acholi and Lango of Uganda, the Alur of Uganda and the Congo, and the Luo of Kenya. They speak closely related languages and name similar religious and magical conceptions by variants of conspicuously similar words. A broad cultural and linguistic division may be made between the Dinka and Nuer, on the one hand, who are primarily pastoralists, and the rest who live for the most part by settled agriculture. It is clear, though, from linguistic and other evidence that originally all these peoples had a powerful and even obsessive interest in cattle, whose praises are still sung and which are widely regarded as the perfect sacrificial offering.

In general, and as compared with many non-Nilotic African peoples, beliefs in magic and witchcraft have a very secondary place in their interpretation of the world. Their pervading beliefs are markedly spiritual and theistic, Nuer and Dinka in particular giving a central position to a High God associated with the sky and heaveuly phenomena, to which ultimately the conditions and vicissitudes of their lives are attributed. There is virtually no religious art among them, and the absence of material representations of spiritual or magical forces contrasts strikingly with the wealth and variety of religious art and physical vehicles of magical forces found among some West African peoples. The iunumerable sculptures of divine forces which earlier travellers in Africa regarded as African

'idolatry' are more foreign to the Nilotic imagination than to the European.

Among the Shilluk, Anuak and Alur variants of a type of divine kingship (see KING) are found. Others follow the religious lead of priests of various kinds, the Nuer and Dinka especially having a well-developed sacrificial priesthood. The roles of both kings and priests are validated by myths which have a profound imaginative appeal to the people, and which serve as the best introduction to their other religious and magical ideas. The widespread association of spiritual forces with the river and the sky, features which dominated the river-plain environment with which all the Nilotes had some original connection, should be noted.

Cult of Kingship

The kings of the Shilluk, who stand in an intermediate position between men and God, are believed to be descended from a culture hero and first leader Nyikango, whose spirit descends on every successor. This first king is represented as descended on the father's side from the sky, and on the mother's side from the crocodile, thus combining in his person the imaginative connotations of the sky and the river upon which Shilluk well-being profoundly depends. Nyikango did not die but disappeared in a whirlwind, according to one widely-received tradition, and can thus in a sense live on in every subsequent king. Shrines to the kings, and priests to serve at them, are distributed over Shillukland. The Shilluk thus have a national cult of the kingship which connects them with a transcendent divinity. A comparable kingship, though in a less-centralized form, is found among the Anuak, whose first king is represented as having been the son of a spirit from the river born of the daughter of a local village ruler. Like the Shilluk royal clan, his descendants have spread themselves and their influence through the land. In these cases the association of the kingship with the sky or the river, or both, suggests that although the kings take part in human society they are also outside and above it.

An Investiture Ritual

The new king has married a girl, traditionally provided by a certain clan, and this girl has an important rôle in the ceremonies of investiture. After the king's enthronement Nyikang seizes the girl and refuses to surrender her to the king on the ground that she was married with cattle from the royal herd, which is Nyikang's herd, and is therefore Nyikang's wife. On this issue Nyikang and the king summon their supporters to a second mock battle, in which the king captures the girl. Nyikang thereupon pays the king a visit to make his peace with him.

Essays in Social Anthropology

The pastoral Dinka, who have no centralized kingship, also explain the spiritual primacy of their priestly leaders by a myth which relates them to the river. The first Dinka priest, Ayuel Longar, is represented as having been born of a childless widow who was grieving over her fate on the bank of the river. A spirit of the river told her to wade into the water, raise her skin skirt (the symbol of a married woman) and draw the ripples towards her. She conceived a miraculous child, born with teeth, who as a tiny baby helped himself to gourds of milk, and later during a period of drought found water for the cattle by pulling up by the roots a type of grass which still has sacred connotations. Yet at first the people refused to accept his authority and he left them. They pursued him to a river which he crossed and then, standing on the opposite bank, Ayuel Longar speared them when they in turn tried to cross, as the Dinka themselves spear fish. Eventually by trickery their leaders overpowered him, and wrested his blessing from him. In this way it came about that his descendants and theirs now form clans of priests, whose task it is to pray and offer sacrifice on behalf of the people, and whose symbols of office are sacred fishing spears, which they flourish as they consecrate their sacrificial oxen.

These particular myths are not found among all Nilotes, but it is true to say that their tone and structure are characteristically Nilotic. Priests and kings, and sometimes relatively minor religious functionaries, are held to be intermediaries between gods

The sky and the river are linked with important spiritual forces: the Shilluk kings are descended from the sky and a crocodile, the Dinka priests from the river itself

Godfrey Lienhardt

and men, sometimes to partake of the nature of the gods, and to have an influence beyond that of ordinary people over the natural phenomena – especially the sky and the clouds – upon which their well-being depends. Hence what have been called 'rainmakers', though not by any means confined to the Nilotes, are widely characteristic of their religious culture. The sense of rightful power in this respect which some rainmakers have is vividly conveyed by an account given by Aidan W. Southall:

> When I was sitting in the open air with the celebrated ex-chief . . . we saw a heavy shower coming towards us across the valley . . . The ex-chief rose . . . facing the oncoming rain . . . and shouted at it to take another direction. By this time I was expecting to get a thorough wetting . . . bnt . . . the shower . . . passed by to one side.

Similar incidents associating religious leadership with unusual effects in the heavens, not only with rain but with thunder, lightning, comets and so on, are widely recorded in Nilotic tradition.

Greedy Spirits

But although a sky god and other spiritual forces associated with the firmament are for many Nilotes the most important manifestations of divinity, there are many others which are highly respected in particular localities. There are spirits associated with particular places, often on the banks of streams, with hillocks, and very commonly with large trees. All these may receive their small offerings, frequently with the intention of warding off any evil they might intend to travellers who neglect them.

The Nilotic gods are not on the whole regarded as morally virtuous forces. When the gods produce effects conducive to human welfare – when they are held to bring fertility and abundance – they are considered 'good', but when they withhold the help they could give, and are associated therefore with death and misfortune, they are 'bad'. The division of the spiritual world into forces which are in themselves good or evil, such as is envisaged in the Christian dichotomy of God and the Devil, is foreign to Nilotic thought, though there is a tendency to appeal more to the benevolence of the higher and more powerful spiritual forces, and to attempt merely to propitiate the lower with offerings. Such lower powers are hence often referred to as 'greedy'. Most serious sicknesses are attributed to one or another spirit, and among the Nilotes, as amongst many other people, diviners are employed to decide, often through possession by spirits, which spirit is the source of a particular illness, why it is afflicting a man, and what it wants from him and his relatives.

There are also traces among several of the Nilotes of a kind of totemic belief, which is by far the most strongly developed among the Dinka. The members of each clan venerate and make offerings to one or another animal or vegetable species, or in some cases to other features of the natural environment, such as clouds, or to a particular type of human artefact. Here the chosen symbol – the totem – represents the whole spirit of clanship and the moral relationship between members of the same clan. The totem should therefore not be injured, its blood must not be shed, it should be 'respected' by gentle and amiable behaviour, and is regarded as the source of the vitality of the clan to which it belongs. It symbolizes the relationship between all clansmen living and dead, and when sacrifice and prayer are offered to it, the ancestors are called upon in association with it. Each clan has its own traditions of origin, and where totemic affiliations are pronounced these traditions include accounts of how the clan acquired its totem – perhaps better called its divinity. For example if a clan respects giraffe, it will have a tradition of some service performed by the giraffe to an ancestor, or it may be held that the animal totem was born as a twin with the founding ancestor of the clan. The extent to which the Nilotes could be said to worship ancestors varies from one authority to another, and from one Nilotic people to another. Perhaps the divinization of the ancestors occurs fully only with those of the Shilluk king, but all Nilotes may express strong feelings of piety toward their ancestors, making offerings to them at commemorative shrines which are in many cases at the place of burial, and attributing some misfortunes to their displeasure.

John Moss

Luo dancer in Kenya: beliefs in magic and witchcraft generally loom less large in the outlook of Nilotic peoples than in that of many other African groups

It is deeply and generally believed that the living can prosper only if they strive to maintain harmonious relations between themselves, the dead and the gods. Consequently all Nilotes seem to have a firm conviction that a man, and in some cases an animal, that has been wronged and has died without forgiving the injustice done to him will haunt those responsible for it. In all Nilotic languages this haunting is represented by some variant of the word *cyen* (pronounced chi-yen), and among many Nilotes it is regarded as a common cause of sickness and death in the living. Among the Anuak in particular, haunting by the dead who have died with bitterness in their hearts is regarded almost as a physical affliction, and seances are held to remove it, in which spiritual doctors act out a struggle to pluck the haunting spirit from the sufferer's body and cast it into the fire. Conversely, a belief in the power of other peoples' blessings to produce well-being, common to all Nilotic peoples, is very strongly marked among the Anuak; the nobles in particular often wear strings of amulets around their necks, each representing a particular blessing they have received. A belief in the force of human intentions as a source of good or evil is apparent here, as in the powers attributed to priests and rainmakers. But the theism of the Nilotes again appears here insofar as it is assumed that the power of human beings to influence either the natural world, or one another's fortunes, is contingent upon divine approval and permissiveness; whether or not in any particular case God or the gods are directly referred to as the prime cause of misfortune and suffering.

Personification of Malice

Beliefs in witchcraft, very subsidiary to the religious themes outlined above, represent a somewhat different aspect of human experience. The gods are associated with conditions of health and sickness, prosperity and misfortune, which potentially affect many individuals. Although smallpox or drought, for example, do cause individual suffering, they are not unique to any individual and evoke the idea of divine forces acting potentially on all human beings. Witchcraft on the other hand is suspected where misfortunes are felt by the sufferer to be directed quite specifically to himself, even though they may also rationally be recognized as part of the common lot. Thus for example many babies die young, but if a hitherto healthy baby suddenly wastes away and dies, the likelihood is that its parent will suspect someone of killing it by casting an evil eye upon it. If a young person considered handsome rapidly loses his health, perhaps contracting a skin disease which impairs his appearance, again the activity of a witch with the Evil Eye will be suspected. Where human envy and jealousy are suspected, in short, they are personified in the figure of the witch. Each individual therefore may on occasion try mentally to identify his own witch, whose attitude to him may be held to explain his particular misfortune at a particular time, while the gods and spirits act from outside the human personality and upon whole social groups. The witch can thus be seen as typifying the malicious intentions of individuals towards one another and in Nilotic fantasy there are still more malevolent 'night-witches', who work secretly and nocturnally against their victims and indeed deliberately subvert the moral code upon which harmonious social relations depend.

The strength of conviction behind these and other Nilotic beliefs naturally varies from individual to individual. The emphasis upon the Supreme Being of the sky, as distinct from his manifestations, may vary from tribe to tribe as well as from person to person. That central conception would seem to be far more dominant among the pastoral Nilotes, the Nuer and the Dinka, than among the rest, who while recognizing a transcendent divinity pay more attention in their rites to its more local and specialized manifestations. Nevertheless the Nilotes as a whole have a markedly spiritualized interpretation of the universe as being an outer expression of unseen and non-material powers.

NINE

A HUMAN CHILD is normally conceived, formed and born in nine months, a fact which has a good deal to do with the role of 9 in numerology. If your name adds to 9 (see ALPHABET), numerologists will tell you that you are a person of great gifts, with a strong bent towards serving your fellow men. You may well be a fighter for social causes, for the poor and unfortunate. Nine is the number of high mental and spiritual achievement, of inspired and inspiring people who have broad interests and wide sympathies. Generous and compassionate, they may often be imposed upon. People of narrower outlook will tend to condemn them as wild, unorthodox, impractical, rebellious, careless with money.

The 9s are passionate, romantic and emotional, attractive and affectionate. They love the limelight, loathe obscurity and resent criticism. They need to be loved and admired, and are easily flattered. Though genuinely concerned for people in the mass, they may be egotistical and conceited in dealing with individuals. High-minded and idealistic, they are not at all austere, far from it: they fall in and out of love with ease and frequency, they enjoy the good things of life, they relish beauty in the arts and in scenery. They hate ugliness, old age and poverty, for themselves and everyone else. They frequently have a difficult time in early life but succeed through determination and resourcefulness. Impressionable and intuitive, independent and quick-tempered, they are easily hurt and need to cultivate emotional stability. But the note which the numerologists sound most consistently is that of 9 as the number of the humanitarian.

This characteristic and many of the others follow from the human gestation period, with the roles of mother and child intermingled. Nine stands for love of mankind, the flesh and the world because it is the number of the child made flesh and born into the world. Early struggles and a dislike of obscurity come from the foetus in the womb. The characteristics of needing love and admiration, rebelliousness, lack of care for money, hasty temper, determination, being easily hurt, are drawn from small babies. Service to others, affection, compassion, are qualities drawn from mothers.

Another influence is the fact that 9 is the last and highest of the numbers from 1 to 9, and so it has the 'highest' characteristics. From this point of view, 10 is merely one repeated on a higher level, but medieval numerologists tended to call 9 the number which is 'all but perfect' or 'all but complete' because it falls short of 10: pointing out that Troy was besieged for nine years and fell in the tenth, that Odysseus wandered for nine years and reached home in the tenth.

Nine can also be seen as marking the transition from one scale (the numbers from 1 to 9) to a higher scale (starting with 10), and so it is the number of initiation, which again parallels the birth of a baby after nine months. This reinforces its character of being easily hurt and liable to injury, because initiations commonly involve ordeals and mutilations.

Generally, 9 is a number of completeness. It marks the end of gestation and the end of each series of numbers, 1 to 9, 10 to 19, and so on. A complete circle has 360 degrees, and $3 + 6 + 0 = 9$. Christ completed his life on earth and died at the ninth hour. Nine categories of people are called 'blessed' in the Sermon on the Mount (Matthew, chapter 5). It is again a circular and complete number because, if multiplied by any other number, it always reproduces itself ($3 \times 9 = 27$ and $2 + 7 = 9$, or $6 \times 9 = 54$ and $5 + 4 = 9$, and so on). This strengthens the egotism attributed to the number.

Like other numbers of completeness (notably 3 and 7), 9 is particularly powerful in magic. A magic circle should be nine feet in diameter. A way of bringing sorrow and misfortune to an enemy is to measure a corpse with a piece of rope, first from the elbow to the end of the longest finger, then from the shoulder to the same point, then from head to toe. Do this three times, making nine measurements altogether, and then measure the victim in the same way.

Why a cat has nine lives, nobody knows. A curious remedy for the itch is for a left-handed man to whirl a black cat round his head three times and then make an ointment from nine roasted barleycorns and nine drops of blood from the cat's tail. He must walk three times round the patient, invoking the Trinity, while the ointment is applied with a gold wedding ring.

NIRVANA

IN POPULAR USAGE the word nirvana means a state of blissful existence, a condition of agreeable inactivity. In this sense, a person living in a wonderful tropical paradise who obtains his food merely by stretching forth his hand and helping himself from the fruit-laden trees, or the opium addict in a state of heatific trance, might be said to be living in a state of nirvana. In the same way, the word is also sometimes used for a state of exaltation and ecstasy.

More correctly, nirvana is the term used to express one of the basic philosophical concepts of Buddhism and remains the chief goal of the Buddhist religion. Yet its precise meaning has not been acceptably defined, so that interpretations vary with the different schools of Buddhism.

Nirvana is also used, though less frequently, in Hinduism, usually in the sense of salvation or deliverance from the cycle of *samsara*, or birth-death-rebirth (see HINDUISM). Nirvana must therefore be distinguished from samsara, man's continuous reincarnations on earth in order to expiate and neutralize the effects of his evil deeds. The ultimate goal of those who strive for liberation is to achieve complete freedom from samsara, so that they might never have to return to earth (see KARMA).

But although nirvana and samsara are thus apparently diametrically opposed, there exists an enigmatic formula that states that nirvana *is* samsara, that liberation is involved in the process of rebirth. Reality, we are told, is the ever-becoming, and salvation can be obtained only by the mature interpretation of one's experience of bondage. It is the living within the fierce maelstrom of the human environment and yet rising above its turbulence. The secret of nirvana lies in this world and we must move within the changing to find the Changeless.

Nirvana is concerned principally with the problem of individuality and the final destiny of the personal human entity. Buddha himself was silent on the issue of what happens to the fully liberated soul when the body dies. The word nirvana literally means 'blowing out', or 'extinction', and in this context signifies the complete cessation of the individual personality after death, or the annihilation of self. If man does possess a soul it vanishes entirely, leaving not a trace behind. It is a condition of absolute nothingness, with no residue of life or consciousness hereafter.

This bleak concept, however, is denied by many Buddhists, who hold that nirvana does not imply a total extinction of self, nor the obliteration of consciousness, but rather a consciousness extended to infinity, or merged into the Supreme Consciousness without being completely lost in it.

In an earthly sense nirvana is the extinction of personality, the loss of all personal awareness. By continually eliminating wrong thinking and harmful desires a man withdraws the fuel on which the ego feeds, till its fierce flame is extinguished. Nirvana is here conceived as the state of non-existence of the 'I'. The ego dissolves, the mind dwells without thought, the senses without activity, the soul without knowledge.

William MacQuitty

Figure of Buddha as an ascetic, his body emaciated by the austerities of his search for enlightenment. Buddha never clearly defined the concept of Nirvana, which is the final goal of the Buddhist religion and has been interpreted in many different ways: the word literally means 'extinction' or 'blowing out'

The core of our troubled condition on earth lies in our individuality, and we nurture a yearning not only to assert ourselves, leading to a self-centred preoccupation with our personal welfare but, paradoxically, also to a deep yearning to obliterate this obsessive self. And the concept of nirvana provides one answer to our quest. When the flame of self is 'blown out', we pass into a state where, all passion spent, we merge with the passionless and transcendent ocean of *Tathata*, or 'Thatness', existence divorced from desire.

This craving for self-extinction may be found in other mystical systems besides Buddhism, for the painful and impermanent nature of 'character', 'personality', and the 'ego' are recognized by many religions as diminishing the value of the eternal inner spirit which is nothing but the Supreme Spirit immanent within us. Thus, nirvana may be likened to the experience of Christian saints known as the *unio mystica*, the final stage of an aspirant's progress when he joins in mystical union with God. But in the Christian experience it means an immersion in the totality of the divine spirit without loss of identity. In the spiritual progress of the Moslem Sufi, the final stage, called *fana*, is that of the passing away of the personality and the death of self, followed by a total absorption in God, or merging with God, where the mystic loses his identity in the divine essence (see SUFIS).

Nirvana again may be interpreted as a form of the privative, or the philosophical negative, the absence of what is ultimately present. It is the doctrine of emptiness or the void, in which all things are present. In its practical application it is expressed in the notions of silence, inactivity, passivity, in a rearranging of our priorities so as to put the illusive self in its proper place. The Chinese sage Lao Tzu taught the doctrine of *wu wei* or non-activity, which was an extension of the same idea. As an example he spoke of the clay bowl which, however beautifully moulded, depends for its usefulness only on that part of the bowl that is empty. 'By letting go', said Lao Tzu, 'all gets done. The world is won by those who let it go.'

A further stage in the gradual mellowing of the concept of nirvana is found in Japanese forms of Buddhism such as the Jodo (Pure Land) School, whose supreme deity is Amitabha, the Buddha of Boundless Light. As opposed to other schools who hold that gods are not necessary for man's redemptive progress, Jodo says that Amitabha's grace is sufficient for salvation; as opposed to the doctrine of annihilation it teaches the continuance of personal identity after death; as opposed to salvation through strenuous effort it preaches salvation through simple faith; and in place of the doctrine of salvation for the elect few, it preaches salvation for all (see AMIDA).

According to yet another school, nirvana is not a post-mortem condition but a state that can be experienced by the living soul while still on earth. It is the fruit of the traditional Buddhist way of life, the result of meditation or calm contemplation on the panorama of the world and a true understanding of its impermanence. The passions are all overcome, not by a face to face encounter but simply by ignoring their existence. It means the end of physical pain, mental anguish, and even spiritual yearning for the individual. In the words of the *Dhammapada*: 'Tranquil indeed is the mind, tranquil indeed the words and deeds of him who is thus tranquillised.'

(See also BUDDHISM; MYSTICISM.)

Farewell the World

Once, when I was sitting in a Soho Chinese restaurant, bombs began to crash down so close at hand that the whole building trembled. At that critical moment, my one prayer was: 'Heaven grant that the bomb doesn't strike until *after* the meal!' What a thought for a man probably about to die! There, if ever, was the time for putting into practice the instructions of my Tibetan Master: 'During the moments preceding death, concentrate with all your strength upon the Inner Light. Visualize the world as a sad, weary place full of hollow pleasures and real sorrows, a place you never desire to see again. Do this that the bonds of attachment may be sundered and a state nearer to *Nirvana* won.

John Blofeld *The Wheel of Life*

MAN, MYTH & MAGIC

VOLUME 8

NORTH AMERICAN INDIANS

The heroic 'Red Indian' has become the subject of a whole mythology in American and European literature

'The world of the American Indians was once a rather lonely but free place where humans were close to Nature and followed a natural system of belief'; the spirits of ancestors, and personifications of the forces of Nature were the basic units of their religion, and every natural object might have a spirit which could be contacted

THERE HAS BEEN so much of a romantic aura surrounding our conceptions of the heroic 'Red Indian' that he has become the subject of a whole mythology in European and American literature. So many of our dreams of the free wild life were projected on the American Indians that they have in a sense become part of our unconscious mind; and so deep was the impression that many of the famous 'guides' of Spiritualist seances have taken on the semblance of monosyllabic warriors of the Great Plains. This is not altogether surprising since our ancestors of the later Paleolithic period nearly 40,000 years ago were living a life very much like that of the earliest Red Indians. Yet we are not directly connected, it appears, for these ancestral groups, who entered North America in ancient times, appear to have been 'mongoloids', and not unlike their modern descendants.

Recent discoveries in the United States suggest that there were humans in North America in the last inter-glacial period. A few hearths and rough stone tools have been found, but no definitely associated human remains were present, so we are still unaware of their appearance in those early days.

Masks with moving parts, representing half-human, half-animal beings, were featured in the ceremonies of the Indians of the north-west coast, who believed that both animals and men had souls and that there was only a slight barrier between them: hinged masks of the Kwakiutl tribe; closed they represent a serpent *(top)* and a bird *(below)*, and when the flaps are opened a human face is revealed

They were probably few in number in any case. Later there came many journeys from Siberia into America. Geologists have shown that in the last glaciation there was an ice-free area just to the east of the Rocky Mountains. A few families hunting deer, bear, and so on, could have trekked from Siberia over the Bering Strait, then a strip

The Ghost Dance Ceremony

The dance commonly begins about the middle of the afternoon or later, after sundown . . . the leaders walk out to the dance place, and facing inward, join hands so as to form a small circle. Then, without moving from their places they sing the opening song . . . in a soft undertone. Having sung it through once they raise their voices to their full strength and repeat it, this time slowly circling around in the dance. . . . As the song rises and swells the people come singly and in groups from several tipis, and one after another joins the circle until any number from fifty to five hundred men, women, and children are in the dance . . . At intervals between the songs, more especially after the trances have begun, the dancers unclasp hands and sit down to smoke or talk for a few minutes. At such times the leaders sometimes deliver short addresses or sermons, or relate the recent trance experience of the dancer . . . Old people hobbling along with sticks, and little children hardly past the toddling period sometimes form a part of the circle, the more vigorous dancers accommodating the movement to their weakness. Frequently a woman will be seen to join the circle with an infant upon her back and dance with the others, but should she show the least sign of approaching excitement watchful friends lead her away that no harm may come to the child. Dogs are driven off from the neighbourhood of the circle lest they should run against any of those who have fallen into a trance and thus awaken them. The dancers themselves are careful not to disturb the trance subjects while their souls are in the spirit world. Full Indian dress is worn, with buckskin, paint and feathers . . .

James Mooney *The Ghost-Dance Religion* (1896)

of dry land about 156 miles wide.

Their route would have been simply that of the migrating animals going further southward over the dry, windy and intensely cold lands towards the pastures south of Canada, which was then just a frozen wilderness. There was no general migration of peoples, just a few families passing from time to time. They must have had good skin clothing and stone-bladed spears and darts with which to kill their game.

From those ancient times there appear to be no remaining legends. Yet from two parts of the Far North folktales have been recorded which describe mammoth-like creatures. A number of tales have been collected from Alaskan Eskimo sources in which a great tusked land animal is described. From Labrador come other tales of enormous tusked creatures which destroyed trees by leaning against them. It is quite possible that the Indians of Labrador had heard such tales from the Norse sailors who visited their coast seeking for timber from the 11th to the 15th centuries, and there is plenty of archeological evidence to show that the Norsemen were acquainted with the Indian elephant. However, the Alaskan Eskimo tales suggest that there is a possibility that ancient tales, retold through the generations, actually included memories of long-extinct mammoths.

However that may be, there came a period in which North America became isolated from the Old World, when the warming of the climate released vast quantities of water from melting ice and so flooded the plain which is now the Bering Strait. After that there may have been a few migrations of people by canoe, although the voyage from the Old World to America by sea was generally impossible until comparatively late times.

The nature of American Indian life was largely conditioned by the terrain occupied by each of the many hundreds of tribes which had developed from the early migrants. The way of life of primitive hunters of the Stone Age persisted into recent times in the wild lands around Tierra del Fuego, and in the immense forests of Brazil where even stone was scarce. Among the poor tribes of the Californian desert life also remained primitive, and they subsisted on whatever animals and plants they could find in their hunting grounds.

North American Indian religion was largely based on personifications of the sun, moon, wind, rain and other forces of Nature; of all these the sun was the most important and was regarded as the supreme deity by many tribes: Kiowa drawing illustrating the legend of a woman who climbed to the sky in an attempt to catch a porcupine that turned out to be the son of the sun. The lower half of the picture shows her falling to earth again

The whole way of life of American Indians was changed by the discovery of maize in northern Mexico in about 5000 BC. The grain took a long time to develop to the point where it became a staple food, but gradually the idea of agriculture spread from Mexico, as far south as the pampas of South America and as far north as the St Lawrence basin. Even the brave hunting peoples of the prairie grew crops of maize, beans and squash in the river valleys; and before they acquired the horse they lived more on the products of their fields than by hunting.

Weather Moons

The growth of agriculture brought with it a new development of science and religion. The farmer knows well enough when the crop is ripe for harvest, but the day for planting the seed has to be calculated with precision. The clue is to be found in the sky, in the passage of the sun through the stars of the zodiac which mark the passage of the year. The moon also is important, and the passage of the moons was noted by all American Indian peoples with great care. The moons were named according to the weather expected in the part of the year during which each was visible.

Aggression is characteristic of human beings, and there is a persistent tendency to make profit by seizing the valuable assets of other groups. The development of civilization in North America was continually hampered by the open nature of much of the country which permitted inter-tribal raiding and warfare to take place. The most peaceful regions were the desolate sea-hunting grounds of the Eskimo, the vast lonely forests in the north, and the mountains and deserts where the more primitive groups found some shelter from their more advanced predatory neighbours.

Every advance towards civilization was dependent upon the development of agriculture and the ability of the tribespeople to defend their livelihood. The greater centres of culture at the beginning of the Christian era, and perhaps a century or two earlier, lay in the middle Mississippi and Ohio river valleys. Here people made themselves towns of wooden and bark cabins around enormous earthen mounds which seem to have supported temples. The mound cultures of the Adena and Hopewell groups show a form of pottery and art which is roughly equivalent to that developed in European Neolithic settlements. Here for the first time are portraits of American Indians carved on tobacco pipes, and engraved on shells and copper plaques. The copper came from great boulders of natural pure metal found in the region of Lake Superior, and must have been obtained through trade with the tribes who lived near the deposits. There is no evidence of ability in smelting and casting metals, a process which seems to have been discovered far to the south in Panama.

What happened to these civilized Indian towns is not known. Maybe they were later disrupted by raids from the more primitive peoples of the plains. However, in the Pueblo area of the American south-west towns were built and survived. They started as agricultural villages in the river valleys but increasing drought made a concentration of people in the most fertile regions a necessity. The same cause brought several prairie tribes raiding the cultivated areas, so the local people built their stone and mud-block houses in caves and on the tops of the *mesas*, the high, rocky tableland of this region.

The most successful political organization of American Indians north of Mexico was that of the Iroquois who, in the 15th century formed a confederation of Six Nations. Their civilization was Neolithic and they lived in villages surrounded by fields and orchards, where they were organized well enough to fight off all other peoples until the white men came. Other civilized tribes, living in organized towns with a hierarchy of chiefs and officials, were found in the southern Alleghanies, and from northern Florida to the delta of the Mississippi.

They were all cultivators, living in wooden villages, and were usually at war with one another. There were so few natural boundaries in this area that it was not possible for any one tribe to remain unmolested and

To the American Indians the stars were lights in a world above the earth; some wise men said they were the camp fires of the tribes in the sky

advance in the arts of civilized life.

The development of a true civilization, though with the use of only stone tools, and no knowledge of wheels, occurred in Mexico. It began in the first millennium BC and after going through a series of periods of decline and revival it finally flourished under the military dictatorship of the Aztecs, whose capital city of Mexico housed nearly a million people at the beginning of the 16th century (see AZTECS; MEXICO).

A study of American Indian religion shows that its complexity developed in line with the development of civilization. The basic units were the spirits of ancestors and personifications of forces of Nature such as wind, rain, thunder, and sun and moon. Every natural object might have a spirit which could be contacted. There were greater powers of creation and destruction worshipped among such people as the Eskimo, who regarded a Great Mother who lived under the sea as a giver of life in addition to sun and moon.

With the Eskimo, as with all other tribes, there was the need for day-to-day aid from the spirits. The nature of coming events was revealed through ecstatic visionaries, generally known as medicine-men because of their special functions as faith-healers. The main worship of the great natural forces usually took the form of a tribal ceremony at the appropriate season of the year. There was a great deal of self-torture by young men seeking to ensure success in war through pain. Most of the ceremonies lasted for four or five days, and everywhere the tribes had sets of carefully prescribed dances and chants to dramatize the occasion.

All American Indian religions were deeply influenced by the passage of the seasons. It was a necessity for the hunting tribes to be aware of the migrations of the animals, buffalo or salmon; and if at least the moon in which the migration could be expected was known, there would be time to prepare traps and snares, and gather supplies of arrows and spears. As a result, the successful medicine-man was likely to be a good astronomer.

The stars were lights in a world above the earth. Some wise men said they were the camp fires of the tribes in the sky. The sky land was a wonderful place, it was always summer there, and the souls of men and animals lived together without need to hunt and kill one another. There the sun had his house and the moon, who was often thought to be the younger brother of the sun, went on his regular journeys. Some of the stars were identified with deities, and the planets were thought to be great divine beings who wandered through the heavenly fields eternally acting out the drama of their lives. In particular, Venus usually had a dual character, being evil as the evening star and a power for good as the morning star.

The Pawnee a century ago still remembered the last occasion on which they had sacrificed a girl to the morning star. It was an ancient ceremony performed infrequently in times of trouble when the aid of this star was required. Being a cultured people, they would not sacrifice one of their own tribe but sent out a special expedition to kidnap a girl from one of the surrounding tribes. Once the captive had been taken she was treated with every consideration, given fine clothes and good food, and was never told the fate which awaited her. When the time came she was led out to a frame in the open air. Stripped

naked, and painted half black and half red, she was tied to the framework. Then the young men danced and shot arrows at her. She was killed quite quickly and it was thought that her spirit would go to the morning star and intercede for the people. It was because they needed her help in this way that they had treated her well during the days of captivity.

Almost every tribe paid reverence to the morning star because this brilliant planet which heralded the sunrise was thought to have something miraculous and fortunate about it.

Old Woman's Grandson

From the Dakota come many star legends, and here the red star Aldebaran, one of the brightest in the heavens, took on a heroic aspect. This young star was the child of the sun and the lady Blue Star. One day he saw approaching him a white buffalo calf (the Pleiades) and wanted to hunt it. He looked around to find a sapling to make a spear, and pulled one up. He opened a hole in the sky world and looked down on the prairies and saw the Indians hunting game. The buffalo calf came near and charged so that he tumbled through the hole in the sky and fell to earth. There he was found by a poor old woman who was gathering firewood. She took him back to her home where she treated him well. People called him Old Woman's Grandson.

On earth he killed many strange monsters which had been troubling the Indians. He stopped the clashing rocks which killed everyone who travelled along the trail which led between them, by sending his dog to dash through the opening, after a huge bonfire had been lit on top of one of the peaks. The stone began to melt, and as the rocks tried to crush the dog they stuck together; they are now a natural rock arch through which people can pass in safety.

Then there was a terrible drought, and Old Woman's Grandson discovered that a great serpent had come up onto the land and was drinking all the rivers. He took his firesticks with him in a canoe, and was duly swallowed by the monster. He then made a fire and burned up its heart. When it was dead he cut his way out through the carcass, and released a great stream of water which became the Mississippi.

He saw the white buffalo calf again and knew that he must hunt it once more and follow his destiny. So they ran across the prairie and came to the edge of the sky where they chased onwards and at last returned home in peace. Old Woman's Grandson was once more in his starry home and was greatly honoured because he had helped the Indians to live without fear.

The earth itself was thought to be a great turtle floating in the endless ocean. Some tribes believed it had been brought to the surface directly by the gods, others thought that diving ducks had brought earth from beneath the sea and piled it on the back of the great turtle, until a mountain was made from which earth spread to make the plains and valleys.

Special animals and birds were reared as sacrificial offerings and messengers to the gods. The Pueblo sacrifice of tame eagles once a year is a case in point. All tribes south of the Great Lakes cultivated tobacco, and it was regarded as a way of making contact with the Power Above, who white men call the Great Spirit. The smoke of the tobacco went upwards bearing prayers and wishes from people on earth, but the American Indian developed no tobacco habit. It was used at conferences to bring about a state of peaceful intent so that discussions could be started without anger. Thus it was used in the pipe-of-peace to symbolize the quiet friendship which would replace war.

In the south-eastern United States there was a charming legend of the origin of tobacco. A young man and his beloved were walking one summer, naked except for their moccasins as was usual in warm weather. They found a patch of scented grass and lay down together. Each was beautiful, and admiring each other they joined together in sexual partnership. It was so beautiful an experience that they remembered it and at the same time the following year they returned to seek the place where such happiness was found. There they found a strange plant growing with beautiful scented flowers. It was the first tobacco plant, the bringer of peaceful happiness. Hence for all future people tobacco was to be a holy plant and the bringer of peace.

Hallucinatory drugs were but rarely used among the North American Indians. Only in the 19th century was the mild narcotic, peyote (see PEYOTE CULTS), introduced from Mexico. It became an important source of visions in the Ghost Dance cult (see GHOST DANCE) but it seems that the expectation of the dreams was more important than any narcotic contained in the peyote. Much more important in rituals were the emetics which cleared the stomachs of those seeking visions, before which the whole person had to be emptied and cleansed. Many quite ordinary people participated in the great ceremonies, at least at the beginning of the year, and danced and took the magical drinks. They chose to take part because of a personal need of enlightenment from the powers above.

Women might occasionally come as assistants to the religious ceremonies, but they usually did not take part actively in the ritual. It was not for them, they thought, to participate in the sky ceremonies. Within themselves they held the powers of the Earth Mother who gave them the blessing of motherhood, and the magic which brought peace to their menfolk. When they painted themselves it was more for beauty, than for the symbolism in which their more brilliantly painted husbands gloried.

Because of the wide differences in cultural needs, a considerable variation in religious beliefs may be observed among the pre-Columbian groups of Indians. On the whole this is most closely represented in the creation myths. The more primitive groups generally regarded the first ancestors as having been created by the Power Above, sometimes by direct bringing into being; but in other myths they were thought of as having been carved or modelled by divine powers and given life by a special god who might be an adversary of the Great Creator.

Among some peoples several different explanations were given of the origins of the ancestors. In general the more advanced agricultural peoples developed a religion which saw their forefathers as emerging from a prehuman animal condition. These legends usually tell of an emergence in stages from one land beneath the earth to another, ever ascending towards more perfect humanity and the light of the sun. The Pueblo and Navaho Indians believed their homeland to have been the first created place, where they had always existed.

Most of the tribes had a belief that mankind had once been threatened by a terrible flood. Whether this is a folk-tradition from

Hamlyn Group Library/British Museum

the days when the ice sheets were melting is not clear, but it seems to have been current among many tribes before they came into contact with Europeans, though later the legend was slightly altered to suit the book of Genesis and the story of Noah. The Mandan of the upper Missouri preserved a ring of planks which they believed to be relics of the Great Canoe in which their ancestors gathered on a hill top, just before the encroaching waters were stayed and then began to recede.

Sacred Houses

All American Indians had faith in charms and amulets, which were revealed in visions. The dreamer would find a similar object in his waking life and keep it in his personal medicine bag. Some objects were so sacred that they were kept in tribal medicine bundles which were passed from hand to hand over the centuries. It was the spirit and the symbol, not the object, which had power for the Indians.

After the 16th century the Plains tribes, who became dependent more on their hunting ability than on the gardens tended by their womenfolk, were obsessed with rituals of hunting and war. The young men were organized into religious confraternities which, by means of prayer, self-torture and dramatic representational dance, encouraged the guardian spirits to bring the tribe abundance of food, and victory in adversity. The leaders were elderly chiefs who knew the proper ritual for every occasion in all its complex detail. The young initiates wandered naked and alone in the prairie, fasting until they were given visions in which they saw their future spirit protectors. These directed them into ways of life which, in effect, determined which magic society they should join.

The rituals of these hunting tribes were more public, and more of a mass festival, than those of the agricultural people who tended to hold their principal ceremonies within a sacred house where they were visible to initiates only. Among the Pueblos the rituals were performed in circular underground chambers called *kivas*, which were decorated with paintings of the gods concerned in the ceremonies. Among the Iroquois the meetings were held in long houses of elm bark which were reserved for the tribal elders.

Such segregation of ritual from the mass of the tribe was bound to lead eventually to the growth of religious orders, in which a priesthood of men dedicated to certain deities was developed. The temple with its subsidiary buildings and priest-houses, which was the end product of this development, was only fully developed in Mexico. Among the northern Indians, such people as the Natchez of the lower Mississippi valley developed a structured society in which the highest class was of chiefs and priests who were called 'suns'. They led the nation in war and directed all tribal activities. The priests were specialists within the upper social group, and tended the temples, performed ceremonies including sacrificial offerings to the gods, and made deities in wood and clay.

Somewhat similar but less highly organized cultures flourished among the Creek, Cherokee and Choctaw Indians of the hill country of the south-eastern United States. They lived in villages built along trackways which joined one town with another. These tribes were advanced in a Neolithic phase of culture, having well-organized plantations of maize, beans, pepper and squash. There were sufficient deer and wild pigs to give some meat in their diet, and fishing was abundant in the many rivers of their country. They had to resist forays from their neighbours and even from the more distant tribes of the prairies, some of whom, like the Pawnee, were related to them. They built temples on mounds, and their gods were served by specialist priests. The passage of the year was marked by a regular series of ceremonies which were expected to bring blessings from the powers of sky and earth.

Everywhere the sun was the most important visible entity, and the moon a changeable secondary power. The earth and her fruits were holy and offerings were made. On the whole, rituals for the sun and sky spirits involved self-inflicted pain, and earth ceremonials involved sexual rituals which included public intercourse by chosen young people. In such ceremonies there was no idea of decency or indecency; the action was holy and part of the world of Nature through which came all the gifts from the gods to their human supporters.

A quite distinct culture in North America was centred on the North Pacific coast where

Most tribes believed that spirit protectors in the form of animals could be acquired by young men through fasting and self-torture

Hanman Museum

a high degree of comfortable village life was achieved without the practice of agriculture. The reason for this unusual state of affairs was that abundant supplies of sea food and wild berries made it possible for people to settle in permanent villages. They carved wooden utensils, built houses and dug canoes out of the great trunks of Douglas fir trees. There was a strong belief in the relationship between human and animal relatives, and tales concerning these were told in the form of ceremonial plays during the winter nights. The idea of the totem (see TOTEM) was more important in this region than in any other part of North America.

Most tribes believed that spirit protectors in the form of animals could be acquired by young men through fasting and self-torture. Such animal-souls occasionally took possession of a skin carried by the owner, and acted as oracles ever ready to help with advice and even a little magic. In some ways they may be compared to the familiars that were said to help European witches.

There was much variation in language and costume in the widely scattered tribes. There were some 700 languages, which were divided into slightly more than 20 linguistic groups, some of them as different in type as are Latin and Mandarin Chinese. Communication between tribes was often conducted in sign language which became a regular inter-tribal code of signals in areas like the Great Plains. Some peoples used picture writing and sometimes symbolic objects such as strings of wampum beads to convey history and information. But it was not until the early 19th century, under European influence, that the first truly American Indian alphabet was invented, adapted to suit the Cherokee language.

Clothing was also influenced by the European settlers, and pictures of the 19th century show that the skin gowns of the squaws on the prairie reflected something of European fashion. But none of the American Indians felt clothing to be a necessity. Rather it was a way of marking social status, and a means of proclaiming individual importance.

Among the Eskimo, clothing was tailored from warm skins, but indoors they generally stripped naked. The women of the prairie had wrap-around skirts and sometimes long gowns held at the sides by a girdle, while men wore a loin cloth. Both sexes had skin blankets to keep them warm when sitting down in the colder weather. In warm weather men and women might go naked in the camp without any comment. Among the Pueblo Indians there was a somewhat similar situation, though girls were presented with a blanket woven by their husbands when they married, and continued to wear such a garment from then on. They went naked before marriage. In early times all tribes wore sandals, but moccasins and short boots were evolved later.

The American Indians of today, although often treated with grave injustice, have tended to become assimilated into the surrounding way of life, although on ceremonial occasions many of them don what they consider to be traditional costumes, and perform dances of ancient origin. Even the Eskimo have adopted framed wooden double-walled houses and motor boats as standard tools of living.

In the reservations Indians try to combine modern necessity with old custom, and many have become indistinguishable from poor whites. They are probably as numerous as they were in ancient times, though many tribes became totally extinct as a result of the bitter wars of the 17th to the late 19th centuries. Even the old locations of the tribes have been disrupted because of the wholesale deportations which characterized the occupation of the prairies by farming communities. But in ancient times the population of North America was small and scattered, and even the Iroquois who occupied nearly all of what is now New York State numbered only about 20,000 persons.

The world of the American Indians was once a rather lonely but free place where humans were close to Nature and followed a natural system of belief. The wars and raids, which became so terrible when horses and arms were obtained from the European settlers, were on a fairly small scale in earlier days, and it is possible that the toll of human sacrifice was almost equal to that of war. But it must be remembered that the primitive life of even the civilized tribes was hard and often unhealthy. Their condition must be equated with that of the various tribes of western Europe from 10,000 to 1,000 BC.

The Earl of Bothwell, cousin of James VI of Scotland, has been suspected of using witchcraft in his attempts to gain the Scottish throne; certainly the witches accused in the North Berwick trials confessed to attempting to kill the King by magic at the behest of the 'Devil'

NORTH BERWICK WITCHES

THE CELEBRATED CASE of the North Berwick witches, with its mixture of politics, high treason, and sorcery, is one of the most interesting in the annals of Scottish witchcraft. According to *News from Scotland*, a contemporary pamphlet published in 1591, the existence of these witches was discovered when David Seaton, the Deputy Bailiff of the town of Trenent, noticed that his maidservant, Gilly (or Geillis) Duncan, was behaving rather oddly.

She had taken to absenting herself from his house at night without permission asked or explanation given, and she had, quite suddenly, acquired a local reputation for healing the sick. When Seaton questioned her about these alleged cures, she refused to answer, and he, suspecting witchcraft, resorted to torture. The author of *News from Scotland* says that, with the help of some others, he used 'the pilliwinks upon her fingers, which is a grievous torture; and binding and wrenching her head with a cord, or rope, which is a most cruel torment also; yet would she not confess anything.' It was not until she had been searched for the Devil's Mark, and something supposed to be that mark had been found upon her throat, that she broke down and acknowledged that she was a witch, and that all her cures were the result of diabolically-inspired magic.

After she had made this confession, Gilly Duncan was committed to prison, and there she named and accused a number of other people. David Seaton must surely have been astonished and horrified by the results of his more or less private examination of a maidservant in his own home, as slowly there came to light, not only the practice of dark magic by bands of local witches, but, more serious still, a murderous plot against the life of James VI.

The instigator of this plot was said to be Francis Hepburn, Earl of Bothwell, who was the King's cousin and had some claim to the throne of Scotland should James die without an heir. He was also suspected of being the 'Devil' of the covens concerned, and of having been present, in ritual disguise, at their meetings.

It is quite possible that both these accusations were true. He and the King were at constant enmity with each other. James's early death, while he was still childless, might have put supreme power within Bothwell's grasp, and he was reputed to be deeply interested in occultism and magic. He may in fact have attempted to clear his way to the throne with the help of the North Berwick witches, as some of the evidence given in the trials that followed suggests. If he did, he escaped the worst consequences of his guilt, although he was eventually forced to fly from Scotland and take refuge in Italy, from which country he never returned. While he lived there, he seems to have continued to dabble in various forms of sorcery. In his *Relation of a Journey* (1623), George Sandys makes the interesting statement that when he was travelling in Calabria in 1610, a man whom he met 'would needs persuade me that I had insight in magic; for that Earl Bothel was my countryman, who lives at Naples, and is in these parts famous for suspected necromancy.'

Of those named by Gilly Duncan, only four were brought to trial. They were Dr John Fian (or Conningham), a young schoolmaster in Saltpans; Euphemia Maclean, Lord Cliftonhall's daughter; Barbara Napier, the only one of the four whose life was spared; and Agnes Sampson, a midwife of Keith, well known in her own district as a wisewoman and healer of the sick.

John Fian appears to have been one of the officers of the North Berwick organization, being, as he acknowledged in his confession, 'clerk to all those that were in subjection to the Devil's service.' He kept a list of their names, took their oaths, and 'wrote for them such matters as the Devil still pleased to command him.' It was stated in evidence that he was always present at the meetings and stood nearest to the Devil, 'at his left elbow'; at the great gathering on All Hallows Eve, 1590, he was the leader of the dance, for which Gilly Duncan provided the music, playing upon a Jew's harp.

When Fian was first examined, he denied all the charges brought against him, but after being horribly tortured, he confessed, and signed his confession in the presence of King James. He is said to have implicated Bothwell directly in some of his admissions, and afterwards to have bitterly regretted having done so, but this cannot now be proved because the original document has been lost. That night he was left alone in his cell to recover from the effects of the torture. According to *News from Scotland*, he had sincerely repented of his past evil life and was anxious to make his peace with God. Next morning, he told his jailers that the Devil had come to him during the hours of darkness, dressed all in black and carrying a white wand in his hand, and had demanded that he should renew his former vows of service. Fian refused, declaring that he had listened to him too much already, and was now utterly undone in consequence. The Devil replied, 'Once ere thou die, thou shalt be mine', and so saying, he broke his white wand, and vanished.

This is an odd tale, of which, at first sight, the most likely explanation seems to be a nightmare, or delirium caused by the dreadful treatment he had received. Dr

The deeds of the North Berwick witches, from *News from Scotland*, a contemporary pamphlet published in 1591: Dr John Fian, clerk of the coven, takes down the words of the 'Devil', possibly the Earl of Bothwell in disguise, who is preaching from a pulpit; the illustration also shows a boat sunk in a storm called up by the witches, and members of the coven drinking wine in a cellar

Margaret Murray, however, in *The Witch-Cult in Western Europe* (1921), suggests that the visitor was real and human, either Bothwell himself, or one of his messengers, and that he came to make arrangements for Fian's escape. It is a fact that, after another day of solitary confinement, he did escape, but instead of going into hiding, he went quietly back to his house at Saltpans, and there remained until, inevitably, he was recaptured.

But by then he was a changed man. Somehow, in that brief interval, he had gained a new and unshakable courage. He denied all that he had confessed before, declaring that his first confession was altogether false, and had been wrung from him only by the fear of pain. He was tortured again most brutally in the hope of breaking down his resistance, but in spite of this he refused to answer any further questions, or to say anything more.

The King, amazed, like everyone else who saw it, at this sudden stiffening of one who had so recently been utterly broken and defeated, came to the conclusion that Fian had seen and been strengthened by the Devil while he was at Saltpans; and perhaps he had, if Bothwell was really the 'Devil' of the North Berwick witches. Whatever the cause, Fian's resolution held, and he died, still silent, in January 1591, being first strangled and then burnt on the Castle Hill in Edinburgh.

Calling Up a Storm

Agnes Sampson was a witness of a totally different kind. It is true that, like Fian, she confessed nothing until she had been brought low by torture, but then she spoke freely, being, as we are told in one account, 'grave and settled in her answers, which were all to some purpose.' She acknowledged that she and certain named companions had conspired against the King's life on more than one occasion. When he was in Denmark and about to return from there with his newly-made wife, she was present at a meeting specially convened for the purpose of raising a great storm at sea, whereby the royal ships might be destroyed. The method employed for this was to christen a cat, pass it three times through the links of the chimney-crook and three times under the chimney, and then bind on to its four feet 'the chiefest part of a dead man and several joints of his body.' When this horrible ceremony had been duly performed, the poor creature was carried to the pier at Leith, and hurled into the sea, as far as the witches could throw it. A storm sprang up immediately, and a boat then coming from Kinghorne to Leith was sunk; but the spell was apparently not strong enough to sink the King's ship which, though much troubled by contrary winds and bad weather, came safely back to Scotland.

The venom of a toad, mixed with other poisons, was tried also. A black toad was hung up by its feet for three days, and its venom carefully collected as it dropped into an oyster shell. Poisons being added, the concoction was kept until a piece of old linen which had once been worn or used by the King could be obtained. Upon this it was proposed to smear the venom and so poison the victim through the medium of the cloth that had once been in contact with his body. The plan failed because John Kers, one of James's servants, of whom Agnes had begged such a fragment, wisely refused to give it. Had he done so, she said, she could have killed the King with extraordinary pains, 'as if he had been lying upon sharp thorns and ends of needles.'

The witches then resorted to the age-old practice of image-magic. Agnes Sampson told her examiners in Holyrood Palace that she had been instructed by the Devil to make a wax image of the King. This she did, and brought it, wrapped in a linen cloth, to a secret meeting held by night at Prestonpans. This was a gathering of the chosen few, those nearest to the core of the conspiracy; only nine other witches were present beside herself, and 'the Devil, their master . . . standing in the midst of them.' She offered him the image for his inspection, and when he had approved it, he returned it to her. It was then passed from hand to hand round the company, each person saying in turn: 'This is King James the Sixth, ordained to be consumed, at the instance of a noble man, Francis Earl Bothwell.' If John Fian had been deeply troubled by the fear that he might have implicated his master in his confession, it seems evident that Agnes Sampson had no such scruples.

From her, and later from Euphemia Maclean and Barbara Napier, the interrogators heard accounts of the great assembly at North Berwick Church on All Hallows Eve. Witches commonly met in the open air, often by standing-stones or on some other traditional site, but in winter they sometimes met in houses or, if the gathering was a large one, in the local church. Their enemies regarded this use of a sacred building as a form of deliberate blasphemy, but it is quite possible that one reason for the choice was simple convenience, since churches are large, not infrequently some way from the houses of the village, and empty at night.

A considerable number of witches were present at this meeting, seven score according to Barbara Napier, 200 according to Agnes Sampson. They came by sea, making merry on the way with flagons of wine. They danced round the churchyard to Gilly Duncan's music, singing as they went:

> Cummer, go ye before; Cummer, go ye;
> If ye will not go before, cummer, let me.

When King James heard this, he sent for Gilly Duncan, and made her play the dance tune for him upon a trump similar to the one she had used at North Berwick.

Under God's Protection

The Devil presided over the gathering in the form of a man wearing a black gown and a black hat. He may have worn a mask also, for his face is said to have been terrible, with great burning eyes and a nose like the beak of an eagle. His hands were hairy and had claws on them, and his feet were like those of a griffin, all of which suggests that he was ritually disguised. Barbara Napier said that he was bearded like a goat, and had a long tail. All made their homage to him, coming and going, saluting him on departure with the posterior kiss. Inside the church, he stood in the pulpit, with black candles burning round him, and called the roll, each person answering to his or her name with 'Here, master!'.

He preached to his followers concerning the obedience they owed him and the evil they ought constantly to do; more particularly, he urged them to work evil upon King James, who was the greatest enemy he had in the world. He enquired what success had been achieved by the melting of the waxen image Agnes Sampson had made, and when an old ploughman named Gray-Meill tactlessly remarked that 'Nothing ailed the King yet, God be thanked', he struck him a fierce blow with his clawed hand. When some of the

witches asked how it was that all their magic had so far failed against the King, though it had not against others, the Devil rather curiously replied that it was because James was a man of God.

To all this, and much else that was marvellous and improbable, the King listened until, suddenly losing patience, he declared that the confessing witches were 'all extreme liars'. Then followed one of the most extraordinary incidents in this very odd case. Agnes Sampson said she did not wish him to think that her words were false, and to convince him of their truth, she would tell him something that he could not doubt. And drawing him a little aside, she whispered to him the words that had passed between him and his bride, Anne of Denmark, when they were alone together on their wedding-night in Oslo.

No one knows why she did this. His incredulity must have seemed like a door opening on the hope of pardon and release, and that door she deliberately closed upon herself and her fellow-prisoners. She was, as far as we know, quite sane, nor does she appear to have been one of those hysterical individuals who will confess to anything, however dangerous, rather than lose importance. The startled King acknowledged that what she told him was quite true, and that she could not have known it by any normal means. 'All the devils in Hell,' he said, 'could not have discovered the same'; nor is it clear, even now, how she came by her secret knowledge.

The effect of the disclosure was, of course, fatal. James, forced to accept one part of her confession, was now ready to accept the rest. She was convicted and, in due course, executed on Castle Hill, and so, some time later, was Euphemia Maclean. Barbara Napier was condemned also, but was eventually released. With the subsequent flight of Lord Bothwell, the North Berwick case ended, for though many others were involved, and their names were known to the authorities, none was brought to trial thereafter.

Nose

Because of its role in breathing, and the essential connection with breath and life, the nose may be guarded by an amulet or ring, to prevent evil spirits from entering the body; unpleasant smells assailing the nose are widely thought of as evil spirits: sneezing, as an expulsion of the life-breath, has frequently been regarded as dangerous and ominous.

NOSTRADAMUS

ASTROLOGER AND PHYSICIAN, Nostradamus (Michel de Nostradame) was born at St Remy in Provence in 1503. Although he achieved renown during his lifetime – he became the adviser and confidant of Catherine de Medicis, who had a weakness for the occult – his perennial fame is due to the extraordinary collection of rhymed prophecies that are associated with his name.

The first of countless editions was published in 1555. A more complete version consisting of 1000 quatrains, or four-line verses, divided into ten *Centuries* (books) appeared in 1558 two years after his death.

Every Nostradamus quatrain represents an individual prophecy. They are not presented in any obvious chronological order and each must be interpreted individually. The Nostradamus enthusiast can try to identify prophecies that have already been fulfilled, or he can attempt to formulate a clear, as opposed to a veiled, prophetic statement on the basis of any given quatrain. Every successive generation discovers something that appears to be significant, and surprising coincidences have been recorded.

A fascinating interpretation, published in 1921 by C. Loog, a Berlin postal official, appears to have predicted the outbreak of the Second World War in 1939. This example illustrates a completely typical interpretative phenomenon. Loog was obviously familiar with two well-known Nostradamus manuals: Le Pelletier's *Les Oracles de Michel de Nostradamus* (Paris, 1867) and the Abbé Charles Nicoullaud's *Nostradamus, ses prophéties* (Paris, 1914). The quatrain in question is No 57 in the 3rd book. Translated into English, it reads:

> Seven times you shall see the English to change,
> Dyed in blood, in two hundred ninety year,
> Not France, by the German support,
> Aries doubteth his Bastarnan pole.

To 'interpret' most of the quatrains it is necessary to identify the period or, even

Nostradamus enthusiasts believe that each of his four-line verses contains an individual prophecy, and he is credited with foretelling the outbreak of the Second World War: imaginary portrait of Nostradamus

Bibliothèque Nationale/Stark International

better, the year to which they might conceivably refer. Nicoullaud proposed that the first two lines implied that during a period of 290 years Britain would experience seven changes of dynasty. But 290 years from when? Nicoullaud thought of 1603, when James I came to the throne, making the year in question 1893. But nothing of any importance happened in that year. So he began again with 1649, when Charles I was executed. This gave him 1939, the date of the start of the Second World War, as the year that would be 'dyed (or tinged) in blood'; the expression was certainly an appropriate one.

Loog, following Nicoullaud's example, based his calculations on the year 1649, and interpreted the quatrain as follows: 'In 1939 there will be the last noteworthy change of dynasty in Britain. "Aries (zodiacal sign) will clearly have doubts about his protectorate Bastarnien." In the era of Tacitus the German tribe of the Bastarnae was on the other side of the River Vistula, hence in "Poland". Aries, the first sign of the zodiac, rules the East. Nostradamus therefore clearly indicates that in 1939 there will be a critical state of affairs in the revived State of Poland hand in hand with Britain's last and greatest crisis.'

Nicoullaud did not equate *Bastarnan* with Poland but with something completely different. Indeed, it was Le Pelletier who provided the Polish indication, but in a completely different context. Loog took his interpretative elements from both Le Pelletier and Nicoullaud and arrived at speculative, although eventually strangely accurate, conclusions that owed something to each of these two writers.

Loog's interpretation was published in 1921. In the autumn of 1939, 18 years later, a number of people more or less simultaneously told Dr Goebbels, the Nazi Propaganda Minister, about it. This led to the German interest in faked Nostradamus prophecies for psychological warfare during the Second World War. It also led to the employment in Berlin of Karl Ernst Krafft (1900–45), a Swiss astrologer who was a great Nostradamus enthusiast and who had studied his works for years on end. Krafft himself never consciously tampered with the quatrains, and all the 'dirty work' was done by the Propaganda Ministry.

There are a number of well-known prophecies that appear to refer to Napoleon. For instance, there is quatrain No 60 in the 1st book:

> An emperor shall be born near Italy,
> Who shall cost dear to the Empire,
> They shall say, with what people he keepeth company!
> He shall be found less a prince than a butcher.

Another quatrain begins: 'From (being) a simple soldier he will come to (achieve or rule) an Empire'. Before 1933 most contemporary Nostradamus pundits supposed that the 'simple soldier' must mean Napoleon, but there were soon some who thought it could equally well be Hitler, who was a mere corporal in 1918 and less than 20 years later was the virtual 'ruler' of Germany.

During the spring of 1940 Krafft delivered a short course of lectures on Nostradamus in Berlin. His rendering of the following quatrain, No 100 in the 2nd book, shows how a prevailing mood or hopes can colour an interpretation:

> In the islands shall be so horrid tumults,
> That nothing shall be heard but a warlike surprise,
> So great shall be the insult of the robbers,
> That every one shall shelter himself under the great league.

For Krafft 'the islands' meant the British Isles, and 'robbers' were the dastardly British who rob and pillage. The 'tumult' in Britain would be horrible, worse than anyone could imagine. The reference to war was construed to mean total war, involving the whole population. The last two lines were supposed to explain that the injuries that the British robbers inflicted upon other nations would be so great that Europe would range herself against Britain to put an end to her predatory acts.

Generation after generation of Nostradamus enthusiasts have supposed that the quatrains, no matter how obscure their contents, must be regarded as genuine prophetic messages.

It is conceivable, however, that Nostradamus composed them with tongue in cheek, and that he was well aware that there is an enduring market for prophecies and particularly for veiled ones.

ELLIC HOWE

NUDITY

THERE IS NOTHING outrageous or shocking about naked bodies seen dimly through the mists of a Turkish bath, precisely because this is where one expects to see them. In the theatre, on the other hand, where nudity is a reversal of the customary or conventional order of things, the incongruity of a naked cast on a normal theatre stage can still create a sensation. The same basic idea of incongruity underlies the use of nudity in myth and magic.

In the Trichinopoly district of southern India, wrote an English observer in 1912, 'when the tanks and rivers threaten to breach their banks, men stand naked on the embankment and beat their drums; and if too much rain falls, naked men point firebrands at the sky. Their nudity is supposed to shock the powers that bring rain, and arrest their further progress.' Another investigator of Indian customs, writing in 1919, reports that 'high caste women or girls in times of drought are in the habit of divesting themselves of clothing at night

Staatsbibliothek, Berlin

A group of German Adamites, heretics who went naked in an attempt to recapture the lost perfection of humanity in the garden of Eden, before the Fall and before Adam and Eve had felt shame at being naked. Adamites have been discovered and persecuted at various times in Christian history and some are reputed to have survived into this century in Russia

and dragging a plough through the fields.' The men are excluded altogether from this ritual, which is performed in the hope that Indra, or some other rain god, will be moved to pity by such an unusual performance.

The harnessing of naked women to the plough is probably linked with the sexual connotations of ploughing, though this may have been forgotten in the Indian ritual. That this is a very primitive rite is shown by the fact that the same custom is found far away from India, in different contexts. As late as July 1905, a case was recorded of peasant girls in Russia, clothed only in their shifts, warding off cholera from their village by dragging a plough round it at midnight. It is also reported that Russian peasants used at one time to punish adulteresses by yoking them naked to the plough.

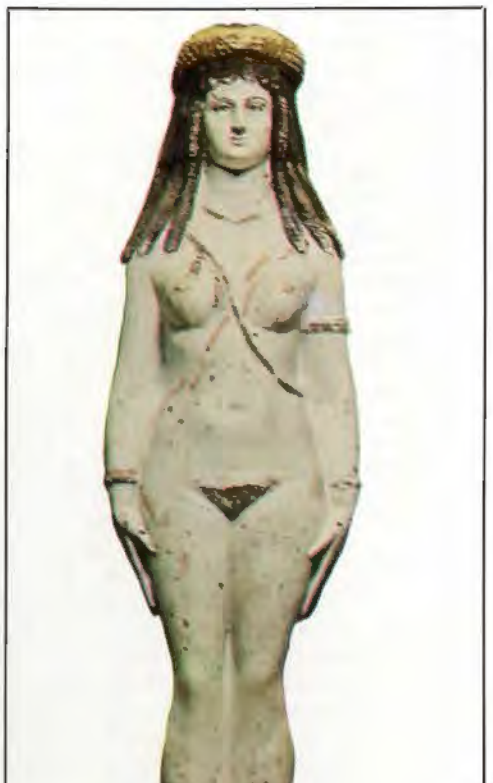
Nudity confers magic powers over the forces of Nature, not only through its incongruity but through the supposed power of the sexual organs to ward off evil. This power is derived from the reproductive functions of these organs, which cause them to be widely regarded as enemies of sterility, death and disease. The remedy against cholera was probably applied at an earlier epoch by completely naked girls.

Considering that the efficacy of nudity in magic comes from the contrast it provides to convention, it is not surprising that in the matter of disease there is the complementary idea of associating nudity with its causation. When the plague broke out in the German town of Schassburg in the early 18th century, it was believed that the signal of the arrival of the disease in quarters of the town hitherto unaffected would be the appearance of a naked maiden. This contrasts with an ancient Roman cure for abscesses recorded by Pliny, in which a naked maiden administered a salve made of seven ingredients with the magic words: 'Apollo says the contagion will not spread where a naked virgin has wiped it out.'

One of the earliest ritual uses of nudity, which may also be linked with its frequent association with rain-making, is in cures for sterility. In Bombay, women desiring to have children go to the temple of Hanuman, the monkey god, strip naked and embrace the god's image. Elsewhere in India, women who suppose themselves sterile walk 108 times round a sacred fig-tree in the nude, winding a cotton thread round the trunk.

Naked at Divine Service

With the passage of time, however, the original significance of nudity in a particular ritual may be forgotten, or confused with some other belief or custom. This seems to have happened with the English legend of Lady Godiva (see GODIVA). The earliest version of this is to be found in Roger of Wendover's *Flowers of History*, written at the beginning of the 13th century. According to Roger, the Countess Godiva rode naked from one end of the town of Coventry to the other, in order to satisfy the conditions laid down by her husband, Leofric, Earl of Mercia, who had promised to free the people of Coventry from the oppression of a heavy toll if she did this.



Michael Holford/British Museum

Nicosea Museum/Sonia Halliday/F.H.C. Birch

Michael Holford

Stories with the same basic motif of a royal, divine or magic favour granted to a princess who makes a public appearance in the nude are told in India, Mongolia and Persia. In many of these, as in later versions of the legend of Lady Godiva, a male witness appears (Peeping Tom in the Coventry story), with disastrous consequences either to himself or to others. That his crime is a serious one is shown by its punishment – blinding – which is symbolic of castration, and reserved for serious sexual offences.

We are here moving away from the strictly magical uses of nudity to its significance in sacred rites. Naked priests, priestesses and prophets feature in the ritual of religions widely separated both in time and space. The Greek author Aelian (3rd century AD) reports that in Epirus the priestess of Apollo, a naked virgin, appears alone before the temple and feeds the serpents. The priest of Shiva, the Vedic god of reproduction, who had to be celibate, appeared in the nude to believers in the *lingam* or phallus.

Here again, the contrary idea, that nudity is sacrilegious, is not far to seek. The ancient Roman *flamen dialis*, the priest of Jupiter, was not allowed to leave so much as his head bare under the sky, which was of course the god himself. If his conical white leather hat fell off during a sacrifice, he was obliged to resign (see JUPITER).

In the history of Christianity sacrilegious nudity has appeared as a feature of heresy, notably in the case of the Adamites, a Russian sect reputed to have survived into this century who sought to get rid of modesty as a relic of the Fall of Man, and who accordingly went naked at divine service and in their houses. That this is a recurring heresy is shown by the fact that there is a record of Pope Honorius IV ordering the persecution of a group of German heretics who professed similar beliefs at the end of the 13th century. And as late as 1925, there was a sect in California that held naked orgies and whose priestess, Anna Rhodes, believed that she and her husband were Eve and Adam, and their home the Garden of Eden.

At other times, nudity has featured in Christian ritual without even being rationalized as a heresy. Father Pierre David, chaplain of a convent in Normandy in the 17th century, commanded the nuns to attend Mass stripped to the skin 'as a sign of humility and poverty'. Not an altogether convincing rationale, though the lascivious chaplain could quote plenty of biblical references to nakedness as a symbol of humiliation and shame. Once again, it is the essential incongruity of the nudity of the Egyptian prisoners in Isaiah 20.4, for instance, 'with buttocks uncovered, to the shame of Egypt' that creates the humiliation.

It is the unconventionality of nudity, perhaps, that recommends it to witches, who work many of their magic spells naked. But there is a typical piece of rationalization to be observed here, for witches frequently say that they work naked so as not to impede the release of magical force which their ceremonies generate in their bodies. A candidate for witchhood in the Ozark hill country in the United States is said to offer herself body and soul to the Devil in initiation rites during which she strips naked and copulates with the man who is responsible for teaching her.

In a society where nudity was the rule, witches would no doubt put on magical clothing. The point of their behaviour is the contrast it makes with conventionally accepted norms, and this is the reason for modern uses of nudity in advertising, for example, or on the stage. This is not to say that nudity has lost its essentially magic function. It is not an accident that in the '30s nudism became fashionable in Nazi Germany, the home of a strikingly irrational cult at the time; or that the present day, with its loss of belief in traditional magic but its unprecedented burden of irrational (and rationally based) fear, has found new and widely acclaimed uses for nudity.

DAVID PHILLIPS

Nudity has many religious and magical uses. It may imply sexuality, and the mother goddesses of the ancient world were sometimes depicted naked to emphasize their power over fertility; or it may be intended to shock, whether those to be shocked are the gods who send too much rain, as in some areas of India, or modern theatre-goers; or, as in modern nudism, it may express a feeling that to be naked is to be natural and in harmony with Nature *Left* Egyptian statuette of a deity combining the roles of Isis and Aphrodite, the Greek goddess of desire *Below, left to right* Statue of Aphrodite; marble torso of a Roman figure; German nudists on the island of Sylt; Miss Nude America

Nuer warrior in ceremonial costume: the Nuer believe in an omnipotent God who is responsible for good fortune and for bad, who is in the sky but is also on earth with man. Man is God's opposite, the created as against the creator, but his 'breath' or 'life' comes from God and returns to God again after death

What small black ants are to man, so is man to God, according to the Nuer people of the Upper Nile, whose beliefs are among the best examples of the intelligence and sensitivity of 'primitive' religions

NUER

IT IS NOT EASY to make a clear and rigid distinction between magic and religion, but most peoples make their own, and in describing the beliefs and practices of any particular people it is convenient to accept their categories and evaluations. If this is done in the case of the Nuer it would be necessary to state right away that except for what may be called fetishes, a recent introduction into their country, and a few charms, they have little of what they call *wal*, a word we might translate as 'medicine' or 'magic'. On the other hand, the notion of *kwoth*, 'spirit', which most people would regard as a religious concept, has a very large part in their thought.

The Nuer are a Nilotic people of some 200,000 souls who live in the swampy and savannah country on both sides of the Nile, in the region where that river is fed by its two tributaries, the Sobat from the east and the Bahr al-Ghazal from the west. Most of the country is waterlogged during the rains when the rivers top their banks, and is baked and fissured clay during the dry season. This would render an agricultural economy precarious, and the Nuer are primarily a pastoral people dependent on their flocks and herds, though some agriculture is practised and fishing provides an important part of their diet. Cattle are their predominant interest, not only because of their economic value but also because they are symbols of prestige, provide the wherewithal for marriage and payment of debts, and are the nexus or link between man and the spiritual world.

Their mode of livelihood in the environment in which they live imposes on the Nuer a trans-humant distribution: they move their livestock according to the seasons, living in villages on ground which rises from the waterlogged plains during the rains, and moving to camps for permanent water and green pasturage and for fishing when the rest of the country is parched. These conditions and the way of life their country imposes determine the spread of villages and camps, and consequently influence political attachments and cleavages.

The Nuer tribe is a political community, all the members of which acknowledge their obligation to combine in warfare against outsiders, and the rights of their members to compensation for injury inflicted by one of them. Each tribe is divided into sections which are structurally opposed to those of like size though, as indicated, they may combine in certain situations. The smallest of these are composed of villages which in their turn are composed of domestic groups.

There can scarcely be said to be any political authority or office in any of the tribes which form the Nuer people. What provides a loose framework of cohesion, and is also the idiom in which political loyalties and enmities are expressed, is the system of clans and their lineages; each tribe has a clan which is regarded as owner of the territory of the tribe, and the genealogical divisions or lineages within the clan are regarded as owners of the sections of the territory. Those Nuer who live in the territory but are not members of that clan, and persons of foreign, mainly Dinka, origin who also live there, identify themselves politically with it, though retaining their distinctness as descent groups.

The adult male population of each tribe falls into stratified sets, each consisting of all those who were initiated into manhood by undergoing a very painful operation during the same period of time. A gap of four years intervenes between the closing of one set and the commencement of another.

Upper and Lower Spirits

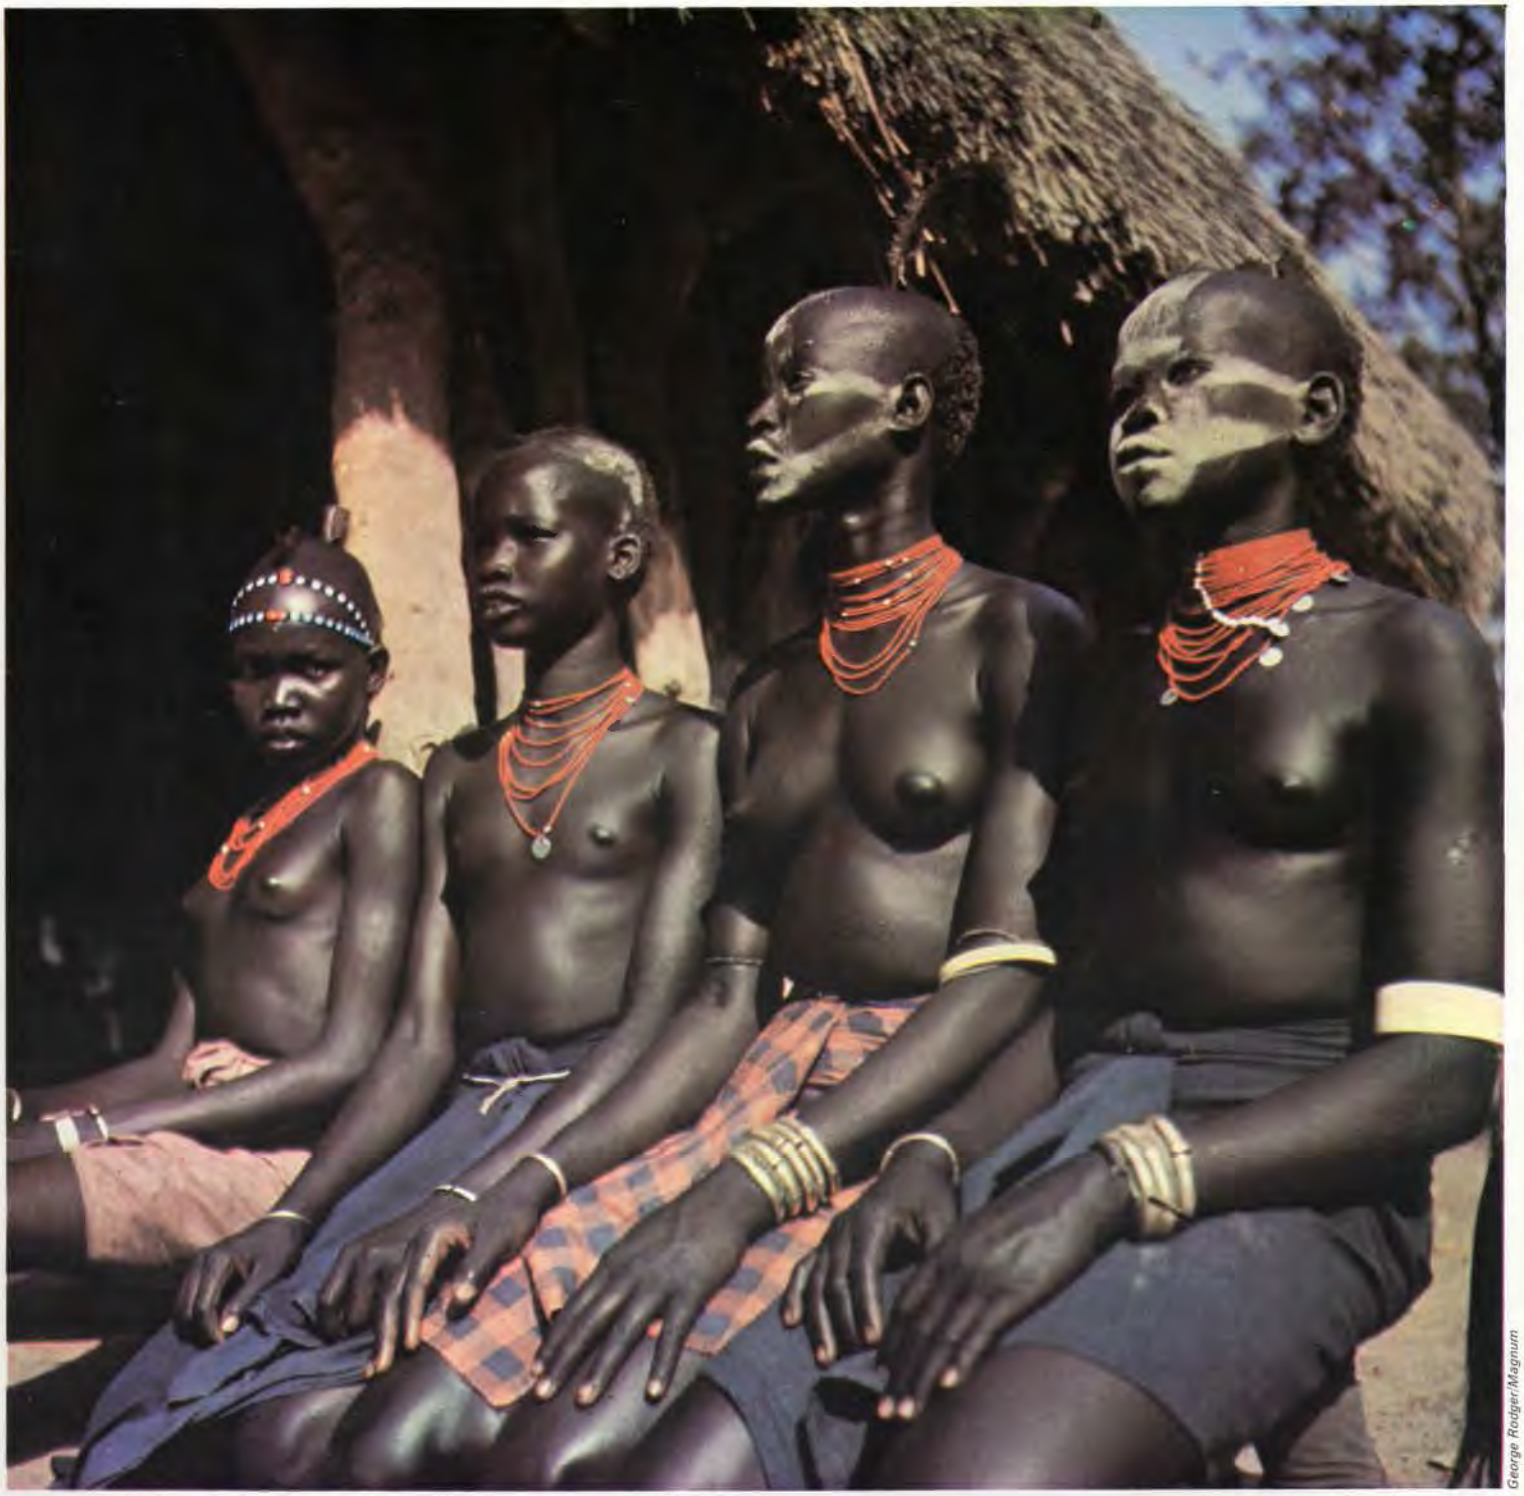
The people who live in the same neighbourhood are closely linked, for a man can always claim relationship of one sort or another with the people he meets. The link may be one of common descent or it may be one of affinity, the Nuer having several forms of marital union. Though monogamous marriage is usual, polygamous unions are frequent.

The Nuer are an intensely religious people, though this has not always been appreciated as they lack formulated dogma, organized cult, liturgy, sacraments, and elaborate mythology. Their religion may be said to be highly spiritual, its central notion being that of kwoth, a word which in its verbal form has the meaning of violent breathing out of air, and which can be translated in its religious sense as spirit. It is near enough to our conception of God to be so translated.

God is thought to be in the sky but he is also thought to be everywhere and is said to be like the wind and like the air; he has no prophets or sanctuaries or earthly forms. So he is both far from man, as sky is from earth, but is also here on earth with man – a common paradox in religion. He created the world and everything in it out of nothing, by thinking or imagining it, as one creates a poem. He is regarded and spoken to as a person and as a father, in a spiritual sense, and as such he is friend to man. At the same time he punishes faults, whether these are deliberate or the result of inadvertence.

Nuer are logical in this matter. God being, to their way of thinking, omnipotent they attribute to him not only fortune but misfortune too. They also recognize that one cannot rationally understand God's nature, and in speaking about him they use what we could call metaphorical and allegorical expressions. They say that they are simple and that what small black ants are to man, so is man to God. Therefore whatever happens, whether good or ill, must be accepted. If it is ill, prayer and sacrifice may bring relief, and if they do not one must be resigned. It is the will of God and he is the owner and disposer of all things. What they ask for in their prayers and invocations are peace of mind and deliverance from troubles.

There are other spiritual beings. Nuer call them 'spirits of the above' and 'spirits of the below', and they are also called *kuth*, the plural of kwuth, 'spirits'. Those of the



George Rodger/Magnum

The Nuer have several different forms of marriage, and although monogamy is usual, polygamous unions are also frequent; if a man has died without sons, a wife will be married to his name so that she may bear sons to it and ensure that the name survives among the living: Nuer girls

'above' are of two kinds: spirits of the air or of breezes, and the souls of those killed by lightning (a frequent happening in Nuerland). Nuer say that God has taken the latter for himself and that they are in celestial union with him. They become patron spirits of their families and also of their descendants so long as they are remembered.

The spirits of the air are associated with various natural phenomena and social activities; they cause sickness and may possess people, who then may become their prophets. Cattle are dedicated and sacrificed to these spirits and hymns are sung to them, hymns full of poetic imagery. The evidence seems clearly to show that though these spirits are conceived of as separate beings they are also regarded as derived from, as manifestations of, God, under various names; that if they are many they are also, all being spirit, one, different yet the same, divided yet whole; hence they have been described as 'refractions of God'. Shrines, cattle and drums are dedicated to them, and they may become attached not only to persons but also to families, lineages, and tribal segments.

None of the spirits of the 'below' are held in high esteem, but the most important are what are generally called totemic ones. The members of a descent group or lineage respect one or other natural species; lions, lizards or snakes, for instance. They will not harm these creatures and they will not eat them even though they may be edible. However it is clear from what Nuer say that what they have in mind is not so much the creature, as the spirit which is concretely manifested in it. The creature is regarded as a sort of emblem or representation of spirit. Spirit is even more immanent in various other earthly manifestations, what might be called effulgent Nature sprites and fetishes, to which, as with the totemic spirits, prayer and sacrifice may be offered.

So whereas God is conceived of as transcendental, lower down the scale spirit is

George Rodger/Magnum

All the members of a Nuer tribe acknowledge their obligation to support each other in war, and the right of members to be compensated for injuries inflicted by one of them: the men of a tribe are divided into stratified sets, each consisting of all those who were initiated into manhood during the same period of time: Nuer chieftain addressing his warriors

more and more embedded in the psychical and material; but in all its forms, though separate, it is still one. Its distribution in diverse forms is to be attributed to the relation of the spirit to a variety of social groups and activities. In relation to all men, and what affects all men, spirit is thought of as one, as God, whereas in relation to any particular social group or any particular person or event, it is thought of in one of the other forms I have mentioned.

The Great Camp of the Dead

Religion is a reciprocal relationship between God and man. A brief account has been given of the Nuer conception of God or spirit. What is their conception of man? They are pre-eminently dualists in their religious thought. God and man, creator and created, are opposites symbolized by sky and earth. Their ideas about the nature of man are perhaps best understood by what they say happens at death. Then what is buried is the *ring*, the 'flesh'. The *yiegh*, 'breath' or 'life', returns to God from whence it came. The *tie*, 'soul' or 'intellect', becomes a ghost; and it is this which in lifetime can curse, and in its ghostly form haunt, should the man have been wronged. It is symbolized for Nuer by the shadow.

Nuer do not pretend to know where what they call 'the great camp' of the dead is, nor what they do there, and they are more interested in the survival of their name among the living, that it be not blotted out. That is why a wife must be married to the name of a dead man if he has no sons, that she may bear sons to his name. Unless ghosts are troublesome Nuer pay little attention to them. In thought they play a secondary role to spirit. Sacrifices may be made for them, but scarcely to them. There is no ancestor cult. Their graves are not remembered. Their monuments are in their descendants.

Spirit in one or other of its manifestations may enter into the affairs of men, and in the case of the minor spirits, the lesser refractions of God, their interference may seem capricious. In the case of spirit conceived of as God, the sickness or other trouble that its entry is thought to cause is generally believed to be due to the breach of some prohibition, or what we may call sin. But it must be recognized that from our point of view the moral content of the prohibitions is highly variable. We can readily understand that they think incest or adultery should be punished; but not that it is a serious fault for a man to milk a cow or eat out of the same vessel from which another man has eaten, with whose kin the first man's kin have a blood feud. This is especially so considering that such faults (*dueri*) are often unwitting ones.

We might say that the fault, manifested in the sickness it brings about, lies less in the act itself than in the breach of the prohibition. What makes it more serious in Nuer eyes is that the pollution may spread (*dop*) and injure others besides the man responsible for it. Sometimes a danger may threaten when there is no question of fault, as when God manifests himself in the birth of twins. Whatever the reason, it is thought that what has happened can be wiped out (*wol*) by sacrifice.

Sacrificial Drama

Sacrifice is the most typical and expressive act of Nuer religion. The officiant may be a priest (a traditional and hereditary office) or a prophet (a personal and charismatic endowment) or a representative of a social group, or any senior man, according to the requirements of the situation. There are two kinds of sacrifice. The collective ones are made on behalf of social groups on occasions of changes in social status, as at initiation, marriage and death, their function being to confirm such changes by calling in God to witness them. The expiatory kind of sacrifice is made on behalf of persons in situations of sickness or danger. In the first kind Nuer wish to bring in spirit, in the second to get rid of it.

Ideally what is sacrificed is an ox, but sheep, goats, and even wild cucumbers may be used in their place. In all sacrifices the

drama is enacted in four acts: the victim is presented to spirit, it is consecrated, it is invoked, it is immolated. In the consecration, by placing the hand on its back, it may be supposed that man is identifying himself with the victim, the ox being a substitute for the man. In that sacrificial sense there is an equation between man and ox. In the invocation the intention of the sacrifice is stated as the officiant walks up and down past the tethered ox, gesticulating with his spear as he makes his speech.

The meaning sacrifice has for the Nuer is complex and variable, as the different words they use to refer to it indicate. We may say that sometimes the sense of gift is uppermost, that often there is in it a touch of the idea of bargain, or it may have more the meaning of redemption, of abnegation, or of absolution. Always it is a substitution. Whichever particular sense is emphasized in any particular sacrifice, it must be borne in mind that Nuer are very conscious of the fact that God gets nothing except the life of the victim (man gets the meat), and that the life, like everything, is his already.

It might be argued that what God gets is man's resignation to his will; from the way the Nuer talk about the matter, it appears that they would accept that in sacrifice they are, in intention, giving themselves and that there is no other kind of giving.

It is not the case, as is often supposed, even by anthropological writers, that the religious thought of primitive peoples – and the Nuer are certainly primitive in the usual sense of the word – is always crude and irrational and hardly worth recording. From this article it will be seen that it is complex, and also intelligent and sensitive. (See also NILOTES.)

NUMEROLOGY

MODERN NUMEROLOGY is based on two extremely old principles. The first is that numbers are clues to the real, underlying structure of the universe. The second is that the name of a thing contains the essence of its being (see NAMES), so that the name of a person, properly analysed and understood, will reveal the truth about that person's character and course through life. When a simple method of turning names into numbers is added, the basic framework of numerology is complete.

The method is taken from the Hebrew and Greek alphabets, in which each letter also stood for a number, so that any word could be turned into numbers and vice versa. On this basis, the name William Shakespeare, for instance, can be made to yield the number 5 (for the details of how this works, see ALPHABET). Over the centuries, a considerable body of symbolism has attached itself to the number 5 and Shakespeare's character and achievements can be interpreted in terms of it.

Any name can be turned into one of the numbers from 1 to 9 (sometimes with 11 and 22 added), which means that the numerologist has a manageable quantity of categories, or broad personality-types, to work on. But he does not maintain, of course, that if your name adds to 5, you must have exactly the same character as Shakespeare and the innumerable other human beings, past and present, whose names yield 5. The number of your full name indicates your general personality-type. Within it, you can find out more about yourself by considering the total of the vowels in your name (the Heart Number, which reveals your inner self, the person you are at heart) and the total of the consonants (the Personality Number, which reveals your outer self and how other people see you). You can consider the numbers given by each letter of your name: the letters of William Shakespeare, for example, do not include a 7 at all (suggesting the absence of introspection and withdrawal from the world) but contain the number 1 five times over (suggesting massive creativity and originality, driving force and egotism).

Again, you can consider nicknames and other variants of your full name, which are supposed to reveal yourself as you are in your relationships with those who use them. A married woman's maiden name should indicate her character before she was married, and her married name should show how marriage has changed her.

Yet another important number is the Birth Number, found by adding up your day, month and year of birth (for instance, if you were born on 12 August 1930, $12 + 8 + 1 + 9 + 3 + 0 = 33$, and $3 + 3 = 6$). This number is believed to reveal the mould in which the mysterious workings of fate cast you at your birth, what you were meant to be or destined to be. If your Birth Number does not harmonize with the number of your name, then you are probably prone to fierce inner conflicts.

The Great Spiral

Whether it is taken seriously or merely treated as an amusing pastime, one of the problems about analysing yourself numerologically is the fact that your name and birthdate may yield so many different numbers. It is difficult to know how to weigh and combine the varying results and how to exclude the elements of wishful thinking or, with historical figures, of hindsight. And the language of numerologists, like that of astrologers (or other, more academically respectable personality analysts, for that matter) is generally vague and woolly, so that with ingenuity almost anyone's character can be fitted into any given number.

Another obvious and powerful objection to numerology is that your name is unlikely to be an index to your character and career, because you acquired it by chance: you just happened to be born into a family named Shakespeare, or whatever it may be. But numerology, like other forms of divination, does not believe in chance. It sees the world as a pattern, a design, in which your name has its allotted place. An American numerologist, Florence Campbell, explains that: 'The soul has taken many journeys in the past and *knows* its present needs. The Soul wants progress upwards on the Great Spiral and *chooses* for the incarnating ego the vowels whose total shall accomplish this purpose . . . there is a long "Dark Cycle" before the child is born, and during this Dark Cycle the vibrations that are to label the new life are so impressed upon the subconscious minds of the parents that they are compelled to carry out the plan.'

Time, of course, runs numerologically. The present century adds to 1, which suggests a period of new theories, discoveries and inventions, and new and aggressive power groupings. The upsurge of popular interest in mysticism, occultism and the supernatural generally in the 1960s is attributed by numerologists to the fact that it was a 7-decade. Within the centuries and decades, each year brings the influence of a new number into play, and within each year so does each month and day. Numerologically, the coming of the year 2000 can hardly be looked forward to with enthusiasm, since it will carry the influence of the evil and ominous number 2. But the year 2001 will usher in the more fortunate number 3.

In addition, each of us has his own personal time-cycle. To find this, add your day and month of birth to the current year. The result is called the Personal Year Number. For example, if you were born on 8 December, then 1972 will be a 3-year for you – a time for making money and achieving success, making new friends, enjoying yourself. But 1973 will be a 4-year for you, suggesting hard work for little reward, difficulties, disappointments and unhappiness, but also some consolidation of ground gained in the 3-year.

Not only can numerology be used to assess your character but also, in theory at least, to make your path through life easier and more successful. If your number is 6, you should try to deal with important matters or decisions only on days which add to 6. You should also live in a house whose number is 6 and a street whose name adds to 6. In considering a city, the vowels which indicate its inner characteristics yield the important number. London's vowels add to 5 – resilience, many-sidedness, sensuality. New York's add to 3 – brilliance, liveliness, glamour. Those of Chicago and Los Angeles add to 9 – the number of high mental and spiritual achievement – and those of San Francisco to 1 – originality, creativity, pioneering. The vowels of Paris, famed for women and wickedness, suitably add to 2, the number of both woman and the Devil.

All sorts of other matters, including taste and diet, can be considered numerologically. People whose names add to 1, 3 or 9 are said to like martial, full-blooded music, 2 and 7 like string and wind instruments, 6 enjoys

sweet, romantic airs, 5 prefers original and unusual compositions, and 4 and 8 like choral and organ music, especially if it is plaintive and gloomy. People whose number is 3 will find wheat, sage and apples beneficial to their health, because they all add to 3 (though not a single apple, which adds to 7).

If your life seems seriously out of joint, some numerologists recommend you to change your number by changing your name: 'Such a change in the majority of cases will produce most fortunate results and set up entirely new vibrations, which will change a lonely, unlucky life into one of happiness or success.' But others deny that you can evade your destiny so easily.

Music of the Spheres

Perhaps the most startling thing about numerology is its assumption that people and traits of character, periods of time, places, items of food, and everything that exists can be described in numerical terms or, to state it at its simplest and flattest, that everything *is* a number. The idea was bequeathed to Western numerology by the Pythagorean philosophers.

Very little is known for certain about Pythagoras himself, but Aristotle, an opponent of the Pythagoreans, gave his version of their views in his *Metaphysics*. He said that they believed that all things are numbers, 'such and such a modification of numbers being justice, another being soul and reason, another being opportunity – and similarly almost all other things being numerically expressible.' The notion is hard to grasp but, to borrow Christopher Butler's analogy, to understand how 'opportunity' could be thought of as a number, it is helpful to remember that although we behave as if a table is what it appears to be, we can also think of it as being 'really' something quite different, a conglomeration of atoms or molecules.

One reason why numbers attracted philosophical speculation of this sort is that they provide a principle of order in a seemingly chaotic universe. Numbers obey rigid laws but they also extend to infinity and have infinite possibilities of combination with each other. These characteristics recommend them to people who are in search of a basic pattern to the universe which will combine orderliness with infinite variety.

It may have been Pythagoras himself who discovered that the musical intervals known in his time – the octave, the fifth and the fourth – can be expressed in terms of simple ratios between the numbers 1, 2, 3 and 4. The discovery had a profound effect on Pythagorean thinking. Aristotle says that, 'since, again, they saw that the modifications and ratios of the numerical scales were expressible in numbers; since, then, all other things in their whole nature seemed to be modelled on numbers, and numbers seemed to be the first things in the whole of Nature, they supposed the elements of numbers to be the elements of all things, and the whole heaven to be a musical scale and a number.' This was the origin of the concept of the 'music of the spheres', the harmony of sound made by the heavenly bodies as they travel their rounds in the sky, which is the

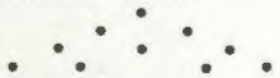
Bodleian Library Colour Filmstrip

basis of the modern numerologist's 'vibrations', or cosmic rhythms which govern the universe (see VIBRATION).

The Pythagoreans were also impressed by the fact that the numbers 1, 2, 3, and 4, added together, make 10. In other words, they create the decad, the first ten numbers which from this point of view are the essential numbers, the others merely repeating them at higher levels. That the first ten numbers are the essential ones is a conclusion naturally drawn from the worldwide practice of counting on the fingers.

The fact that ten is produced by 1 + 2 + 3 + 4 suggested that these four numbers were the origin and basis of all numbers, and therefore the basis of everything in the universe. This was confirmed by finding the basis of construction of all solid objects in the same four numbers: 1 is the point, 2 is the line, 3 is the triangle, and 4 is the tetrahedron or pyramid, the simplest solid (see FOUR).

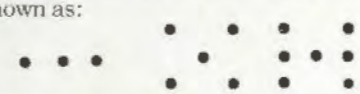
The Pythagoreans venerated a figure called the Tetractys, which is a simple demonstration that 1 + 2 + 3 + 4 = 10, and which looked like this:



This early way of representing numbers, by pebbles or dots, suggested or supported the distinction between male and female numbers which has influenced numerology ever since. Like other Greek philosophers, the Pythagoreans regarded the existence of pairs of opposites as an important characteristic of the universe's construction. Among these pairs were good and evil, male and female, and odd and even. Good and male were associated with odd numbers, evil and female with even numbers.

The principal meanings of the numbers in modern numerology still fit neatly into a table of opposites. Briefly 1 is active and positive, where 2 is passive and receptive; 3 is lucky and spiritual, 4 is unlucky and earthly; 5 is many-sided and adventurous, 6 is plain and domestic; 7 means withdrawal from the world, 8 means involvement in the world; and 9 is left over at the end.

When numbers are represented by dots, it is immediately obvious why the odd numbers are male and the even numbers female. The numbers 3, 5 and 7, for example are shown as:



The even numbers 2, 4 and 6 are shown as:

The odd numbers each have what Plutarch called 'a generative middle part', while in each even number there is 'a certain receptive opening'.

Later philosophers followed the example

One of the 'numbers of completeness', seven of a thing often makes a set, as in the 7 deadly sins; 13th century illustrations showing punishments for 6 of the sins *Far left, top to bottom* Envy, wrath, sloth and *(left, top to bottom)* lechery, gluttony and avarice

of the Pythagoreans in seeing numbers as divine concepts, ideas in the mind of the god who had fashioned the world. God was a great mathematician, who had created a universe of infinite variety and satisfying order to a numerical pattern. The same principle appears in the Cabala, where the *Sefer Yetsirah* describes the making of the world by means of numbers and letters.

In the Middle Ages numerology continued to flourish as a key to the nature of the universe and to the mysteries of the Bible. One was the number of God the Father, 2 of his arch-opponent, the Devil, 3 of the Trinity, 4 of the earth and solidity, 5 of the senses and the flesh, and so on. But it should not be supposed that medieval numerologists, any more than modern ones, were always consistent and invariably interpreted each number in the same way. On the contrary, the number would have several different meanings and the one which best fitted a given set of circumstances would be applied to that particular context. For example, 13 could be the number of sin (because it goes beyond the 12 apostles of Jesus) or it might be a sacred number, combining the Ten Commandments and the Trinity.

Some numbers, especially 3, 7, 9, 12, 22 and 40 are 'numbers of completeness' and have played a particularly important role in number mysticism and magic. Seven of a thing, for instance, frequently makes a complete set – the 7 planets of antiquity, the 7 days of the week, 7 colours of the spectrum, 7 notes of the musical scale, the 7 deadly sins and 7 corresponding virtues. As a result, 7 is powerful in magic, for to repeat an action 7 times is to repeat it 'all possible' times or to do it 'completely'.

Numinous

Term coined by the German theologian Rudolf Otto for the state of mind aroused by the mysterious, uncanny and supernatural, the state of religious awe or dread, the sense of the presence of the *mysterium tremendum*, 'the overpowering mystery'; he regarded this state of mind as the starting point of the development of religion; derived from *numen*, the Roman word for awe-inspiring supernormal power; the concept of 'the numinous' is very close to the Polynesian concept of *mana*.

The persistence down the centuries of the innocent jingles of childhood may well be due to many nursery rhymes containing references to mythology, folklore and witchcraft: Four and Twenty Blackbirds, *for instance, signifies resurrection while* The House that Jack built *has undertones of ritual sacrifice*

NURSERY RHYMES

AT THE BEGINNING of *The Golden Bough* Sir James Frazer tells of the priest-king of Diana of the Wood, 'who slew the slayer and shall himself be slain'; and the Old Testament story of Abraham and Isaac in which Abraham, about to offer his son as a sacrifice, is stopped from doing so by God, is well known. It is a little more difficult to associate these examples of human sacrifice with the killing of the wren, the king of the birds, which used to take place in many villages on St Stephen's Day, in memory of the saint's martyrdom, and to recognize that this may be a substitute for the death of a human being. In Ireland the rhyme that accompanied this rite ran:

> The Wren, the wren, the King of all birds,
> Was caught St Stephen's day in the furze . . .

The wren was caught, killed, and his body hung on a pole, with great ceremony, and he was finally buried in the churchyard.

In the Scottish version, where the characters are Fozie Mozie, Johnie Rednosie, Fozlin Ben and others, the wren's body is cut up and shared out. This happens also in other versions, and Frazer suggests that this may symbolize eating the body and drinking the blood of the god. In Brittany, the bird is a thrush or blackbird, and it goes on singing after it is dead, a phoenix-like resurrection which occurs in much folklore and many religions including Christianity.

This resurrection of the blackbird in France leads us back again to England, to a very familiar nursery rhyme beginning:

> Sing a song of sixpence, a pocketful of rye.
> Four and twenty blackbirds baked in a pie.
> And when the pie was opened the birds
> began to sing . . .

In parts of France it was Robin Redbreast who was sacrificially eaten.

The House that Jack built is one of the best-known English nursery rhymes. In one version the last verse, which is a summary of the whole rhyme, starts with the knife that killed the cock; sacrificing a cock on a wedding day is a pagan religious custom. This cumulative nursery rhyme is very like an old Hebrew chant of 1590 or earlier:

> A kid, a kid my father bought
> For two pieces of money
> A kid, a kid.
> Then came the cat that ate the kid,
> That my father bought for two pieces
> of money
> A kid, a kid.

The rhyme has been explained as a parable of the persecution of the Israelites.

A skipping rhyme, recorded in Dundee in 1949 in a school playground, which is the nursery of most working class children, is:

> I am a poor, poor orphan, my mother she
> is dead;
> My father he's a drunkard, and won't
> buy me no bread.
> I see it at the window and hear the
> organ play;
> It plays to bless my mother, for she is
> far away.
> Ding, dong, fashion bells, farewell my
> mother; . . .
> My coffin shall be white, six little
> angels by my side,
> Two to stay, and two to pray, and two
> to carry my soul away.

Now the last two lines are 'the White Paternoster', a form of words said as a charm, which was known in Babylon as an incantation. 'Shamash before me, behind me Sin, Nergel at my right, Nonib at my left,' corresponding to the angels at the 'four

The phoenix-like resurrection of birds who continue to sing after they are dead is a recurrent theme in much folklore: in England there are the four-and-twenty blackbirds in *Sing a Song of Sixpence*; the maid whose nose was pecked off by one of the resurrected birds while she was hanging out clothes in the garden is shown in this 19th century illustration by Edmund Dulac of various nursery rhymes. The king in his counting house, the old woman who lived in a shoe, and the three blind mice are also depicted

COUNTING HOUSE

Victoria & Albert Museum/Chris Barker

Far left **Rich in mythology and folklore, many nursery rhymes contain hints of supernatural power; the cow jumps over the moon in the jingle that starts 'Hey diddle diddle, the cat and the fiddle . . .': illustration by Arthur Rackham** ***Left*** **Mother Goose: one of the earliest collections of nursery rhymes was published in the 18th century as *Mother Goose's Melody***

corners of my bed' in the modern rhyme.

In the 14th century, the carpenter in Chaucer's *Miller's Tale* quotes the White Paternoster in a rhyme intended to protect his house at all four compass points against fairies and other creatures.

A rhyme from Dundee, printed as written down by a child, is:

My mither killed me,
My father ated me,
My sister pickit my banes,
And laid me atween twa marble stanes –
And noo I've grown intae a little white dove
To fly ower the fields o Airlie.

This rhyme from the folktale of *Pippety Pew* still lingers in folk memory in Buchan. Goethe adapted a German version of the same rhyme, as a song sung by Margarete in the prison scene in *Faust*. One interesting point is that, as in some of the ballads which describe a talking bird, the little white dove of the rhyme is the soul of a dead child.

In the year 1660, a man named Douglas and eight female companions were strangled and burned for, among other sins, having merry meetings with Satan, with music and dancing. The two favourite airs of his Majesty were:

Kilt thy coat, Maggie,
And come thy way with me.

and the tune of the following rhyme:

Hoolie, the bed'll fa!
Wha'll fa wi't?
Twa een, twa hands,
And twa bonnie feet.
Hoolie, the bed 'll no fa!
Wha'll no fa wi't?
Wee Robin Redbreast
Sound asleep.

It is elsewhere recorded that the favourite tune played by Satan at the witches' meetings was the tune to the following rhyme:

The silly bit chicken,
Gar cast her a pickle,
And she'll grow mickle,
And she'll grow mickle.
And she'll grow mickle,
And she'll dae good,
And lay an egg
To my little brood.

Without any alteration they are typical nursery rhymes.

A Border rhyme of Holy Week contains the lines:

Hey for Sunday
At twal o'clock,
When a' the plum puddins
Jump out o the pot.

Sunday midday is, of course, the time of Christ's resurrection, and this is symbolized in the last two lines.

Adult Code of Joviality

It can safely be stated that the overwhelming majority of nursery rhymes were not in the first place composed for children; in fact many are survivals of an adult code of joviality, and in their original wording were, by present standards, strikingly unsuitable for those of tender years. They are fragments of ballads or of folk songs ('One misty moisty morning' and 'Old woman, old woman, shall we go a-shearing?'). They are remnants of ancient custom and ritual ('Ladybird, ladybird', and 'We'll go to the wood'), and may hold the last echoes of long-forgotten evil ('Where have you been all day?' and 'London Bridge'). Some are memories of street cry and mummers' play ('Young lambs to sell! young lambs to sell!' and 'On Christmas night I turned the spit'). . . . One ('Matthew, Mark, Luke, and John') is a prayer of Popish days, another ('Go to bed, Tom') was a barrack room refrain. They have come out of taverns and mug houses. ('Nose, nose, jolly red nose' still flaunts the nature of its early environment.)

Iona and Peter Opie ed
The Oxford Dictionary of Nursery Rhymes

Victoria & Albert Museum/Michael Holford

Brian Netscner

The killing of animals in nursery rhymes has associations with human sacrifice; in *Who Killed Cock Robin?* the robin was killed by the sparrow, traditionally associated with evil in parts of Europe: the funeral of Cock Robin, from Potter's Museum at Bramber, Sussex

The Berwick rhyme of *Pearlin Jean* has authentic folk simplicity:

O, Pearlin Jean!
O, Pearlin Jean!
She haunts the house,
She haunts the green,
And glowers on me
Wi her wul-cat een.

Whether the ghost had been a lace-maker, or was dressed in lace (pearlin), or looked like lace, has a fascinating uncertainty, but her wild-cat eyes are a folk poet's image, from a time when people really did believe in ghosts.

Some rhymes are borderline. If you believe in witches they can be charms; if not, they can be looked upon as verses inherited by children, like this churning charm:

Come, butter, come,
Come, butter, come!
Peter stands at the gate,
Waiting for a buttered cake.
Come, butter, come!

The following verse from the old fishing village of Auchmithie is a children's rhyme, based on the fact that the boats must on no account be counted when at sea, and no gathering of men or women or children must be numbered.

Ane! Twa! Three!
Ane! Twa! Three!
Sic a lot o fisher-wifies
I do see!

Fisherwomen would be very angry if children pointed at them and shouted this rhyme, as if counting them.

NYMPHS

GENERALLY REGARDED as goddesses of subordinate status, nymphs are personifications of human feminine youth, invested with magical charm, beauty and dread, and often, of course, with superhuman power. They belong to the oldest and deepest layers of Greek popular religion, mythology and folklore, populating seas, rivers and springs, caves, trees and mountains, in fact Nature in all its aspects. In Greek 'nymph' means simply a young girl, a bride (and, in a secondary sense, a nurse).

The Oceanides, nymphs of the ocean, were looked upon as daughters of Ocean himself. A band of them forms the chorus of Aeschylus's *Prometheus Bound*. After he has been chained to the rock, Prometheus invokes all the forces of Nature. He hears strange sounds in the distance:

> A faint sound, a fragrance, is floating about me.
> Is it god or man? Who is it that seeks me out,
> Visiting this desolate edge of earth,
> Spectator of my agony? It must be so.
> Then see imprisoned here an ill-starred god –
> The detested of Zeus, the rejected of all who walk in
> The heavenly courtyards, one that held mankind too dear! Ah!
> Yet again that murmur! The air is astir with
> The whisper of hurrying wings. How fearful is all that approaches!

The chorus of ocean nymphs then enters, performing a dance as if riding sea-horses. They address the tormented Prometheus:

> You need not fear us, we are friends. Our father said no, but
> We pleaded, then in haste took to the air,
> Breathlessly beating long wings,
> And on and on raced with the wind,
> Riding the crests of the mountain breezes.
> We heard the dull strokes of a hammer through the sea-caves,
> And we leapt a horse without time to remember manners,
> Each foot in the stirrup without a sandal.

They are still with him, impulsively sympathetic and loyal, at the end of the play, when Prometheus, refusing to disclose his secret, is caught up in the earthquake of Zeus. 'No, no, we refuse to desert him, we stay at his side to the end; for of all vile things in the world the worst is a traitor.' The young nymphs as it were counterpoise the most generous and tender impulses of Nature against anger and violence directed against the weak and vulnerable.

The Nereids were the daughters of Nereus, the wise old man of the sea. Traditionally, there were 50 of these marine nymphs of the Mediterranean, dwelling with their father in the depths of the sea, lovely young goddesses, kindly to sailors. One of their number was Thetis, the mother of Achilles, who also befriended both Dionysus and Hephaestus. Brought up by Hera, she was obliged by Zeus and Hera to marry Peleus, a mortal. The story of the marriage illustrates a common folktale motif of the fairy or nymph won through guile and struggle, at least for a period of time. Thetis, like other sea creatures, had the power of self-transformation, but Peleus, instructed by Chiron, the wise old centaur, held her fast until she promised to marry him.

After the birth of Achilles, Thetis returned to the sea, but emerged again from time to time to give him comfort and succour. At the end of the *Odyssey*, the ghost of Agamemnon tells how Thetis came up from the sea with the other Nereids to join in the mourning at the funeral of Achilles, and brought a golden urn for his bones, a gift from Dionysus, made by the smith god, Hephaestus.

Different from the nymphs of the broad ocean and the sea were the Naiads, the nymphs of running water, of rivers and springs. These are the divine counterparts of the human girls who regularly purified themselves at such places before religious ceremonies or who, as brides, bathed before their weddings in rivers or in water brought from them. There were also the Oreads or Orestiads, special mountain nymphs, and the Dryads and Hamadryads, who were closely involved with trees and tree cults.

As M. P. Nilsson pointed out (in *Greek Popular Religion*), Artemis is a great goddess very similar to the nymphs and is traditionally accompanied by nymphs. She haunts mountains and meadows, and is connected with the tree cult, with springs and rivers. She protects women in childbirth and watches over little children. She was leader of the nymphs; small wonder that she was a popular goddess, nymph incarnate. She took the young of all creatures under her care and a choral passage in the *Agamemnon* of Aeschylus portrays her anger at the sight of two eagles tearing a hare with her unborn litter in the womb.

Artemis was known as a bear goddess in various parts of the ancient world in a ritual associated with initiation and marriage. In Arcadia, the mother of Arcas, after whom the district was named, was changed into a bear shortly before he was born. The mother's name was that of the nymph Callisto, properly an epithet of Artemis. Artemis Brauronia had her temple at Brauron in Attica. Here girls, dressed in saffron, performed a bear dance before they were married (see BEAR; DIANA).

It has been reasonably argued that the bear goddess belonged to the ancient Pelasgians, who brought her to Arcadia from Attica, to Attica from Lemnos, and ultimately from the shores of the Black Sea, reaching the Aegean by way of the Propontis, now known as the Sea of Marmara, which connects the Black Sea with the Aegean. It has been argued that she was identified with Artemis because of the influence of the Ephesian fertility goddess.

Evidence which has come to light in recent years has further suggested the possibility that the Cretans perpetuated a similar

Personifications of feminine youth, charm and beauty, the nymphs come from the oldest and deepest layers of Greek popular religion and stand for 'the most generous and tender impulses of Nature': fresco of Pan with nymphs

association in the neighbourhood of the peninsula of Akrotiri, north-east of Canea, now the island's capital city. A local myth implies a ritual involving a sacred bear, a cult of a divine nursing-mother in a cave, whose worshippers were pre-Dorian. The myth and the ritual could be associated with the cave on Akrotiri called Arkoudia, 'Cave of the She-bear', described under that name by travellers for several centuries.

Some nymphs were connected with the sea, others with mountains or trees. The nymphs of rivers and springs were divine counterparts of human girls who purified themselves there. As spirits of the pulsing life of Nature, the nymphs were the companions of the lustful satyrs: medallion of a sleeping nymph with satyrs

The old traditional sphere of the nymphs was to look after mortals in the days of their youth. They were mothers and nurses of heroes and they were also said to look after infant gods. As Homer says in his Hymn to Dionysus:

> I will begin my song about Dionysus, the ivy-crowned,
> Loudly-clamouring god, the glorious son of Zeus and of
> Far-famed Semele, who was received in their arms by long-haired
> Nymphs from his father, their lord, and they fostered and cherished him tenderly
> In the valleys of Nysa . . .

The infant Zeus was also tenderly nurtured and legends of his childhood show the close relationship between nymphs and wild creatures. After his birth in a Cretan cave, it was said, the baby Zeus was fed by a pig or by doves or by bees or a goat. Two nymphs, Melissa and Amalthea, supposedly the daughters of Melisseus, King of Crete, reared the infant on the milk of a goat. Amalthea made him a golden ball and put him to sleep in a golden cradle.

Tradition said that in Crete there was a cave sacred to bees, where Rhea gave birth to Zeus, which neither god nor man might enter. The cave was occupied by sacred bees, nurses of Zeus, and the god fed on honey. It is possible to argue that this story was replaced later by the legend of the nymphs, who retained the title *melissai*, bees.

R. F. WILLETTS

C. M. Dixon Victoria & Albert Museum

Stephen Dalton/N.H.P.A.

In Germany anyone found damaging an oak was put to death: the long-standing belief that it was unlucky to cut an oak stemmed from the awe in which this tree was held all over Europe

Strong and imposing, the oak tree has been worshipped from very ancient times

OAK

FROM PRIMITIVE TIMES to those of the Druids the oak, strong, durable and very long lived, was undoubtedly the chief sacred tree all over Europe and Scandinavia. The oak was associated with the myth of Balder because the sacred mistletoe, the mysterious 'golden bough' by which the Scandinavian god was slain, grew on its branches (see BALDER; MISTLETOE). Balder was perhaps a later version of a primitive tree deity, who had to be sacrificed in order to ensure fertility of crops and men. In later times this ritual was worked into a kind of mummers' play associated with May Day, in which the tree spirit, enveloped in leafy oak boughs, was executed.

Several references in the Bible indicate that oaks were important to the earliest worshippers of Yahweh, as when Jacob buries the 'foreign gods' and the ear-rings of his household under the oak of Shechem (Genesis 35.4). The followers of Baal sacrificed below an oak tree or in an oak grove – 'under every leafy oak, wherever they offered pleasing odour to all their idols' (Ezekiel 6.13).

One of the most famous oracles of ancient Greece, that of Zeus at Dodona in the north-east, was in an oak wood, and the priestess had her temple under an enormous oak, the rustling of whose leaves she interpreted in answer to questions. The Argonauts' ship Argo was built of oaks from this grove, and one timber could speak and advise the voyagers. Socrates swore by the oak, as the sacred oracle tree; Homer describes how people made solemn agreements under an oak because it was a place of security; and oak wreaths were worn by those taking part in the Mysteries of Eleusis (see ELEUSIS) at the temple of Demeter.

A possible parallel with the Balder myth

may be seen in ancient Italy, where in the Arician Grove there lived the King of the Wood (see KING). The same grove was also the home of the water nymph Egeria, described by Plutarch as one of the oak nymphs who lived in every oak grove. Egeria married King Numa in the sacred grove. J. G. Frazer considered this 'a reminiscence of a sacred marriage which the old Roman kings regularly contracted with a goddess of vegetation and water for the purpose of enabling him to discharge his divine or magical functions', and pointed out 'how very often in early society the king is held responsible for the fall of rain and the fruitfulness of the earth'. In Roman times oak boughs were carried at weddings to ensure a fruitful marriage.

Later on, the oak became the sacred tree of the Romans, and Jupiter was reputedly sheltered by an oak at his birth. Acorns were widely held to have been the first of man's foods and legend tells how Ceres – the Roman goddess of agriculture (see DEMETER) – replaced them with corn; to recognize man's debt to the acorn, oak was worn at festivals in honour of Ceres and by reapers as they harvested. Romans who had saved the life of a fellow citizen were granted an oak leaf crown, which gave them many privileges.

Pliny describes how sacred the oak was to the Gauls and their Druid priests (see DRUIDS); so deep went its power that in the 8th century the missionary St Boniface had to destroy a sacred oak at Hesse in Germany. However, St Columcille, when destroying the worldly town of Derry, saved its oak wood from fire. In Ireland the oak was one of the Seven Noble Trees, which could not be destroyed without payment of a fine.

In ancient Germany anyone discovered damaging an oak was punished in a horrible way, as Frazer tells us: his navel was cut out and nailed to the wound in the tree, and the offender was then driven round the tree till his intestines were wound round the trunk – a wound for a wound, man's death for the tree's life.

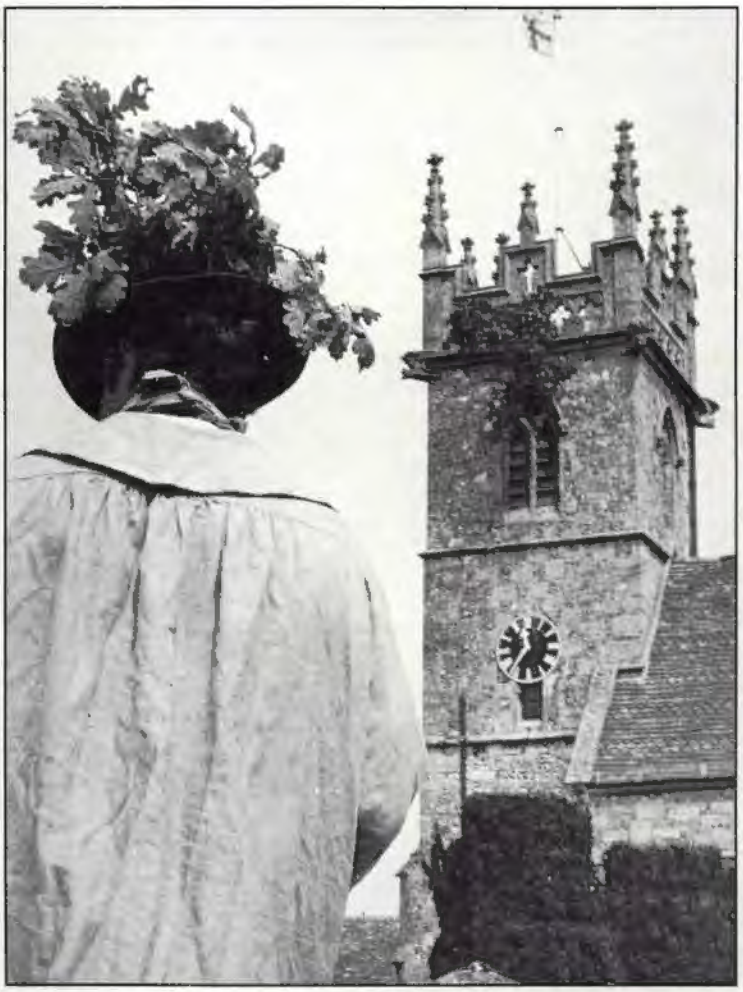
In later centuries the ancient sacredness of the oak left a deep-seated fear of damaging or cutting them down. John Aubrey (1626–97) mentions how 'When an oak is felling, it gives a kind of shriek or groans, that may be heard a mile off, as if it were the genius of the oak lamenting.' He adds, in a circumstantial aside, 'E. Wyld, Esq., hath heard it several times.'

Protection Against Lightning

In Scandinavia the oak was sacred to Thor, and for this reason was known as the 'thunder tree'. In many places the oak is thought to ensure safety from lightning, although it is in fact more prone to being struck than most trees (perhaps because it lives longer), and a Sussex rhyme has the line: 'Beware the oak: it draws the stroke.' But superstition dies hard, and oak branches

Keystone Press Agency

Oak leaves play their part in the ritual observed by Druids at Stonehenge on Midsummer Day; the reverence of the ancient Druids for the oak is mentioned by the Roman author Pliny



British Tourist Authority

Horner Sykes

Traditions connected with Oak-Apple Day, the anniversary of the restoration of Charles II, are thought to derive from much older ceremonies *Left* Villagers of Wishfort in Wiltshire still wear a garland of oak leaves round their hats on Oak-Apple Day *Right* At Castleton, Derbyshire, the day is marked by a procession led by a 'king' bearing a flower-covered frame; eventually the frame is hoisted onto a pinnacle of the church tower, the other pinnacles being decorated with branches of oak

were formerly kept in houses to protect them from lightning. Later these were replaced by acorns, and the acorn-shape of the bobbin on pull-down blinds was in the same way originally intended to be protective. If an oak did happen to be struck by lightning, pieces of its timber became especially protective as a result.

Not surprisingly, oaks or their leaves protected from witchcraft. The Venerable Bede recorded how the heathen King Ethelbert made St Augustine preach to him under an oak, rather than indoors, so that the king would be safe from any spell the unfamiliar Christians might try to cast on him.

The marriage oak is often mentioned in folklore: newly married couples would dance round such a tree for luck. This was a relic of pagan wedding ceremonies under the sacred oak. Another relic of the past is the gospel oak, a single tree at a point on a parish boundary. The numerous places with this name make it clear that when, on Rogation Day, processions went round 'beating the bounds' of the parish, a short service in which verses from the gospels were read took place under each of these boundary trees. There were other Christianized oaks, such as one in Leicestershire which has left the name Holy Oakes, and one in Shropshire at a place now called Cressage: in Domesday Book this appears as Cristesache, that is, Christ's oak. There were also cross oaks, planted at crossroads, which had the reputation of curing certain illnesses.

By the 17th century little was left of oak worship but superstition. Veneration of the oak seems to have been revived indirectly by Charles II, by way of the Boscobel oak, which saved him when he hid in its branches after his defeat at the battle of Worcester. In 1664, after Charles's restoration to the throne, 29 May became known as Shick-shack Day, Royal Oak Day or Oak-Apple Day. On this day, the date of Charles's birthday and of his return to England, it was necessary to wear a 'shick-shack', an oak twig, if possible bearing an oak-apple. Anyone without this token was liable to be beaten with nettles. In the afternoon the oak twig was replaced by a bunch of ash leaves. This is with very little doubt a relic of a much older ceremony, like the mummers' plays previously mentioned: it may be the termination of the May rituals, which had begun on May Day with the 'Green Man', the 'Man in the Oak', 'Jack in the Green' or 'King of May' – destined to be sacrificed under whatever name (see GREEN). It will be noted that the leaves usually carved around those curious heads to be seen in many churches, which represent the Green Man, are usually oak leaves.

It is interesting to see the association of oak with ash in the 'shick-shack' custom. It is more familiar in the old weather rhyme:

> If the oak comes before the ash,
> We shall only have a splash.
> If the ash comes before the oak,
> We are sure to have a soak.

Oak was the material used for starting the need fire, whose usual purpose was to curb an outbreak of disease among men or farm animals. All other fires in the district had to be put out, and the need fire was lit by rubbing together pieces of oak wood or a piece each of oak and fir (see FIRE).

The burning of a Yule-log is almost certainly a survival of the fire festival of the winter solstice; the log was often of oak. This festival was concerned with ensuring luck, protection and fertility to farm and household in the coming year, and the charred wood and ashes left after the burning acquired special qualities.

The oak is an important symbol in dream interpretation, and normally a favourable one. To dream of a leafy oak means a long and happy life; of one bearing acorns, wealth; of many young oaks, several courageous sons. But a dream of a withered oak foretells poverty in old age, and of a blasted oak, sudden death. In the language of flowers an oak tree signifies hospitality (a sentiment transmitted pictorially, one imagines) and oak leaves indicate bravery.

A. J. HUXLEY

Though they now have degenerated for the most part to meaningless profanities, oaths were once regarded as full of occult power: the supernatural sanction invoked in the ooth acted as a guarantee of good faith

OATH

THE IDEA THAT TRUTH – or for that matter, virtue – can be its own reward is a relatively modern principle of morality. In the past it was taken almost for granted that no individual in his right senses would be likely to act in a manner contrary to his own interests, and for this reason a man's solemn word was not considered an acceptable token of his intentions unless it had been reinforced by supernatural sanctions. An oath consisted of a form of words capable of invoking punishment from the supernatural powers, should the obligation contained in them not be carried out. The oath has been described as 'essentially a conditional self-imprecation, a curse by which a person calls down upon himself some evil in the event of what he says not being true.' In its original form the oath was a magical formula, arising from the power inherent in the cursing words.

Oaths take a wide variety of forms. They involve calling upon a god or gods, or upon the psychic force contained in some ritual object or symbol of power, but they can also be self-imprecatory as in the familiar children's declaration: 'Cross my heart and hope to die.'

The oath which is sworn by or on some sacred, divine or even dangerous authority is intended to establish contact with its power, which can then be turned against the one who violates his given word. Developments of this are the oaths sworn upon Yahweh or Allah, or that in which the Comanche Indian calls upon the Great Spirit as witness to the truth. Similarly in New Guinea the tribal gods are commissioned to take immediate vengeance upon any oath-breaker.

In other cases it is not so much the god who is invoked as the sacred object with which he is associated, and this is reverently touched at the time that it is sworn upon. The particular object varies in accordance with whatever happens to be considered of psychic importance in a particular community. The early Hebrews, for example, swore upon their genitalia, the symbols of procreative power, while in the modern courtroom the witness takes the oath upon the Bible. Despite the identification of this principle with the higher forms of religion, it represents a clear relic of the older system of magic by touch, the punishment arising not so much from the outraged god as from the inherent power of the object itself.

One example of this type of oath is the Gold Coast ordeal in which the accused is given an article of food which 'in some way appertains to a deity, who is then invoked to visit a breach of faith with punishment'.

The same principle underlay the medieval custom in which an accused person would eat the host, praying at the same time that it might choke him if he were not telling the truth. In one medieval form of ordeal a piece of consecrated bread made from unleavened barley was swallowed by the suspect and any violation of the truth was supposed to choke the perjurer or to rack his body with convulsions.

This form of oath depended upon the transmission of a curse into the body of the bread so that it would work upon the perjurer. A well-known English example of the practice was that involving the witch Joan Flower, who strove to defend herself from hanging by calling for the ordeal of bread and butter, wishing that 'it might never go through her if she were guilty'. In the event she 'fell down and died as she was carried to Lincoln Jail'.

Trial by Ordeal

The Emperor Charlemagne was strongly in favour of the Judgement of the Cross, a ceremony in which the accused, having declared his innocence upon oath, took up one of two sticks wrapped in fine wool from the altar, one bearing the concealed mark of a cross while the other was unmarked. If he picked up the stick marked with the cross his innocence was established beyond all doubt in the sight of God and man, but if he took

By courtesy: the Treasurer and Masters of the Bench of the Inner Temple

An accused man takes his oath at the court of King's Bench; various forms of trial by ordeal, to test the truth of a prisoner's oath, were accepted features of medieval law

the other he was judged guilty and punished accordingly.

The legal theorists of medieval Europe made a clear distinction between the spoken and the written oath and that which had been ratified by contact with a sacred object, such as a holy relic. To use the words of one historian: 'So little respect was felt for the simple oath that the adjuncts came to be looked upon as the essential features and the imprecation itself to be divested of binding force without them.'

The older magical principles continued to manifest themselves in medieval jurisprudence. A well-known example was the judgement of trial by ordeal, in which the accused was made to immerse his arm up to the elbow in boiling water to supplement the oath of innocence, in the expectation that God would protect him from the injury if he really was innocent. At an earlier period the accused would be blindfolded and compelled to walk barefooted over nine red-hot ploughshares; if unhurt he would be adjudged as having told the truth. A further expression of the same principle was trial by combat or wager by battle, in which the accused, having taken his oath of innocence, fought out the issue fully armed in the lists and if triumphant was regarded as completely vindicated. On the other hand, to be defeated was evidence of guilt.

Blood Covenant

The covenant is another form of oath-taking, consisting of a mutual oath or a mutual conditional curse: each party conveys the curse to the other should he violate the conditions of the engagement. The binding effect of the covenanting oath is familiar in the rites of secret societies, the best known modern example being that of the Mau Mau movement in Kenya (see KIKUYU). This type of oath-taking is often reinforced by the most fearful ceremonies and includes the blood covenant, which demands either the drinking or sharing of blood. According to Herodotus (c 485–425 BC) the Medes and the Lydians, when taking an oath, made flesh wounds in their arms, following which they drank each other's blood. The signed contract is the modern equivalent of the ancient oath-bound compact or covenant between the parties.

At all times and among most peoples the oath has played an immense part in binding communities together for the achievement of a common purpose. Sometimes an oath involves the allegiance of the subject to his monarch, while the coronation oath, on the other hand, compels the monarch to honour certain obligations towards the state.

The binding effect of an oath was never more apparent than in Nazi Germany, when it secured the allegiance of the officer caste to the Nazi regime. Its power is also demonstrated in the solemn pact sworn by the desperate English naval mutineers at the Nore in 1797, which was so seriously regarded that the same year a repressive

law made it an offence punishable by transportation to administer an unlawful oath. This later resulted in the trial and conviction of the Tolpuddle martyrs, who in 1834 were found guilty of swearing men into a trade union lodge at a time when trade unionism was in itself perfectly legal.

So frightening were the imagined consequences of violating an oath that had been made upon some sacred or magical object, that in the past certain individuals were denied the privilege of oath-taking, since any perjury on their part could have severe repercussions upon the community. Among those exempted in Roman society were the priest of Jupiter and the Vestal Virgins.

An example of a primitive legal oath is that of the Samoan who, when accused of theft, solemnly swears: 'In the presence of the chiefs now assembled I lay my hands on the stone. If I stole the thing may I speedily die.' Such a device has often been quite sufficient to bring a culprit to light. Where this technique fails, however, the unknown thief may well become the target of that ancillary to the oath, the solemn curse, of which the following is an example: 'May fire burn the eyes of the one who stole my bananas. May fire burn his eyes and the eyes of his god also.'

Opposition to oath-taking played a not inconsiderable part in the development of legal and social practices. Certain religious groups, like the Quakers, have always contended that the word of truth requires no reinforcement, submitting also that the taking of an oath weakens rather than strengthens any declaration or promise. For support the religious man could turn to the precept of Christ: 'Do not swear at all.' At the other end of the ethical scale the free-thinking Charles Bradlaugh was prepared to stand his ground in the House of Commons and even to be ejected from the House by force rather than take an oath in the name of a deity in which he had no belief. The right to affirm instead of swearing upon the Bible has now been established.

Within the legal system the oath now exists as an appeal to God as witness to the truth of the evidence given, for it must be declared on oath that what is to be said shall be 'the truth, the whole truth and nothing but the truth'. Cross-examination of the witness has now taken the place of the primitive ordeal, while the pains of imprisonment have replaced the divine punishment once meted out by an enraged deity.

There is no difference in essence between the oath of the old-time Khond who stood upon his tiger skin and demanded death if he failed to speak the truth, and that of the medieval Englishman with his 'By God!', 'By Jesus!' and 'By the saints above!' Each called upon the supernatural powers as witness to the truth of a declared intention or statement, demanding to be punished if his word were broken. The extent to which the once reverent oath has degenerated into sheer profanity is a reflection of the debasement of old spiritual values as much as of the misuse of words.

ERIC MAPLE

Signed in Blood

'Now look-a-here, Tom, less take and swear to one another – that's what we got to do – swear to keep mum.'

'I'm agreed, Huck. It's the best thing. Would you just hold hands and swear that we –'

'Oh, no, that wouldn't do for this. That's good enough for little rubbishy common things – specially with gals, cuz they go back on you any way, and blab if they get into a huff – but there orter be writing 'bout a big thing like this. And blood.'

Tom's whole being applauded this idea. It was deep, and dark, and awful; the hour, the circumstances, the surroundings, were in keeping with it. He picked up a clean pine shingle that lay in the moonlight, took a little fragment of 'red keel' out of his pocket, got the moon on his work, and painfully scrawled these lines . . .: "Huck Finn and Tom Sawyer swears they will keep mum about this and they wish they may Drop down dead in their Tracks if they ever tell and Rot."

. . . Tom unwound the thread from one of his needles, and each boy pricked the ball of his thumb and squeezed out a drop of blood.

In time, after many squeezes, Tom managed to sign his initials, using the ball of his little finger for a pen. Then he showed Huckleberry how to make an H and an F, and the oath was complete.

Obeah
General term in Jamaica and other parts of the West Indies for supernatural power; also applied to evil magic involving the use of objects as containers of occult force, especially balls of earth mixed with feathers, hair or rags, tied up with string and sometimes studded with beads or parts of the bodies of human beings, cats and dogs; soil from graves, eggshells, rum, blood and broken glass are also used in spells; practised by specialist magicians called obeah-men or women.
See VOODOO AND OBEAH.

C. M. Dixon

Obelisk
Four-sided pillar, usually of stone, tapering to a pyramid at the top, frequently associated with graves and temples in Egypt, where it was a symbol of the sun, and also known in Syria; possibly a representation of a ray of the sun, possibly phallic, but its significance is nut fully understuod: also the name of a symbol formerly used in printing to mark a passage in a book as 'spurious or indelicate'.

By doing no more than hold some object – a cap, a photograph – psychometrists may be able to give the most amazing, detailed information concerning the person, and the circumstances, with which the object is connected

OBJECT READING

THE USE OF AN ARTICLE, called an 'inductor', as a means of receiving extra-sensory impressions is known as object reading, or psychoscopy; the term more usually employed in this country is psychometry. Extra-sensory perception (paragnosis) is a broad term covering various concepts, of which the most important are telepathy and clairvoyance. Clairvoyance, the ability to see objects not actually present, may be in time – seeing into the past, present or future – or in space (telaesthesia), in which case it should be considered as synonymous with clairvoyance in the present.

The following experiment will serve as an example of a psychometric test of which the results depend upon telepathy. It concerns Mrs L.M., whom the present writer tested in a series of experiments. On one of these occasions, I handed her an envelope containing a photograph that I had received from Mr K., whom I knew personally. She put her right hand briefly into the partially open envelope without looking at the photograph, which served as an inductor but contained no clues for practical purposes. Mrs M. commented as follows: 'Someone who reads and writes a lot. He is at home in any field. He performs journalistic work. He is quickly stimulated. He leads a hurried and irregular life. I see him writing while seated in a train. He picks up every scrap of news. This is not just curiosity – he has to keep abreast of everything that happens. He can be curt at times. Stacks of papers lie on his desk in a complete jumble. He has a good sense of humour. He speaks foreign languages. Machines form part of his environment. I hear a regular thumping sound. The air reeks. I smell a peculiar, vile scent. The uproar is awful. He himself does not work among the machines, but he walks between them. He sits at a desk. He has a feeling for poetry. He gets a lot of books sent to him.'

It was totally unknown to Mrs M. that Mr K. was in those days the managing editor of a provincial newspaper. This case was therefore a direct paragnostic (or 'psi') 'hit'. I was in frequent touch with Mr K. in those days, had visited his office several times and there was usually a 'complete jumble' on his desk. From time to time during our talks, he would stroll into the composing room to give various instructions. The room smelled of printer's ink, and there were the familiar noises of a printing plant. As a journalist, Mr K. was always in search of news, and travelled a lot by train. He possessed a good sense of humour, was a lover of poetry, and was accustomed to receiving books for review. From this it appears that Mrs M. was able to pick up in her mind the thoughts that crossed mine when I saw Mr K.'s passport photograph. In other words, when touching the portrait, she had the power to bring to mind what I was able to remember when seeing his picture.

The nature of telepathy now becomes apparent. It is the reception in one's mind of thoughts that emanate from another person's mind. It must be pointed out that the picture was no more than a prerequisite for my remembering all sorts of things about Mr K. The same can be said regarding the picture as an inductor to the psychometrist's 'upwelling' of thoughts that rise from within the mind, coming, as we might say, 'out of the blue'.

When we observe psychometrists during experiments and ask them about their ways of working, it appears that they usually get their impressions in the form of images coming to them or being 'forced' upon them: this is how the various thoughts connected with the object handed to them are experienced. These 'enforced' thoughts may be regarded as the forerunners of the 'veridical hallucinations' (hallucinations bearing a correspondence with reality, with actual fact) which occur to sensitives. The 'enforced' thoughts underlie the veridical hallucinations and in certain circumstances they will turn up in them. Here a parallel can be drawn between what is observed in sensitives and what are known as the laws of memory. Research has shown that invariably, along with a clear graphic memory such as is found in people who are able to experience eidetic images (that is, to visualize objects and events), a non-graphic memory can also be discerned. There exists in sensitives a gradual transition from non-graphic ideation to graphic 'knowing', just as one can in general depict a gradual transition from non-graphic to graphic memorization.

The self-observations of our subjects show us that their 'hallucinations', just like eidetic images, can sometimes be exceptionally sharp and detailed. The veridical hallucinations of sensitives seem not only to be limited to sight, and the same is true for the hallucinations of people with eidetic abilities.

Seeing Bits and Pieces

Psychometrists often show an inclination to compare themselves with those who have difficulty trying to recollect a forgotten word or name. If anyone tries to bring to mind such a 'missing' word he will often observe that, at first, names or words which have some kind of associative connection with the forgotten word seem to be 'thrust' upon him.

The same thing happens in psychometry, as is obvious from the following example, pertaining to the well-known sensitive Gerard Croiset. One day he asked a student about his Oedipus complex: 'Have you an Oedipus complex or are you interested in it?' When the student denied his involvement, Croiset continued: 'And yet you have something to do with it.' The student again denied this. Then there was a moment of silence, during which Croiset seemed to wait for complementary impressions. Then he said: 'Now I see other pictures. Did you see a person this morning in a flood of tears that could not be stanched?' The student answered that he had seen that morning a patient in the eye hospital who had an excessive flow of tears. When we ask ourselves how Croiset came to talk about an Oedipus complex, it is not difficult to give an answer. Croiset's brother Max is a famous actor, who has many times played the principal character in *Oedipus Rex*. At the very moment that Oedipus plucks out both his eyes, pieces of red beet are put over the actor's eyes, causing a flood of tears. So, for Gerard Croiset, a flood of tears is associated with Oedipus and whatever is connected with this drama.

When we try to remember a name heard in the past, or an event which happened a long time ago, it can happen that this name or event suddenly 'stands before our

eyes'. But it also can happen that such a name or event will return to us in bits and pieces. Every event is built up of a number of various elements. The same difficulty in getting a complete 'picture' can be observed in psychometrists. Often they will get only a few letters of a first or last name 'thrust onto' them in a paranormal way, or they very often 'see' only a few elements of the totality of events occurring in the past of people with whom they are in telepathic rapport. In one psi experiment the subject, on being introduced to a lady unknown to him, suddenly 'saw' the image of a pair of long white gloves and long ear-rings. The sensitive told the lady that both images went together and had something to do with her, but he did not know what the connection was. She then explained that as a member of a theatrical group she had recently played a part in which she had to wear long white gloves and long ear-rings. For the second act she had to change costumes, and one evening one of the gloves got caught in an ear-ring. This agitated her a great deal especially since she had so little time before going on stage again.

Alternatively, events are thrust onto the subject complete, rather than in bits and pieces. If, for instance, I am asked in which year the Society for Psychical Research was founded, I will answer immediately 'in 1882', and at the same time recall a number of other facts connected with the Society. How do I know that this date is correct? G. E. Muller, who contributed a great deal to the development of the psychology of memory, has pointed out certain signs which he called 'exactitude criteria' – standards by which the accuracy of memory may be gauged – and which together form the 'total exactitude-consciousness' or certainty about the thing remembered (in this case, the date). These criteria include the exclusiveness and the persistency with which the reproduced fact or name is forced upon us. A very important exactitude-criterion is the 'fullness of ideas', by which is meant the fact that we are aware that these ideas which are forced upon us are connected with others. In the chosen example, for instance, not only was the year forced onto me but also the names of the founding members and the titles of works written by those pioneers.

In experiments with psychometrists it is very often found that the impressions they receive are coupled with a firm exactitude-consciousness. When we question them about how their minds work, and especially about this exactitude-consciousness, we find that we are dealing with the same criteria as the ones found in memory research.

A Lowered Consciousness

A lowered state of consciousness, that causes the person to be less inhibited, is evidently favourable to psychometry. In observing psychometrists, their level of consciousness during the experiments is seen to be lowered totally or in part. In most cases this lower level is so slight that it can only be detected with special instruments. With a few subjects this lowering of the level of consciousness goes so far, however, that one may speak of trance and auto-hypnosis. The state of lessening of inhibition resulting from the auto-hypnosis enhances the flow of telepathically received impressions.

Experiments with psychometrists have shown that not only are they not affected in their functioning by distance between experimenter and subject but that they can also break through the time barrier. Some of their experiences show that they are able to get impressions from persons they will meet – by chance – in the future.

In 1946 I developed a test which is known now as the chair experiment. This test consists of two steps. First the subject (Gerard Croiset) gives a description of the characteristics and certain outstanding experiences of a person whom he expects to occupy a certain chair in a lecture hall. Next, often some weeks later, the person who by chance occupies this chair is questioned, to see to what degree Croiset's description fits or deviates from the personality and experiences of this individual. These chair experiments have now been going on for over 20 years and they have taken place in many parts of Europe.

Extensive experiments in the Parapsychological Institute of the State University of Utrecht have proved that some sensitives are able under certain circumstances to furnish data about lost persons, thefts and murders; the Institute has now initiated extensive research into this subject. This discovery raises the question of how far sensitives might use their gifts for practical purposes. However, it must be emphasized that to the science of parapsychology the question of whether ESP can have a practical application is only secondary. There are parapsychological 'hits' of tremendous theoretical value but with little practical implication.

Reasons for Blind Spots

The man in the street tends to think, incorrectly, that sensitives are able to see anything and everything. Nothing is further from the truth. Continual research has taught us that in nearly all such persons we find a more or less specialized interest determined in part by their own experiences. A psychoanalytical approach should, then, provide a knowledge of the urges which motivate them towards the direction of their interest. In my book on the use of sensitives *(Beschouwingen over het gebruik van paragnosten)* I reported the case of a sensitive who regarded it as almost his holy mission to detect thieves and succeeded repeatedly in doing so. Talks with this man showed that, when he was about 17, his father wrongly suspected him of having stolen some money. This suspicion caused quite a lot of difficulties for him which only stopped when his father received proof that his brother, who was always supposed to set an example, was guilty of the theft. The urge which this sensitive showed to solve thefts was clearly related to the psychical trauma which this suspicion had caused.

In contradistinction to the urge to see certain things, there exists also the urge *not* to see certain things. It is self-evident that this negative urge ought to interest the researcher just as much as the positive one:

Chris Barker

The brooch (*above*) is said to have belonged to the ill-fated Mary Queen of Scots (*right*). A 'sensitive' may provide accurate information about the owner of an object (an 'inductor') and experiments suggest that in some cases the explanation is telepathy from the mind of an investigator who knows the object's history

the more so because many of the blind spots that are considered to be shortcomings of the sensitives are closely linked to such negative urges.

The following case is a starting point. In October 1958, a Mrs A.B., who has often given evidence of psi abilities, was visited by a woman. In the course of the visit, Mrs A.B. spontaneously asked her visitor whether her father was possibly interested in the play *Gijsbrecht van Amstel*, as she got the impression that in some way or other he had something to do with this tragedy. On receiving a negative answer, Mrs A.B. did not pursue the matter further.

On 17 January 1960 the visitor's father died. The family inserted the announcement of his death in the newspaper *Tubantia* the following day and Mrs A.B.'s visitor also signed the announcement. Under this insertion, at a distance of about 6 inches, there was an advertisement of a forthcoming performance of the tragedy *Gijsbrecht van Amstel*. Because both announcements were coincidentally associated in space as well as in time, and both were read by the visitor, we may accept that we have here a case of a so-called 'displacement' or substitution based on 'defence' mechanism which certainly originated in a repression.

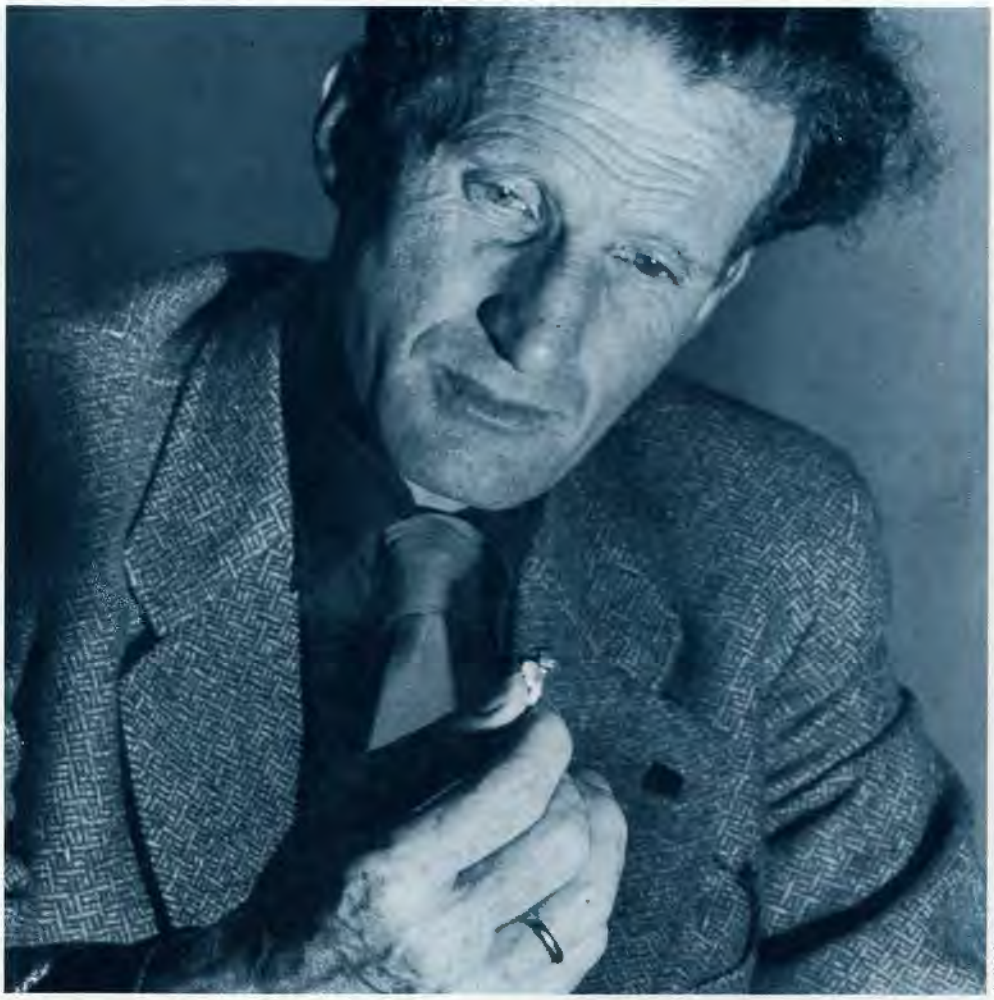
Some years ago I came into contact with a 23-year-old student who was gifted with psi abilities to some degree. A series of psychometric experiments followed which on the whole produced satisfying results. One day, when I handed him a cap to be used as an inductor, the subject told me that this object gave him a very unpleasant feeling. The cap, which had been made available by the police, belonged to a man sought in connection with the murder of the new-born child of his unmarried daughter. The student told me that he felt terrified. Suddenly he threw the inductor away, stating that he did not get any impressions.

Some days later, though I had not given him any information about the origin of this object, the test subject asked me whether it

had something to do with the murder of a new-born child. When I asked him why he put this question, he told me that he had had a dream about a man who had put a new-born child under a heap of pillows. At that point I could only reply that this 'picture' was correct. Afterwards a conversation followed about 'displacements' in time as observed by Whately Carington, S. G. Soal and others. Suddenly the subject exclaimed: 'Now I know why I did not get any impressions a few days ago.' He began to talk in detail about an event in his childhood. His mother gave birth to a second child and gave so much care and attention to the new baby that it aroused feelings of hate and repugnance in him. One day, an aunt who happened to visit them saw him deliberately throwing bricks into the cradle: his aunt consequently gave him a sound spanking.

When I asked him if he could find any connection between this experience of his youth and his not being able to tell anything about the inductor (that is, the cap) given to him a few days previously, the subject answered: 'It's quite clear. Unwittingly I identified myself with the murderer of the child. Something within me told me: "You might have done the same thing: you are capable of doing something like that." Therefore I did not want to see it.' When he was asked if he could account for his anxiety when he took the inductor in his hand, the subject answered without hesitation that this anxiety must have resulted from a deep repression. 'Evidently, I knew at once when you handed me the inductor that this had to do with the murderer of a child. Because I identified myself with the murderer, however, I must immediately have repressed these impressions, which caused anxiety. During my sleep, when censorship was weakened, the story loomed up in me.'

The famous Dutch 'sensitive' Gerard Croiset holds a ring during an object reading session. He has often helped to trace missing objects and persons, and has assisted police investigations of thefts and murders



Leif Geiges

Condensing Space and Time

In the dreams and hallucinations of sensitives the phenomenon of condensation or compression has also frequently been noticed. The following is an interesting case of such condensation. It concerns a sensitive, W. Tholen, who, like Gerard Croiset, has succeeded innumerable times in supplying details by telephone about missing persons, animals and objects. On August 1964 he was consulted on the telephone by a doctor, unknown to him, whose wife had mislaid three trinkets. Mr Tholen gave a description of an antique cupboard which was supposedly in the consultant's home. He 'saw' the missing objects in this cupboard. Since the doctor did not possess such a cupboard he paid no further attention to the sensitive's words. One day he did find the three trinkets, but in three different cupboards. He then realized that the sensitive had amalgamated parts of these three cupboards into a new piece of furniture.

Similar compressions and condensations appear to exist in connection with both the past and the future. Many descriptions by sensitives have been recorded in which situations both from the past and the future blend with situations from the present into a new and at first unrecognizable whole. Croiset, for instance, when asked to indicate where a missing person might be found, described a stretch of river where ships were moored. The ships were at that time no longer there but had been moored there some days previously. It was the place where the missing person had drowned, and Croiset had wanted to indicate where to look.

Obsidian

Natural glass of volcanic origin, used by American Indians and other primitive peoples for weapons, tools and ornaments, and for mirrors and scrying: a black scrying mirror of obsidian, which seemed to smoke when diviners looked into it, was the symbol of the black Tezcatlipoca in Aztec religion: among California Indians boys and girls undergoing initiation were cut with obsidian knives and priests mimicking bears slashed people with obsidian 'claws'. See AZTECS.

C. A. Burland

Occult

Secret, mysterious, hidden behind surface appearances and veiled from the common view, from Latin *occulere*, 'to conceal'; vague general term for things magical or mystical, beliefs shrouded in mystery and known only to the initiated few.

ODIN

GRIM LORD OF VALHALLA

An old man with one eye, dressed in a cloak and broad-brimmed hat; this was the god Odin, whose other eye had been sacrificed in return for wisdom and was kept hidden in the underworld – a story connected with his role as bestower of the arts and learning, and god of the dead

THE GOD Odin stands out as a dominant figure in Scandinavian myth and legend, and scenes and symbols associated with him abound in the pre-Christian art of the Viking Age. He has a double heritage from the Germanic past, taking over from the war god and sky god Tiwaz on the one hand and from Wodan, ruler of the underworld and ancestor of kings, on the other. The wealth of traditions concerning him may be partly due to new influences from Eastern Europe in the Viking Age, imparting fresh vigour to his cult at a time when contacts between Sweden and the East were well established. It is noteworthy that the figure of the god on his eight-legged horse Sleipnir first appears in Scandinavian art on memorial stones of Viking Age date on the Baltic island of Gotland, on the direct route to Russia.

Certainly the cult of Odin as reflected in literature and art is a rich and many-sided one. Odin is the god of the dead, the guide who conducts them to the otherworld, either in his own form or represented by his messengers, the Valkyries. He is also the god of inspiration and ecstasy, who brought mankind the gifts of poetry, oratory and learning. He is the god of battle, inspiring his worshippers, the warrior princes and leaders, with fanatic loyalty. Sometimes, in spite of his association with the dead, he is seen as All-Father, the leader of the gods, and he possesses some of the powers and symbols of the god of the sky. He is a shape-shifter and expert on magic, and he is a travelling god, moving up and down the world and taking an active interest in the affairs of men, while he also journeys beyond

This statue of Odin emphasizes the god's majestic aspect as All-Father and leader of the Norse gods. At his shoulders are the two ravens which every day flew round the world and reported to Odin what they had seen. The two wolves which accompanied the god symbolized, like the ravens, Odin's association with the battlefield, for these creatures fed on the corpses of the slain

National Museum, Copenhagen

Royal Library, Copenhagen

Royal Library, Copenhagen

Far left **Odin was a travelling god, an observer of the affairs of men who also visited the realm of the dead; here the one-eyed god is shown on his eight-legged horse Sleipnir, on which he journeyed faster than the wind**

Left **Baugi drills a hole in the stone mountain within which his brother giant had hidden the mead of inspiration. Odin was then able to enter the mountain in the form of a snake and steal the precious liquid, which gave him the gift of poetic inspiration and oratory**

it and visits the realm of the dead in order to learn hidden secrets.

Men and animals were sacrificed to Odin, and he himself claimed to have been sacrificed by his own special rites, pierced by a spear as he hung from a tree, that he might win knowledge for gods and men. He moved among the heroes as an old man with one eye, dressed in a cloak and a broad-brimmed hat. It was said that he had given up his other eye in return for wisdom and that it was hidden in the well of Mimir, the ancient guardian of the underworld.

Bodies Hung from Trees

Sacrifice indeed formed an integral part of Odin's cult. In one legendary tale of a certain King Vikar, the king had promised a sacrifice to the god in return for a favourable wind, but when lots were drawn to find the victim, he was the chosen man. He decided to stage a mock sacrifice, standing upon a tree trunk with a rope of calf's intestines round his neck, fastened to a tree which was held down beside him. The warrior conducting the sacrifice touched the king with a rod, dedicating him to Odin, and immediately the intestines became a strong cord and the rod a spear, so that the king was pierced through and the tree sprang back into position, carrying the body of the slain man high among the branches. Just such a sacrificial scene as this is carved on one of the Gotland stones, with the eagle, symbol of Odin, hovering above; the twisted knot, Odin's symbol, is shown above the scene. In the 11th century history of Adam of Bremen the writer quotes the testimony of an old man of 70 who could remember in his youth seeing the bodies of men and animals hanging from trees in the sacred grove at Old Uppsala, the sacred place of the Swedes, after one of the great festivals of the gods.

There also exists a dramatic account by an eyewitness of the sacrifice of a young woman at the funeral of a chief of the Rus, the Scandinavian settlers in Russia, about 922 AD on the middle Volga. The chief was given temporary burial while preparations went on for the funeral ceremony, when he was to be burned on his ship in the river, and one of his slave-women volunteered to die with him. She was feted and pampered until the day of the funeral, but her end was a grim one. After an elaborate ceremony in which the entry to the otherworld was enacted, when she described her relatives and her dead husband awaiting her there and sang a long farewell to her companions on earth, she was stabbed by an old woman called the Angel of Death, while at the same time a cord was drawn tight around her neck until she died. Her body was placed on the ship beside her master, together with various animals sacrificed with her.

This picture of a splendid and barbaric funeral among the Eastern Vikings is fully in keeping with what appears in Scandinavian literature concerning the cult of Odin, whose followers were said to be burned with their choicest possessions that they might pass rapidly to the realm of the god. There is also a persistent literary tradition of suttee, implying that not only warriors who died in battle but also women who were courageous enough to be slain with their husbands might be welcomed in Odin's kingdom. Several archeological finds from the pre-Christian Viking Age suggest that a woman has been sacrificed at the funeral of a chieftain, in particular one in the Isle of Man and one in Orkney.

Rage of the Berserkers

The fierce joy with which devotees of Odin met their end is characteristic of the madness and ecstasy with which he inspired his followers. The tradition of the berserkers, who fought in the skins of animals instead of armour, howled like wolves in the combat and were impervious to wounds while the battle fury possessed them, goes back before the Viking Age, but it was still vividly remembered in the later literature. It is said that there were berserkers in the royal bodyguard of Harald Fairhair of Norway in the 9th century, with a special place on the king's warship. Legends of shape-shifting are probably associated with the berserker tradition: there is the story of Sigmund the Volsung, for instance, who lived out in the woods with his son while he planned vengeance against the man who slew his father and brothers, when it is said that the two wore wolf-skins and spoke the speech of wolves; or of the great champion Bodvar, who lay sleeping in his tent while a huge

H. R. Ellis Davidson

bear fought in his place in the king's army and wreaked havoc among the enemy. The Icelandic sagas have instances of old warriors on the farms who were sometimes overcome with fits of berserk fury which they could not control, when they would destroy anyone who came in their way and were left drained of energy when the rage had spent itself.

Odin sometimes behaves like a shaman of the steppe, the man who in a state of trance can send his spirit to the otherworld and act as emissary between gods and men (see SHAMAN). His voluntary sacrifice on the World Tree suggests the initiation ceremony of such a shaman, while his eight-legged horse resembles the steed which carries the spirit of the shaman to the heavens while his body remains on earth. It is indeed said of Odin that while he lay asleep his spirit could travel in animal form, and he sometimes took on the shape of serpent or eagle to achieve his end.

The Mead of Inspiration

One of the myths tells how Odin won the mead of inspiration for gods and men by his magic powers. This mead had been brewed from the blood of the all-wise giant Kvasir, mixed with honey. The dwarfs who slew him filled three vessels with the magic drink, but it was taken from them by a giant, Suttung, and he shut it within his stone mountain. Odin set off to achieve it by cunning, and in disguise he went among the men of Suttung's brother Baugi as they cut hay. He sharpened their scythes with a wonderful whetstone, so effectively that they began to quarrel over it and ended by cutting each other's throats. Odin took the place of all nine of them, asking no wages except a drink of the magic mead. Baugi agreed but his brother was unwilling, so with Baugi's help Odin bored a hole in the mountain wall, crawled in in the form of a serpent and slept three nights with the giant's daughter, who agreed to give him three drinks of the precious liquid. In three draughts Odin emptied the vessels and then flew away in eagle form to Asgard, where the gods were waiting with a row of vessels to receive it; he spat it into them, and from that time the gift of poetic inspiration and oratory has been his to give to men. Knowledge of the runes, which were bound up with magic spells, was also due to Odin, since he won

King Hakon of Norway, entering Valhalla after death in battle, refused to lay down his weapons since no trust could be placed in Odin

them by his endurance on the World Tree.

Odin, like Wodan before him, was the ancestor of kings, and he would appear to young warrior princes, encouraging them by gifts of special weapons, horses or armour, and instructing them in battle magic and the art of warfare. One of his treasures was the great spear Gungnir, the flight of which decided victory when armies met. There was a tradition that it was a lucky omen to be the first to hurl a spear over the advancing enemy, for this dedicated them to Odin and so ensured victory. But though the god gave aid to his warriors, he was bound to play them false in the end when their time came to fall in battle. The splendid sword given by Odin to the young hero Sigmund the Volsung was shattered by the spear of the god on the battlefield in the end, and Odin himself hurled down Harald War-tooth of Denmark from his chariot, when he had withdrawn his favour and given it to Harald's opponent. Thus the capricious nature of Odin's generosity and his treachery to those who have served him faithfully is stressed in both poetry and prose. The god Loki taunted him with giving victory to cowards who did not merit it, while in a 10th century Norwegian poem King Hakon of Norway, entering Valhalla after death in battle, refused to lay down his weapons since no trust could be placed in Odin. The reason given in the poetry for his faithlessness is his need for great champions in his own realm, against the day when he must lead out his army to do battle with monsters and the enemies of the gods.

The Hall of the Slain

Those who died in sacrifice to Odin, either in battle or by some terrible end like that of the old hero Ragnar Lodbrok, who perished in a snakepit with a song of triumph to Odin on his lips, were said to be welcomed in the hall of Valhalla after death. The Valkyries, the fierce battle-maids of the god who rode to do his will on the battlefield and conduct dead princes back to his realm, welcomed them there with horns of mead, and this scene is pictured many times over on the Gotland memorial stones. It is said in the poems that in Valhalla, the hall of the slain, men fought all day and those who fell were restored again in the evening, when all feasted sumptuously on pork and mead. To a large extent Valhalla appears to be a symbol of death and the grave, in which an everlasting battle is said to take place, rather than any bright palace in the heavens, and it must not be taken to indicate a literal belief in a special kind of immortality. But the idea of kings and high-born warriors joining their ancestors after death and being welcomed by the god they had served is a tradition deeply established in the lore associated with Odin's cult.

Odin was the great magician, the god with the power to bind and loose by means of spells which he laid upon the minds of men. Such spells could cause panic and paralysis at a moment of crisis, or could free the mind from fear and hesitation so that Odin's men emerged triumphant at the time of testing. His symbols are in keeping with his many-sided reputation: the spear, the raven and the wolf because of his connections with battle; the horse and the eagle because of his power to travel between the worlds and over the sky; the three-way knot to signify his power to bind, no doubt associated also with the sinister knot which dispatched his victims; the maiden with a horn or cup in her hand to welcome the dead because of the joyous entry into Odin's realm – a link also with the mead of inspiration.

His cult was primarily an aristocratic one, not a religion of the common people or of the community as a whole like those of Thor and the Vanir. The works of art and the literature which it inspired are such as would emerge from the courts of kings and leaders, and could have been used for the education of young warriors of noble families, proud to remember the exploits of ancient heroes counted among their own ancestors. So it comes about that the sinister figure of the one-eyed god, feared and suspected rather than loved, but followed with wild enthusiasm by those who despised a straw death and sought the wild excitement which he offered, has left an indelible mark on the northern world of myth.

Oedipus

In Greek mythology, a king of Thebes who was fated to kill his father and commit incest with his mother; to prevent this, as a baby he was abandoned in the hills with a spike driven through his feet, hence his name, 'swell-foot'; he grew up unaware of his true parentage, killed his father, Laius, solved the riddle of the Sphinx, and married his mother, Jocasta; when the truth was discovered, he blinded himself, and went into exile; Freud named the 'Oedipus complex' after him.

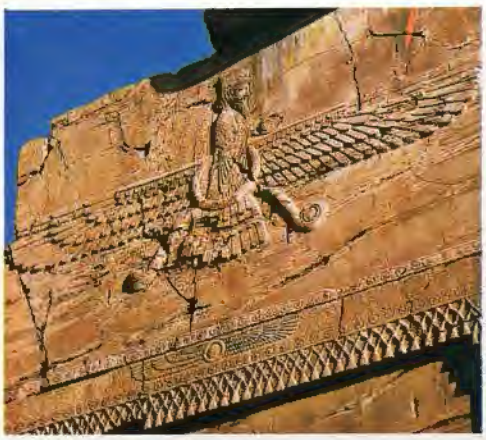
In later Zoroastrianism, Ohrmazd takes over the mantle of Ahura Mazdah, creator of heaven and earth; he is the eternal adversary of the Destructive Spirit, over whom he eventually triumphs

OHRMAZD



Roger Wood Studio, London

Relief of the god Ahura Mazdah from a temple at Persepolis, ancient capital of the Achaemenid kings of Persia: Ahura Mazdah was at first distinguished from his Holy Spirit, but in the course of centuries the two merged to produce the new figure of Ohrmazd

OHRMAZD is the Middle Persian (c 200–700 AD) form for the Zoroastrian God who first appears in the *Avesta* (the sacred book of the Zoroastrians) as Ahura Mazdah, the 'Wise Lord' or the 'Lord Wisdom'. It is not known whether such a god existed before the appearance of the Iranian prophet Zoroaster, who probably flourished in the 6th century BC. It seems, however, most probable that he assumed overriding importance only with Zoroaster himself, who regarded himself as Ahura Mazdah's prophet and believed himself to be in direct communication with the god (see ZOROASTRIANISM).

The oldest part of the *Avesta*, the *Gathas*, is usually considered to be, if not Zoroaster's own words, then at least directly inspired by him; and the centre of this 'revelation' is the god Ahura Mazdah, creator and sustainer of the universe. There are other divine beings beside Ahura Mazdah himself, but these are always subordinated to him and he is sometimes called their 'father'. These divine beings were later formed into a group of seven, who constituted God's 'court'. Originally, however, they seem to have been aspects of God: they are the Holy Spirit, Truth, the Good Mind, the Kingdom, Right-Mindedness, Wholeness and Immortality. Collectively they would later be known as the Bounteous Immortals.

Ahura Mazdah, however, stands above and beyond them in the *Gathas*: he is their 'father' and their creator. By 'father' Zoroaster did not understand anything physical (since his God was pure spirit) but simply the origin of all things. Ahura Mazdah creates Truth, for instance, by his will or wisdom and he maintains it by the Good Mind. So too at the beginning of existence Ahura Mazdah *thinks*: 'Let the wide space be filled with lights', and it is so. And it is 'by his mind' that he 'fashioned forth corporeal things, consciences and wills', that 'he created bodily life, and deeds and doctrines among which men could freely make their choices'.

Ahura Mazdah is holy: and by 'holiness' the Zoroastrians understood creativity and fruitfulness. He is the creator of all good things, both spiritual and material. He thinks creation into existence and there does not seem to be any pre-existent matter from which he creates: he creates out of nothing. He is omnipotent and 'rules at will'; he is judge and in the last days will judge all men according to their good and evil deeds.

There is one thing, however, that Ahura Mazdah did not create, and that is death. His Holy Spirit is the spirit of life, and death was the work of another spirit, Angra Mainyu or the 'Destructive Spirit', who was later to be called Ahriman (see AHRIMAN). In the *Gathas* this Destructive Spirit is the eternal adversary of God's Holy Spirit but not of God – of Ahura Mazdah – himself. The Holy Spirit is the author of life and holiness, while the Destructive Spirit is the author of death and diminution. And so we read: 'Of these two Spirits he who was of the Lie chose to do the worst things: but the Most Holy Spirit, clothed in rugged heaven, (chose) Truth . . .'

There is, then, an evil spirit beside the life-giving Holy Spirit of God, who brings death and destruction into the world. The evil spirit is not particularly prominent in the *Gathas* but was later to become an independent principle and the antagonist of God himself.

In the later *Avesta* the ancient 'pagan' gods re-appear as helpers of Ahura Mazdah and his role is seriously impoverished. This process can also be discerned in the inscriptions of the Achaemenid kings, in the later of which the old god Mithra and the goddess Anahita appear alongside Ahura Mazdah. Yet Ahura Mazdah remains essentially the creator of heaven and earth and of 'what is excellent on earth'. He is the source of increase and fertility, of good order in general and of the particular 'good order' among men established and assured by the Achaemenids, the royal house of the first Persian Empire (546–330 BC).

Adversary of Evil

With the sack of Persepolis by Alexander the Great in 330 BC, Zoroastrianism, of which Ahura Mazdah was the Supreme God, ceased to have any privileged position; and it was only with the foundation of the second Persian Empire by the Sassanians in 226 AD that Zoroastrianism not only rose out of obscurity, but became the official religion of the Empire. Ahura Mazdah re-emerged as Ohrmazd but, though still the same God, he was yet not quite the same.

In the course of the centuries Ohrmazd (as he was now called) had been identified with the Holy Spirit of the *Gathas*; and this identification caused a quite new picture to appear. The Holy Spirit had been the eternal adversary of the Destructive Spirit (Angra Mainyu, now called Ahriman), but this role now fell to Ohrmazd himself. This meant that God and the Devil were independent powers – the first wholly good and the second wholly evil, the first dwelling in eternal light, the second in eternal darkness.

'Ohrmazd was on high in omniscience and goodness; for infinite time he was ever in the light. That light is the space and place of Ohrmazd . . . omniscience and goodness are his totality . . . Ahriman, slow in knowledge, whose will is to smite, was deep down in the darkness: (he was) and is, yet will not be. The will to smite is his all, and darkness is his place.'

Such was the state of affairs in the beginning, and so it would have remained if Ahriman had left well alone, but seeing 'valour and supremacy superior to his own', he was jealous of it and longed to possess it. He was not strong enough, and so he created other devils to assist him. Ohrmazd in self-defence first created the Bounteous Immortals and other kindly spirits and then the material creation – the sky, water, the earth, plants, cattle and finally man. Strictly speaking Ahriman cannot create material things, he can only destroy or corrupt them. His first attack on Ohrmazd's spiritual creation failed, for Ohrmazd repulsed him by the power of the holy Word. His second attack on the material creation was only too successful, however. 'Like a serpent he darted forward, trampled on as much of the sky as was beneath the earth, and rended it . . . Then he fell upon the waters . . . which are below the earth; and he bored a hole in the middle of the earth and entered it thereby. He fell upon the plants . . . and upon the (primal) Bull and Gayomart (primal man); and he slew them both.' Thus the second battle ended in a complete defeat for Ohrmazd, or so it seemed.

Even so, Ohrmazd's spiritual creation remained untouched; and once Ahriman had entered the sky he found himself imprisoned within it. Moreover, the seed of Gayomart, the primal man, and of the Bull had fallen into the ground; and from there human life and the life of man's friends in the animal creation were to grow up and to carry on the good fight against Ahriman and his demonic hordes. For 3000 years the two spiritual armies are locked in indecisive battle but in the last 3000 years allotted to this world Ohrmazd's victory becomes every day more apparent, until in the last days Ahriman is defeated by a war of attrition; and the whole demonic creation, seeing Ohrmazd's creation elude it, falls upon itself in a suicidal civil war. Finally Ohrmazd smites Ahriman and he is expelled into the eternal darkness in which he will remain forever unconscious, never to rise again: and all Ohrmazd's creation will be reunited with him in the eternal light and in unceasing joy for ever and ever.

A great source of prestige to the kings of France was their claim to be anointed with oil of divine origin, incorporating the famous oil of Clovis: at the ceremony of consecration its special sanctity would be passed on to the monarch

OIL

THE SUBSTANCES that have been employed for anointing have been very various: they include vegetable oils, often perfumed and containing gums and balsams, animal fats, blood, saliva, honey and mud. Their use in ritual is both ancient and widespread. They might be employed in the worship of a god, as a means of consecration, for the unction of the sick or the burial of the dead, or to impart special powers. A magical factor is present in all these forms of anointing.

The cosmetic use of oils and unguents in religion was obviously patterned on their employment in secular life as aids to the toilet. The Egyptians, for example, made much use of perfumed ointments as pleasing emollients: the celebrated golden throne found in the tomb of Tutankhamen depicts, on its back panel, the queen anointing the young king; on festal occasions the Egyptians wore cones of perfumed ointment on their heads, which gradually melted in the heat and anointed their bodies. Consequently, in the daily toilet-ritual performed in temples for the pleasure of the gods, their cult images, as representatives of themselves, were solemnly anointed. Similar toilet ceremonies are performed in Hindu temples where the devotees of Shiva anoint the *lingam* symbol of their god. Greek mythology also reveals that the gods were thought to delight in fragrant unguents as mortals did. The goddess Hera, seeking to win the favour of Zeus, carefully prepares herself by bathing in ambrosia and anointing herself with perfumed oil (*Iliad*, book 14).

Pleasing to God

A particularly notable instance of the cosmetic use of oil in the service of a god is recorded in the book of Genesis. The patriarch Jacob, after his marvellous dream at Bethel, 'rose early in the morning, and he took the stone which he had put under his head and set it up for a pillar and poured oil on the top of it' (Genesis 28.18). This stone pillar was a cult object, denoting the presence of deity. The sequel to Jacob's act is significant. God announces himself to Jacob in a dream: 'I am the God of Bethel, where you anointed a pillar and made a vow to me' (Genesis 31.13). God was evidently understood to have appreciated the cultic service rendered to him by the anointing of the pillar.

Ancient Hebrew religion provides some of the best evidence of the use of oil as a means of consecration. Chapter 30 of the book of Exodus gives elaborate directions for the making of holy oil. 'Take the finest spices: of liquid myrrh five hundred shekels, and of sweet-smelling cinnamon half as much . . . and of aromatic cane two hundred and fifty, and of cassia five hundred . . . and of olive oil a hin; and you shall make of these a sacred anointing oil blended as by the perfumer; a holy anointing oil it shall be.' Then follow instructions about anointing sacred objects, the 'tent of meeting and the ark of the testimony' and all their cultic furniture and vessels. The purpose of doing so is clearly stated: 'you shall consecrate them, that they may be most holy; whatever touches them will become holy. And you shall anoint Aaron and his sons, and consecrate them, that they may serve me as priests.'

British Museum

The woman anoints Christ's head with ointment as he sits at supper: 15th century manuscript. Her action was interpreted by Jesus as an anointing preparatory to his burial

The virtue which this anointing imparted to the objects and persons concerned involves an important religious concept. The oil was regarded as being impregnated by a divine power or virtue; and its application to suitable objects or persons had the effect of endowing them with the character of holiness.

The Lord's Anointed

The consecration of Aaron and his sons by holy unction to serve as priests of Yahweh is paralleled in Hebrew records by the anointing of kings. The classic case is that of the consecration of Saul by the prophet Samuel: 'Then Samuel took a vial of oil and poured it on his head, and kissed him and said, "Has not the Lord anointed you to be

University Films

A lingam, symbol of the god Shiva, is worshipped after being anointed and garlanded with flowers. The ritual of anointing cult images and symbols of the gods was based on the cosmetic use of oils in secular life

prince over his people Israel?"' (1 Samuel, chapter 10). This sacring conferred on Saul an indelible distinction which was still respected even when he had fallen from divine favour. Thus David, his young rival, refused to take the opportunity of slaying Saul, saying 'who can put forth his hand against the Lord's anointed, and be guiltless?'

There is evidence of the anointing of kings in ancient Egypt, in Hinduism and among the Aztecs; but it was the Christians, following Jewish precedents, who made anointing an essential part of the coronation ceremony. The French kings claimed to be anointed with oil of divine origin. A legend told how at the baptism of Clovis (c 465–511), the reputed founder of the French monarchy, a crystal phial descended from heaven with the chrism (consecrated oil) for the anointing of the king. Every French king, down to the ill-fated Louis XVI, was anointed at his coronation with chrism that contained a tiny fragment of the solidified oil of Clovis. The claim of the medieval French kings that their regal status was conferred by this divine oil was a source of envy to their English rivals. Eventually English kings were enabled to claim a like prestige. During the reign of Richard II, a phial of oil was miraculously found in the Tower of London. It was identified as one alleged to have been given to St Thomas of Canterbury by the Virgin Mary for the anointing of the kings of England. Before Richard could avail himself of the divine gift, he was deposed. To his supplanter Henry IV the oil was truly a godsend, for his consecration by it endowed him with a prestige that Richard lacked.

The sacring of the monarch remains a crucial part of the English coronation service. A rubric directs: 'on the morning of the Coronation early, care is to be taken that the Ampulla be filled with oil, and together with the spoon, laid ready upon the Altar of the Abbey Church.' The ceremony of anointing is prefaced by a short consecratory prayer, 'to bless and sanctify thy chosen servant who is to be anointed with this oil and consecrated King'. The Archbishop of Canterbury anoints the monarch, in the form of a cross upon the head, breast and hands. A compound oil is used, which is consecrated by a bishop of the chapter of Westminster on the morning of the coronation.

In Catholic Christianity the consecratory aspect of anointing is a feature of its use in baptism, confirmation and the ordination of priests. The chrism that is used is a mixture of olive oil and balsam. It is employed also in the consecration of churches, altars, sacred vessels and baptismal water. In the Roman Catholic Church, chrism is consecrated by bishops on Maundy Thursday; in the Orthodox Church the privilege is reserved to patriarchs only.

It is to be noted, in this connection, that the title 'Christ' comes from the Greek *Christos*, meaning 'the Anointed One', which in turn translated the Hebrew *mashiah* (Messiah). The Hebrew title had become the designation for Yahweh's chosen or 'anointed' representative, who would ultimately effect the salvation and restoration of Israel. Jesus of Nazareth was identified by his followers as the expected Messiah; the title *Christos* was soon added to his personal name, and from it the word 'Christian' derived.

Extreme Unction

The ritual anointing of the sick, known as the Unction of the Sick, is a sacrament of Catholic Christianity. The scriptural authority for the rite is given in the epistle of James, chapter 5. 'Is any among you sick? Let him call for the elders of the church, and let them pray over him, anointing him with oil in the name of the Lord; and the prayer of faith will save the sick man, and the Lord will raise him up; and if he has committed sins, he will be forgiven.' As this passage indicates, and as was the custom in the Early Church and still is in the Greek Church, this Unction was primarily considered as a divinely instituted means to recovery from sickness. In the Roman Catholic Church, however, the rite has come increasingly to be known as Extreme Unction, being administered as a preparation for death to those near their end.

The use of oil and other unguents in burial rites is ancient, and it has been practised by many peoples. Among the Egyptians it figures prominently in the ritual of embalmment (see MUMMIFICATION). The Greeks placed vessels of oil known as *lekythoi* in tombs for the use of the dead, and the Romans poured perfumed oil over the ashes of the dead. The Christian gospels contain two notable passages concerning the mortuary use of oil. Jesus interprets the action of the woman who anointed him at Bethany with the words: 'She has done what she could: she has anointed my body beforehand for burying' (Mark 14.8). And female followers of Jesus bring spices to his sepulchre to anoint his body on Easter morning (Mark 16.1).

Unguents that confer supernatural powers on those anointed with them figure in the folktales of many peoples, particularly in tales connected with witches. One of the earliest examples occurs in the famous *Golden Ass* of Apuleius, written in the 2nd century AD. A colourful narrative relates how the witch Pamphile, by the application of a special ointment, changed herself into an owl and flew away (see also FLYING OINTMENT). Although such instances may be classed as 'black' magic, the religious use of holy oils and other unguents equally involved the principle of contagious magic – that supernatural power or grace can be obtained by contact with a substance that is charged with it.

OLD AGE & WITCHCRAFT

Behind the figure of the witch as a bent old hag is the landscape of the society that created her; mental illness among lonely old women was construed as witchcraft by the people of their time, partly to satisfy psychological needs of their own.

ALL GENERALIZATIONS are subject to exception, but Reginald Scot's verbal cartoon of the 16th century English witch as 'lame, blear-eyed, pale, foul and full of wrinkles' seems to have had wide European currency. In his examination of Spanish witchcraft materials, J.-C. Baroja noted that the Evil Eye was more particularly found in elderly spinsters. Perpetuated by German and Scandinavian folklorists, the stereotype of the witch as a malign old woman has found contemporary reaffirmation in Disney films.

But the bent old hag, whilst she may indeed have typified the European witch, is not a universal symbol. Anthropologists would admit that those arraigned for witchcraft in Africa, although they are usually women, are by no means typically elderly. In fact in most African communities the old are revered rather than rejected. If one accepts the idea of the witch as a special personality, it would be logical in terms of modern sociological theory to interpret her as a function of the society or culture that produced her. With this concept in mind, the differences between African and European witchcraft beliefs may be instructive.

African society is organized around the 'extended family', which consists of several generations and a number of kinsfolk living together. In the extended family, which tends to be found in rural and agricultural communities, the position of each member is defined with some clarity and the elderly retain both status and respect. Contrasted with this type of family organization is that typical of the Western world, the nuclear family, which consists of mother, father and their children. Members of the older generation tend to be found both intrusive and disruptive in the nuclear family, and for these reasons often to be excluded.

Since even in modern Europe examples of the extended family still survive, it is not

An old woman is examined by a monk for the 'witch's mark', sign of her allegiance to the Devil: scene from *Witchcraft Through the Ages*

National Film Archive

Many of the characteristics of the witch can also be identified in the schizophrenia of old age

an unreasonable supposition that earlier European society very closely resembled the social organization found today in Africa and Asia. Furthermore, one might suggest that in the evolution of the European nuclear family from its original form as an extended family, outbreaks of witchcraft accusation could be expected to coincide to a large extent with those periods of social change when elderly women in particular had become a burden that the emerging social structure was unable to support.

Even allowing for the fact that feudalism as a social system had shown earlier signs of disintegration, there can be little doubt that the Black Death in the 14th century accelerated economic, and hence social, changes which disrupted the extended family and made the economically non-productive old a considerable burden on such families as were spared. In addition, freed from the age-old restraints of feudalism, people began to offer their skills in a more competitive market which demanded their physical mobility. If they left behind them forever much that had become irksome, they also renounced a web of personal relationships which had once helped to give meaning to their lives, as well as those side-benefits which had largely guaranteed some degree of security to the old.

After the Black Death there must have been increasing numbers of old people who were turned out of their houses because their families had either been wiped out by the plague or had seized the opportunity to bargain for more remunerative work elsewhere. The 'generation gap' could reach sordid proportions on occasion: children not only charged their elders rent after they had succeeded to the family property but in many cases went to law against them. Something of the human misery of the changing order was noted by Robert Cowley, whose main complaint was the hardship caused to labouring families by the system of enclosures. Speaking of the bailiffs who, as administrative officers for the great landlords, came in for much resentment, he says: 'These idle bailiffs will devour all that we shall get by our sore labour in our youth, and when we shall be old and impotent, then shall we be driven to beg and crave of them that will not give us so much as the crumbs that fall from their tables. . . . Better it were therefore for us to die like men than after so great misery of youth to die more miserably in age . . .'

Since Europe at the end of the Middle Ages lacked adequate welfare mechanisms to cope with the widespread plight of the aged, it looks as though unconscious forces first isolated the old and then destroyed them by fire for witchcraft. Later generations were to use the gas chamber with a different set of rationalizations.

Witch Behaviour

One of the problems encountered in the study of medieval European witchcraft is that the research worker has to rely on people living centuries ago to supply him with materials. And of course, these people perceived their world in ways often very different from ourselves. There is always the danger therefore, in reinterpreting observations made in past centuries, that one may lose valuable significances. Nevertheless, as one examines the bizarre evidence of the witchcraft trials, one is struck by the psychotic flavour not only of many of the accusations but also of the confessions. One wonders to what extent many of those found guilty of witchcraft were, in fact, elderly people whose minds had degenerated into some form of schizophrenia. Edmund Spenser in *The Faerie Queene* noted – and misunderstood – the typical schizoid withdrawal of the witch:

> So choosing solitary to abide
> Far from all neighbours, that her devilish deeds
> And hellish arts from people she might hide,
> And hurt far off, unknown, whom she envied.

Whilst one must be careful to discount many of the confessions, which were extracted under the most callous torture, there nevertheless remains a catalogue of delusion that calls for re-examination. The stress on sexuality, the claim to be directed by voices and the alleged ability, after stripping, to be able to fly, all provide a pattern which modern research may help us to interpret.

As a recent Anglo-Scandinavian study was able to demonstrate, many of the characteristics of the witch can also be identified in the schizophrenia of old age. It is interesting to notice that of the sample studied, more than half were unmarried women and over 40 per cent were living alone. Almost without exception these were women who until comparatively recently had regular employment and who, now in retirement, had been reduced to straitened circumstances. Of interest to the analysis of the medieval situation is the medical comment on this sample: 'Although such social circumstances are no doubt the lot of many aged, we believe that these consequences and the general decline in health and vigour associated with senescence fell with special severity on this group of paraphrenics, as it consisted predominantly of women, unmarried people and people without close family or personal attachments.'

Modern studies of the mental condition

Anti-Feminism and the Witch

When the witch proper first appeared she was still outwardly beautiful, though inwardly rotten and treacherous – the snake-witch or *lamia* of antiquity. This concept was in some ways reinforced by Christian anti-feminism; for example, in the Middle Ages Jane Shore, the mistress of Edward III, was accused equally of immorality and witchcraft as if the two charges were interdependent. At that time, as we have seen, the witch in the mind could well be young and beautiful – like the witch in the fifteenth-century painting preparing a love filtre. Gradually, however, she became repulsive in an obvious, sexual sense as well as a secret one. In Goya's pictures of witches at work, for instance, the women are for the most part fairly young, but it is hard to describe in words the sense of utter physical repulsion they arouse. There is a vulgarity and brutality in the painting of them which betrays, to my mind, a strong resentment of the female. More commonly, however, this resentment expressed itself in the simple projection of the witch as an *old* woman, since age is the nemesis that overtakes female sexuality far more than it does that of the male.

The typical Gothic witch of fable, in fact, is quite *un*typical of the type of person who actually seems to have practised witchcraft in the early days of the Inquisition. Initially, it was communities that were investigated, mixed bodies of men, women and children; and their links with one another and confessions of joint activities were an important part of the charge. But the witch of fable is essentially a lonely figure. Old, repulsive, she is a pariah, living outside normal society . . .

I suggest that this sexual antagonism is one reason that persecution fell more, as time went on, upon *old* women. The old woman is at last vulnerable. With her shaky, withered body and toothless gums she represents a cruel travesty of female allure. She has been unsexed, and the resentful male may at last attack with impunity.

Gillian Tindall *A Handbook on Witches*

of some of the aged not only confirm the findings of this particular research project but closely resemble surviving accounts of witch behaviour. Discussing the onset of paraphrenia (a type of schizophrenia found in the aged) the authors comment: 'The first signs are manifested in an increasing quarrelsomeness or unprovoked abuse of those living near. Oddities in speech, appearance or other aspects of behaviour are noticed. The patient may seclude himself, refuse callers, break off contact with tradesmen, and wander outside or move about the house at night, talking, laughing or crying out.' Modern society considers that such people need medical attention rather than the stake. But one hesitates to think what England's 17th century Witch-Finder General, Matthew Hopkins, would have decided. It is by no means unheard of in medical case histories to find elderly women complaining that men, who have hitherto shown not the least interest in them, have sexually molested them – an allegation not without parallels in the strange erotica of European witchcraft.

The Role of the Outcast

The danger of so much anthropological analysis is that it merely permits the substitution of one system of labelling for another. Undoubtedly many witches were insane. But if the value of modern research lies in the insight that it may give into historical events, so too the value of past events such as the massive witch hunts of the 16th and 17th centuries, lies in the light they can shed on our contemporary life. The fact that old people today are committed to hospital rather than burnt, does not really remove the underlying social pressures which continue to produce aged outcasts.

It is generally accepted by psychiatrists that an emotionally disturbed person is to some extent satisfying unconscious needs of

The 'confessions' of old women accused of witchcraft had a pronounced sexual element: the same delusions have been noted by psychiatrists in elderly women whose minds have degenerated into schizophrenia *Left* Drawing by Austin Spare of a repulsive old witch and her 'exteriorization', the alluring form which she assumed in order to seduce her victims *Above* An elderly witch strikes an inviting pose: 16th century drawing by Niklaus Manuel Deutsch *Right* The excitements of the witches' sabbath, described by numerous victims of the Inquisition, are illustrated in this painting by F. Francken

his immediate family or its equivalent. In fact, the family is itself in part responsible for unconsciously demanding and unconsciously rewarding the sort of behaviour now labelled as psychotic. And this implies that the family, although it is not consciously aware of the fact, has an emotional investment in the abnormal behaviour which, if maintained, must militate against the patient's recovery. In this interpretation of insanity as to some extent an expression of the needs of others, lies the reason why many modern psychiatrists like to include the whole family in the therapeutic strategy.

Whilst this particular theory does not exclude hereditary factors, it does assert that the particular form (and possibly the depth and duration) in which insanity will manifest itself is determined by social conditions. Scattered studies of schizophrenia in Africa, and particularly of *Ukuthwasa*, or witch-doctor's disease, support these contentions. Ukuthwasa is a type of schizoid condition regarded as an essential characteristic of a would-be witch-doctor, which, because of differences in social attitude, has usually quite a different course and outcome from that of schizophrenia in a white European community.

The problem under consideration is the extent to which witchcraft can be seen as a role that satisfied unconscious group expectations – just as contemporary expressions of insanity may be seen as responses to unconscious group needs.

The extraordinarily complex interaction of the individual with those with whom he is associated helps us to see abnormal behaviour as at least partially determined socially. Hollingshead and Redlich, examining the social origins of psychotics, found that most schizophrenics came from families who were semi-skilled, partially educated people, suspicious, individualistic, self-centred and hostile to formal educational controls. These are traits that lead to further isolation and discrimination. 'Such people in our society,' Hollingshead comments, 'tend to be dropped by their families as injured limbs are cast off by some organisms.'

The gradual reduction in sharpness of sight and hearing in old age may well have the effect of further emphasizing an isolation already partly produced by social forces.

Socially rejected, with failing sight and hearing, the medieval old woman must have suffered to a pitiful degree: it is no wonder that she responded with bemused and antisocial reactions

Kunsthistorisches Museum, Vienna

Changes in behaviour due to a reduction of communication are likely to follow. Modern studies of conditions of sensory deprivation show that strange and sometimes irreversible changes can be induced in the personalities of people subject to solitary confinement.

Naked to the Sabbath

Artificially created sensory deprivation has been used as one of the main techniques in 'brainwashing' political prisoners, and similar experiences have been noted in people exploring the polar regions or lost in great deserts. Admiral Richard Byrd, for example, isolated in Antarctica for several months, noticed that after the 12th week he was in a state of deep depression, which was succeeded by a loss of identity during which he felt that he was floating like a disembodied spirit; this would have been evidence enough to convince the authors of the *Malleus Maleficarum*, Heinrich Kramer and Jacob Sprenger, that they had another case of witchcraft on their hands. Christine Ritter subjected herself to periods of up to 16 days of isolation in the polar wastes and recorded an almost overwhelming désire to run naked into the snow. If this calls to mind witchcraft evidence concerning women who stripped and went naked to some sabbath, the monsters which the hallucinated Christine Ritter saw seem to rival the bestiary of witch annals.

Alone, socially rejected, with failing sight and hearing, the medieval old woman must have suffered to a pitiful degree. If in addition her faculties were frequently weakened by hunger and cold, it is no small wonder that she responded to rejection with bemused and antisocial reactions.

The study of witchcraft raises far more than an image of a bumbling old hag; for behind her is the society that created her. Eventually one is left wondering who are the more pitiful, those condemned for witchcraft or those who accuse of witchcraft. After considering the monstrous legal and religious armoury of the Middle Ages piled up against the frail, short-sighted old woman, one is inclined to wonder how much of our modern legislation will not come to be regarded as a monument to our own less reputable desires.

LRIAN W. ROSE

Having survived the severest persecution, first under the Tsars and then under the Communists, the Old Believers still preserve the traditions of the ancient Russian Church

OLD BELIEVERS

ANYONE LUCKY ENOUGH to locate the Old Believer community at Erie, Pennsylvania, and to attend their church near the lake front very early on a Sunday morning will find young, middle-aged and old people, all in peasant costume, immersing themselves in the atmosphere of traditional Russia. It is not an atmosphere artificially created or fed by any sort of zealotry, but one sustained as an expression of an isolated though living culture, which is nurtured by devotion to its intrinsic richness. The children are sent to the crowded Sunday school, where they learn Russian and sing the old chants, and the young people may go on to study Russian and other subjects at university. All come together regularly for worship and other communal pursuits, led by their head. Such a community (one of four similar in the United States), though it obviously faces problems of maintaining its identity, enriches the religious life of the country.

The original Old Believers (or Old Ritualists) came into being as a result of the Great Schism in Russia in the 17th century. Patriarch Nikon wanted to introduce into the Orthodox Church, the established Church of the country, certain ritual and liturgical reforms on a Greek model. He was resisted by the compelling personality and total commitment to the traditional faith of Archpriest Avvakum (1620–82), who suspected the Church at Constantinople of being, among other things, tainted by Western influence.

To this day, Avvakum is revered by the Old Believers as a saint and by historians as one of the greatest writers of old Russia. He lost his cause, but carried with him a very large number of people. They eventually divided into two main streams: those having priests, the *Popovtsy*, and those without them, the *Bespopovtsy*. The Erie community is an example of the latter.

As with the Roman Catholic Church at the Reformation, once the great religious monolith of the Russian Orthodox Church had been shattered there seemed to be a compulsion to splinter further. The personality of a local leader or the geographical isolation of a community was often a decisive enough factor to produce a new subdivision. The 'priestless' communities were naturally more inclined to fragment than those which retained or regained a hierarchical system. One Soviet researcher, F. I. Fedorenko, lists no less than 46 'denominations' among the Bespopovtsy.

Avvakum was not himself a fanatic but his uncompromising stand easily inspired fanaticism in others. It led millions into exile; many who did not die at the hands of Tsarist oppressors believed they could keep the purity of the old faith and ritual by taking premature leave of the corruptions of this world, so they died together under the compulsion of a mass hysteria (as happens at the end of Mussorgsky's opera *Khovanshchina*).

Both main streams have now abjured fanaticism. Not only at Erie, Pennsylvania, but in thousands of towns and villages of the Soviet Union, the Old Believers are respected for their peaceable disposition and their positive contributions to local life. The more extreme elements which survived into recent times should not properly be classified as Old Believers at all (see SKOPTSY).

Despite their past suffering, the atheistic Soviet State has not spared the Old Believers any more than other religious bodies. However, those hardened by long experience of Tsarist persecution have not found it as difficult as some others to endure similar treatment from the Communists.

Russia's 'Lost Tribes'

In this, geography has been their friend. An initial desire to flee from population centres, simply in order to avoid the attentions of Tsarist officials, was soon replaced by a positive compulsion to seek the 'land of white water' which they believed was situated somewhere in the East. Starting from the populous areas of European Russia, the Old Believers found plenty of space for their wanderings. They not only tamed the land. They found themselves havens which lay undisturbed for centuries.

Walter Kolarz, in his book *Religion in the Soviet Union*, has told the impressive story of the discovery of a 'lost tribe' of Old Believers which was found by a Soviet expedition to the Bukhtarma valley in north-east Kazakhstan in 1927. Another group was located in 1931 on the Sino-Soviet border, 250 miles from the nearest railway and in the middle of a tiger-infested jungle.

A more recent journey of discovery to a 'lost' community, whose traditional way of life is still intact, has also been recorded. In the summer of 1965 an expedition was sponsored jointly by the Soviet atheist monthly, *Science and Religion*, and the Institute of Scientific Atheism. It was to seek out 'priestless' Old Believer communities on the right bank of the River Ob, miles out in the *taiga* (an area of marsh and coniferous forest) north of Tomsk. One of its members, A. Shamaro, kept a diary, from which the following extracts are taken.

'The cell of a *Pustynnik* (member of the "hermit" sect) in the taiga is a simple, old-fashioned Russian hut, dark, cramped, low and roofed with birch-bark or branches used like slates. It usually stands on the edge of a clearing in the forest which has been converted into a kitchen garden. Outhouses and awnings lean against the hut.

'They build the cells with their front windows aligned accurately towards the east – or more precisely, towards the "east of the Annunciation". This is the name given by the Old Believers of these parts to that point on the horizon where the sun rises on the Festival of the Annunciation – 25 March, old style. The hermit has his chapel in the front corner of the hut – each one is both church and dwelling, just as each hermit is both priest and congregation. This applies all the more if he lives alone.

'The icons are hung behind curtains, the blackened faces of their figures being painted in the "pre-Nikon" style and with copper reproductions of those images which are especially esteemed among the Old Believers. In front of the iconostasis (screen on which icons are placed) there is a shelf with thick volumes on it – service books, sermons and prayer manuals. These books are so bulky and old that thick embroidered cushions are placed under the cover for support when they are opened for reading, so that the binding does not disintegrate. Larger cushions hang on the wall by the iconostasis. They are called "arm-cushions" and the hermits put them under their elbows, so that their old bones are not overstrained by their countless prostrations . . .

'The hermits call themselves *Prostetsy* – that is, monks who are not priests. Though they have no clergy, all their days and nights are tightly packed with services. The day of worship begins in the second or third hour after midnight with a vigil . . . This is followed by matins, "the first hour", "the hours" (the hermits' mass), vespers and compline. Then follows the vigil again. In addition, they recite offices "for the repose of souls". There can be up to ten services in a period of twenty-four hours. On the great church festivals, of course, there is even more worship. Those clocks which work are set to "Jerusalem time" – six hours out from local time.'

Present-Day Revival

If there is any popular notion at all of what the Russian Old Believers generally represent today, it is that they are effete, fanatical and no longer a factor of any importance in the religious life of the Soviet Union. This view may be based on the evidence of visits which tourists have paid to the picturesque Old Believer churches in the outskirts of Moscow, where undoubtedly the congregation does seem to be chiefly comprised of old women practising their ancient rituals. Nevertheless, as we have seen, there are still places where all the old traditions are preserved in their purity and there are vigorous communities with a proportion of young people in their membership, both inside and outside the Soviet Union; furthermore, some of the Moscow Old Believers have joined the religious wing of the mounting pressure group for the establishment of human rights in their country. Recent evidence from the Soviet Union is decisive in proving that the Old Believers are very far from being moribund and that militant Soviet atheists are faced with much more than the persistence of an obsolete faith in backward areas.

Even during the height of Stalin's purges, there were Old Believers who had the temerity to try and avail themselves of their legal right (categorically established in 1929) to petition for the opening of a church when there were 20 believers of the same faith in the same place who desired it. Fifty of them were arrested in 1937 at Tiraspol as 'counter-revolutionaries' merely for making such a request. During this period, the vast

Novosti Press Agency

A Moscow church of the Old Believers, who keep to the original forms of worship practised by the Orthodox Church before the Great Schism of the 17th century

majority of places of worship in accessible areas were forcibly closed; the Old Believers were affected, in common with all other religious faiths. However, with the general relaxation of attitude by the State towards religion during the Second World War, there occurred what present-day Soviet researchers term a 'reactivation' of the Old Believer faith. As the author of the latest Soviet book on the subject, V. F. Milovidov, puts it: 'In many areas of the country communities of Old Believers were reborn which, it seemed, had once and for all disintegrated and discontinued their existence; large numbers of petitions were received from Old Believers requesting the opening of churches and prayer-houses.'

There have never been any accurate statistics on the Old Believers, but it is quite commonly held by Soviet commentators today that there were not less than 20 million of them by 1917. They hasten to add that this number has now fallen to a maximum of one million but this, at best, with 'lost' communities still being discovered, can be no more than a guess; at worst, it is a figure devised for purely propagandistic purposes. It is not only the nationwide renewal of the movement after the Second World War which makes this figure suspect. Whole new communities in Poland and Latvia were enveloped by the pushing westward of Soviet frontiers just before and towards the end of the war – and these were more active and better organized than their counterparts who had endured the purges.

In addition, the central organizations of the chief denominations of the Old Believers became active again and seem to have been more successful than the Russian Orthodox Church in securing permission to hold representative assemblies. One group, the Church of the Belo-Krinitsa Concord, was able to appoint three new bishops and 50 new priests and deacons in the six years from 1942.

Reliable statistics on the number of young people active among the Old Believer communities are naturally even more difficult to come by than figures for the nationwide membership of the movement. Yevgeny Bobkov was a brilliant law student at Moscow University, but also carried the standards in processions at an Old Believer church in the city. For this he was expelled from the university in 1959. If this could happen in the capital, it could occur much more easily in the provinces – and more recent anti-religious propaganda suggests that this was very far from being a unique instance.

At the beginning of 1969 there occurred something totally unexpected. A short document reached the West, claiming to represent the 'voice of the Old Believers from the U.S.S.R.' From its wealth of hard fact it appears genuine. It complains, for example, of serious state interference in the internal life of the Church, which is against the law:

> The secret police have penetrated into the very heart of the Archiepiscopate . . . and put into it their own important agent, Protodeacon Georgy Alexandrovich Ustinov, as secretary . . . All incoming and outgoing mail passes through his hands: correspondence with the parishes, priests and believers, petitions, complaints of believers about persecution by the local Soviet authorities, and so on, and the answers of the Archbishop and his officials – all this immediately becomes known to the secret police.

With this appeal for justice, the Old Believers join those Baptists, Orthodox and Catholics who have been petitioning the Soviet authorities during the 1960s to allow them their basic human rights. Whatever their image has been in the past, this puts their future into a new perspective. Soviet atheists who have been expecting them to be among the first religious groups to die out will have to reconsider their opinions. The Old Believers are demonstrating that persecution may frighten away the half-hearted, but it toughens the fibre of those who remain. They are not alone among Soviet Christians in this, but their troubled history has given them a longer chance to prove it than any other group in Russia.

Radio Times Hulton Picture Library

As an emblem of peace and reconciliation, the olive was adopted as a Christian symbol: early Christian sign of a bird with an olive branch in its beak, from a Roman catacomb

OLIVE

THE TREES once went forth to anoint a king over them; and they said to the olive tree, 'Reign over us.' But the olive tree said to them, 'Shall I leave my fatness, by which gods and men are honoured . . . ?' The innumerable references to olive and olive oil in the Bible testify both to the importance of the olive and its oil as food and to the great symbolic significance of anointment with the oil, both factors which appear in this quotation (from Judges, chapter 9).

Exactly when and where the olive was first cultivated is a mystery, but it seems probable that it was known to the ancient Egyptians. It is the tree most closely associated with the development of civilization, and its importance today throughout Mediterranean lands is unabated.

The first Bible reference to the olive is in Genesis, in the story of the Flood. To find whether the waters had subsided, Noah released a dove from the ark: 'And the dove came back to him in the evening, and lo, in her mouth a freshly plucked olive leaf' (Genesis 8.11). So well known was the olive even in those distant times that the single leaf sufficed for identification, showing that it was safe to come out of the ship. Ever since, the tree and the bird have both symbolized peace and friendship. The olive also represents prosperity, beauty, strength and divine blessings.

The garden of Gethsemane was an olive grove. Whether the few trees in it today date from the time of Christ cannot be ascertained, but it is certainly possible, for the olive is among the longest lived of trees. Its trunk may decay within but the outer shell continues to thrive; and even if the top is entirely cut down or burnt away the root will sprout again. When a garden is mentioned in the Bible or in old travellers' tales, an olive orchard is usually meant.

Gift of Athene

In Greek legend Athene (Minerva to the Romans and Etruscans) was responsible for having made the olive bear fruit. Virgil referred to her as *Oleae inventrix*. When she and Poseidon were disputing for the possession of Attica, Poseidon caused a salt-water spring to gush from the rock of the Acropolis on striking it with his trident (another legend suggests that he created a horse). Athene, however, caused an olive tree to appear, and this was considered by the gods to be the more valuable gift. So the city of Athens got its name, and the Athenians adopted Athene as their particular goddess. An olive branch is portrayed on early Attic coins. Goats were the special sacrifice to Athene because of the harm they did to olives (as to most vegetation).

The olive on the Acropolis was burnt by Xerxes when he sacked Athens in 480 BC but it reappeared as if by magic. There is still an olive on the Acropolis. Herodotus tells how Xerxes, before his Greek expedition, dreamt that he was crowned with an olive wreath which instantly vanished, and indeed his was a hollow victory. The Athenians revered the sacred olive and severely punished anyone who damaged it. Olive was used for victors' crowns at the Olympic Games, and was equal to the laurel in importance.

Olive was also one of the symbols of the Greek harvest festival, represented in more recent times by a symbolic tree branch known as the Harvest-May. The *eiresione*, a branch of olive or laurel decorated with fruits of the earth and bedecked with ribbons, was carried in procession and finally fixed over the farm door. Here it was left for a year, guaranteeing the successful growth of further crops. The Yule-log, symbolic winter sacrifice for fruitfulness, was sometimes of olive.

Medieval Christians had many legends about the olive. One of the basic – if very variable – ones was that when Adam died the angel guarding the garden of Eden – the first orchard – gave Seth a seed each of olive, cedar and cypress. These were placed in Adam's mouth and eventually sprouted from his grave, forming a single triple-trunked tree. It was from this tree that Noah's dove plucked the symbolic leaf, beneath this tree that David wept, and it was this tree that Solomon cut down. Too hard to be formed into timber, it was used as a bridge on which the Queen of Sheba crossed a bog. Eventually it formed the basis of the cross. A comparable, simpler legend suggests that the cross was formed from four separate trees – olive, palm, cedar and cypress.

In its capacity as emblem of peace and reconciliation, olive is shown on martyrs' tombs; it was thought to be carried by the angel Gabriel and certain saints, and was in some quarters regarded as the symbol of the Virgin Mary.

In medieval and later centuries olive was regarded as a safeguard against lightning, witchcraft and evil in general; a branch in the house was insurance against such disaster. To dream of olives was lucky, though to dream of plucking the fruit meant trouble. In the language of flowers the olive, naturally enough, represented peace.

The Rubaiyat of Omar Khayyam, *illustrated by Edmund Dulac and published by Hodder and Stoughton*

'How Sultan after Sultan with his Pomp, Abode his Hour or two, and went his way': illustration of a characteristic passage in Edward FitzGerald's version of the *Rubaiyat*

It is no longer believed that the Persian scientist Omar Khayyam wrote the whole poem known to the West as the Rubaiyat; *it is more likely that it is a compendium of impromptu verse which was later written down and added to by various hands*

OMAR KHAYYAM

MORE FAMILIARLY KNOWN as Omar Khayyam, the Persian astronomer, mathematician and epigrammatist Ghiyas-al-Din Abul-Fath Umar ibn Ibraham al-Khayyami, was born in Nishapur c 1048, and died in the same city in 1123. Little is known of his early life, but it seems clear that he received a broad education in the learning of his day, particularly in the sciences of geometry and astronomy (which at that time included astrology). In his own writings he claims the great Arabic philosopher Avicenna as his master, by which he probably meant that he followed the same rationalist and speculative outlook as his great forebear, and to a certain extent this is borne out in his few rather non-committal philosophical and scientific writings. In Khayyam's day the spirit of orthodoxy and conformity was beginning to predominate, and free thought and speculation were actively discouraged. To a man of his rather cautious and taciturn nature, it would seem wise and discreet to conceal his true beliefs, if they were the sceptical ideas to be expected from a trained medieval scientist.

Khayyam entered the service of Nizam al-Mulk, the famous vizier of the Seljuk ruler Malik-Shah, and in 1074 was put in charge of the observatory at Isfahan, with the special task of reforming the calendar. This employment seems to have lasted about 20 years, until the deaths of his patron and his sovereign and the consequent political changes suggested the desirability of an extended journey abroad. During his latter years he enjoyed a secure reputation and the patronage of a number of princes and rulers, by whom he was often consulted for astrological prognostications – a science in which, there is some reason to think, he was not a wholehearted believer. He was evidently a respected and admired teacher of the sciences of his day, though he also had the reputation of being distant and even irritable in his relations with his students.

Afraid of his Discoveries

Among the dozen scientific and philosophical works of his that have survived are a pioneering work on algebra, a thesis dealing with some of the difficulties encountered in Euclid's theorems, a short tract on chemistry, and a number of philosophical and metaphysical essays on the problems of existence, good and evil, free will and predestination. All are dealt with rather briefly and throw little light on their author's personality. Most of these are in Arabic, some translated from Greek.

Piecing together the scraps of biographical information available to us, we gradually build up the picture of a somewhat humourless, taciturn and unambitious man, moderate and conservative in his tastes, a man of

simple pleasures, and at the same time a widely-read scholar with a restless and probing mind. He was a recognized master of the learning of his time who wrote little and was uncommunicative even in his lectures. He constantly sought to extend the boundaries of knowledge yet was fearful of what he might find, reluctant to accept the discipline of orthodoxy but not willing to commit himself publicly to a dangerously heterodox position.

Riddle of the Rubaiyat

The clarity of this portrait is blurred by two incongruities. If tradition is to be accepted, this morose, uncommunicative man was also the author of a considerable body of caustic, satirical and even ribald verse. In this connection there are certain points which need to be made clear.

In the first place the poem by Edward FitzGerald published in 1859 and known to the Western world as the *Rubaiyat of Omar Khayyam* bears only a distant relationship to the Persian originals. Whereas FitzGerald's work is a single and complete poem, the *rubaiyat* (the word means simply 'quatrains') on which it was based are a collection of separate and unrelated verses of an epigrammatic nature, written in a special metre and form, and bearing a slight resemblance to the Greek epigram or the Japanese *haiku*. Secondly, of the 1500 or so rubaiyat attributed to Khayyam in one place or another, not one can be said with certainty to have come from his pen, and many are obviously – on grounds of language, vocabulary, and so on – not of his period, and are also found in the works of other poets. Even those that could be assigned to the 11th or 12th centuries display so many contradictions of style, outlook and belief that it is inconceivable that they could all have emanated from one mind. We also have to account for the fact that Omar Khayyam's poetical gifts, if they existed, were unknown to contemporary writers. Only 50 years after his death is there any mention of his poetry, and the first quotation of a Persian quatrain attributed to Khayyam comes in a work written some 30 years after that. Even if we add together all the rubaiyat contained in historical and biographical works and anthologies up to the middle of the 14th century, we still cannot muster more than 50 or 60. It is not until the 15th century that we find substantial collections, and from then on the numbers and variety steadily increase.

It is perhaps possible to account for some aspects of this mystery by supposing that Omar Khayyam the poet was not the same person as Omar Khayyam the astronomer. But perhaps there is no need for such a hypothesis. The most probable explanation is that Omar Khayyam was in the habit throughout his life, like may other educated Persians past and present, of dashing off impromptu verses at parties and social gatherings of his friends, which were not written down at the time but memorized by his hearers and transcribed later, probably in several different versions. Indeed the older and therefore possibly more authentic rubaiyat sound very much like the thoughts that a scholar of Khayyam's type might have thrown off in his lighter moments:

> A drop of water fell into the sea,
> A speck of dust came floating down to earth.
> What signifies your passage through this world?
> A tiny gnat appears – and disappears.

But whichever theory is the correct one, his name eventually came to be associated with the quatrain form to such effect that later minor poets and anthologists saw nothing wrong in giving an unknown verse (or even a known one) a cachet by ascribing it to Omar Khayyam. It would probably be correct then to think of the rubaiyat of Omar Khayyam not as the work of a single individual, but as a compendium of traditional wisdom and proverbial lore stemming from many different sources and expressing many different thoughts and ideas.

The other incongruity that confuses our picture of Khayyam the scientist is the legend that he practised as a Sufi teacher. This belief is to be found mainly in the teachings of certain later Sufi sects, who for obscure reasons adopted Khayyam as a kind of patron saint, and were no doubt responsible for the addition of those verses that have a more obviously Sufi content. There is no trace of the legend in the main stream of the Sufi movement and certain well-known Sufis attacked him as an atheist and blasphemer. Nor is there any contemporary evidence whatever for this story, which is not mentioned in the accounts given by those, like his pupil Nezami Aruzi, who knew him personally. Above all, while his philosophical writings show that, like all educated men of his time, he was familiar with Sufi teachings, there is not a hint of adherence to them; while those early rubaiyat that seem most likely on external evidence to be genuinely from his pen are diametrically opposed in theme and spirit to the outlook of the Sufis:

> Here we are, trapped beneath this ancient vault,
> Scurrying like ants in search of some escape;
> We're lost, and yet feel neither hope nor fear,
> Confused and blindfold, like the miller's ox.

Whereas the mystics saw the material world as mere emanation of the Divine Spirit, and looked forward confidently and longingly to union with God in the next world, Khayyam had no hope of life after death and saw man even in this world as an insignificant figure in a hostile universe.

When William the Conqueror first trod on English soil, he stumbled: minor accidents like this were not thought of as meaningless coincidences but often as important indications of the shape of things to come

OMENS

C. M. Dixon

In the ancient world, the examination of an animal's liver was a way of taking omens; not only the shape and condition of the liver but also its veins and colourings were believed significant: clay model of a sheep's liver divided into 55 zones, from Babylon, dated between the 19th–16th centuries BC

'WE SUFFER as much from trifling incidents as from real evils,' wrote the famous 18th century essayist Joseph Addison. 'I have known the shooting of a star spoil a night's rest . . . A screech owl at midnight has alarmed a family more than a band of robbers; nay, the voice of a cricket has struck more terror than the roar of a lion. There is nothing so inconsiderable which may not appear dreadful to an imagination that is filled with omens.'

That coming events cast their shadows before them is a deeply entrenched belief and an omen has been defined as 'some phenomenon or unusual event taken as a prognostication either of good or evil.' The rigorously fatalistic view that the future is determined in advance and cannot change has rarely been fully accepted in practice. Men have taken omens not so much as pointers to a predetermined future but as warnings of dangers to be avoided or as signals of opportunities to be seized.

When the world of Nature is seen as an orderly system with a definite rhythmic pattern, any variation or disturbance of the established pattern tends to cause anxiety and to be interpreted as a sign of trouble ahead. The sky, the scene of the orderly and regular procession of the stars, has been a fruitful source of omens of what is to come. The meteor, the eclipse and the comet have perhaps created the greatest dread of all, the appearance of a comet being taken as a portent of the coming of the end of the world. Even in 19th century England, as Robert Hunt points out in his *Popular Romances of the West of England*, the lowering of tempest clouds could arouse great alarm among country folk. There is a surviving folk tradition in the British Isles that a mighty storm usually heralds the death of a king. Known as 'the Royal Storm', it paradoxically burst upon Republican England on the night when Oliver Cromwell died.

In the Bible, Noah sees in the rainbow a sign that there will be no more flood, and God says: 'I set my bow in the cloud, and it shall be a sign of the covenant between me and the earth' (Genesis 9.13). In the book of Isaiah we read: 'Ask a sign of the Lord your God; let it be deep as Sheol or high as heaven.' In the Middle Ages considerable disturbance was created not infrequently by signs and portents which were taken to show that the Last Judgement was imminent.

It was this sense of apprehension, of impending disaster, which gave the word ominous its present meaning as a sign of future evil. In the realm of Nature this sombre aspect predominates, a flower or plant blooming out of season portending trouble, or death.

Signs from the Animals

Among wild life, birds especially have been considered to have significance as omens (see BIRDS). The cuckoo, as the embodiment of spring, indicated by its call what the future held. If the first call heard came from the right, the omen was good; if from the left, disaster was at hand. Birds have always been regarded as messengers of the gods, the agents of communication between Fate and ourselves.

Like the birds, wild and domestic animals have made an immense contribution to omen lore, partly arising from the old belief that animals could be ancestral spirits animated by the desire to protect their descendants. Among communities as far apart as Africa and Lapland it is unlucky for a hare to cross one's path. The ill-repute of the hare (see HARE) in the British Isles is derived from the tradition that this animal was one of the forms that was assumed by the shape-shifting witch.

Both the dog and the cat figure very largely in the folklore omens of Northern Europe. Among schoolchildren the appearance of a spotted dog is a portent of good luck, while three white dogs provide an even happier omen. It is also extremely fortunate if a strange dog should follow you home and fawn on you. In China dog omens were drawn from the animal's physical characteristics and an official who happened to breed a white puppy with tiger stripes could look forward to speedy promotion. For a cat to cross one's path is a token of good luck but only if it proceeds from the right hand side; an approach from the left can have the most sinister implications. It is also lucky if a strange cat enters the house of its own accord.

Modern animal omens rarely relate to horses, now that the horse plays a lesser role in the social economy. A host of other animal omens have survived, however, representing an old but far from extinct mode of thought. A swarm of bees, the traditional bearers of the goodwill of the gods, which alights in one's garden portends prosperity. For a ship at sea to be followed by a shark continues to have the most ominous implications for sailors.

Messages from Home

Within the self-created environment of man's home a special class of omens exists. The accidental falling of a picture or breaking of a mirror are ominous occurrences. In Devonshire it is still believed that if a rasher of bacon begins to curl up while frying, a new lover is on his way. It is a widespread belief that to discover nine perfect peas in a pod promises a fruitful marriage. The hearth, once the shrine of the domestic god, remains the centre of a whole class of omens, one of the best known of which is that a spluttering coal indicates a forthcoming quarrel. Some country folk hold any change in the rhythm of a clock to be a sign of death because it symbolizes a corresponding disturbance in the rhythm of the life cycle.

The human body itself involuntarily provides omens, in the form of shivering, sneezing, tingling, itching and stumbling. Because of its association with the sensation of fear a shiver running down the spine is immediately interpreted as a sign that 'someone is walking over my grave'. Sneezing was once supposed to indicate that the soul (which was equated with the breath) had been violently ejected from the body, hence the polite salutation of everyone in the vicinity of the sneeze, 'God bless you' (see also SNEEZING).

Itching and tingling are happy or unhappy auspices, dependent upon whether they are experienced on the right side of the body or the left. If the itching is felt in the sole of the foot, it means that you will soon tread on strange ground. The most common of all bodily omens, however, is provided by stumbling. To totter, to take a wrong step, or to fall indicates unhappy prospects for the project in hand and this is reinforced by the proverb: 'He who hesitates is lost'. William the Conquerer is said to have tripped and fallen on landing on English soil, causing consternation among his followers.

An ominous interpretation can be put upon the chance encounter with certain ill-favoured individuals. If your first experience of the day is to come upon a man or woman whose eyebrows are drawn together, meeting across the nose, it portends some misfortune. In the past it would have meant that you had passed close to a vampire or a werewolf. Cross-eyed people are still regarded with apprehension by gamblers and schoolboys for the now forgotten reason that those so afflicted were once supposed to be cursed with the power of the Evil Eye.

Mankind has always been unnerved by any disturbance of the normal pattern of sexual relations which, to the superstitious mind, represents unknown dangers. The great crises of life from birth to death are occasions when omens are looked for and discovered in the world about us. If a child is born with the incoming tide the omen is good, but if at the ebb tide the portent is bad. In a recent article in the magazine *Prediction* it was said that some astrologers ascribe deformities in babies to eclipses taking place at conception. To the housewife it is ominous if her wedding ring is accidentally broken, for this foreshadows the destruction of her marriage.

In sickness it is a sign of forthcoming

sorrow if a bird of dark plumage settles upon the roof. Certain psychic manifestations belong to the category of death omens, as for example the banshee, the Jack o'Lantern and the phantom coach. The fetch, or psychic double of a person who is shortly to die, which manifests itself to someone near and dear to him, comes within the category of the omen since it represents a forewarning of death (see DOUBLE). Among those who are unknowingly near to death there is sometimes an unconscious awareness of their condition. They make their wills, settle their affairs, and make preparations for the end. As Jung pointed out: 'Dying has its onset long before actual death.' Premonitions of death in the elderly are as much justifiable states of mind as they are omens. This kind of omen has an affinity with the prophetic powers that are so often associated with the dying.

The anxiety which mankind seems destined to suffer when contemplating the future was responsible for the system of omen interpretation known as augury (see AUGURY). In ancient Rome a college of priestly augurs interpreted the indications of approval or disapproval signified by the gods in relation to coming events. These signs might take the form of the flashing of lightning or the flight of birds. The augur stood facing south, with the east or lucky quarter, associated with the sun's rising, to his left and with the unlucky west to his right, and attempted to determine the meaning of the phenomenon from its angle of approach.

The augur did no more than stage a situation within which the laws of chance could operate freely, leaving the sign itself to be presented spontaneously by Nature. In an extreme example of this class of divination, called alectromancy, a circle representing the letters of the alphabet was prepared and upon each of the letters a grain of wheat was placed. A cockerel representing the non-human agency was introduced and began to eat the grains. The letters corresponding to the grains thus eaten were built into a word which supplied answers to the questions asked.

More directly associated with the natural

Illustration from John Keat's poem *The Eve of St Agnes* part of which is quoted below

Victoria and Albert Museum

They told her how, upon St Agnes' Eve,
Young virgins might have visions of delight,
And soft adorings from their loves receive
Upon the honey'd middle of the night,
If ceremonies due they did aright;
As, supperless to bed they must retire,
And couch supine their beauties, lily white;
Nor look behind, nor sideways, but require
Of Heaven with upward eyes for all that they desire.

Full of this whim was thoughtful Madeline:
The music, yearning like a God in pain,
She scarcely heard: her maiden eyes divine,
Fix'd on the floor, saw many a sweeping train
Pass by – she heeded not at all: in vain
Came many a tiptoe, amorous cavalier,
And back retired; not cool'd by high disdain,
But she saw not: her heart was otherwhere;
She sigh'd for Agnes' dreams, the sweetest of the year.

type of omen however was extispicium, a system of divination based upon the examination of entrails (see LIVER), and oneiromancy, the interpretation of the symbolism of dreams (see DREAMS). Another curious method, based upon the movement of the wind, was capnomancy, or divination by means of smoke arising from the burnt sacrifice. If the smoke ascended perpendicularly the omen was good, but if on the contrary it spread out in some other direction it was unfavourable.

Yet another system of omen divination involved placing a finger at random upon the open page of a Bible and deciding from the text thus marked out what the fates had in store. In this example we see a reversal of roles, the human becoming the active agent while the omen represented by the text is passive.

The overlapping of the magical arts into the area of signs and portents can be clearly observed in apotropaic actions (intended to avert evil) like the ejection of spittle or making the sign of the cross, or 'touching wood'. The magical principle of 'like curing like' can be called upon in some cases to annul an evil omen. This process was described by Sir James Frazer as an attempt 'to circumvent destiny by accomplishing it in mimicry . . . substituting a mock calamity for a real one.' A very common subterfuge of this type occurs when the housewife defers to the superstition that casualties always occur in threes by snapping two matchsticks after breaking a piece of crockery, which is an expedient for making the omen run its course.

Public Portents

Belief in the power of omens has had a considerable influence on the course of history. Llodowick Lloyd in 1602 described in his *Stratagems of Jerusalem* how 'The First King of Rome builded his Kingdom by the flying of birds and soothsaying.' It is also recorded that the Emperor Constantine, while locked in battle with the barbarians, saw in the sky a shining cross with the words *In hoc signo vinces* (By this sign, conquer), which he then inscribed upon his banner and went forward to victory. The warriors led into battle by St Joan of Arc found encouragement from the vision of St Michael in the sky beckoning them onwards, and from the white dove of the Holy Spirit which by alighting on Joan's standard provided a favourable omen.

In the reign of Henry II (1133–1189), Peter of Blois gave solemn warning to one of his followers: 'Do not entangle yourself in the false opinion of those who fear to meet a hare, or a woman with flowing tresses, or a blind man or a lame man . . . or if a wolf meets them, or a martin flies from left to right, or if on setting forth they hear distant thunder or meet a hunchback or a leper.'

The revolutionary years of the 17th century were filled with ominous portents, among which were phantom armies marching through the clouds as if to announce the approach of civil war. When the Civil War finally shattered the English calm, it produced some very ominous portents, as at the trial of King Charles I when the head of his staff fell off. Before Cromwell's death, it is said, a terrible storm broke over the country and 'a great whale came to Greenwich'. King James II was apparently foredoomed to the loss of his kingdom by the omen noted by John Aubrey who recorded 'the tottering of the crown upon his head, the broken canopy over it, and the rent flag hanging from the White Tower when I came home from the Coronation'.

By 1832 science had begun to intrude into the folklore of omens. By a reversal of the usual process the comet prophesied for that year was regarded as the cause, rather than the sign of forthcoming disaster. Vast numbers of panic-stricken citizens, particularly in Germany, at once refrained from all commercial activities until finally convinced that a collision between the earth and the comet was not inevitable. Perhaps the last of the truly great omens of the modern age was the burning of the Crystal Palace in South London in 1936, a disaster considered by many people to he a sign of the coming of the Second World War.

In a world of baffling diversity and variety, men look for unity and singleness, for the One which transcends all multiplicity

ONE

THAT ALL THINGS are essentially one thing, that underlying and unifying all the phenomena of existence there is a One which is also the Whole, is a belief found in many religious and mystical traditions. The human longing for unity and singleness, the tendency to regard oneness as good, multiplicity and diversity as evil, is deep and widespread. Many mystics have longed to become 'one' with God. People search anxiously to find out 'who they really are', which means a quest for an inner self which is a unity. In Judaism and Islam God is One, in Christianity he is Three but also One. Even the surface polytheism of the Hindus conceals monotheism, for 'the gods are only manifestations of an immanent and unitary principle which is the ground of the universe – a principle that is at first regarded as being an impassive Absolute but which may also appear as a personal God' (see HINDUISM).

One is good and many bad, which is why 2, the first number to break away from 1, is traditionally the number of evil and in Christian numerology belongs to the Devil. Numerologically, the many are divisible, reducible to units of 1, since 2 = 1 + 1, 3 = 1 + 1 + 1, and so on, but 1 is not divisible (fractions having no place in number symbolism), the indivisible unity of the divine in the multifarious universe.

As a result, 1 has been reverenced by number mystics from the Pythagoreans onwards as the Infinite God, the First Cause, the One which transcends all multiplicity. Whether 1 could properly be called a number at all was long in doubt and until comparatively modern times it was generally thought of, not as a number but as the essence or underlying principle of number, all other numbers being made of it. It was said to be neither odd nor even but both, because if added to an odd number it makes it even, and vice versa. So it combined the opposites of odd and even, and all the other opposites in the universe.

From this point of view, the number 10 is 'completion' and 'perfection', because it completes the series of the essential numbers and brings them back to unity (1 + 0 = 1). Influenced by Pythagorean ideas and by the Cabala, in which the 10 sefiroth emanate from God, the occult tradition has grown up that the succession of numbers from 1 to 10 symbolizes, or is actually identical with, the coming into existence of the universe. For example, Leonard Bosman says (in *The Meaning and Philosophy of Numbers*): 'Thus the 1 is in the All, the 0 or Circle Potential, and acts with it to produce the Universe . . . Thus arise all numbers, the simple numbers, 1–9, emanating from the 1 in the 0 . . . Hence in the beginning, the 1 and the 0 are potentially 10, i.e. complete and perfect, but have to become unfolded, as symbolized by the figures 1–10, before the Perfection innate within them can be manifested.'

Tarot card designed by Aleister Crowley to symbolize the doctrine that 'Change is the support of stability': the mingling of opposites in the One is shown in the Yin and Yang symbols and in the snake eating its tail

Gerald Yorke Collection/Warburg Institute

If your name adds to 1 (see ALPHABET), you will be described by modern numerologists as a person of exceptionally powerful and dominating personality. Individualistic and self-centred, you are intensely original and creative, an inspiring leader and a born pioneer. You are unlikely to find deep happiness in love or friendship, as you tend to look on other people rather as potential supporters or opponents than as possible partners. Generous to those who support you, you make a ruthless enemy when opposed.

People whose number is 1 are daring and self-reliant, stubborn and contrary. They stand on their own feet. They resent anyone else's authority, rarely seek advice or follow it, and take their own initiatives. They generally dislike detail and prefer to be concerned with broad lines of policy. Aggressive and forceful, vain, boastful, efficient and determined, they are good at setting things in motion, conceiving and executing new projects, and should flourish as organizers, inventors, designers, planners, engineers and technicians. Decisive and ambitious, forceful and far-seeing, 1-people are single-minded, wilful, impatient and hasty-tempered. They hold strong and positive opinions, and are quite likely to take an obstinate pride in being difficult to deal with.

Most of this follows from the fact that in Christian number symbolism 1 is the number of God the Father. The creativity, originality and bent for organization and technology of 1 are derived from the God who created the world and many of the other characteristics, including dominance, initiative, leadership, loneliness, impatience of rivals and intolerance of opposition, self-reliance, generosity to supporters, are drawn from the God of the Old Testament. This is reinforced by 1's position as the first of the numbers, so that a year which adds to 1 is said by numerologists to be a time of fresh beginnings and discoveries, new ventures, an outburst of creative activity. The fact that the figure 1 resembles an erect phallus has not escaped the notice of numerologists and contributes to their view of the number's creativity but also of its solitariness and independence.

(See also MYSTICISM; OPPOSITES).

OPPOSITES

'LOOKING BACK on my own experiences,' wrote the great American psychologist William James, in *The Varieties of Religious Experience*, 'they all converge towards a kind of insight to which I cannot help ascribing some kind of metaphysical significance. The keynote of it is invariably a reconciliation. It is as if the opposites of the world, whose contradictoriness and conflict make all our difficulties and troubles, were melted into unity. Not only do they, as contrasted species, belong to one and the same genus, but *one of the species*, the nobler and better one, *is itself the genus and so soaks up and absorbs its opposite into itself*. This is a dark saying, I know, when thus expressed in terms of common logic, but I cannot wholly escape from its authority.'

It is a common observation that man is torn between opposite tendencies, between love and indifference, dependence and independence, extraversion and introversion, intellect and instinct, and innumerable others. Similarly, the phenomena of the world outside can be classified in terms of opposites – life and death, light and darkness, good and evil, active and passive, positive and negative, matter and spirit, and many more. The course of Nature seems to swing from one opposite to the other and back again, like the pendulum of a clock. Night follows day, winter follows summer, decline follows growth, the crops are born and die and are born again. The tides flow in and out upon the shore, and the same rhythm seems to swell and ebb all through the universe.

This way of looking at things has been of great importance in religion and magic, and religious dualism is the tendency to see two powerful opposite principles at work throughout all existence (see DUALISM). But few people who see the world in this light are so simple-minded as to leave it at that, and few systems are uncompromisingly dualistic. They look behind the opposites for something greater, in which the opposites are contained and unified as the tides are in the sea, for the unity into which William James's opposites 'melted', for the One in which duality disappears (see ONE).

In China the interplay of the opposites of Yang and Yin was thought to underlie everything that existed, but they were united in something greater, the Tao. The lingam and the yoni, the male and female symbols, are united in Hindu temples. The central pillar of the Tree of Life in the Cabala reconciles and harmonizes the right and left pillars. The symbol of the cross unites two pairs of opposite directions with the centre. The Greek philosopher Heraclitus (c 500 BC) said that God is day and night, winter and summer, war and peace, and all the opposites. In the New Testament St Paul says, 'There is neither Jew nor Greek, there is neither slave nor free, there is neither male nor female; for you are all one in Christ Jesus' (Galatians 3.28), and in the Old Testament Isaiah (chapters 11 and 40) says that the wolf will dwell with the lamb and the leopard lie down with the kid, and every valley shall be lifted up and every mountain made low, when all opposites and contradictions disappear in the unity of the perfected world.

The Bisexual Ideal

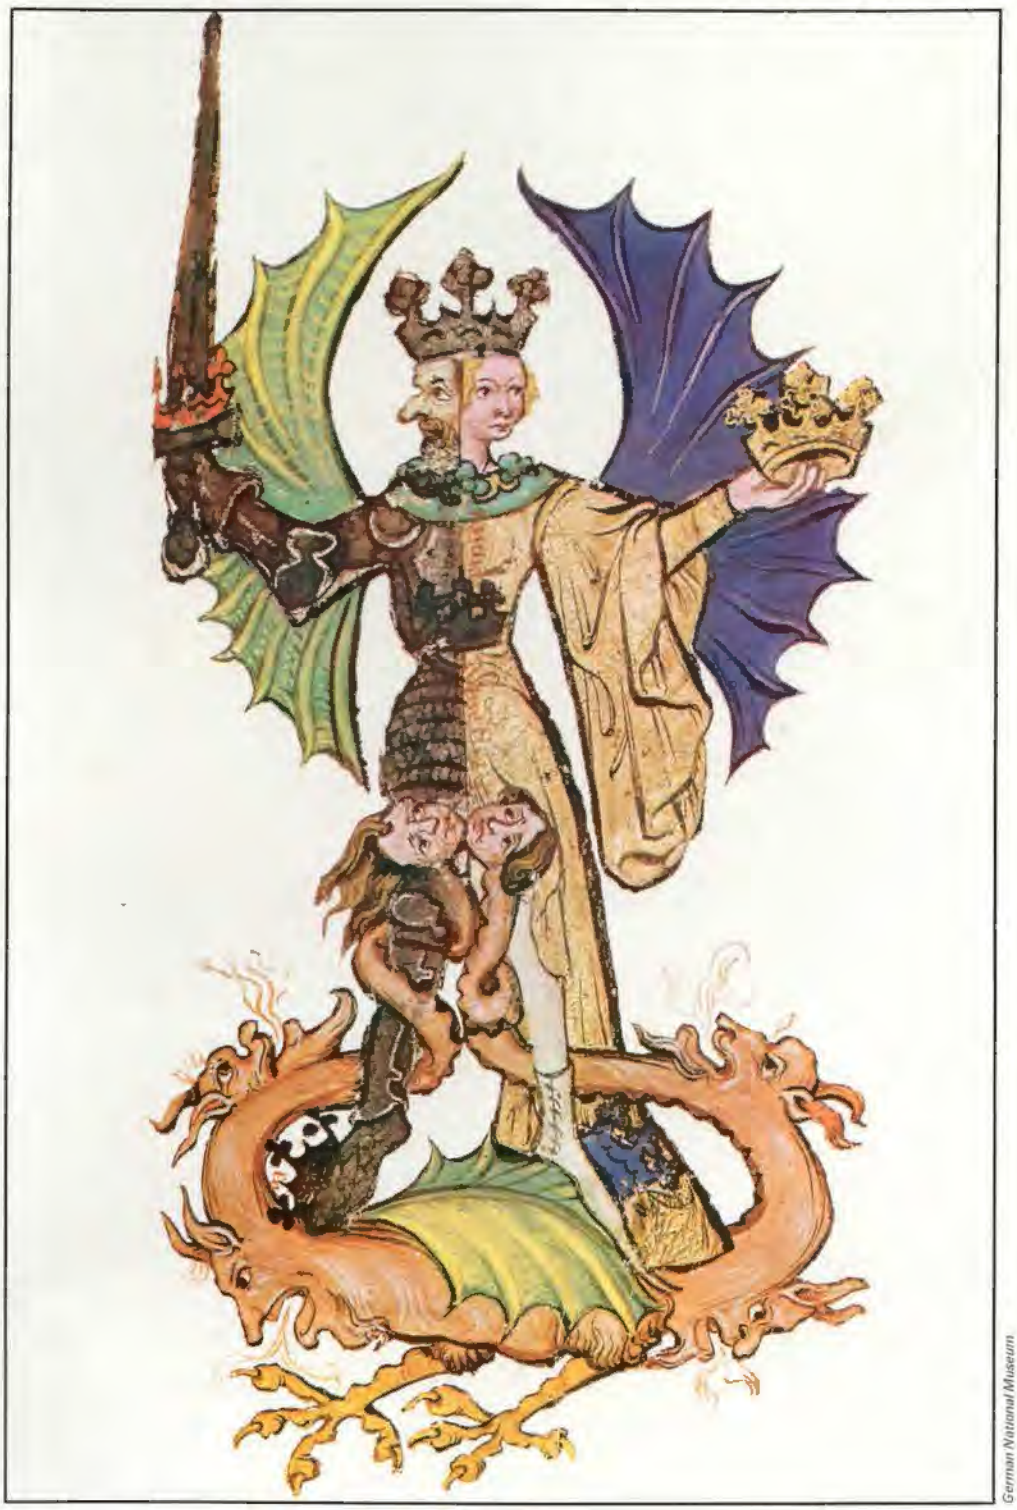
For hundreds of years in Europe everything was believed to be made of four elements which combined two pairs of opposites – hot and cold, wet and dry. Aristotle said that the Pythagoreans saw ten fundamental pairs of opposites in the universe, and this has affected numerology ever since (see NUMEROLOGY). Astrologers say that opposites attract each other, so that you are likely to be drawn to people born under the sign opposite your own in the zodiac circle. One of the theories of animal magnetism (see MAGNETISM) was that the positive and negative poles of a magnet could be used to correct an imbalance of opposite forces in the body, and there is the same idea in acupuncture (see ACUPUNCTURE).

In some creation myths the making of the world begins with the separating out of opposites (light and darkness, for instance, or sky and earth) from a preceding totality. C. G. Jung saw in this a reflection of the human mind. He says (in *Psychology and Alchemy*): 'The essence of the conscious mind is discrimination; it must, if it is to be aware of things, separate the opposites, and it does this *contra naturam* (against nature). In nature the opposites seek one another . . . and so it is in the unconscious, and particularly in the archetype of unity, the self. Here, as in deity, the opposites cancel out. But as soon as the unconscious begins to manifest itself they split asunder, as at the Creation; for every act of dawning consciousness is a creative act, and it is from this psychological experience that all our cosmogonic symbols are derived.'

What Jung called 'individuation' was the reconciliation of the opposites of human nature in a complete self ('the archetype of unity') and he was impressed by the emphasis which the alchemists placed on the union of opposites. The Philosophers' Stone itself is often described as a mysterious reconciliation of contradictions – it is made of fire and water, it is a stone but at the same time it is not a stone, it comes from God and yet it does not come from God. One reason for the importance of mercury in alchemy, and for its occasional identification with the Stone, is that it seems to combine opposites, in being a metal and also a liquid, and in being liquid but not wet. It was called 'the masculine-feminine' and was frequently depicted as a hermaphrodite.

The 'conjunction' or union of opposites in alchemy was symbolized by the marriage of king and queen, of sun and moon, of the red man and the white woman. Or it might be shown as incest between brother and sister, or mother and son, or as the re-entry of the son or the king or the dragon into the womb of the mother, to indicate the mingling of opposites which had separated out from an original unity.

There is the same symbolism in the ideal of the androgyne or hermaphrodite as the perfect human being, who has unified all the opposites. In *The Two and the One* Mircea Eliade quotes one of the German Romantics on the ideal human of the future: 'Eve was engendered by man without the aid of woman; Christ was engendered by woman without the aid of man; the androgyne will be born of the two. But the husband and wife will be fused together in a single flash.' And the poet and scholar Friedrich von



The 'conjunction' or union of opposites, from a German alchemical MS: a hermaphrodite is frequently a symbol of the ideal being who has reconciled all opposite forces and factors in unity, and this is one of the purposes underlying the magical use of sex

German National Museum

Schlegel (died 1829) believed that 'the goal towards which the human race should strive is a progressive reintegration of the sexes which should end in androgyny.' The tradition that Adam was originally bisexual probably stems from the idea that God, and man as made in the image of God, must combine all opposites to be perfect (see also FIRST MAN; HERMAPHRODITE).

The union of the sexes is the stock European occultist's example of a reconciliation of opposites which is physically fruitful (in the conception of a child) and also spiritually and magically fruitful. The magical ideal is 'the whole man', the man who unites all human characteristics and potentialities in harmony, the man who is all that a human being could possibly be, and so, in effect, the man who has become the One, or God. To do this, he must bring all the opposite forces of his nature into balance.

This is one reason for the importance of sex in magic. Richard Cavendish says (in *The Black Arts*): 'Many magical ceremonies are deliberately designed to summon up and unleash the animal driving forces from the deeps of human nature. The *whole* man is to be raised to the power of infinity, not man as civilized thinker or man as ravening beast, but man as a combination of both.' It follows that although the magician may use sex in a magical operation as a powerful source of energy, he must not allow himself to be carried away on the floodtide of desire. He must master it and subordinate it to his purposes.

One result is the importance of 'balance' in magical ceremonies, of maintaining an equilibrium between opposite forces so that they can be equally blended in a greater whole. The principle is by no means confined to the West. 'Yoga is a harmony,' says the *Bhagavad Gita*. 'Not for him who eats too much or for him who eats too little; not for him who sleeps too little, or for him who sleeps too much' (see BHAGAVAD GITA). And the *Gita* teaches the lesson that God is not only perfect peace but also its opposite, irresistible power, for it ends with a vision of 'Deity in all its blazing fury'.

Victoria and Albert Museum

Yahweh ordered 'a girdle embroidered with needlework' to be made for the high priest, and the Bible abounds with similar references to the cultic use of embroidery; in the Middle Ages religious embroidery was England's unique contribution to European art

OPUS ANGLICANUM

THE FAMOUS EMBROIDERY executed in England in the Middle Ages, which was in great demand throughout Europe, was known as *opus anglicanum*, meaning 'English work'. It was used chiefly for ecclesiastical vestments and furnishings.

This medieval use of embroidery in the service of religion has a long and fascinating history. The Latin phrase for to embroider was *acu pingere*, that is 'to paint with a needle', and the art can be traced back to ancient Babylonia where it was used to decorate the ceremonial robes of kings. A notable example of such work in ancient Egypt appears on a statue of Queen Tiye, the wife of the Pharaoh Amenhotep III (c 1405–1367 BC). The Queen wears a dress embroidered with a bird's-wing design signifying her association with the vulture mother goddess Mut.

The Hebrew scriptures abound with references to the cultic use of embroidery. According to Exodus 26.31, the God of Israel instructs Moses on the furnishings of the Tabernacle, in which the Ark of the Testimony was to be set as the place of Yahweh's presence: 'And you shall make a veil of blue and purple and scarlet stuff and fine twined linen: in skilled work shall it be made, with cherubim; and you shall hang it upon four pillars of acacia overlaid with gold . . . and the veil shall separate for you the holy place from the most holy'. Later, directions are given for a screen at the entrance of the Tabernacle, 'embroidered with needlework'. Yahweh also orders that there should be made for the high priest 'a girdle embroidered with needlework'. The reference to the figures of cherubim is especially interesting, for these were mysterious winged beings who guarded the throne of Yahweh. The purpose of their embroidered images on the veil

hiding the Holy of Holies was either symbolic or prophylactic. The Jewish historian Josephus, writing in the 1st century AD, describes the veil in the sanctuary of the Temple at Jerusalem as it was in his day: 'of Babylonian tapestry, with embroidery of blue and fine linen, of scarlet also and purple, wrought with marvellous skill'. Its pattern had a mystic meaning, typifying the universe but with the signs of the zodiac omitted.

Inspired by these biblical examples of the cultic use of embroidery, Christians soon began to use both tapestry and embroidery for the furnishing of churches and the vestments of the ministers. Early examples of both survive from Coptic Egypt. In early Byzantine churches the altar and choir were closed off by veils which were later supplanted by the solid screen known as the *iconostasis*. They were decorated with appropriate biblical scenes (such as the wise and foolish virgins, or Christ and the apostles). A notable form of Byzantine embroidery from the 13th century was the *epitaphion*, used on Good Friday, on which the body of Christ, laid in the tomb, was portrayed.

The later achievements of English medieval embroidery are foreshadowed in the famous St Cuthbert vestments at Durham. They were given about 934 by King Athelstan to St Cuthbert's shrine at Chester-le-Street, County Durham. Embroidered on these stoles or maniples are figures of saints or prophets. The celebrated Bayeux Tapestry may also be mentioned here, although the subject is secular, namely the Norman conquest of Britain. This long band of embroidered figures was ordered by Odo, Bishop of Bayeux, and hung in Bayeux Cathedral; but it was most probably made in England in the 11th century. The work significantly illustrates contemporary religious belief and superstition: for example, the hand of God is shown stretching down from heaven to bless the newly-built Westminster Abbey, and the English are represented as appalled by the appearance of a comet, portending disaster for Anglo-Saxon England.

Treasury of Medieval Faith

The embroidery of England began to be internationally famous and sought after from the time of Henry III (1207–72), and it developed into a professional undertaking in which both men and women were employed, after serving an apprenticeship of seven years. Some indication of its fame is given by the fact that the great Vatican inventory of 1295 includes more pieces of *opus anglicanum* than any other type of embroidery. It did indeed constitute England's unique contribution to the great achievement of medieval art.

Although it had its secular use in heraldic embroidery, it was to the service of religion that the resources of *opus anglicanum* were mainly devoted. Medieval religious art had two chief aims: to dedicate human skills and riches to the glory of God, and to proclaim graphically to the faithful the great truths of Catholic Christianity. The art of embroidery was pre-eminently suited to performing both these functions. It could combine human artistry with the richest of materials – silk, silver-gilt thread, pearls and precious stones – in the service of the Church. And the vestments and furnishings, on which this art and wealth were expended, provided means of portraying the doctrines of the faith and instructing the people. Accordingly, altar hangings and vestments were embroidered with scenes of the life of Christ, of the Virgin, and the martyrdom of the saints.

A superb example of *opus anglicanum*, now in the Victoria and Albert Museum, is the Syon Cope (dated 1300–20), which shows among its surviving 20 subjects the coronation of the Virgin, Christ crucified, the archangel Michael slaying the Dragon, the funeral and assumption of the Virgin, and St Bartholomew with a flaying-knife. Indeed, the remaining examples of *opus anglicanum* form a rich treasury of medieval faith and legend, as well as attesting to the technical skill and artistry demonstrated by the English embroiderers.

In England most of this work was destroyed at the Reformation; but some of its finest products are still to be seen in Continental cathedrals and museums.

Left The most influential oracle of the classical world was that of Apollo at Delphi, on the slopes of Mount Parnassus *Above* The 'rock of the sibyl' at Delphi: the sibyl, or medium, went into trance to deliver oracles which were often ambiguous and enigmatic *Far left* The booming echo of the Oracle Room of the Hypogeum in Malta suggests that this room was used to consult oracles through a priestly elite *Following page* Temple of Apollo at Didyma in Asia Minor; when the future of the pagan oracles was threatened by Christianity the priests of Didyma supported the Emperor Diocletian in his persecution of the early Christians

Questions about settling a workmen's strike, or solving a problem of paternity, were among those put to the ancient oracles, while in primitive societies the witch-doctor must combine the qualities of a psychologist with those of a professional detective

THE ANCIENT GREEKS felt a deep need for guidance in the problems of life, but, unlike believers in the modern world who are guided by the Bible, the Koran or the holy books of Eastern religions, the Greeks had no such sacred writings. Greek poets were often thought to be inspired by the Muses, but this did not make their poetry the word of God. Even their priests were of little help. Their function was to perform public worship, mostly by offering sacrifices to particular gods, but they delivered no sermons and heard no confessions. At best they could decide technical questions of religious law – whether a certain act had made the inquirer impure and how he could be cleansed. But at a number of temples throughout the Greek world there were oracles to which the inquirer, whether a private individual or a state, could bring a question and receive an answer which was supposed to express the will of the gods. These temples were mostly dedicated to Apollo, whose cult had spread from Asia Minor to Greece (see APOLLO).

The chief feature of the oracles was that the replies were delivered by a man or a woman who had been put into a trance and who would answer from the subconscious. In the trance the medium would speak with a changed voice and personality, understood to be Apollo himself speaking through his instrument; this was apparently confirmed when the medium on returning to normal consciousness could not recollect what had been said. The modern psychologist finds no difficulty in explaining that such a trance is produced by suggestions. If a simple worshipper of Apollo were brought up to believe that on entering the innermost shrine of the god, after various elaborate ceremonies had been performed, he or she would be inspired, then by carrying through the appropriate ritual that effect would actually be produced. The priests who conducted the ceremonies need not consciously apply hypnotism to the medium. The suggestion implanted years before by the traditional practices would operate of itself.

Costly Consultations

The answers of the medium when in a trance might often be confused. This was satisfactorily explained to the ancient Greeks by the belief that the gods, and particularly Apollo, did not answer man's questions candidly, but could be expected to bewilder and even mislead the rash inquirer by ambiguous and enigmatic answers. Actually the inquirer did not usually receive the medium's utterance direct. He was allowed to listen when the question was put and then after the medium had spoken; but a priestly functionary would convey the official version of the answer, often in verse. One is inclined to suspect that this was the point at which human intelligence in the person of the priests took a part in the framing of the oracle. Particularly when the inquirer had

Blood for Blood

Orestes has been instructed by Apollo through the oracle at Delphi to kill his mother and thereby avenge the death of his father

ORESTES: The word of Apollo is of great power
and cannot fail.
His voice, urgent, insistent, drives me to
dare this peril,
Chilling my heart's hot blood with recital of
threatened terrors,
If I should fail to exact fit vengeance, like
for like,
From those who killed my father. This was the
god's command:
'Shed blood for blood, your face set like a
flint. The price
They owe no wealth can weigh.' My very life,
he said,
Would pay, in endless torment, for disobedience . . .
But when, he said,
A father's blood lies unavenged, and time
grows ripe,
The neglectful son sees yet more fearful
visitations,
As, towards eyes that strain and peer in dark-
ness, come
The attacking Furies, roused by inherited
blood-guilt,
Armed with arrows of the dark, with madness,
false night-terrors,
To harass, plague, torment – to scourge him
forth from his city
With the brazen lash, in loathed and abject
filthiness.
Banquet and wine, grace of libation, he may
not share –
This was the oracle's word; his father's anger,
unseen,
Bars him from every altar; no man may receive him
Or share his lodging; scorned, friendless and
alone, at length
He lies a shrivelled husk, horribly embalmed
by death.

Aeschylus *The Choephori*
(trans. Philip Vellacott.)

not been a private individual, but an embassy from a state presenting a political question – such as the advisability of a given alliance or the outcome of a prospective war – the priests might very well have wished for reasons of policy to favour one particular line. Then the confused words of the medium were shaped by the priest to express the official view.

It is not surprising that this rather elaborate ritual of inquiry was expensive for the private individual and could only be used rather infrequently. At Delphi, for instance, in the 5th and 4th centuries BC the minimum charge was the equivalent of two days' wages for an Athenian, and he would have to pay additional sums in free-will offerings, as well as his travelling expenses. States were charged by the priests at ten times the rate for private persons. This full-scale form of consultation was only available on one day a month – the seventh, which was traditionally Apollo's birthday – and the oracle was closed for the three months during the winter when Delphi was difficult to reach by sea or by the mountain roads.

On the actual day consultations went on from morning to night. Two women with a third in reserve acted as mediums on a shift system for it must have been exhausting work even if the mediums were accustomed to it. If there were many inquirers or if the ceremonies did not go smoothly, some applicants would be left disappointed at the end of the day before their turn had arrived. Because of this, the Delphians used to confer on some states or individuals an honorary precedence which evidently guaranteed them a high place in the queue. Otherwise positions were determined by a ballot.

Simpler and cheaper forms of oracle were available more frequently. The commonest was by a process of drawing lots. This was also practised at Delphi, but little is known of it there. Its favourite oracle centre was in the far west of Greece at Dodona, in a mountainous region near the modern town of Jannina. There an oracle of Zeus had existed from the second millennium BC. Originally it was associated with a sacred oak which was said to utter prophecies itself, which were interpreted by its priests, the Selloi, who observed the curious taboos of sleeping on the bare

Peter Larsen

At the great Greek oracle of Zeus at Dodona the god's answers to questions were obtained by drawing lots, probably black and white beans. In Africa oracles may be obtained from the relative positions of objects in a witch-doctor's bag, after it has been shaken up ***Left*** **Tools of the witch-doctor's trade at a market in Dahomey** ***Above*** **Drumming to summon spirits in Dahomey: it is a widespread belief that oracles can be drawn from the dead, who can see the future because they are no longer bound to the human time-scale**

ground and not washing their feet. All this strange ritual is not typical of Greece as a whole. In fact its nearest analogies come from pagan Prussia where there were also sacred oaks and priests with these curious taboos (see OAK).

Advice on Personal Problems

Consultation at Dodona was by drawing lots: inquirers were given thin strips of lead on which they wrote their questions. These were usually expected to be framed so that they could be answered 'yes' or 'no'. The strip was then rolled up so that the questions could not be read, and the name of the inquirer or a number was scratched on the back. Thus the secrecy of the question could be guaranteed. The questions were put into a jar, and the priestess drew them out, one by one, while at the same time drawing a lot for each, probably a bean coloured black or white to show whether the god's answer was 'yes' or 'no'.

It is fortunate that this simple method was used at Dodona, for some hundreds of these strips of lead have been found: some of them still folded, others showing signs of having been smoothed out after one inquiry and then used again for another. They illustrate the rich variety of questions posed to the oracle. A few are from cities: Corfu asked about goodwill among its citizens; a town in Thessaly whether it might invest the funds of its goddess; the people of Dodona itself 'whether it is on account of the impurity of some human being that the god is sending the bad weather'. But most of the questions were from private individuals, pouring out their own personal troubles: 'Gerioton asks Zeus concerning a wife whether it is better for him to take one.' 'Lysanias asks Zeus whether the child is not from him with which Annyla is pregnant.' 'Leontios consults concerning his son Leon whether there will be recovery from the disease on his breast which seizes him.' 'Cleotas asks Zeus if it is better and more profitable for him to keep sheep.' All the practical problems of life show up, and the confusions and anxieties of inquirers are revealed in their clumsy expressions and individual handwriting. The would-be sheep farmer, for instance, was visibly unused to writing.

For some centuries the oracles at Dodona and Delphi engaged in professional rivalry and competition. Dodona claimed to be the sanctuary of the 'father of gods and men', and the oldest oracle in Greece. Delphi asserted that Apollo who spoke through its medium was the chosen mouthpiece of Zeus. Both priesthoods claimed a share in Greece's legendary past. But under the rule of the Roman Empire, Dodona was destroyed and Delphi continued but mainly only as a tourist centre.

By this time, the centre of population and wealth had shifted to Asia Minor. In what is now the thinly-populated coast of western Turkey there were huge new temples dedicated to Apollo and equipped with oracles within easy reach of crowded commercial cities. The temples have recently been excavated, and some of their history revealed. At Didyma, for example, a colossal temple had been begun about 300 BC but over four centuries later it was still not quite completed. It contained a magnificent ceremonial staircase, obviously designed for religious processions, and a huge window in the facade of the temple from which the prophet could announce the god's oracles. Some of the questions which Apollo answered are curiously modern. One was the settlement of a strike of workmen building the theatre at Miletus.

Guidance from a Fountain

Didyma's chief rival was Claros, about 100 miles north. The old Greek colonies favoured Didyma, but the new towns consulted Claros. Corresponding to this division, the oracle of Didyma spoke in classical verse while that of Claros went in for all sorts of lively metres in a new style. The cities that consulted Claros often did it annually, and this civic outing included a choir who sang a hymn to Apollo specially composed by one of the citizens. The

Like all oracles, ancient and modern, the witch-doctor must be a shrewd psychologist familiar with his clients' personality and background

consultation itself must have been an exciting occasion. The inquirer was brought by night to a passage in the temple leading to the subterranean vaults. There was only room to walk in single file guided by torchlight, and the maze-like corridor led by six right-angled turns to a hall where the consultants could sit while the prophetic medium continued to an underground fountain whose water was supposed to convey the inspiration. The experience must have been awe-inspiring. But sometimes it may have been conducted rather hypocritically. The medium was supposed to get a list of inquirers' names and then, without knowing their questions, to give the appropriate answers in verse. But a Cynic philosopher who received an ambiguous reply, apparently promising him rewards after toil, found on investigation that the same verses had been uttered to a number of other consultants who, as he grimly remarks, had all experienced the toil, but none of them the promised blessings.

At last, in the 3rd century AD, the work of the various oracles seems to have petered out. It was a time of economic and political collapse in the Roman Empire. Individuals were abandoning official religion and seeking refuge in private cults and magic. Christianity was gaining ground and was the chief critic of the oracles, which it regarded as the personal utterances of devils. In reply, the priests of Didyma tried to organize a combined front of all pagan beliefs and supported the Roman Emperor Diocletian in his persecution of the Christians. But Christianity triumphed, and devastations in the inner sanctuaries at Delphi and Dodona bear witness to the vengeance of the new religion.

The oracles had fulfilled a human need which was thereafter to be satisfied by other methods. Our evidence from ancient times is not sufficient to prove whether in any instance they had really used supernormal or supernatural powers. No doubt the trances of the prophetic mediums were genuine enough. The answers which they gave, or were said to have given, for centuries convinced the majority of inquirers. This belief was chiefly produced by the oracles conveying the assurance that the gods were guiding the human questioner in the problem which he had laid before them.

H. W. PARKE

The Primitive Oracle

The oracle is an essential element in all primitive religions. It is consulted wherever men wish to know the cause of their present misfortunes or the shape of things to come, for the oracle is the medium between gods and mortals.

In truly primitive races, the profound belief in spirits, ghosts, witches, and unseen forces leads to a deep-seated reliance on the visionary powers of the oracle. And the principal difference between the oracles of African pagans, for instance, and those of more sophisticated cultures is that the former are just as much concerned with what has happened as with what is to come.

Both the Australian aborigines and the African tribes consult their soothsayers to explain the cause of death, the presence of danger, the reason for droughts, and so on. In all such cases, the malevolence of some evil person or spirit is suspected so that it becomes essential for the safety of the community that a specialist in the occult is available to give guidance.

Many methods of discovering the secrets of the unknown are employed by primitive people. Necromancy, or communication with the spirits of the dead, is probably the oldest of the diviner's arts, since primitives do not accept death as a 'natural' phenomenon but believe that a 'dead' person continues to take part in the communal life and can be asked for help through the medium of an oracle.

Among Voodoo exponents in the West Indies (see VOODOO) it is still believed that dead men in the form of zombies can be summoned from the grave to intervene in human affairs. The Western version is seen in the cult of Spiritualism (see SPIRITUALISM) whereby the medium acts as the oracle and, like the witch-doctor or the Delphic priestesses, enters into a state of trance in order to act as a mediator between the known and the unknown world.

Oneiromancy, or divination by dreams, is also a very ancient form of the oracular process (see DREAMS). Hydromancy (water or crystal-gazing), pyromancy (fire-watching) and astrology are all practised among primitive people, but the high priest of divination is always the witch-doctor, a student of magical arts, a specialist in the occult, and a respected member of society.

The typical witch-doctor wears a headdress of gaudy feathers, daubs his face with red and white clay, and wears a cloak dangling with the claws, heads and tails of animals. The paraphernalia of his art is kept in his basket, which might be filled perhaps with the following objects: some skin or bone from the forehead of a dead chief; a piece of the nerve from inside an elephant's tusk; the hair of an albino; the wing-case of a big beetle; the feather of a grey parrot; a piece of charcoal from the site where a witch was burnt; part of the burnt heart or liver of a witch; charcoal from the camp fire where novices were circumcised; a root dug up from under such a fire; the horn of an antelope; the shell of a small tortoise filled with 'medicine'.

When the witch-doctor has made his preparations and is ready to consult the oracle, either on the cause of some disaster or the outcome of a future event, he shakes up the basket and proceeds to examine the relative position of each item. The secret of his art consists in knowing the significance of his various ju-jus. Thus, the relics of a dead chief signify renown or fame. The prominent appearance of the elephant tusk nerve means impotence or infertility. The beetle's wing-case suggests the presence of a witch, a lump of charcoal from the camp fire where novices have been circumcised means a big gathering of the tribe.

If a witch or some other evil-doer is suspected, the witch-doctor may produce his 'magic' tortoise to pronounce the oracle. This animal usually has the feather of a guinea fowl inserted into its anus, the theory being that both tortoise and guinea fowl are always looking for their prey. The person towards whom the medium waves the feather is held responsible for the crime or misfortune which the diviner has been called in to solve. To those who might object to the haphazard results of this form of magic, the reply would be that God will protect the innocent.

Shrewd Psychologist

Why do people, both primitive and civilized, accept the pronouncements of oracles which their reason tells them are illogical? The answer in the case of African pagans is that the witch-doctor does not rely solely on mumbo-jumbo to practise his art. Like all oracles, ancient and modern, he must be a shrewd psychologist, familiar with his clients' personality and background. The

A modern Western oracle, the wheel of fortune; like many other oracles, it is based on the belief that things do not occur by chance, so that signs of the future can be drawn from apparently random occurrences

primitive diviner has a great advantage in that he knows many facts about the members of his community and so is able to make his predictions on the basis of his observations.

To this extent his 'magic' is comparable with the scientific aids used every day by civilized people to predict coming events. For example, the height in a column of mercury in a barometer foretells a change in the weather. To the pygmy or bushman the flight of birds or the behaviour of animals is a similar means of divination. Where he differs from the less-superstitious Westerner is that he does not admit that there is any such thing as the laws of chance.

The divining rod is still used almost everywhere in the world to find water or metal. In the hands of a witch-doctor, the wand is relied upon to discover evil-doers exactly as it was in medieval Europe to track down witches, criminals and heretics.

It is easy to see, therefore, why the primitive oracle has always been an integral part of paganism, the 'natural' religion of people who have no other means of foretelling the future. The oracle is a specialist in the occult, and when the witch-doctor enters into a trance-like state, he is believed to be in communication with unseen powers.

On the other hand, observers who have watched him at work point out that he always begins his seance by staring each member of his audience in the face. He takes care to ask them, 'Why have you come to me?' From that question he proceeds to others which gradually bring out the facts he needs to know. And it is very likely that under his stern cross-examination, the guilty person will give himself away, or the individual who has come for a glimpse of what the future holds will hint at what it is that he wants.

The diviner can then proceed with the magical part of his 'act', shaking up his basket and carefully studying the relative positions of its contents. And like a good fortune teller anywhere, he is able to put two and two together and using a little psychology, make his predictions.

Such, at any rate, is the rational explanation of the art of divination. But psychologists themselves admit that not all occult manifestations can be explained away so easily, particularly in the case of primitive oracles. For there are many examples of mystical phenomena which baffle the realists, phenomena which are accepted by primitive races as evidence of the existence of unseen forces. For this reason they have implicit faith in their oracles who speak to them through the medium of the witch-doctor, who holds an important and as respected a position in pagan communities as the psychiatrist does in civilized societies. Ordeal

Trial of courage, strength and endurance, frequently imposed on candidates for initiation who are tortured, mutilated, bullied, humiliated, frightened, and may undergo a symbolic 'death': the medieval trial by ordeal was a method of proving guilt or innocence by subjecting the accused to a test, in the belief that God would preserve the innocent from harm.

See INITIATION; OATH.

Ronald Sheridan

Orgy

Sexual revel, usually assisted by dancing, drink or drugs, in which conventional restraints are thrown aside: in religious and magical contexts, based on the belief that release of the animal and irrational impulses of human nature brings an ecstasy in which man is raised to the level of the divine; the word is derived from *orgia*, the rites of worship of the Greek god Dionysus.

Jewish Observer

Chinese Jews worshipped in temples built in the Chinese style and lived by Confucian principles; Indian Jews did not eat beef and were assimilated into the caste system. Unlike the Jews of Europe who became tightly-knit as a result of persecution, the oriental groups were largely tolerated and lost much of their religious exclusiveness

ORIENTAL JEWISH COMMUNITIES

THE FIRST JEWISH settlers in China were probably silk merchants for the Roman Empire who came by the caravan route over Asia in the first millennium AD. In the 16th century the Turks blocked the overland trade routes, and the Jews living in the middle of China were isolated, both from the West and from other Jewish communities. Jews from India, who probably travelled to China by sea in the 16th and later centuries, established communities on the Chinese coastline, but we are concerned here with the older and more isolated community in central China which was concentrated in Kaifeng, the capital of the Chinese Empire during the Sung Dynasty (960–1280).

A Jewish place of worship or temple was built in Kaifeng in 1163 AD. An inscription, written at the time, tells us that there were 70 Jewish clans in China. At the beginning of the 17th century, when Portuguese Jesuit missionaries discovered that Jews were living in China, there were 10 or 12 clans or between one and two thousand individuals, and by the middle of the 19th century there were only two or three hundred Jews left in China. A register of the Jewish congregation compiled at the end of the 17th century shows that many Jewish men took Chinese Mohammedans and other Chinese as their wives. By the 20th century the Chinese Jewish community had been almost completely assimilated.

In addition to their social absorption through intermarriage, the Chinese Jews were also religiously and culturally assimilated. The Jesuit missionaries and other visitors to the Chinese Jews in the 17th and 18th centuries described a religion which combined Jewish beliefs and practices with those from the surrounding Buddhist, Taoist and Confucian religious cultures. The Jewish temple was similar to other Chinese temples. On two sides, there were wells and baths which the Jews used in their ablutions in the same way as the Moslems. In addition, the Jewish worshippers took off their shoes before entering the temple. Both the Moslems and Jews in China faced west, towards the 'holy places', when they prayed, but by the 17th century the Chinese Jews had lost all historic knowledge of Israel and Jerusalem; they believed that their religion originated in India.

An important place in the Chinese Jewish temple was given to the Emperor's Tablet which was required in all Chinese temples until 1911, and in the front hall of the synagogue there was a long table bearing

Learning a forgotten language: 'Black Cochin' Jews learn Hebrew in Israel; isolated from other Jewish groups, the Indian Jews adopted Hindu beliefs and customs

five ceremonial objects common to all authorized temples since the Ming Dynasty, an incense tripod with a candlestick and a flower vase on each side. In front of the Emperor's Tablet there was a large chair called the 'Chair of Moses' where the Pentateuch was read, and in the extreme western part of the temple, which was the most sacred area, there was a highly decorated ark containing 13 rolls of the Pentateuch. In the 17th and 18th centuries the Chinese Jews still practised many traditional Jewish rites. The Sabbath was kept on Saturday and some Jewish festivals and fasts were kept. The Kaifeng Jews practised circumcision and they also kept some of the dietary laws; they were known as the *Tiao Chin Chiao* or 'the Religion that plucks out the Sinews'.

The influence of the religious surroundings on the Chinese Jews was evident, however, in their ancestral worship and in their use of inscriptions, written on stone tablets, to transmit religious beliefs. The inscriptions, which were written in Chinese, include many quotations from Confucian writings but none from the Pentateuch. The Chinese Jews never appeared to have translated their Hebrew texts into Chinese. The earliest existing stone tablet of the Chinese Jews, set up in 1489, shows the influence of Buddhism with its lotus-curved base stone. The writers of both this stone inscription and another,

set up in 1512, maintained that the principles of Confucianism and Judaism were the same. Inscriptions on archways and tablets in the temple also included references to Chinese classics and quotations from Confucian writings. Since many Jews were men of letters and filled important official posts, they must have been required to perform Confucian ceremonial practices. Thus, although little is known of the religious and social life of the Chinese Jews, it is well established that they adopted many non-Jewish beliefs and symbols and practised many non-Jewish rituals.

By the middle of the 19th century Chinese Judaism had almost disappeared; the temple no longer stood, no one could read Hebrew, services were no longer held and religious observances had ceased. Of the once prosperous large community, there remained only a few poor families who could not afford to rebuild their place of worship. By 1866 the synagogue buildings had entirely disappeared; in 1914 the temple site was sold to a Christian mission.

Indian Jews

The Jews in India may be divided into four groups: the Bene Israel (Sons of Israel), the Cochin Jews, the Baghdadi Jews, and a few hundred Jewish emigrants from Europe. The Baghdadi, who live in the cities of Bombay, Calcutta and Poona, emigrated from Baghdad and other Middle Eastern areas in the 19th century.

As in the case of the Chinese Jews, there is some uncertainty over the origin and date of arrival of both the Cochin Jews, who live on the south-west or Malabar coast of India, and the Bene Israel, who in the past were dispersed in the villages of Konkan but who now live mainly in Bombay. The Bene Israel maintain that they are descendents of the ten lost tribes (see LOST TRIBES) and that they left Israel about 175 BC, but it appears certain that they came from Arabia in the first millennium AD. The Cochin Jews claim that their ancestors came to India after the destruction of the Second Temple in 70 AD, but although Israelites may even have reached India in pre-Christian times, the only certainty is that Jews had settled on the Malabar coast before the end of the first millennium AD.

Today the Indian Jews are comparatively orthodox, but during their isolation from other Jewish communities, their Judaism declined, they adopted many Hindu customs, and they were assimilated into the caste system. The Indian Jews became separate castes and they were also divided into a number of sub-castes. The Cochin Jews are divided into three castes: the White Jews, the Black Jews and the Meshuararim. The Black Jews, whose skin is dark in colour, are the descendants of the original Jewish settlers who converted a number of their native slaves and servants and then, over a period of time, intermarried with them. In the early centuries of the second millennium AD, the Cochin Jews were wealthy and occupied a high position in the local raja's kingdom. It is evident from 13th century tombstones that they had an imperfect knowledge of Hebrew and the Bible. However, in the 17th and 18th centuries Dutch Jews emigrated to India and reinstated an orthodox form of Judaism. The Dutch Jews probably intermarried with the wealthiest families of the established Jewish community, but they came to form the White Jewish caste and completely distinguished themselves from the Black Jews who they claimed were not of 'pure' Jewish descent. The skin colour of the White Jews ranges from white to medium brown. The third caste, the Meshuararim, is made up of the slave and servant converts of white Jews.

The Bene Israel appear to have had very few contacts with Jews from other communities before the 19th century. In their comparative isolation, they forgot how to read Hebrew, but they remembered the Shema, an important Hebrew prayer, and observed the Sabbath, some of the holy days, some dietary regulations and the practice of circumcision. They adopted a number of religious beliefs and practices from their Hindu neighbours. For example, they did not eat beef, they objected to the re-marriage of widows, and they were assimilated into the caste system. The Bene Israel were known as Saturday Oilmen; a caste of oil pressers who did not work on Saturday. They were also divided into two sub-castes: the *Gora* or White Bene Israel, who claimed they were pure descendants of the first Jewish settlers in India, and the lower caste *Kalu* or Black Bene Israel. From the 18th century the Bene Israel migrated from their villages to Bombay where they became a more tightly-knit group, entered a wider range of occupations and, helped by other Jewish groups, strengthened their Judaism.

Tolerated and Assimilated

Neither the Chinese nor the Indian Jews were coerced into accepting the religious beliefs and values of their non-Jewish neighbours. The sociologist Max Weber wrote that Asia was 'the land of the free competition of religions, "tolerant" somewhat in the sense of late antiquity. That is to say, tolerant except for restrictions for reasons of state.' In China, apart from the state's emphasis on the ancestor cult and the recognition of the religious status of the Chinese Emperor (see CHINA), there was little or no formal constraint on the Chinese Jews to conform to non-Jewish beliefs and practices. In India, the Hindus tolerated other religions which did not threaten the caste system (see CASTE) and the supremacy of the Brahmins, but although the dominant Hindu groups did not actively attempt to enforce a Hindu monopoly, the assimilative character of the caste system and the syncretism of the Hindu religion resulted in a virtual monopoly of Hinduism over much of India. Although the Bene Israel who were oil pressers had only acquired the status of an impure caste, it had been to their advantage to accept voluntarily certain Hindu rituals and the caste system, because it was difficult for an alien and therefore impure group, which was not economically self-sufficient, to exist outside the Hindu community. The strong syncretistic character of Hinduism allowed the Jews to be accepted into the Hindu community. Once the Jews had adopted the caste system and the principal rituals of Hinduism, their own distinctive beliefs and rituals were tolerated within the Hindu community itself. We may tentatively conclude that Judaism lost much of its religious distinctiveness and exclusiveness in environments where, for long periods, the Jewish communities had little or no contact with other Jewish communities, and where the surrounding non-Jewish religious groups were strongly disposed to tolerate other religions.

Original Sin

In Christian theology, a taint of sinfulness and predisposition to evil, with which all human beings are infected from birth, apart from and in addition to the sins which they actually commit during their lives; traditionally, this taint stems from Adam's disobedience in Eden and has been inherited by mankind, his descendants.

Orion

Constellation which resembles a man with belt and sword; named for a gigantic and beautiful hunter of Greek mythology who was killed by the goddess Artemis and despatched to the sky; revered by the Egyptians, who saw in it the figure of the god Osiris.

ORPHEUS & ORPHISM

THERE IS really no such thing as Orphism. There is Orpheus, the legendary singer, about whom various stories are told; and there is Orphic literature, that is, a mass of poems, mainly now lost, composed in different places at different periods for different purposes, and for the most part having nothing in common except that Orpheus was claimed as their author. Until not very long ago, it was taken for granted that these poems collectively represented the teaching of a body of people called The Orphics, and a great religious movement called Orphism was constructed and extensively written about.

The truth is that no prophet or sect had a monopoly of Orpheus' name. The 'Orphic' poems fit into no overall scheme. The most that can be said is that under the Roman Empire one poem of a somewhat encyclopedic nature achieved a sort of canonical authority: new Orphic poems took account of it, and academic theologians accepted it as the authentic revelation of Orpheus. Its vogue is one thing that might be called Orphism.

Orpheus, like several other legendary singers was held to come from Thrace, the semi-barbarous, semi-mythical country to the north of Greece; or from Mount Olympus, where the Muses themselves were born. And according to an alternative account of his parentage, Orpheus was born from the Muse Calliope and the most musical of gods, Apollo. But he was a mortal, with mortal descendants. Genealogies were constructed which made him the ancestor of other famous minstrels, including Homer. The number of generations inserted in these genealogies implies a belief that Orpheus belonged to a period well before the Trojan War (13th century BC, on our reckoning). That is a period well covered by a network of Greek legends and genealogies which may preserve some genuine memories of the Mycenean age. But Orpheus, as a Thracian, stands outside the Mycenean world, and is only very loosely connected with the main body of heroic mythology.

Legends of Orpheus

Probably the best known of the stories about him is that he sang so beautifully with his lyre that not only the creatures of the wild came and stood entranced around him, but even the rivers stayed in their courses, and the rocks and trees came sidling down from the mountain. This eccentric miracle has no context, it is not associated with any particular occasion. It is true that a similar effect is produced when Orpheus sings for the Argonauts, but that was at sea, and the typical trees and rocks are absent. The story was that Orpheus took part in Jason's famous expedition to get the Golden Fleece. Though not a stalwart fellow, he came in very useful, for among the dangers that had to be overcome on the voyage were the Sirens, who lured sailors to their shore with their beautiful singing, to sit and listen till they wasted away. Orpheus saved the Argonauts by striking up in competition. The tale belongs to the type common in folk literature, in which a group of companions undertake a difficult task and are able to survive a series of dangers because each of them has some special skill. It is older than the *Odyssey*, in which the Sirens are one of several motifs transferred from the Argonauts to Odysseus. But the identity of the Argonautic minstrel is not fixed in the tradition, and Orpheus himself need not be so ancient. We cannot trace him definitely earlier than the 6th century BC.

His other famous exploit was his descent to Hades to recover his wife – usually called Eurydice – after she had been fatally bitten by a snake. Again it was his singing that was important, enabling him to prevail upon Pluto and Persephone to make an exception and release their visitor. But (the story usually proceeds) he failed to bring her safely back: he looked back at her before they reached home, and the poor dear was at once compelled to return. This was a piece of magic, like others in myth and ritual, that could only be accomplished with averted eyes. But Orpheus remained one of the few, like Theseus, Hercules and Odysseus, who penetrated to the land of the dead and returned to tell the tale.

As for his eventual death, one story was that Zeus struck him with lightning: an ambiguous fate, often the wages of sin, but sometimes the means of translation to a higher existence in Elysium or even heaven. The more widespread version, however, was that for one reason or another he was

set upon by the Thracian Bacchants and torn limb from limb. Again, this is a typical theme. Orpheus is only one of a number of people (normally either young children, or men who interfere with the service of Dionysus) who are torn apart by Bacchants. But in his case there was a surprising sequel. His head, thrown into the River Hebrus, continued to sing. It was carried out to sea and across to Lesbos, where it was found on the shore still carolling away. It was installed in a chasm on the island, where it issued oracles to inquirers. Once more, a folktale element is involved, for there are several stories about murder victims whose severed heads retain the power of speech (see HEAD). We may say generally that the myths about Orpheus are of this sort, folktales that have attached themselves to a convenient hero. There seems to be no residue of historical memory, and in answer to the questions who Orpheus really was and when he lived, if he lived at all, we must confess that we have no notion.

Orphic Poems

The practice of foisting theological poems on Orpheus begins, so far as we can see, with Pythagoras and his early followers, about 500 BC. Pythagoras was an intellectual priest-prophet who claimed to be an incarnation of Apollo. His teaching combined a superstitious insistence on old religious precepts and taboos with the novel doctrine of transmigration of souls through different animal bodies and different regions of the universe; probably also a mystical reverence for numbers (see PYTHAGORAS). Writers in the 5th century speak of his 'making a selection' of certain writings, or specifically of his publishing under the name of Orpheus. We hear of rites which are 'called Orphic and Bacchic but are really Egyptian and Pythagorean'. We know the titles of several poems of metaphysical content, nominally by Orpheus but remembered as the work of early Pythagoreans called Brontinus, Zopyrus and Cercops, and we can see reflections of Pythagorean thought in their subject matter. The *Robe* may have developed a myth of Pherecydes (540 BC), for whom the earth's surface was a robe worn by the earth goddess after her marriage to Zeus the sky god. For Brontinus the weaving of the robe may have been more than a metaphor – an insight into the physical process by which vegetation spreads across the earth in spring.

The *Net* must have been a rather similar poem. The knitting of the net illustrated the formation of a living creature, with its tissue built up loop by loop, its soul being the air captured in the interstices. Then there was the *Mixing Bowl*; the mixing process played an important part in cosmological theory of the time and the cosmic mixing bowl reappears in Plato. Apart from these metaphysical expositions, there was a *Descent to Hades*, probably a straightforward apocalypse in which Orpheus gave an account of his quest for Eurydice, and revealed to mankind the fate of souls in the other world.

In the second half of the 5th century we find Orpheus mentioned as an inventor of spells and incantations. But his principal gifts to mankind, according to Aristophanes, are 'sacraments, and abstention from bloodshed'. This implies a religious vegetarianism, a typically but by no means exclusively Pythagorean discipline. The sacraments referred to may include those of the Eleusinian Mysteries (see ELEUSIS), for it is not much later that we find Orpheus named as their founder. The hero of Euripides' *Hippolytus* (428 BC) has been to the Eleusinian Mysteries, he follows a vegetarian diet in his desire for purity and holiness, and he 'has Orpheus for his master, paying service to the vapourings of many writings'. A little later, Plato tells of people who persuade both private individuals and the greatest cities (surely a reference to Eleusis) to take sacraments that bring purification and release from sin, personal or inherited; they offer 'a throng of books, of Orpheus and Musaeus' (another mythical singer). The purified, it is said, feast with the gods for ever, while the rest lie in mud. In the next generation, Theophrastus notes it as a mark of the superstitious man that he takes his family every month to the 'Orpheus-ministers', who no doubt charged him a suitable fee for his salvation.

One of the favourite stories about Orpheus, the legendary Thracian singer, was that he made such beautiful music on his lyre that the creatures of the wild came and stood enraptured about him: by the Flemish painter Savéry, 17th century

Scala

It was such a man, perhaps, who took with him to the funeral pyre an allegorical commentary on an Orphic theogony, not far from Salonica: the scroll was only charred, and a few years ago it came to light, the oldest surviving Greek papyrus and the only one found in Greece itself. Full publication of the text is impatiently awaited. To the same period, the late 4th century, belongs the oldest of the famous gold tablets, which turn up in tombs in widely separate places (Thessaly, Crete, Italy) down to the 2nd century AD. Although they say nothing of Orpheus, they throw light on that desire for personal salvation which often did take Orpheus for its evangelist. They are reminders to the soul of what to do and say in the other world; they are mainly in verse. The longest reads: 'Now you will find to the left of the halls of Hades a spring, and beside it a white cypress standing. Do not approach this spring. You will find on the other side cool water flowing from the Lake of Recollection; but there are guards before it. Say "I am a child of Earth and Sky, of heavenly race, you know it well: but I am parched with thirst, I perish. Give me, quickly, the cool water from the Lake of Recollection." And they shall give you to drink from the holy spring, and after that you shall enter the kingdom of the Heroes.' There are similarities to the *Book of the Dead* here, and many scholars admit an Egyptian influence.

But we must return to Plato, for only one side of his Orpheus has been described. He mentions Orpheus more often than any earlier writer, and this may not be unconnected with the fact that he was much influenced by Pythagoreanism. A Pythagorean origin should perhaps be posited for the Orphic theogony that he and presently Aristotle mention. (It is not yet clear whether it was the same as the theogony of the Salonica papyrus.) Like the old theogony of Hesiod, it gave a genealogy of the gods, interspersed with narrative episodes. Its content seems not to have been startlingly different from Hesiod. But we cannot tell how it ended; and the ending will have been the important part, containing a religious message to which the genealogy merely served as a background. If it was Pythagorean, it may have set out the

doctrine of transmigration, which Plato knows as an 'ancient account' told by 'godly' poets. He also mentions 'ancient sacred accounts' which tell of penalties imposed on souls by judges; and the imprisonment of the soul in a body as a punishment is linked with the name of Orpheus.

The Apparition

The theogony had a long and varied career. First, it was chosen as the opening poem of the Epic Cycle, an artificial chain of epic poems spanning the whole of legendary history, and this involved certain alterations and omissions. Secondly, at least one rival Orphic theogony appeared, totally different in content. It features Unaging Time, portrayed as a winged serpent, with extra heads of a bull, lion and god, coiled with a female counterpart, Destiny. Time produces Light, Darkness and Chaos, and in the middle a shining egg. From it a splendid creature hatches, with golden wings, four eyes and horns, various animal heads, and the organs of both sexes. He has many names: Zeus, Pan, Dionysus, Eros, Firstborn, Phanes ('Apparition'), and more obscurely Erikepaios. The world is filled with radiance at his appearance, but he himself is invisible except to Night. He mates with her as well as with his own female parts, producing heaven and earth, and other gods, and so our world takes shape. This extraordinary poem is thoroughly oriental in inspiration, having its closest parallels in Iranian theology, and was probably composed in the East in the 3rd century BC.

There were now two or three theogonies by Orpheus in circulation, telling very different stories. The conflict was resolved soon after 100 BC, when a redactor forcibly conflated them, together with whatever other 'Orphic' material came to hand. There was a tale that Homer's poems had had to be reconstructed after his death from 'rhapsodies' (the Greek word means recitations) which he had left behind in different towns. So it was pretended that the new epic had been constituted from Rhapsodies of Orpheus, 24 of them as in the *Iliad* and *Odyssey*.

Instead of being the permanent ruler of the world, Phanes was now the first of six divine kings. He was no longer Zeus and Dionysus: they were the fifth and sixth kings, born long after him. Yet Zeus remained the creator of the world, for he swallowed Phanes and the universe with him, and then produced it all over again. The climax of the complicated narrative came when Dionysus was set on the throne at the age of six. The Titans (see CRONUS), diverting him with a curious assortment of ritual objects, cut him into seven pieces, which they boiled and tasted. But Apollo, by burying the pieces, was able to restore the child to health; the Titans were blasted with thunderbolts, and from the dirty smoke that this produced, man was created. His soul is immortal: after death it is judged, spends 300 years in pleasant or nasty surroundings, and is then reborn in a new body. But men aim to achieve release from this round of ills, and Dionysus and Persephone are appointed to help them, if they perform the correct sacrifices and purification rites.

The dissection and cooking of Dionysus must be compared with the myths of Bacchants tearing people apart, and seems to be a mythical reflection of a procedure of animal sacrifice. We first hear of the death of the god as a local legend from Delphi in the early 3rd century BC. It is presupposed in a broken papyrus of about 220 BC which contains notes for a sacrificial ritual and prayers for personal salvation addressed to Demeter, Persephone and Erikepaios (here probably a name of Dionysus). This reveals a cult in Greek Egypt very like what we would have to postulate, besides the rival theogonies described, to account for the contents of the Rhapsodies. It is noteworthy that Ptolemy IV, who ruled Egypt from 222 to 205, was a great devotee of Dionysus and claimed descent from him. He issued an edict that all who held Dionysiac sacraments must register in Alexandria, state who they had learnt their ceremonies from, and deliver a signed copy of their holy story. Various 'Orphic' poems must have been collected as a result.

'Orphic' Cults

The Pythagoreans still had shares in the name of Orpheus. As their interests spread, in the last centuries before Christ, to subjects like medicine, astrology and divination, their Orpheus modified his poetic output accordingly. Varro (116–27 BC) knew a poem called the *Lyre*, said to be about summoning up souls, and perhaps based on an analogy between the seven strings of Orpheus' lyre and the seven planetary spheres through which, in post-Platonic speculation, the soul ascended to heaven. The elder Pliny (23–79 AD) more than once cites Orpheus as an authority on herbs, a topic which Pythagorean writers were investigating by 50 BC at the latest.

The fact that Orpheus was adopted as the founder of the Eleusinian Mysteries should mean that he composed the sacred poetry, and a chronicle of 264 BC probably named him as the author of a cult poem on the rape of Persephone. In fact we possess such a poem, among the hymns ascribed to Homer, and parts of it are quoted as 'Orpheus' in a papyrus of the 1st century BC. The practice of attributing to Orpheus poems composed for local cults became increasingly prevalent in the Hellenistic period and under the Roman Empire. As early as 320 BC he is the founder of Dionysus-mysteries. Later we find him linked with cults in Aegina, Sparta and Phrygia. We hear of a *Corybanticum* and of *Enthronements for the Divine Mother*, both belonging to rites in which initiates in the service of the Great Mother (see CORYBANTES; CYBELE) were set on a throne and danced round by the others. We hear of a *Girding Song* (in some cults, the initiate put on a special girdle); *Verses for sacred investiture*; *Verses for founding a shrine*; *Verses for naming*; *Cosmic invocations*; *For Salvation*; *Oaths*. There must have been much more. One specimen of 'Orphic' cult poetry has come down to us intact: a collection of 87 hymns, very homogeneous in style and probably the work of a single author in the 2nd or 3rd century AD. He refers to himself as Orpheus, and alludes to the Rhapsodies. The hymns were apparently used by members of a private religious society who met at night in a house somewhere in west Asia Minor and prayed to all the gods they could think of, to the light of torches and the fragrance of eight varieties of incense. Occasionally their ceremonial extended to a libation of milk. Dionysus is prominent, being the recipient, under different titles, of eight hymns. We get a picture of cheerful and inexpensive dabbling in religion by a literary-minded circle.

The tradition of sub-scientific Orphica continued concurrently. There is record of a *Book of Eighty Gems* (on the magic properties of stones), various astrological poems, and directions for divination from birds, dreams, eggs, entrails and earthquakes. Two compositions that stand apart from the rest are the *Testament*, possibly a

Jewish effort, in which Orpheus repudiated his earlier teachings and acknowledged a single God, and the *Argonautica*, a short and derivative epic in which Orpheus described his participation in Jason's expedition. The poem is hardly earlier and perhaps later than the 4th century AD. It was consciously designed as an addition to an already bulky corpus of Orphic literature, for Orpheus begins by reviewing his previous compositions. He summarizes part of the Rhapsodies, and mentions among other things Corybantic rites, Demeter's search for Persephone, cults of Lemnos, Samothrace, Cyprus, and of Osiris in Egypt; poems on astrology, divination, purification, propitiation of gods and departed spirits, and an eye-witness account of the underworld.

Such was Orphic literature at the time: a vast hotch-potch. But pride of place is given to the Rhapsodies; and Dionysus is the god with whom Orpheus is most firmly associated in cult. The reason is perhaps simply that the Dionysiac mysteries were more popular than any other. If it had fallen to a Greek god to conquer Europe, it would have been Dionysus; and the Orphic Rhapsodies would have been our Bible. Among our Apocrypha might have been the *Bacchica*, a late poem which reidentified Dionysus with Zeus and Phanes, holding all these names to be titles of the divine Sun. But for the Neoplatonist philosophers of the 5th and 6th centuries, 'Orpheus' meant primarily the Rhapsodies. They discussed the poem in seminars and written commentaries, quoted it constantly, and misunderstood it completely, finding in it an allegorical exposition of their own vapid metaphysics. In antiquity as in modern times, Orpheus was all things to all men.

For the Egyptians Osiris was both saviour and judge; murdered by Seth he was raised to life again and became god of the underworld. His royal character was designed to effect the resurrection of the dead pharaoh who was ritually assimilated to Osiris

OSIRIS

THE ANCIENT EGYPTIAN god Osiris is one of the most interesting and significant deities known to historians of religions. He is also one of the oldest gods of whom records survive; and he may rightly claim to have been worshipped longer than any other god – his cult was already well established by 2400 BC, and it continued until the forcible suppression of paganism, in favour of Christianity, in the 4th century AD.

Because Osiris was so important to them and they were so familiar with his myth or legend, the Egyptians never seem to have written a formal account of their beliefs about him. Their literature, both sacred and secular, is replete with references and allusions to him, and he is one of the figures most abundantly portrayed in their art. Yet it was left to the Greek writers Diodorus Siculus, in the 1st century BC, and Plutarch, in the following century, to provide posterity with descriptive accounts of this ancient Egyptian god, who was still a potent figure in their day. Their accounts must, inevitably, be treated with much caution; for it is unlikely that they had any direct access to Egyptian records, and they were concerned to rationalize and philosophize what they had learned from their Egyptian guides and interpreters. However, there is reason to think that they did preserve some authentic traditions, and their accounts are significant as evidence of what Osiris had come to mean to Graeco-Roman society more than 2000 years after he first appears in Egyptian records.

In the Pyramid Texts (see BOOK OF THE DEAD), which are concerned with the afterlife of the pharaohs of the 5th and 6th Dynasties, Osiris plays a strange but vital role in the mortuary ritual. Among its rubrics and spells, reference is made to his murder and the finding of his body: 'Isis comes and Nephthys . . . They find Osiris, as his brother Set laid him low in Nedjet.' Nedjet in historical times was located near Abydos, in Upper Egypt, which was the chief sanctuary of Osiris. In another text of about the same period (2400 BC) there is reference to the drowning of Osiris in the River Nile at Memphis, the ancient capital of Egypt. There are references also in other texts to the casting of Osiris's body into the Nile or to finding it upon its banks. The two traditions are not mutually exclusive; but what is consistently attested throughout all Egyptian records is that Seth murdered Osiris.

Raised by Magical Chants

The Egyptian evidence is also agreed that the corpse of Osiris was found by Isis (see ISIS) and Nephthys, who either prevented its decomposition or restored it when decomposed by various acts of embalmment. After effecting the preservation of his body, the dead Osiris was then raised to life again. Various deities are associated in the texts and iconography with this resurrection, namely, Isis and Nephthys, Atum-Re, Anubis and Horus (see EGYPT). The means by which it was effected varies. Generally it would seem that magical incantation was envisaged to resurrect the god. Sometimes a more practical way was imagined, as in depictions showing Isis and Nephthys fanning air into the inanimate Osiris with the falcon wings attached to their arms.

Although he was thus raised to life again, Osiris did not resume his earthly life in Egypt where, as the texts indicate, he had been a king. Instead, his cause against his murderer Seth was tried before a tribunal of the gods of Heliopolis. The verdict was concise 'Guilty is Set: Osiris is just.' Osiris then became 'the lord of the West', the underworld or realm of the dead.

The legend of Osiris also involves a number of other divine figures. Isis is both the wife and sister of Osiris. Nephthys, her sister, is the consort of Seth, who is represented as both the brother and murderer of Osiris. Horus was regarded as the posthumously begotten son of Osiris (see HORUS). Grown to man's estate, he is represented as fighting with Seth to avenge his father and secure his patrimony. He is also described, inconsistently with his posthumous birth, as performing various mortuary offices for his father, including the ceremony of 'Opening the Mouth' (see MUMMIFICATION).

Such, then, is the story of Osiris as it can be reconstructed from Egyptian texts. The versions of Diodorus Siculus and Plutarch are fuller narrative accounts, composed according to contemporary Graeco-Roman taste; but they preserve some outline of the basic pattern of the Egyptian original. Diodorus presents Osiris as an ancient king who taught the Egyptians the arts of civilized living, including agriculture – Isis had discovered the use of wheat and barley, which had hitherto grown wild. He is murdered by his brother Typhon (Seth is here identified with an evil monster of Greek mythology), who divided his body into 26 pieces, which he gave to his followers in order to implicate them in his crime. The death of Osiris is avenged by Isis and Horus, who slay Typhon. Isis recovers the parts of her husband's body, except the phallus, and buries them secretly. In order to promote the worship of Osiris, she then made exact replicas of his body and entrusted them severally to colleges of priests to bury in their local centres – this is obviously an attempt to explain the fact that several places in Egypt claimed to have the tomb or some relic of Osiris. After reigning for many years, Isis died and was deified. Memphis claimed to have her tomb; but many believed that both Osiris and Isis were buried in the island of Philae in Upper Egypt. This account by Diodorus shows no insight into the real nature of the deity or his place in Egyptian religion.

Treachery at a Banquet

According to Plutarch, Osiris was also a king who civilized both the Egyptians and the rest of mankind; he was identified by the Greeks with their god Dionysus (see DIONYSUS). After the return of Osiris from his world travel, Seth planned his death with the help of 72 fellow-conspirators. Having secretly measured the body of Osiris, Seth made a beautiful chest, richly decorated, exactly to its dimensions. Then, at a banquet to which Osiris was invited, he offered to give the chest to any guest whom it fitted. When Osiris laid himself within it, Seth slammed the lid, and secured it fast. The chest was thrown into the River Nile, carried to the sea, and drifted to Byblos, on the Phoenician coast. It came to rest on the shore, and a lovely tree grew up and enclosed it. The tree's size and beauty caused the King of

Michael Holford Library

Osiris 'may rightly claim to have been worshipped longer than any other god': this statue shows him wearing the white crown of Egypt and holding the royal symbols of crook and flail

Byblos to cut it down and use it as a pillar of his palace.

The sorrowing Isis, who had long been seeking her husband's body, eventually located it, and by a display of magical power, obtained it from the King of Byblos and brought it back to Egypt. There it was discovered by Seth, who cut it into 14 pieces and scattered the parts throughout the land. Isis patiently searched for the parts, burying each where it was found – another explanation of the many burial places of Osiris in Egypt. The phallus was not found; it had been devoured by a fish that became tabu to the Egyptians. Osiris then emerged from the underworld, to train and equip his son Horus to punish Seth. Horus conquered Seth after a hard struggle, and his legitimacy, questioned by Seth, was vindicated by the gods. Isis conceived a son called Harpocrates by her dead husband – Plutarch here mistakes one of the Greek names ('Harpocrates', derived from the Egyptian 'Horus the child') of Horus for another deity. Plutarch also regarded Osiris and Isis as demigods who, because of their virtue, were translated into gods.

These Greek versions are evidence of the fascination that Osiris had for Graeco-Roman society. But although Egyptologists today are better placed to evaluate the ancient god than the Greek men of learning, many problems still remain unsolved.

The Mighty One

The Pyramid Texts show that the kings of Egypt were associated with Osiris in death. This association was clearly not a novel one, and it must have extended far back into the past, possibly into the pre-dynastic period. The name 'Osiris' has been the subject of much study, in the hope that it might provide a clue to the deity's origin, but none of the many interpretations that have been offered has yet been generally accepted. The most recent suggestion, which has much to commend it, is that the name meant originally 'the Mighty One'. Equally obscure is the problem of the original location of the cult of Osiris. Busiris (from an Egyptian word meaning 'House of Osiris') in the eastern Delta of the Nile was an ancient cult centre of Osiris, but the local deity there was Anzeti. However, since Osiris is invariably depicted wearing the tall white crown of Upper Egypt, it would seem that he had originated from that province.

The royal aspect or character of the god is presented in his traditional iconography: besides the white crown, he holds the symbols of Egyptian royalty – the crook and flail. The image, however, is a curious compromise between a living and a dead king. For the body of Osiris is represented in the form of a mummy, yet the face and head are free of mummy wrappings and the hands protrude from the wrappings and firmly grasp the royal insignia.

The association of the pharaoh with

Osiris in death, which constitutes one of the most notable themes of the Pyramid Texts, was designed to effect the resurrection of the dead king. It was based on the principle of imitative magic, the dead king being ritually assimilated to Osiris. The whole drama of the mortuary ritual was, in fact, modelled on that of the legend of the death and resurrection of Osiris. In the Pyramid Texts the subject was the dead king; but gradually the royal mortuary ritual was democratized, so that by the New Kingdom all persons who could afford the expense could hope for revivification through ritual assimilation to Osiris.

Because of his connection with the fundamental mysteries of death and the afterlife, Osiris became the most significant of the gods for the Egyptians. At Abydos, the chief centre of his cult, a dramatic presentation of his death and resurrection was periodically performed. Osiris was also connected with the cult of the Apis bull, from which was derived his transformation into Serapis, the great deity of Hellenized Egypt, whose worship was promoted by King Ptolemy I (304–282 BC) as part of his policy to unite his Greek and Egyptian subjects. In the form of a Mystery religion, the cult of Isis and Osiris spread far into the Roman Empire; and the famous *Golden Ass* of Apuleius (2nd century AD) attests to the power of its appeal – although Isis, as the great compassionate goddess of the universe, tended to dominate the attention of the devotees, leaving Osiris a somewhat background figure invested in deep mystery.

The ever-increasing importance of Osiris to the Egyptians resulted in his association with natural phenomena, especially with the growth of corn and the fructifying waters of the Nile. This has led to his identification as a vegetation deity of the dying-rising type by many scholars, pre-eminently by Sir James G. Frazer (see DYING GOD; VEGETATION SPIRITS). The identification appears to be strikingly confirmed by the custom of placing in tombs moist earth shaped in the form of Osiris: the seed sown in it quickly sprouted in the dark warmth, thus symbolizing new life rising from the dead Osiris, and perhaps facilitating the resurrection of the dead person buried in the tomb. However, although a fertility role was certainly assigned to him, Osiris's character of a vegetation god was later and subordinate to his mortuary significance.

Judge and Redeemer

Another role which Osiris acquired was that of judge of the dead; but it was not until the New Kingdom that he appears in this guise, and it is not clear how he came to acquire it. In the Book of the Dead Osiris is presented as exercising his fateful office in two different ways: the dead are directed to make their first 'Declaration of Innocence' to him; and he presides at the weighing of the soul (see JUDGEMENT OF THE DEAD). The role of judge of the dead logically contradicted that of saviour of the dead which Osiris had in the mortuary ritual. This discrepancy is extremely interesting, because a similar one occurs in Christianity, where Christ is both saviour and judge. The cause, however, is not the same in each case: Osiris probably came to be regarded as the judge of the dead because he ruled the land of the dead; the diverse roles of Christ derived from the Pauline and Jerusalem traditions that were eventually fused together in orthodox Christology (see PAUL).

It is difficult for us today to appreciate what the ancient Egyptians felt when they looked on the image of Osiris. But some insight is perhaps given, if we bear in mind that the image was that of a divine hero who had suffered and died, and then rose from the dead. Thus Osiris was not some remote transcendent deity such as Re, the sun god, but one who had endured the grim ordeal that awaited all men. In his image, moreover, the Egyptian devotees saw also the promise of their own resurrection from death and eternal life in the realm of Osiris. Phenomenologically, if not historically, Osiris was thus a prototype of Christ.

OSTRICH

IT WAS PROBABLY as a source of food that the ostrich first aroused man's interest, for its eggs have been eaten since very early times. A North African rock engraving of the Stone Age depicts a hunter aiming an arrow at an ostrich, while frescoes in Egyptian tombs show the bird's plumes being used for personal decoration. Greek and Roman writers refer to the ostrich, but in Europe traditional lore concerning it mainly sprang from the biblical allusions which credited it with being forgetful, stupid and cruel (Job 39.13–17; Lamentations 4.3). As few Europeans until recent times had opportunities to observe the behaviour of the bird in the wild, there was ample opportunities for the little that was recorded to be misunderstood.

Biblical writers incorrectly inferred that the ostrich neglected its young, partly from the bird's habit of retreating when approached, and also because ostriches in the Near East sometimes left their eggs covered with sand to be kept warm by the sun's heat. The notion that the bird did not brood, which dates from at least as far back as the 2nd century, led to the belief that it hatched its eggs by gazing at them intently. This belief was repeated by writers down the centuries, including Vincent of Beauvais and Montaigne, and the ostrich egg thus became a symbol of single-minded devotion. In present-day Greek churches an ostrich egg suspended in a conspicuous position is a reminder to the worshipper to focus his thoughts and prayers. The moral was drawn that as the ostrich leaves the eggs so the hermit retires from worldly involvements.

Sonia Halliday

The ostrich became a symbol of single-minded devotion because it was believed that it hatched its eggs by gazing at them: mosaic from the Roman site of Thurburbo Majus in Tunisia

The belief that the bird consumes hard, inedible objects is also of long standing. Pliny said the ostrich could digest anything, but Aelian, who was better informed, stated that it kept pebbles in its gizzard. Rabbinic writers commented that it ate glass. An early Christian document (*Physiologus*) remarks that the ostrich eats glowing iron because 'his nature is very cold', and the poet John Skelton (c 1460–1529) mentions that the bird will eat a horseshoe. In *Henry VI*, Part 2, Jack Cade blusters: 'I'll make thee eat iron like an ostrich.' Living in unnatural conditions ostriches will indeed swallow incongruous objects; thus observed fact was exaggerated into fantasy.

Among the fanciful ideas about ostriches given currency by writers of the 15th and 16th centuries were that these birds terrified horses by flapping their wings, and that underneath the wings there was a small bone with which they pricked themselves when provoked to anger. Such ideas may have arisen from observations of these strange birds flapping their short wings as they ran away.

For some reason the idea arose that the ostrich is deaf as well as silly. In Philemon Holland's translation of Pliny, *Historia Naturalis* (1602), we read: 'But the veriest fools they be of all others; – for as high as the rest of their body is, yet if they thrust their head and neck once into any shrub or bush, and get it hidden, they think then they are safe enough, and that no man seeth them.' Hence the proverbial ostrich, symbolical of stupidity and an inability to face realities. No doubt the belief arose from ostriches being seen with heads down feeding before they became alarmed.

The belief, mentioned by Aristotle, that ostriches lay more eggs than any other bird was based on the finding of large clutches. As many as 60 have been recorded but the ostrich is polygamous and several may lay in one nest.

Victoria and Albert Museum

Interest in the messages produced by table tilting, ouija boards or planchette, and the tendency to believe that they come from the spirit world, are not confined to the West: in this Japanese print fox spirits are communicating with human beings by tilting a table

Although the messages that 'come through' the ouija board can often be traced to the performers' subconscious, there are cases when they appear to emanate from some source which is not so far recognized by orthodox science

OUIJA BOARDS

THE NAME OUIJA derives from the French and German words for 'yes', *oui* and *ja*. A ouija board is a flat polished sheet of wood, about 18 inches by 12, which has the alphabet written in a wide half moon along its longer side. On top of this board is placed a much smaller one, heart-shaped and mounted on tiny castors which enable it to slide about. If one or more persons place their finger tips lightly on the smaller board, in many cases it will slide, without being consciously pushed, so that the apex of the heart points from letter to letter, making words or even sentences which are not expected by the performers. Sometimes, though not often, information comes to them which is not at the time known to their conscious minds, though it may have been known to one or more of them in the past and then forgotten. Very occasionally it seems not to have been known to any of them at all.

One variant of the ouija board is called a planchette. In this case a pencil is attached to the apex of the heart-shaped pointer and a blank sheet of paper is placed on the larger board. Again, this sometimes but not always results in the pencil moving about without being consciously pushed, and what it writes may range from aimless marks to whole sentences and even long stories. But as a rule its productions do not make much sense. A second variant of a ouija board may be made by cutting out the letters of the alphabet and setting them in a circle on a polished table. If a wine glass or smooth rimmed tumbler is then placed

Chris Barker

The simplest form of ouija board, an upturned glass in the centre of a circle of letters (*left*), and a planchette (*right*): both devices seem to open up 'shortcuts from subconscious to conscious' and can be upsetting, embarrassing or frightening if 'censored' material comes through

upside down within the circle and the fingers of one or more persons lightly rested upon it (preferably one finger, per hand, per person) it will sometimes slide from letter to letter forming words in the same manner as the heart-shaped pointer. Why such devices can be made to function by some people and not by others is not known. It may be a matter of the psychological attitude of the performers, or – a wild speculation – the cause might even be an electrical one.

Shortcut to the Surface

Table tilting – or tipping, or turning, as it is sometimes called – works on the same general principle as a ouija board although it is slower and more laborious. If one or more persons place their fingers on a table, preferably a small circular one on a three-footed pedestal, on some occasions, which cannot be predicted in advance, it will tip up and tap a foot without being consciously pushed by any of the performers. As a rule Spiritualists make use of a code by which it can answer questions – one tap for 'yes', two for 'uncertain' and three for 'no'. Or letters of the alphabet may be recited and responded to by taps – and so on. Such activities are still popular in Spiritualistic circles, and they were extremely so, even among the sophisticated, in the 19th century. Queen Victoria and Prince Albert are on record as having once tilted a table. In those days the entities which purported to communicate through the board or table were widely assumed to be what they claimed to be, discarnate spirits, but nowadays modern psychology has produced a rival source nearer at hand – the subconscious of one or more of the performers.

It is now for the most part accepted that much mental and emotional activity in the human psyche takes place beyond the threshold of consciousness. Glimpses of it can be seen in dreams and its results may also come to the surface unexpectedly, 'out of the blue', and can range from idealistic and creative ideas at one end to apparently motiveless destructive impulses at the other. It seems, in fact, as if those hidden areas contain all kinds of material, some of it 'higher' in quality than the conscious self, some of it 'lower'. Psychoanalysis has also emphasized that memories of distressing events can be repressed into those areas because they are too painful to be faced by the conscious self, and that goes too for desires which do not fit into the pattern of life ordained by that self. A natural conclusion from this is that the highway from subconscious to conscious may sometimes be blocked, that there may be some sort of psychological censorship. The symbolic nature of many dreams hints at such censorship.

There are certain procedures which seem to open up what may be called shortcuts from subconscious to conscious, and by means of these censored material is sometimes able to get through. Such procedures have been given the blanket name of automatisms, since what they produce has not been consciously willed or even known in advance and they often seem to involve some degree of dissociation, however slight. One form of automatism is trance mediumship; another is automatic writing and even automatic speech uttered in a less than trance state – for occasionally an individual will make statements or, say, preach a sermon, without the motivation coming from his conscious self, but still without that self being entirely in abeyance (see AUTOMATIC ART; MEDIUMS). Ouija board conversations, planchette writing and table-tipping are usually practised by several persons at a time and may then be called collective automatisms; these have the advantage that each participant can assume that the motive force comes from, or through, one of the others and that he himself is free from responsibility for what is said. In this context it is of interest that in most traditional attempts to provide information acquired through ESP even the individual sensitive uses some kind of procedure which implies that the information is being mediated to him through some outside source such, for instance, as a medium's control, a possessing god, a crystal, tea-leaves, hands, bones, a pendulum, a divining rod or automatically written messages which claim to come from a discarnate entity. To believe in any such procedure may be of

'All the world is much interested – not to say excited – with the newly-developed force as manifested in table moving': illustration to an article in *The Illustrated Magazine of Art*, 1854, implying that even the children's weight will not prevent the table from moving

genuine help to the performer for several reasons: it frees him from responsibility for what is said – he is only the transmitter; it reduces the analytical conscious mind to a passive role, hence its activity is less likely to blur faint intimations that may well up from beyond the threshold; and it may also tend to encourage slight dissociation which appears to facilitate the emergence of subconscious material.

The following examples may help to indicate various sources from which material obtained through the ouija board and table-tipping type of automatism seems to come. The first case is one in which conscious and subconscious wishes apparently corresponded, but even so, the material was produced in an intriguingly oblique manner, one which almost suggested that the subconscious of one or both performers was entertaining itself at the expense of their conscious selves. Theodora Bosanquet, at that time literary editor of *Time and Tide*, and I were trying to get some first-hand knowledge of automatisms by working a ouija board together once a week. We could trust each other not to cheat by pushing the pointer consciously and we assumed that what it wrote came from her subconscious or mine, though we did not rule out subconscious telepathic collaboration. We did not take very seriously the Spiritualist idea that the board's remarks came from a discarnate entity as they purported to do, although if the conversation was to flow at all naturally it was essential to dramatize that one was talking to a person rather than to a piece of wood. Miss Bosanquet came in for a session on the morning of 8 May 1945 (the date of the end of the Second World War in Europe) and as usual we asked the board what it wished to talk about; it is seldom of any use to force the subconscious to talk about subjects it has not chosen. 'The sixth noun in Hamlet', was the immediate reply. We had neither of us read or seen Hamlet for some years, nor had we the slightest recollection of what that noun might be. We found it half way down the page, a good deal further down than we expected, and it was the word 'relief' in the sentence, 'For this relief much thanks!' – an apt enough subject for V.E. Day. A trivial incident, but it raises a number of questions; for instance, did one or both of us subconsciously know Hamlet by heart? And if we did, why count up the nouns and bring up the word relief in that circuitous way?

'Victorian Uplift'

The next case illustrates the emergence of material which has been repressed. (This quite often happens; I have known of three occasions, for instance, when a concealed love affair of one of the performers was revealed by the board, to the great distress and embarrassment of the person concerned.) On this occasion, at his own request, a psychiatrist came to observe the board in action, and I asked him if he would like to add his fingers to ours. He did so and the board at once began to pour forth a stream of religious sentiment, which, being Freudian-trained, he declared indignantly was nothing but 'Victorian uplift'. The temptation to remark that the uplift only began when he put his fingers on the board was too great for me to resist. After some thought, his outlook being that of a true scientist, he admitted generously, 'You are right, I was unduly angry. It must have been me.' Ten years later he became a Christian. I have seen the same type of 'upwelling' occur with a religiously inclined young man who had married an attractive, ardently left-wing humanist wife and to please her had repressed his religious leanings. Conversely, hidden resentments, frustrations and jealousies can also emerge; in fact, the use of ouija boards and other such devices by persons ignorant of the psychology involved can lead to tricky and painful situations, especially as many people are more impressed by statements – and predictions – which come from a mysterious source than they are by those from one which is familiar.

But still, there are hints which cannot be ignored that the material which emerges by means of this type of device does not always originate in the subconscious of any of the performers; occasionally it seems to be due to some unknown kind of contact with distant events or the thoughts of distant persons. An example of this possibility

occurred just after four o'clock on a wet Sunday afternoon shortly after the Second World War. Staying with me was Miss Gertrude Johnson, a talented sensitive who had achieved remarkable results in many controlled experiments in ESP done by the scientist and psychical researcher, G. N. M. Tyrrell. In those days a programme called the Brain's Trust, in which experts answered questions sent in by listeners, went out on the radio every Sunday afternoon. Having nothing else to do and there being no radio in the house, it occurred to me that we might try to obtain a piece of information, which we could not have known already, from a ouija board, by asking it to tell us one of the questions being asked on the current programme. I knew I could check the result from the repeat of the programme the following Thursday. The board replied to our inquiry, 'Something about the difference between two kinds of language', and I heard on the Thursday repeat broadcast that one of the questions asked that Sunday afternoon had been about the relative usefulness of studying classical or modern languages.

Automatic Poetry

Incidents as simple as this, of course, could easily be dismissed as accidental coincidences, were it not for the existence of others similar but so much more complicated that to ascribe the many resemblances in them to chance is very difficult. Take the following case investigated by the Society for Psychical Research. A group of six Spiritualists used to meet regularly at Flushing in Holland with the idea of getting into communication with the dead. On the evening of 23 July 1922, they began by table tilting but had no success. Then they turned to a device similar in principle to a ouija board in which a moveable pointer was held over the alphabet. This time things went better: they spelt out that an Englishman was communicating and that he was prepared to write them a song. (Four of them knew no English; the other two had once learnt it but had not kept it up.) A poem was then spelt out (see C in box) as from the Englishman who was, presumably, in view of the following facts, a subconscious dramatization resulting from their Spiritualist beliefs.

Opposite the house where the meetings took place lived a 15-year-old boy, who, scenting a mystery, very much wanted to attend the gatherings, but was not allowed to. On that July evening he watched the visitors go into the house for the meeting and ardently longed to join them. Then, disconsolately, having nothing to do, he got out an old school book which contained an English poem (see A in box) he had once had to learn, and drowsed over it during the course of the meeting across the road. The next day one of the participants at the meeting heard what he had been doing during the meeting and asked him to type out the poem from memory (see B in box).

A	B
Original Poem	***Boy's Version***
Evening Song	***Evening Song***
The sun has set	The sun has set,
And now anew	and now a new
With fallen dew	With fallen dew
The grass is wet.	The grass is wet
Each little bird	And little burd
Has sunk to rest	is sing to rest
Within its nest	Within his nest
No song is heard.	No song is heard

C

Automatists' Version

THE SUN HAS SET
AND NOW A new
WITH FALL END EW
THE GRASS IS WET
First part F
each little bird
Has sunk sto rest
with Its nets tn
o sng is hear

However intriguing, suggestive and complicated such material may be, so far nearly all of it is anecdotal; hence the sceptic can always dismiss each instance of it separately as due to fraud; it most, he insists, be produced in controlled conditions to order. This is a tough challenge for neither investigator nor performer has any idea of the psychological processes involved since these are entirely unconscious – how unconscious is neatly demonstrated in some ingenious experiments carried out by the eminent French psychologist, Professor Charles Richet, in the early days of psychical research. Another psychologist, Dr Alan Gauld, has recently summarized them as follows in *The Founders of Psychical Research* (1968):

> The set-up was complex. At a small table sat two persons, A and B, with the alphabet laid out in front of them. A passed a pointer continually over the alphabet. B noted down the letter over which the pointer was each time he heard a bell ring. The bell was rung automatically whenever another table in the room, at which sat three other persons, C, D and E, was tilted. C, D and E had their hands on the table in ordinary 'table-tilting' fashion: they were so seated that they could not see the activities of A and B. A sixth person, F (usually Richet), sat apart from both groups, concentrating on a name (obtained randomly from a reference book). The letters spelled out in many cases closely followed the letters of the name on which F was concentrating. It was easy to show that the coincidences between them greatly exceeded chance. Yet C, D and E did not know what they were spelling out, and A and B, who did know it, did not know the target.

Such scattered hints of unconscious interlinkage between the living are not uncommon, but for the most part scientists are inclined to look on them with a jaundiced eye. This is natural enough, for to them the process implied is a heresy; it does not fit into the pattern of the physical world as they envisage it. Worse, many of the people who provide the material containing such hints want to believe that their material comes from the dead, and to orthodox materialist science that is a primitive superstition. There is a further reason for regret, that the questions of survival and of unconscious interlinkage between the living are so often entangled: at present there seems no way to prove – or disprove – survival, which therefore becomes a remote problem, whereas experimental research into ESP suggests that the interlinkage hinted at by ouija board and similar activities may one day be recognized as a constantly occurring natural phenomenon.

ROSALIND HEYWOOD

Ouspensky was already deeply committed to an attempt to reconcile Western logical thought with Eastern mysticism when he met Gurdjieff, and discovered that many of his teachings complemented his own. From then on he devoted his life to the development of Gurdjieff's ideas

OUSPENSKY

RUSSIAN AUTHOR, mathematician and mystic, Peter Demianovich Ouspensky was born in Moscow in 1878. His philosophic and speculative writings *Tertium Organum* and *A New Model of the Universe* were bestsellers in the United States in the 1920s, but he is chiefly known for his lucid account of the teaching of G. I. Gurdjieff (see GURDJIEFF), published posthumously with the subject's consent under the title *In Search of the Miraculous*.

A short, stocky man with grey-blue eyes and pince-nez spectacles, Ouspensky was an outstanding lecturer on account of his penetrating thought and challenging approach. His father, Demian Petrovich Ouspensky, was an army officer and his mother was a painter. Of precocious intelligence, after reading Lermontov and Turgenev, at the age of six he became interested in poetry and painting; at 13 his interest turned to dreams and consequently to psychology; by 18 he had begun to travel and write. He continued studying intensively biology, mathematics and psychology. He relates: 'I was very anarchistically inclined at that time. I particularly distrusted all forms of academic science and took a firm decision never to pass any examinations and never to take any degrees.'

Ouspensky's first book was *Kinemadrama*, a novel on the theme of eternal recurrence. In 1907 he discovered theosophical literature, then prohibited in Russia, and 'found a possible angle for the study of religion and mysticism and received a new impulse for the study of "higher dimensions".' The publication in 1909 of *The Fourth Dimension* placed him in the front rank of writers on abstract mathematical theory.

The same year, at the age of 31, he moved from Moscow to St Petersburg (Leningrad)

where he published several books including *Superman*, *What is Yoga?* and, in 1912, *Tertium Organum*. This book deeply questioned the whole philosophic foundation of the scientific thinking of the day concerning space, time and relativity; it endeavoured to reconcile Western logical thought with Eastern mysticism. A year later, in 1913, a short work on *The Symbolism of the Tarot* was published.

Ouspensky then began to travel extensively in search of a contact with Eastern traditional and esoteric schools. In 1913–14 he went to Egypt and continued to Ceylon and India, returning to England shortly after the outbreak of the First World War. A notable series of lectures on his travels and 'search for the miraculous', given in 1915 in St Petersburg, attracted large audiences and a rapidly growing following in Russian intellectual circles. Among this audience was Sophia Grigorievna Maximenko, whom he married two years later.

Meeting with Gurdjieff

In 1915 Ouspensky met George Ivanovich Gurdjieff, an event which marked a turning point in his life. Gurdjieff's ideas profoundly impressed him, he recognized that Gurdjieff had discovered in the East many things for which he himself had searched. 'I realized,' he wrote, 'that I had met with a completely new system of thought surpassing all I knew before. This system threw quite a new light on psychology and explained what I could not understand before in esoteric ideas.' Ouspensky began to form special study groups in St Petersburg which Gurdjieff visited regularly. From that moment until Ouspensky's death the study and practical development of Gurdjieff's ideas constituted his principal aim.

These activities were interrupted at the end of 1916 when Ouspensky obtained a commission in the army but he was honourably discharged after only four months on account of poor eyesight, two weeks before the Revolution broke out. Seeing then no hope of continuing his work in Russia, he decided to emigrate to London.

Ouspensky rejoined Gurdjieff, who had already left Moscow, in Alexandropol in June 1917; in July with several friends from the Moscow and St Petersburg groups they moved to Essentuki and then to Tuapse on the Black Sea. In the autumn of 1917 Ouspensky paid a last visit to St Petersburg to rescue what he could of notes and manuscripts, leaving a bare week before the Bolsheviks overthrew the provisional government.

Interested from a very early age in the study of dreams and psychology, Ouspensky became a disciple of the remarkable Russian teacher Gurdjieff, whose ideas prompted him to write: 'I realized that I had met with a completely new system of thought surpassing all I knew before.' Ouspensky devoted his life to exploring and expounding these ideas

The year 1918 was spent in the company of Gurdjieff on the Black Sea; but that winter Ouspensky returned to Essentuki. He only succeeded in reaching Constantinople (Istanbul), crowded with Russians, in January 1920. There he wrote and lectured on psychology and his travels. That summer he again met Gurdjieff, arrived by way of Tiflis in company with some of their friends. In 1921, still without the means to reach England, Ouspensky unexpectedly received an invitation to visit London from Viscountess Rothermere, who wished to meet the author of *Tertium Organum*, which had aroused considerable interest on its publication in English.

Reaching London in August, Ouspensky found himself in contact with influential people who became interested in his work. In 1924 he broke with Gurdjieff and decided to continue his work in England, independently.

From 1924 until 1940 Ouspensky wrote and lectured in London, and held study groups to investigate Gurdjieff's ideas which were attended by many well-known people. He completed *A New Model of the Universe* incorporating revisions of several previous works and wrote a detailed account of his years with Gurdjieff, *In Search of the Miraculous*.

At the outbreak of the Second World War Ouspensky moved to New York to continue lectures, discussions and work on Gurdjieff's ideas and on his own last book. Publication of *Kinemadrama* in English, entitled *The Strange Life of Ivan Osokin*, was arranged. Early in 1947 Ouspensky, accompanied by a few pupils, returned to England; he died there later in the same year.

OUT-OF-THE-BODY EXPERIENCES

AN OUT-OF-THE-BODY experience is one in which the subject appears to view the external world from some position other than that of his physical body. The following is an example:

> . . . It was summer time, the day bright and sunny and I wore a dress and blazer. I was walking along Brentwood High Street in Essex and there were people shopping and walking near me. As far as I can remember I was thinking of nothing in particular when suddenly I was about 15 ft. above myself and I watched myself walking towards a cinema called the Palace which was a short distance ahead of me. I noticed the people walking round me. I supposed I watched myself walk about 30 or 40 steps and then I was back 'inside' myself again. I felt in no way different and just went on walking along the High St. The whole incident must only have taken a few seconds . . .

Experiences of this kind seem to be relatively common. When the Institute of Psychophysical Research appealed by means of the Press and sound radio for first-hand accounts of experiences of this kind, cases were received from some 400 subjects, and it was clear that with further publicity more cases could have been obtained. The accounts exhibited many common characteristics, some of which are discussed in this article.

Out-of-the-body experiences may be of two kinds, firstly, 'parasomatic', in which the subject appears to be located in a duplicate body more or less resembling his physical body, and secondly, 'asomatic', in which the subject, at his new point of view, does not appear to be associated with a body at all – in other words, he feels he is just a disembodied consciousness or 'a pin-point of presence', as one subject puts it.

The following is an example of a parasomatic case in which the subject's duplicate body appeared to resemble her normal physical body very closely, even to the

extent of duplicating the kind of clothes that the subject normally wore.

> I looked down at my second self and found myself to be a complete replica of my material self. I touched my clothes, and looked at myself and was astounded to see that I was wearing the same black skirt white blouse with small red spots on it same shoes etc. . . I can remember touching myself and feeling the texture of my clothing this all felt quite solid . . .

In the asomatic case, on the other hand, the subject may describe himself as 'looking at himself from nothing'.

The circumstauces under which out-of-the-body experiences may occur are extremely various. Some subjects, such as the one first quoted, may be walking at the time of the experience, or carrying out such everyday activities as gardening or housework.

Many of the cases collected by the Institute occurred when the subject was involved in an accident or suffering from physical illness of some kind, but some seem to have occurred when the subject was simply in an 'everyday' frame of mind, or even feeling particularly happy or relaxed. One person writes, 'I had just become engaged and I cannot remember any other time of feeling such pure happiness.'

If the subject is engaged in some kind of physical activity at the time of his experience his body may continue to function in an apparently normal way while he appears merely to observe it from outside. In one case reported to the Institute, a dentist extracted a tooth while 'standing some three feet behind myself and to the left'. Other subjects describe watching themselves from above as they drove cars or motorcycles, or hearing their own singing performances or lecture from the back of the hall.

More Real than Reality

Cases such as this clearly raise the question, how can someone continue functioning in an apparently normal way while his 'consciousness' is concerned only in watching his movements from an external point? In some cases the subject may be performing an action which is so habitual that it is completely 'automatic' anyway, but in others some degree of conscious skill appears involved. Skill does not seem to be impaired while the subject 'watches' himself – though one woman who was 'settled firmly on the roof' of the car watched herself 'making every sort of fool of herself' in a driving test.

The emotions felt by the subject during an out-of-the-body experience are nearly always positive ones. Subjects appear to feel completely normal or natural in the out-of-the-body state, and may comment on how 'solid' or 'real' they felt, despite the fact that they were apparently disembodied. Some even described the out-of-the-body state as feeling more real than the normal state. As one subject put it: 'I had no further interest in my physical body, or indeed my physical life. I only wanted to pursue and prolong this happy state of being where everything was more bright, vivid and real than anything I had previously known.' As the following case illustrates, the subject may feel perfectly

British Museum

calm and detached despite the seemingly desperate condition of his physical body.

> I was in a farmhouse, in the line, in Italy in the summer of 1944 when the house was hit by a shell. I was thrown through the air and, as it transpired, hit in the forehead and arm.
>
> As I landed on my back, my injured arm fell across my forehead. Unable to feel anything in either part, I assumed that my head had been half blown off and I lay, waiting to die.
>
> During this period, the length of which I have no idea, although subsequent events proved it must have been seconds only, I was completely calm, in fact disinterested. Also during this period, I became aware that I, or my seat of consciousness, seemed to be hovering above my body at a height of perhaps 8–10 feet, which would have meant that my normal body would have been halfway through the roof.
>
> Unfortunately this state was of extremely short duration and my objective view seemed to be limited to my normal body below, which I could see in some detail.
>
> Again, my reaction was one of serenity and disinterest. My body could have been any body or any object, come to that, such was my state of disinterest.
>
> This state must have lasted microseconds and I returned to a normal state, where I decided that I wasn't dying and that I had better get to my feet and see what was happening.

Often the subject feels in an extremely happy or joyful state, and feelings of excitement, elation, and exhilaration may be reported. He may also claim to have felt extremely well during his experience, even if his body was ill at the time. 'The escaped me felt absolutely wonderful, very light and full of the most wonderful vitality, in fact more well than I have ever felt before or since.' One subject sums up: 'The whole experience was absolutely wonderful, and I wish I could experience a similar one again . . .'

If unpleasant emotions such as anxiety do arise, these usually seem to be connected with attempts to end the state. For example the subject may become anxious if he feels that the experience is not entirely under control; he may be afraid of being unable to end it, or of 'not being able to get back into the body'.

The subject is quite clear that he is in an out-of-the-body state, once he has seen his physical body from outside. In addition, subjects describe their intellectual processes and reasoning powers as being quite normal or even superior to normal. As regards 'the way things look' in an out-of-the-body experience, it seems that they look just as they do in the normal state – for example, normally coloured and with the same amount of visual definition. One subject wrote that he could see the room in great detail, even the specks of dust. Another describes experimenting on her hearing: 'I wondered, as I saw my physical body in the bed "Is my hearing acute, without ears?" and I approached a patient who was asleep, and listened to her breathing. I could hear it extremely clearly. I thought "My sight is acutely clear too".' Sometimes subjects report that their perceptions were enhanced and some comment on the brightness of the colours seen.

Leaving the Body At Will

Although many out-of-the-body experiences occur involontarily and, more often than not, only once in a lifetime, there are people who claim to be able to induce the out-of-the-body state more or less at will. Three methods of inducing or encouraging these states are predominant among those mentioned by people who have made a practice of doing so. These are firstly, physical relaxation exercises, secondly, various kinds of concentration and meditation, and thirdly, the cultivation of lucid dreams, those in which the subject is aware that he is dreaming. Oliver Fox, a subject who trained himself to have out-of-the-body experiences, claimed to be able to enter them directly from the lucid dream state. This method is discussed in my book *Lucid Dreams*.

A number of other subjects have found that the systematic practice of relaxation exercises favoured the occurrence of out-of-the-body experiences. The following is one such subject's account of the result of his relaxation procedures:

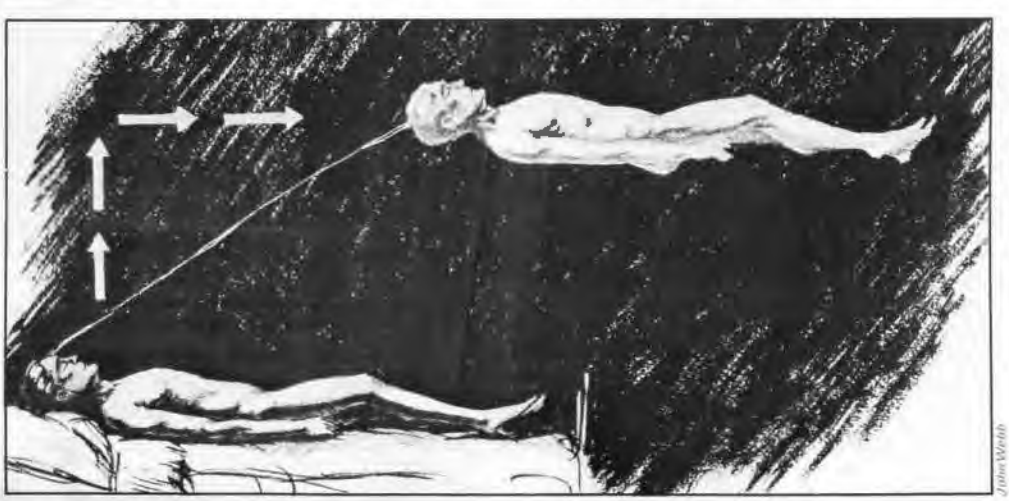
> I went through all the usual proceedings of relaxation on each occasion, but sometimes when I was completely relaxed and numb all over I used to feel this very pleasant rising feeling whereupon I became conscious of something very close to my face. This happened three or four times during my experiments.
>
> Of course I didn't realise what was happening at that age . . . As for my recent experiences . . . after a few false starts I felt this familiar rising feeling and low and behold I could 'see' the ceiling right in front of my face. . . Upon realising where I was and my apparent success I was literally pulled back into my flesh body.

Once out of his body the subject may attempt various kinds of experiment. For example, he may move about or 'travel' to a distant place to 'see' what is going on there. Sometimes he appears to obtain information in this way that he could not have obtained in the normal state or from the position occupied by his physical body. The following case will illustrate this possibility:

> Floated over Cheltenham – to friend's . . . Room. could not find – went searching – deeply perturbed. found her asleep – in a Divan, in partly furnished room. spoke to her but did not disturb. Met her for lunch three days later – jokingly asked her where she was on the Sunday night, I described room and Divan, she looked very shocked, said yes, I was there . . .
>
> . . . she did (take) me there one week later and asked if we might see the room in which I had found her on that Sunday night. NOTE: It was absolutely as I had described it – even to the unfinished white blouse on sewing machine.

The room in question was a sewing-room; the subject and the friend whom she 'visited' there agree that the subject had never entered this room. The subject's friend was sleeping in this room on this particular night, and not in her own house, as a result of a sudden domestic crisis. The friend confirms her part in the incident as follows:

> Mrs. A. was a friend whom I saw from time to time, and one day she got in touch with me, and related that she had in her sleep been trying to find me, and said had seen herself looking into the house where I lived and could not see me. Actually I was staying with a friend about seven minutes walk away and it seems she saw me lying there. Her description of the room was accurate, it was really a sewing room with a divan in the corner, all of which she described to me. I then took her along and Mrs. A. said 'Yes this is the room – We both used to visit here, myself very very often, but Mrs. A. only I should say three times and I am sure had never been to the top of the house, where this room was.



The experience of getting out of one's body has naturally interested occultists *Left* 'The World', a Tarot card often interpreted as a symbol of release from the everyday physical plane and entry into the astral: Italian, early 19th century *Right* Illustration from the *Projection of the Astral Body* by Sylvan Muldoon and H. C. Carrington (Rider, 1929), showing the astral body leaving the physical body: the experience can be deliberately induced, though the connecting 'cord', on which Muldoon placed great emphasis, does not appear in many people's descriptions of their experiences

Out-of-the-body experiences raise important questions for philosophers and psychologists. When someone perceives his surroundings in an apparently normal way but from a position which is different from that of his physical body, what part do his visual and other sense organs play in producing the experience? Indeed what part do his sense organs play in his normal mode of perception if he can apparently do without them in the out-of-the-body state? We must remember that in about one third of the cases the subject's physical body is unconscious at the time of the experience, so that his eyes are shut throughout, and cannot therefore be helping him to construct a picture of the world as it would look from the new point of view. Nevertheless, some subjects have described what was going on around them while unconscious, and those present have subsequently confirmed their accounts.

One also wants to know what is the electrical activity of the brain (as measured by the electroencephalogram, or 'EEG') during an out-of-the-body experience. In many cases the subject appears to be deeply unconscious. Now if the electrical record of the brain in such cases shows the patterns appropriate to the subject's physiological state (for example the slow *delta* rhythms observed during sleep as opposed to the faster waves which are dominant in waking states) we have to reconcile this with the fact that the subject is apparently having a conscious experience at the time. Alternatively, if the subject's EEG shows the rhythms appropriate to conscious experience, we have to reconcile this with the fact that his physical body is apparently inert and unresponsive to physical stimuli. At all events, out-of-the-body experiences present science with a challenging phenomenon of which no satisfactory explanation exists.

(See also ASTRAL BODY.)

C. M. Dixon

Because it is a creature which is active in the dark and because its face, with staring eyes, is uncannily human, the owl (*right*) has gained a sinister reputation, being often associated with death, mourning and evil *Above* Owl painted on the inner wall of a coffin from El Bersha in Egypt, c 2000 BC

OWL

ALMOST EVERYWHERE owls have been associated with strange powers, especially the forces of evil and misfortune. The lore concerning owls has such basic similarities throughout most of the world that it would seem to have arisen from a deep-seated and disquieting emotional response, evoked by a creature having characteristics interpreted as partly human. Thus, an owl with large eyes set in a flattish 'face' stares like a human being. Moreover, many species utter hoots, halloos or screams which sound like human calls. To hear a screeching at night in a tropical forest as of a woman in agony is a spine-chilling experience – until it is realized that the call is being uttered by an owl. The nocturnal habits of owls contribute to their sinister reputation, especially as their silent flight enables them to appear with alarming unexpectedness from the darkness. Furthermore, as owls often roost by day in holes and crevices in abandoned, dilapidated buildings, they are often regarded as embodiments of spirits or evil presences.

As early as the Old Stone Age we have evidence of the interest aroused by this bird, for a pair of nesting snowy owls with their chick is engraved on a rock face in a cave in southern France. On a Sumerian tablet dating from 2300–2000 BC a nude goddess is depicted flanked on either side by an owl. She is believed to be the goddess of death. A number of biblical references associate the owl with misery and desolation, and the bird is mentioned in connection with 'dragons' and wild beasts and also with mourning. Greek and Latin writers refer to the owl as a bird of ill omen. Ovid, Pliny and other authors associate the birds with death and their calls are mentioned as sinister. When an owl appeared in the Capitol at Rome it occasioned such alarm that the place was cleansed with water and sulphur to expel

Eric Lindgren/Arden Photographics

Museum of the American Indian

Although it often has strongly evil associations, by contrast the owl is sometimes regarded as a wise and benevolent bird *Left* The demon Andras, who stirs up quarrels, shown with wings and an owl's head, riding a black wolf and carrying the sword of faction: from *Dictionnaire Infernal* by Collin de Plancy *Above* North American Indian effigy jar in the shape of an owl

any evil influences it might have brought.

As is not uncommon with creatures or objects regarded as mysterious and arousing a strong emotional response, owls may sometimes be regarded as having properties contrary to those generally attributed to them. Something which is apt to frighten people may come to be considered effective as a deterrent against that which they fear; the evil thing may be enlisted as an ally. In ancient China, where owl sacrifices were offered, ornaments called 'owl corners' were placed on buildings in the belief that they protected them from fire. In Semitic countries the owl is usually regarded as ominous and in Persia is spoken of as 'the angel of death', yet in Israel little grey owls are considered good omens when they appear near the crops. Perhaps the belief originated from the observation that these birds prey on birds and mammals which damage crops. In ancient Athens the little owl was associated with Athene, probably as goddess of night, but being a common bird it was regarded in a friendly way and became the emblem of the city. 'There goes an owl' was the Athenian saying indicating signs of victory.

Latin writers early in our era alluded to the custom of hanging up owls in order to deflect storms and it was believed that an owl nailed up with wings outspread would avert hail and lightning. The custom of nailing owls to barn doors persisted into the 19th century in England. The Romans used representations of owls to combat the Evil Eye. Among the tribes of northern Asia owls were regarded as able to counteract evil powers. An owl might be placed over a child's cot to frighten away evil spirits. In India owl feathers were placed under the pillow of a restless child in order to induce sleep. The Ainu people of Japan made wooden images of owls and nailed them to their houses at times of famine or pestilence.

In Great Britain, as in most of Europe, the owl has been, and to some extent still is, regarded as ominous. Chaucer wrote of the owl as the bringer of death, and Shakespeare in *Julius Caesar* (Act I, Sc. 3) mentioned it among other evil omens:

> Yesterday the bird of night did sit
> Even at noon-day upon the market-place
> Hooting and shrieking . . .

In Africa owls are commonly associated with sorcery. When an owl perched on a dwelling in Bechuanaland the witch-doctor was called in to perform purificatory rites. The souls of sorcerers were called 'owls' in Madagascar. The Yoruba of Nigeria believe that wizards send out owls as their emissaries to kill people. In certain regions of Nigeria the natives avoid naming the owl, referring to it as 'the bird that makes you afraid'.

Owl-Egg Soup

In North America notions concerning owls varied. While the Pawnees thought of them as giving protection, the Ojibwas believed in an evil spirit which appeared in the guise of an owl. In California the white owl was thought to be an evil spirit and its feathers were worn as a counter-charm.

Since owls were regarded as embodying weird powers they were associated in Germany and elsewhere with witchcraft. The witches in *Macbeth* (Act IV Sc. 1) included in their brew 'Lizard's leg and howlet's wing': Pliny stated that an owl's heart placed on a woman's breast would force her to divulge secrets. This was repeated by Albertus Magnus and reappeared as recently as 1863 in a book published in Pennsylvania. Among the Greeks magical and medicinal virtues were attributed to owls' eggs. Given to a child they would ensure his life-long temperance. Owl-egg soup was a remedy for epilepsy and treatment of grey hair with the contents of an owl's egg would darken it. As the egg had to be one from which a male chick would have emerged, any failures could be easily explained.

The owl figures in a number of fables and legends. The story of 'The War of the Owls and Crows' may have symbolized the opposition between the moon and the sun. It came into Greek literature from India. According to a legend from Normandy the owl is disliked and mobbed by other birds because when the wren burnt its feathers in trying to fetch fire from heaven the owl refused to help by contributing some of its own to clothe the wren (see WREN). The owl's reputation as a bird of wisdom may have arisen through its association with Athene, the goddess of counsel.

Janet Kerr

The old folk culture of the Ozarks still thrives in local legends and songs, containing elements of British and European tradition, brought by emigrants and developing in its own way in the isolation of the hills: hill-billy music at the 'Fiddlers' Convention'

Famous for their 'feudin', fightin'' ways, the hill-billies of the Ozark mountains love to tell tall stories of fabulous monsters, such as the chaw-green, a bear with a candy-striped rump and a fondness for chewing tobacco

OZARKS

THE OZARK HILLS have been called 'a splendid and sequestered laboratory' for folklorists. They sprawl across the Arkansas-Missouri border, a region about 300 miles long and 150 wide, notable for peaks and knobs often reaching 2500 feet and made rugged by forest and razor-back ridges. In the valleys and on the hillsides live an isolated and inbred people known in the American popular idiom as 'hill-billies', famous in song, story, comic strip and film – and to some extent in reality – for their uncouth, illiterate, poverty-stricken, 'feudin' and fightin'' ways.

The isolation of the Ozark people, their semi-hidden existence deep in the backwoods, has allowed them to retain intact much of the old folk culture, the traditional pioneer American folklore, long lost in more civilized areas. So out of the Ozarks has come one of the 'richest regional folk cultures' in the United States, in the words of the American folklorist Richard M. Dorson. It contains elements of old British and European traditions, brought by the colonists, altered in certain ways over the generations but still traceable to its roots. At the same time, the Ozark regional culture also includes many regional specialities: 'local events flowering into legend, village ways hardening into custom'. Whatever the origins of the traditions, the lore remains a vital part of backwoods life for those who still live it today. Our knowledge of Ozark lore comes mainly from Vance Randolph, who lived among the hill folk for decades, accumulating a hoard of Ozark

Hill Country Tales

The creative genius of Ozark folk expression lies in the short anecdotal legend. For all their abundance, folksongs in the Ozarks fail to reveal much of a regional imprint. . . The rich Ozark idiom of folk speech that flavors the tales little affects the balladry, and surprisingly few native ballads originate in the Ozarks. But the repertoire of tales is fresh and distinctively regional, even though one constant form refashions all the varieties of narrative. Märchen, legends, jokes, supernatural experiences, stories of local characters, neighborhood events, all emerge as actual incidents that transpired somewhere in the next holler or on the other side of the mountain. "One time there was. . ." the Ozark storytellers begin, and launch into a brief true narration, localized like an anecdote, believed like a legend, but structured, with opening and closing formulas and action in the middle, like a formal folktale. The word of the hillman comes into focus in these narratives, which served him in lieu of newspapers and radio. Gossip of the hills, sensational matters, pranks and antics and tomfoolery, circulate as local stories. The European wonder tale that wanders in from the southern Appalachians is cut down to size and given an Ozark setting; the abbreviated jest from the city is expanded and tied into an appropriate personality; the Negro story from the Mississippi Delta takes on a hill country hue. Because the tales are so splashed with local color, only the comparative folklorist discovers that the great majority are widely traveled.

Richard M. Dorson *American Folklore*

doings and sayings, and collecting their songs, their tales, their myths and their magical beliefs.

Many of the region's favourite myths concern legendary folk heroes who reflect the more masculine Ozarkian virtues – heroic drinking, fighting, hunting, feats of strength and daring. Davy Crockett, the famous backwoodsman, who became legendary, spent some time in Arkansas, and the hill folk enthusiastically claimed some of the heroic tales about him for their own. Colonel Davy, it is said, came to the hills riding a catamount (a mountain lion or puma) with a bear under each arm. On a hunting trip, he travelled so far that he jumped on the sun for a ride home, but had to circle the whole world because he got his directions reversed. He had a 'snaggle-toothed grin' that could frighten animals into unconsciousness; he fought bears with a knife to save bullets, ate bearskins for breakfast, and once started a fire by striking his 'important member' (the euphemism is Vance Randolph's) against a rock to make sparks.

When Crockett left for Texas there was no shortage of heroes. The sharp-shooting gambler Ab Yancey claimed to have gone hunting with one bullet and, in a series of 'tall story' coincidences, to have bagged eight turkeys, two squirrels, two rabbits, 41 quails and a deer. Gib (or Kemp) Morgan was an oil driller who built pipelines so big that when the wells ran dry farmers could drive their cattle to market along the line; sometimes cows would wander off into the threads, at the junction of the pipes, and be lost for days. Tree-top Johnson was a woodsman so tall that he could never tell whether his feet were freezing or whether he had stepped into a forest fire; when thirsty, Johnson would squeeze out a cloud like a sponge. A giant blacksmith named Bib Tarkey once helped some harvesters by making a 24-foot scythe from metal wrenched off a railway bridge; he used an oak tree for a handle, and mowed 80 acres in half an hour.

The Big Black Booger

These heroes fit into that branch of folktale which the Ozarkians call 'windys' – exaggerated lies, a favourite form of American folk entertainment. Another hero, vaguely called 'Jack' and perhaps not always intended to be the same man, can be found in a few tales dealing more explicitly with the supernatural. (He is related to the beanstalk Jack and the giant-killer Jack, both of which grisly nursery tales have made their way, only slightly altered, into the Ozark repertoire.) Jack comes along at a crucial moment to use some homespun magic and defeat the Devil or one of his witches. In one story, he becomes a St George character: a monster called the 'gower', lizard-like and 40 feet long, is raiding livestock and taking a maiden each year – until Jack kills it with two silver darts tipped with steel from a thunderbolt. The gower is only one of the Ozarkians' list of fabulous monsters; but it is clearly demonic and Jack's weapons evidently those of a sorcerer.

Apart from the tale of the gower and similar individualities, the Devil and witch lore of the Ozarkians closely resembles the old European tales from which it derives. So the Devil wanders the hills looking for sinners to snap up; he may appear as 'a big black booger' or bogeyman, or a headless giant with a cloven hoof, or an ordinary man who leaves no shadow or footprints – apart from his more usual horned and leather-winged guise. A heartfelt invocation of Christ, rather than magical means, is usually sufficient to thwart him, except in the case of really hardened sinners.

Somewhat more effort was needed to deal with the witches who, according to the tales, infested the hills in swarms. Some Ozarkians were recognized 'witch-masters', experienced in detecting and destroying these minions of Satan. Their detection involved scratching a cross on the suspect's chair, or placing a Bible under her bed; if the suspect was a witch, the Christian object would make her ill. Alternatively, salt placed under a suspect's chair would melt if she was a witch, and cause her dress to stick to it.

Once the witch-master had pinpointed his witch (sometimes literally, for like the medieval witch-hunters the Ozarkians believed that witches feel no pain from pin-pricks) he obeyed the old biblical maxim 'thou shalt not suffer a witch to live'. He might either load his squirrel rifle with a silver bullet and shoot the old woman straightaway, or paint a picture of her and shoot that. Again, he might drive a nail through the heart of a picture of her drawn on the north side of a black oak; or cut her silhouette out of paper and tear it slowly to bits; or make a wax image of her and shoot, knife or burn it.

The ordinary folk kept their houses free from witches by driving three nails into their doors in the shape of a triangle, or fastening crossed hazel twigs to the doors, or the entrails of a horned owl, or indeed the traditional horseshoe, open end up for the horns motif. Others might drive a three-pronged cedar peg into their pathway to form the Trinity motif, regularly used in protective amulets and talismans; or they created that Ozarkian oddity called an 'egg tree' – a dead and trimmed shrub on which were carefully placed the blown shells of eggs.

All these punishments and precautions seemed justified, in terms of what a witch could do. They can cast spells on animals and crops, especially frequent with regard to cows, whose milk they steal by magical means or dry up. (Modern Ozark witches can put spells on cars, as they once did on horses or mules.) They make people ill, using the old technique of a doll or image containing some of the victim's hair or finger-nail clippings, and they can even kill. A gruesome recipe for murder requires the witch to scrape dirt from a grave with her left forefinger at midnight; mix it with the blood of a black bird, preferably a raven; tie the mess in a rag that has touched a corpse; and bury the thing under the victim's doorstep, or hide it under the seat of his wagon or car. When he steps over it, or sits above it, he will die within days.

Hen-Pecked by a Ghost

Witches often roam the countryside invisibly, or in the shapes of cats, wolves, even rabbits, to carry out their evil work. When not plaguing honest Christians, they are flying up the chimney or through the keyhole to attend an orgiastic sabbath at which the Devil usually presides. Just as familiar to the student of European witchcraft is the careful Ozarkian distinction between witches, the Devil's handmaidens, and various non-evil workers of magic. The latter are generically called 'power doctors', and may include the village herbalist or 'yarb' doctor, the dowser or 'water-witcher', and the healer who cures illness by different combinations of laying on of hands and quasi-biblical incantations.

Ghost stories seem to occur fairly abundantly in the hills, and like the witch tales

are often clearly reminiscent of their European origins. Many concern old Ozarkians returning to right some wrong, to haunt the scene of some injustice, to reveal the whereabouts of buried treasure. Characteristically, some Ozarkians come back out of sheer 'cussedness' such as the nagging shrewish wife of one tale, whose ghost continued its marital pattern well after the husband had become a widower. One day some neighbours showed alarm when they heard the dead wife's spectral voice screaming and cursing at the husband from inside the cabin; but the long-suffering man, sitting quietly on his verandah, said in a typical Ozark understatement, 'Don't get excited, she ain't mad at nobody but me.'

The Side-Hill Hoofer

Those weird tales of the Ozarkians which are neither demonic nor ghostly reveal some interesting preoccupations of the hill folk, including a prevalence of bestial sexual unions and their monstrous offspring. Naked wild men or women have been said to run with wolf packs, in the old days, and to sire or bear children who were half-human, half-wolf. Some traditional Indian lore creeps in here through the influence of Cherokee legend, often containing the motif of the female animal in human form who marries a man but returns to the wild when her son is born. One such tale concerns a man whose human wife finds he has another partner – a giant female blacksnake, on whom he has fathered offspring. The human wife left him, remarking that she could have put up with a cow or a ewe but a snake was going too far.

A number of tales concern some superbly fabulous monsters that are said to lurk in the deep wilderness. Among these the gower, already mentioned, has a cousin (or an alter ego) called the 'gowrow'. This too is reptilian, 20 feet long, with horns on its back and webbed feet, an eater of livestock and sometimes of people. Another huge lizard, the 'jimplicute', ambushes travellers by night and sucks their blood. The 'kingdoodle' or 'whangdoodle' is a lizard 14 hands high, but mild-mannered and not carnivorous. But the reptilian 'high-behind', which has back legs ten times longer than its forelegs, is said to lap up people 'like a toad-frog ketchin' flies'.

The 'snawfus' is an albino deer sometimes said to be winged, sometimes wingless but able to jump higher than the treetops; sighting it is an omen of death. The 'bingbuffer' is shaped like a giant hippopotamus, but with a 40-foot hinged tail which it uses as a sling to hurl stones at its prey. The 'gally-wampus' is a huge cat-like or mink-like monster, at home in the water and a great killer of livestock; also cat-like is the 'whistling wampus', who kills people after luring them with its whistle into the forest.

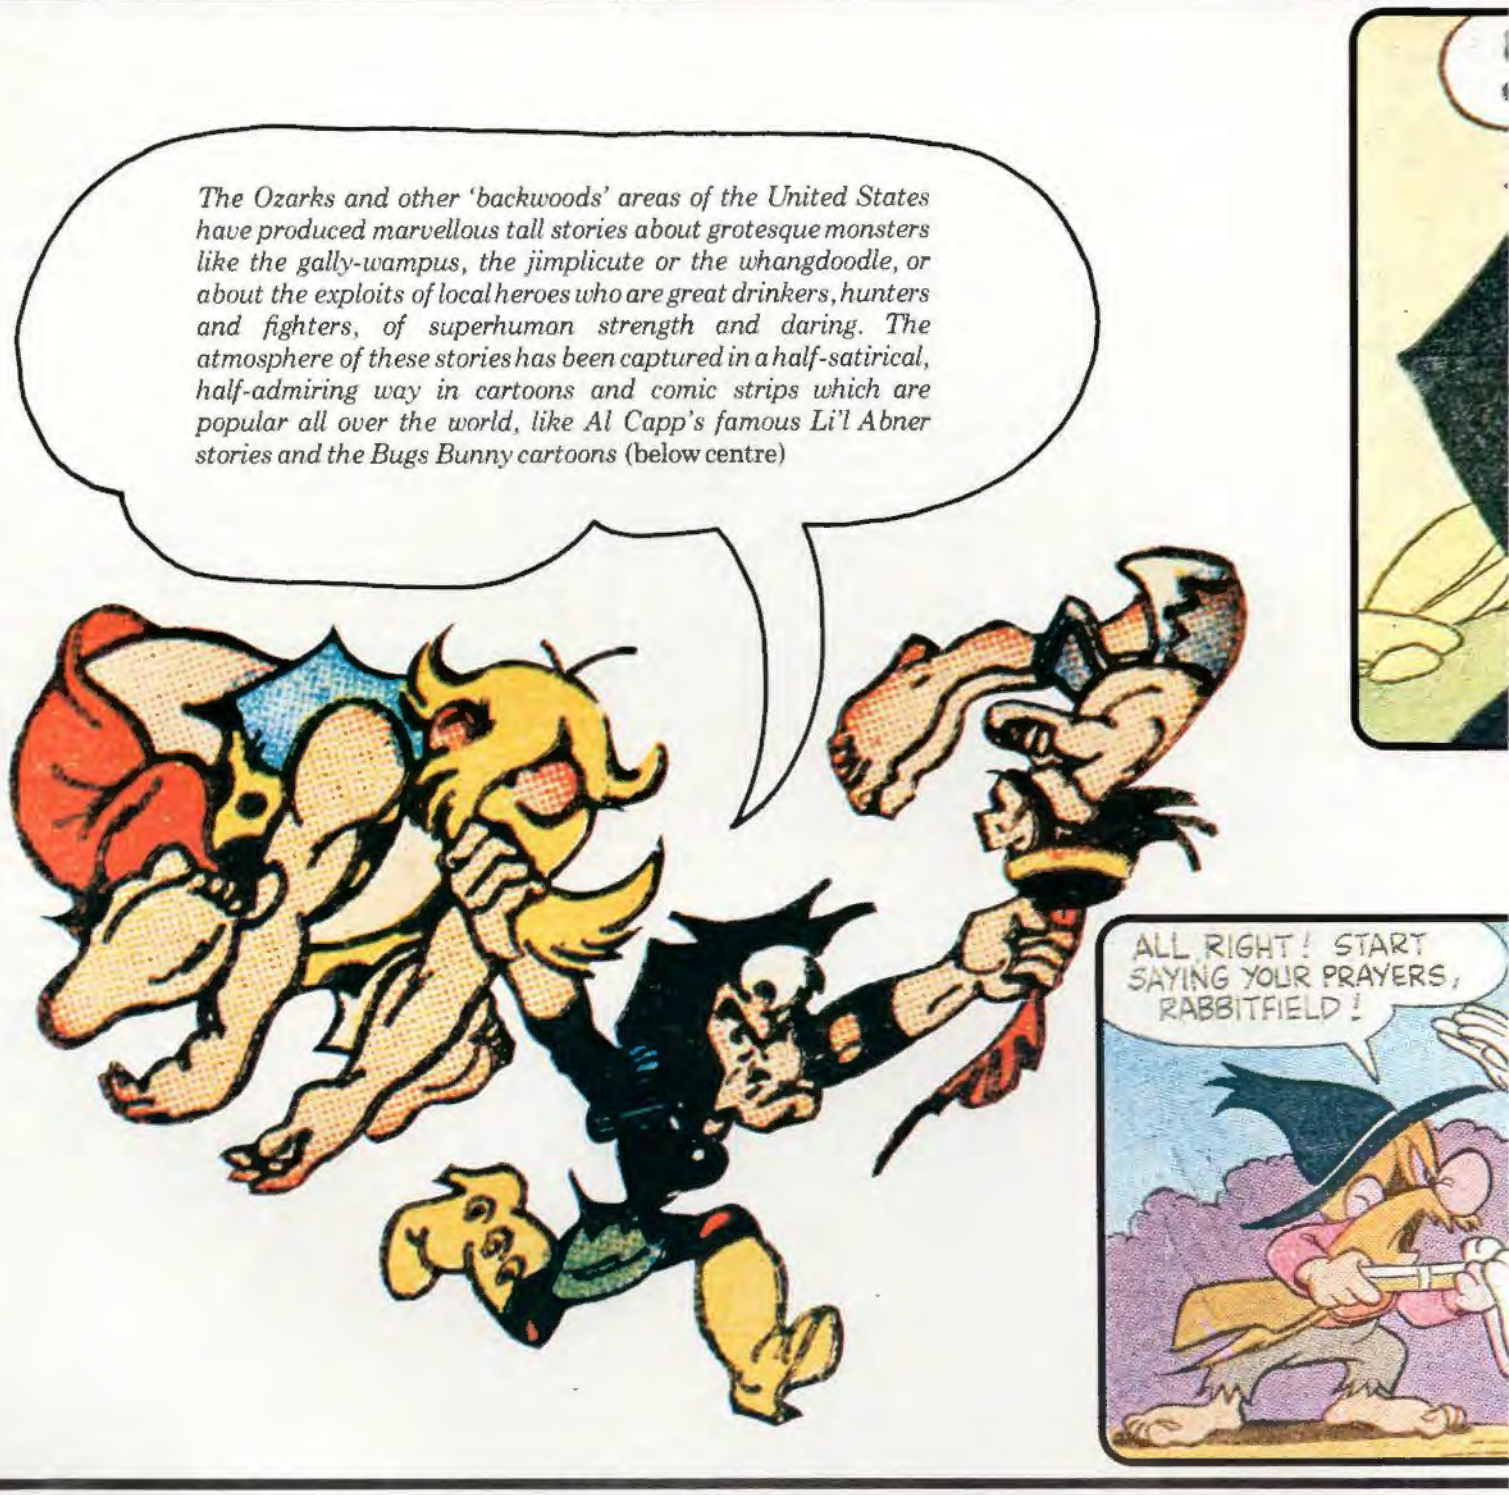
The 'chaw-green' is bear-like, but with a candy-striped rump and a fondness for chewing tobacco. The 'fish hound', having fur on its belly and feathers on its back, may be a cross between an otter and a waterbird: it eats all the fish to thwart fishermen. The 'side-hill hoofer' looks like a beaver but is as big as a yearling calf; its legs are shorter on one side so that it can run upright on the sides of mountains – but only in one direction. Equally unbalanced is the 'baldknob buzzard', a vulture with one rudimentary wing: it must fly always in circles, round mountains. The 'whiffle-bird' always flies backwards, either to keep the dust out of its eyes or because it is more interested in where it has been than where it is going. The 'fillyloo' or 'gillygoo' bird manages to fly both backwards and upside down. 'Old Walleyes' is a creature with a huge mouth and revolving eyes who can run faster than a horse and who has a prodigious appetite; the more he eats of animal or human flesh, the bigger his mouth gets and the faster his eyes spin round.

These glorious inventions of Ozark 'windy' spinners are filled out by tales of frogs as big as steers, vast turtles that gobble up mules, and hordes of water monsters very like that of Loch Ness. The creatures' names alone make it obvious that they are not to be taken seriously: they spring from the Ozarkians' love of tale-spinning, not from hill-billy credulity. Credulity occurs, however, when visiting folklorists or anthropologists confuse tall stories with folk belief. Still, even if the legendary monsters and

Fess Parker (*right*) as Davy Crockett in a Walt Disney film, *Davy Crockett and the River Pirates*: tall tales gathered round this backwoodsman, who lived in Arkansas for a time and whose 'snaggle-toothed' grin was said to frighten animals into unconsciousness

Walt Disney Productions Ltd

The Ozarks and other 'backwoods' areas of the United States have produced marvellous tall stories about grotesque monsters like the gally-wampus, the jimplicute or the whangdoodle, or about the exploits of local heroes who are great drinkers, hunters and fighters, of superhuman strength and daring. The atmosphere of these stories has been captured in a half-satirical, half-admiring way in cartoons and comic strips which are popular all over the world, like Al Capp's famous Li'l Abner stories and the Bugs Bunny cartoons (below centre)



heroes are proffered as entertaining lies, the vast range of supernatural beliefs including those of ghosts and witches are (or once were) held to be true.

Never Sleep on a Rifle

Among the enormous range of beliefs still more or less current in the backwoods are some familiar motifs, with local details added. Sympathetic magic is often evident in the hill folk's superstitions, as in their practices connected with healing or the prevention of disease. Ozarkians would wear buzzard feathers in their hatbands to ward off rheumatism, and carry hogs' teeth in the right-hand trouser pocket to prevent toothache. The principle of magical transference underlies such practices as curing warts by pricking them with pins and thrusting the pins into the earth while blindfolded, and then ensuring that the pins are never disturbed.

In the category of omens, weather prediction takes precedence. Snake tracks foretell rain, as do dogs eating grass and cats sneezing. The number of fogs in August equals the number of snowfalls to come in winter; the number of thunderclaps heard in February indicates the number of frosts to come in May. Omens directed elsewhere include the belief that a cobweb over the door means a girl's lover will never call again; a dream that occurs during one's first sleep under a new coverlet must always come true; bad luck on one's birthday means bad luck all the year round; general good luck is indicated by a dead crow on the road, or a butterfly in the house.

There are certain specific taboos among the beliefs of the Ozarkians. Girls must not comb their hair after dark or they will lose their lovers; pregnant women must not cross running water or they will die in childbirth; housewives must not run out of salt, or they face a year's poverty. Farming taboos are especially numerous: you must not laugh while planting corn, or the grains will grow too far apart; you must never pull a hog's tail, or he will not fatten; killing toads makes the cows' milk bloody; changing a horse's name may cause its death; slaughtering pigs while the moon is waning ruins the pork. Above all, never transplant a cedar tree or burn a peach tree, for fear

of terrible disaster. To avoid bad luck in general, you should not lend or borrow salt, go back into a house for something forgotten when you have just left it, put rifles under beds, sing before breakfast or in bed, or whistle in the privy; women should never be allowed to whistle at any time.

A number of superstitions take the form of explicit ritual, active magic either to forestall bad luck or to bring good. Farmers should get angry when planting peppers, and should cause cucumbers to grow to a good size by ensuring that they are planted by a virile, well-endowed man. Bees must be told verbally of a death in the family, or they will leave the hives. A feather from each of your chickens, buried under the henhouse, will protect them from animal or human marauders. Salt and pepper must be the first objects taken into a new house. Girls can increase their sex appeal by eating raw chicken hearts, while men can improve their virility with wild ginseng root; girls can win a man's love by slipping a bit of their fingernails or a drop of menstrual blood into his drink; a boy can hide the dried tongue of a dove in the girl's house, and she can then deny him nothing.

If a woman shakes her skirts at the new moon, she will get a new dress; if she catches a butterfly and bites off its head, she will get a dress the colour of the butterfly. Windows and doors should be kept open on New Year's Eve, for good luck all year. You should kill the first snake seen in spring, or you will be ruined by autumn.

In a way, the hills have acted like a game reserve for the folk beliefs of the Ozarkians. But it would be incorrect to infer that they have remained wholly static in their primitive beliefs, for the 20th century has made inroads into the traditional way of life. The fact remains, however, that more of the old ways have been preserved longer in the Ozark backwoods than most other regions of the Western world; if they are not always practised or believed in today, they are nevertheless freshly remembered.

DOUGLAS HILL

PACIFIC NORTH-WEST INDIANS

Given to fun and feasting in the winter months, before the serious business of the year, the Indians of the North-West Pacific coastline marked their most important occasions with a ceremony known as the potlatch, which might take months or even years to prepare

'IN THE BEGINNING there was nothing but water. The Raven was flying over the surface of the water, but could not perch anywhere because there was neither land nor tree. He decided to create the world. He picked up some small pebbles and flew over the sea. Now and then he dropped a pebble into the water and an island came into existence. Thus the dry land appeared in the midst of the water of the ocean. After that the Raven started to create all things. He created trees and grass, fish in the water, and birds in the air, and every kind of beast in the forest. There were now all living creatures except man. He wanted to create man also but could not do it for a long period of time, because he did not know the suitable material to use. He tried to use stone, water, air and many other materials, but in vain. At last he took some clay and wood and created a man and woman.'

So says one of the many creation myths of the Kwakiutl tribes. A supreme god is not recognizable in North-West Coast religion and mythology, although there are a number of dominant characters drawn from the sky, earth, sea and underworld who are credited with, or identified with discoveries and aspects of the way of life.

In effect the legend was a lesson from

British Museum/C. M. Dixon

Raven as the creator was a supreme trickster; whilst bestowing gifts on man he could at the same time make a fool of man

which man learned and developed a pattern of behaviour based on that of the birds, animals and fish upon which he depended for food and, therefore, for life itself. Man in fact identified with a particular beast and was that beast in human form, having at some point shed the human form for that of the beast, and returned at a later point in time as a human endowed with the secrets, wisdom and powers of the beast. It was these beasts in addition to the human form that appeared usually in traditional stylized forms in the graphic arts and carvings.

Raven as the creator was a supreme trickster (see TRICKSTER); whilst bestowing gifts on man he could at the same time make a fool of man and other mythological characters alike. A Haida myth of the origin of light tells how Raven, seeing the world in darkness and feeling sorry for man hunting for food, set off one day to the Chief of the Sky who kept the ball of daylight hidden to punish the people. To get into the house of the Chief of the Sky, he changed into a spruce needle that fell into the spring, and was swallowed by the Chief's daughter who had come to drink. Soon she became pregnant and a son was born who was Raven in disguise. The Chief was pleased and himself tended the child, who soon learned to crawl, moving from room to room in search of the ball of light. This he found, and began to cry 'Ball, Ball' until eventually the Chief reluctantly and on the insistence of his advisers gave him the ball to play with. Each day he was given the ball, until the Chief and his advisers eventually gave up watching him. At this he rolled it to the door, turned himself back into Raven and flew back to the people, breaking open the ball and allowing the bright light to spread so that the people could see to hunt.

At the time of European contact and in the early fur trading period, the population of the seven major tribes – Kwakiutl, Tlingit, Tsimshian, Haida, Bella Coola, Nootka and Salish – was variously estimated at around

Bone pendant ornament inlaid with haliotis shell and shaped like a soul-trap, a box which the shamans of the Pacific North-West used for recovering souls that had escaped from their owners' bodies, causing them physical and mental illness

Abbey Museum/Michael Holford

70,000 people. Although linguistically each tribe was quite different, contact between them for trade, warfare, intermarriage and slave-taking resulted in an interchange of ideas and material culture along the rugged, forested Pacific coastline from south Alaska to northern California, which produced a culture that was similar.

The seasons governed the activities of the people, with spring and summer being the time for outdoor activities, particularly food gathering with the long winter months in mind. Autumn was a time for travel and feasts, and winter confined the people to their villages when the social life was the dominant feature. From the sea and rivers they took fish, mostly salmon, for food. Wood for their houses, utensils and other goods came from the forests, together with animals for their clothing. From the same sources they also developed beliefs and customs which characterized the culture of the area.

They lived in small villages mostly on the rivers and coastline, in large timber houses adorned with beautifully carved and painted decorative motifs that compare favourably with other primitive and developed societies throughout the world. Their artistic ability was well developed and encompassed all aspects of the material culture; canoes, furniture, clothing, tools, weapons and utensils were usually carved and painted with traditional designs that blended into the form. Many objects produced for religious, mythological or political

Animals played an important part in Indian beliefs, for man modelled his patterns of behaviour on animals, birds and fish, on which he depended for food and so for life itself *Above* Haida rattle in the form of a raven, bearing on its back a man, a frog and a thunderbird, a mythical creature which caused thunder by flapping its wings. Raven was a great trickster and, in a Haida myth, stole the ball of daylight from the Chief of the Sky and brought it to the people to relieve them from darkness and give them light to hunt by. He did this by getting himself born as the Chief of the Sky's grandson and demanding the ball of daylight to play with *Below* Shaman's charm in the form of a killer whale, a motif which appears again in a copper mask (*right*) and a blanket (*far right*). The hunting of whales involved special ceremonies

British Museum/C. M. Dixon

purposes used designs originating from legendary and mythological beliefs which in turn originated from the environment.

In every society there was a mythical beginning, and on the North-West Coast all living things were thought to be equal and in balance, differing only in their appearance. They were the same in thought, word and deed and taking human form. Man was Salmon, Bear or Raven for example, and conversely Salmon, Bear or Raven was Man. Clan names were claimed through descent from these creatures. The front of the house would be painted with the crest of the ancestral creature, as would be the articles of daily and ceremonial use.

Season of Fun and Feasts

The cold, wet winter months confined the people to their own villages and houses, and were a time for ceremony, singing, dancing, initiation of the young, feasting, speeches and ritual. There were many dance societies, involving the use of ceremonial costumes and fantastic masks combined with a sense of theatre that demanded elaborate timing, staging and direction.

The prelude to this ceremonial season was marked with a gay carnival of feasting and fun, a period in which the people unwound and relaxed after a season of toil. It began with a memorial service for those who had died since the last season, and finished several days later when the festivities were interrupted by a masked orator who announced that a new season would begin tomorrow and that life would again be a serious business. This heralded the beginning of the ceremonial season in earnest and the arrival of the spirits to prepare the novices for initiation.

The next day each novice would allegedly be taken away by a spirit, but was in fact confined to the dancing society house, from which all non-initiates were barred. There he was prepared and rehearsed for his entrance into the society with a short apprenticeship, on the completion of which all the village and visitors from surrounding villages were invited to witness his return from the spirit world to become human again.

The ceremony was dramatic, and often lasted several days. The novice entered, cried, danced and performed acts of magic, thus showing that he was possessed by the spirit. He was attended by assistants who helped him throughout and eventually quietened and calmed him until he had returned to human society. At the end of each day's performance a feast was held, and gifts were distributed.

The various dance societies performed throughout the winter months and a long pageant of drama, comedy and illusion ensued both inside and outside the houses. Houses were set up as theatres, with the use of curtains, the light of the central fire that created effects, tunnels under the floor and speaking tubes. Props such as a false-bottomed box, or a carved figure which was substituted for an initiate allegedly killed, then magically restored to life, were used.

Illusion and trickery were employed extensively. Beheadings, disappearances, voices from the air, sudden appearance of spirits or reappearances of the dead, walking on or handling fire; all were planned and rehearsed. At the public performance speakers, musicians, heralds and other specialists, along with the performers and dancers, played out their parts to convince the audience of the real presence of spirits and the supernatural, culminating in their final departure and the return to the normal order.

By the end of the season, when all who had applied for membership to the societies had been initiated and food supplies had become low, final gifts and payments were distributed. Then the last songs and dances were performed and the orator warned that a new season would soon begin – the season of work, food gathering and travel.

The Potlatch Ceremony

A major ceremony and the most important social event was the potlatch. Invariably associated with status, either of an individual, a clan or a village, it was an occasion for the distribution or re-distribution of the wealth upon which the economy was based.

The occasions for such a ceremony were many; the raising of a totem pole for a deceased chief, the introduction of a new chief, the coming of age of a close relative, a marriage, the giving of a new rank or name, the use of a new crest or the raising of a new house. But it was not uncommon for the planning and preparation to take many months or even years, for guests might amount to several hundreds and might stay

'Man in fact identified with a particular beast and was that beast in human form'**

for some weeks, requiring an abundance of food and gifts. The glory and prestige of the hosts depended upon the success of the occasion.

The rank of the guests governed the importance of the gifts; carved and painted chests, dishes, baskets, clothing, jewellery and even slaves were distributed in correct precedence. A rival chief might receive a canoe, whilst someone of low rank would receive a token gift of a strip of cloth.

The gifts were acquired for the potlatch in two ways, either by manufacture by the household members specifically for the occasion, or by redemption of loans, often with accrued interest as high as 100 per cent. The distribution of the gifts and the loans created a credit system, and careful accounts were kept. In this way the potlatch became the basis of the economy.

Guests were invited by agents of the chief, who acted as guides for the visitors at the appointed time; they were greeted by the host's family singing and dancing on the beach as they approached. After the speaker had announced them the feasting began, with the dishes being passed round in a prescribed traditional way. The speaker meanwhile gave a commentary on the food and urged all to enjoy themselves.

Each day, events would be featured varying in importance, so that a potlatch might include both a major event such as the raising of a totem pole, and a minor event such as the naming of a child. There would be dancing, singing, dramas and speeches, all the participants wearing their finest robes, head-dresses and jewellery, and some gifts would be distributed each day. On the final day, which was the grand climax of the occasion, the most valuable gifts would be given strictly in accordance with degrees of rank.

As a symbol of wealth, the copper also changed hands at the potlatch, but usually as a result of pre-arranged bargaining. The more a copper changed hands the greater its bargaining value, and on occasion a chief might deliberately shatter his wealth by breaking the copper and giving it to a rival chief, who in turn was expected to destroy wealth or lose face. A broken copper could be riveted together and re-used, but lost its original bargaining power which had to be re-established.

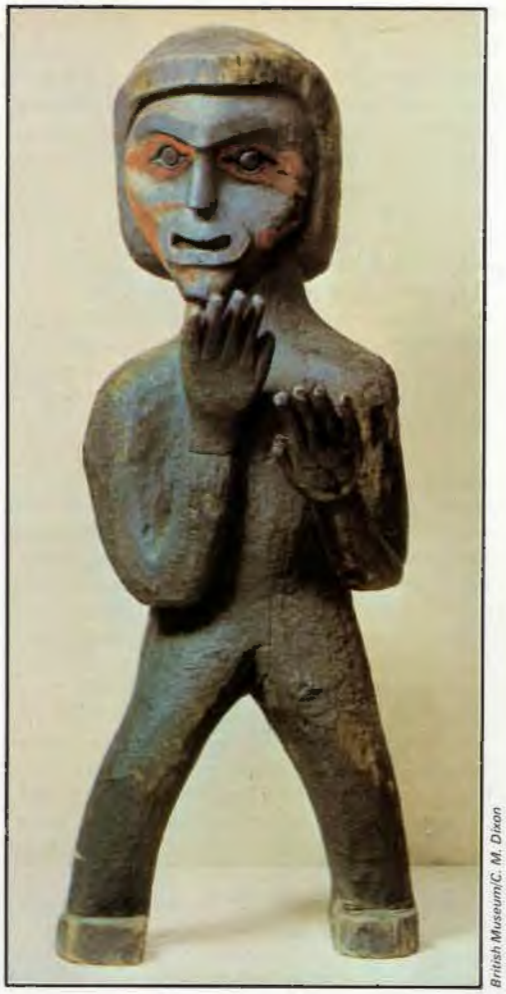
In 1921 the potlatch was prohibited by law although in remote areas the practice was continued secretly; by the time this law was repealed in 1951 much of the Indian way of life had been destroyed. The potlatch was subsequently revived with some ardour, and a fine pole carved by Robert Davidson, a young Haida artist, was raised at a ceremony at Masset in the Queen Charlotte Islands as recently as June 1969.

Shaman with Magic Box

The shaman or medicine-man played an important part in the life of the village. He was the healer, the contact and interpreter of the spirits. The position of shaman was generally acquired by heredity, an uncle revealing his spirit to a nephew before he died; or by a supernatural being possessing a man or occasionally a woman, and revealing itself to the human world through that person. To become a successful shaman took time in which to build a reputation and demanded cleansing of the soul by fasting, abstaining from sexual intercourse, washing in the sea, drinking warm salt water to empty the stomach and drinking fresh water afterwards.

Fasting and visions, followed by chanting and the shaking of the rattles and beating of drums, were regular parts of a shamanistic ceremony, in which the shaman dressed according to the spirit speaking through him. He would probably wear a blanket woven of mountain goat's hair and cedar bark twine or a Hudson's Bay decorated trade blanket with leggings to match, a skin apron painted and hung with puffin beaks or deer hoofs that rattled in the dance; a crown and necklace of bear claws or carved horns. Accoutrements for the occasion would consist of a rattle, usually round; a staff carved with the symbols of his visions and supernatural spirits; carved bone and ivory charms, carried or worn as a pendant; a soul-catcher, similar to the charms but actually a box, also in wood, often inlaid with abalone shell and with a removable stopper, and a drum often painted with a symbol.

Primarily concerned with healing, the shaman would visit the patient accompanied by an attendant or two. Whilst the shaman sang over the patient, the attendants and people of the house would beat the drums and boards, until a vision or dream occurred



British Museum/C. M. Dixon

to the shaman which would tell him the cause of illness. He usually attributed it to a supernatural object or a natural object disorganized supernaturally. The shaman at this stage would be a supernatural being able to see what ordinary man could not and would set about capturing the offending object, still accompanied by drums, rattles and chants. This would be done either by drawing it out of the body, or if it was the soul of the patient he would pursue it with his soul-catcher with the stopper removed until he could pop it into the magic box, replace the stopper and return it to the patient. For this service the shaman would be paid, but if the patient died the payment would be returned.

Today the Indians of the North-West Coast are predominantly Christian. Old practices and beliefs still persist in some places, with a growing awareness and revival, but not as part of their religion so much as a revival of tradition. It will be many generations before they integrate into modern society; environment, cultural heritage and racial background will prevent a rapid transition. It is to be hoped that the emergence will be gentle and allow them to retain their own identity.

'And in the end this Exominate was contented to give him her soid Soul'; a formal agreement, renouncing one's soul to the Devil in return for his services, is an important element of the Faust legend and of European witchcraft

PACT

THE PACT with the Devil bulks large in the history of witchcraft and also in Western literature, especially in connection with Faust. It is based on the belief that the Evil One hungers for human souls and that every Christian on whom he can fasten his talons is the spoil of a triumphant campaign in the war which he has waged against God and man ever since he was expelled from his high seat in heaven. He therefore offers his services to greedy magicians and grovelling witches in return for their souls and bodies. The formal agreement with him may be made verbally or in writing and, if in writing, may be signed in the sorcerer's blood, the blood which carries his life-energy and so conveys his life into the Devil's hands. The pact may last for the whole of the signer's natural life or for a limited number of years, at the end of which the Devil will come to claim his victim.

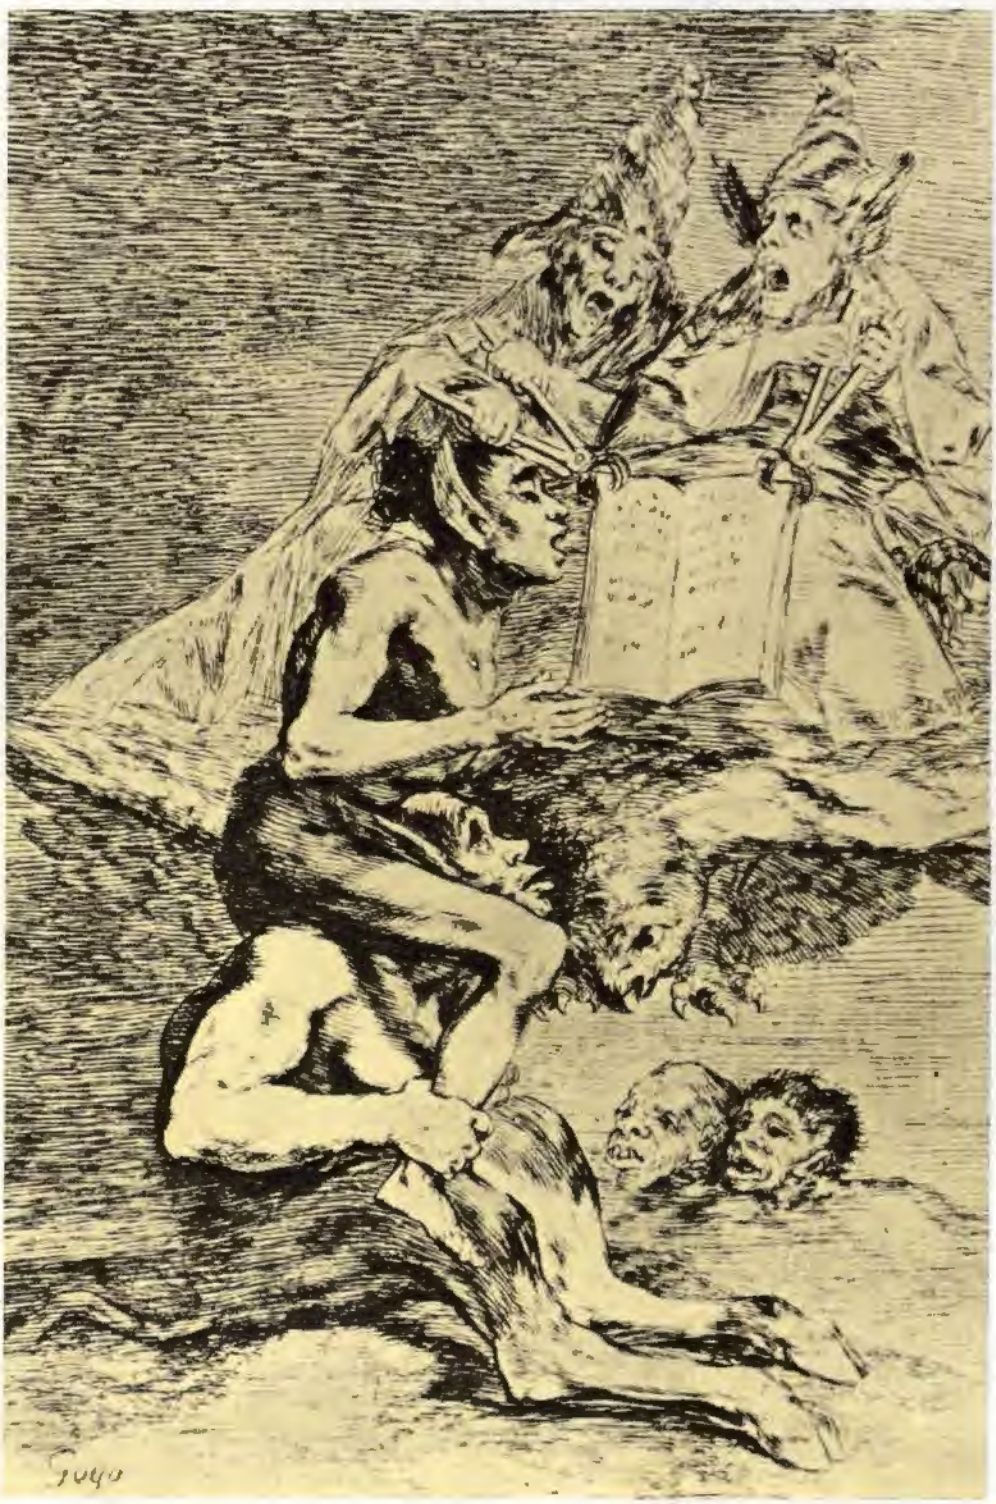
Scriptural authority for the possibility of a pact with the Prince of Darkness was found in Isaiah 28.15. This verse originally had nothing to do with any bargain with the Devil but the Vulgate translation suggested that it had: *percurrimus foedus cum morte et cum inferno fecimus pactum*, 'we have signed a treaty with death and with hell we have made a pact'. The early Christians tended to believe that magicians and diviners obtained their effects through the assistance of demons and the main impetus to later belief in the Satanic pact came from St Augustine who (in *De Doctrina Christiana*) condemned sorcery, astrology and other occult arts, 'arising from the pestiferous association of men with demons, as if formed by a pact of faithless and dishonourable friendship.' This passage was quoted by later authorities and became part of the Church's law.

Stories began to circulate about people who had sold themselves to the Devil. An early one is the tale of Proterius, a servant who fell hopelessly in love with his master's daughter. To win her, he appealed to the Devil and signed a paper renouncing his baptism and his faith in Christ and promising to share the horrors of hell with his new master. The Devil kept his part of the bargain by causing the girl to fall in love with Proterius but the latter was saved from hellfire by St Basil (bishop of Caesarea in Asia Minor, in the 4th century), who forced the Devil to return the signed paper. This story already has the element of having your cake and eating it which is typical of many pact tales. The Devil demands a formal contract to make sure that the bargain cannot be broken but, although he keeps his part in it, the contract is broken through the intercession of some high spiritual authority and the signatory gets the best of both worlds.

The same thing happens in the story of Theophilus of Adana, which has been traced back as far as the 6th century and was included in *The Golden Legend*, a 13th century collection of legendary lives of saints which was extremely popular in the Middle Ages. Theophilus was a Christian who was persecuted by his bishop, and resented it. He consulted a wicked Jew, who took him in the middle of the night to a place where they saw a crowd of creatures in white robes. They carried candles and seated among them was their prince, the Devil, who demanded that Theophilus 'deny the son of Mary and those things which are offensive to me, and let him set down in writing that he denieth absolutely.' Theophilus did so, sealing the writing with wax (though by at least the 13th century he was said to have signed the statement in his own blood).

The fortunes of Theophilus spectacularly improved after this but he began to be depressed by the terrible prospect of an eternity in hell. He wailed and bemoaned himself so noisily that the Virgin Mary heard him. She took pity on him, obtained divine forgiveness for him and recovered the written pact. It was publicly burned after Theophilus had made an open confession.

In some stories the human signer of the



Left Sorcerer making a diabolic pact, a drawing by Goya *Right* The most famous pact-signer of legend was Faust, who bargained his soul away to the Devil in return for superhuman power: Faust and Mephistopheles, an illustration to Goethe's *Faust* by A. von Kreling

Chris Barker

pact intends trickery from the beginning. An example is the case of Roger Bacon, the 13th century scientist and philosopher, who was said to have promised the Devil his soul unless he died neither in the Church nor out of it. The Devil readily agreed but lost his prey because Bacon constructed a cell in the wall of a church, neither inside nor outside it, and took care to die there.

But the Devil is not always cheated and, psychologically, if you believe in him, perhaps, once summoned, he is not so easily got rid of. There was a well-known medieval legend that the brilliant Gerbert of Aurillac, who became Pope Sylvester II in 999, was a sorcerer who had signed a pact with Satan. A speaking brazen head, which he had made with the Devil's assistance, told him that he would not die before he celebrated Mass in Jerusalem. Gerbert naturally decided to go nowhere near the Holy Land but one day, in the year 1003, he was saying Mass in a church when he felt his strength draining away from him and sensed the presence of an army of gloating demons. He discovered that the church was dedicated to the Holy Cross of Jerusalem, and just had time to confess before he died.

Damnation of Faust

The most famous pact-signer of legend was Faust, who was said to have started the rumour that he was in league with the Devil, so as to gain prestige (see FAUST). There was a story that a friar begged Faust to mend his evil ways but that Faust refused to break the blood-pact he had signed: 'The Devil has honestly kept the promise that he made to me, therefore I will honestly keep the pledge that I made and contracted with him.' As the term of the pact drew near, Faust despaired and lamented and on his last night on earth, soon after midnight, a great storm blew up and there was heard a whistling and a hissing like the sound of legions of snakes. Faust cried feebly for help but no one dared go to him. What was left of his body was found next morning in the yard, near the manure heap. His room was swimming in blood, brains and teeth, and his eyeballs were stuck to one wall.

The pact was important in prosecutions for witchcraft because it was evidence of heresy, of the repudiation of Christ and deliberate enlistment in the ranks of the Enemy. According to the *Dialogus Miraculorum* of Caesarius of Heisterbach (13th century), about the year 1200 two heretics came to Besançon, in eastern France, and worked all sorts of marvels and miracles. It was discovered that they carried written pacts with the Devil concealed under the skin of their armpits. The documents were removed and the heretics were burned to death.

In 1320 an inquisitor in Carcassonne, in southern France, was instructed to proceed against people who worshipped demons and gave them writings and made pacts with them. *Errores Gazariorum*, written in Savoy c1450, says that becoming a witch involved swearing an oath of fidelity to the Devil, who then drew blood from the neophyte's left hand and wrote with it on paper and kept the paper. One of the Arras witches, in 1460, confessed to signing a pact in his own blood and Antoine Rose, tried in 1477, said she had kissed the Devil's foot in homage and renounced the Christian faith, and then the Devil put his mark on her (see FRENCH WITCHCRAFT).

The *Malleus Maleficarum* (1486) says that when a new witch joins the cult, the Devil asks her 'whether she will abjure the Faith, and forsake the holy Christian religion and the worship of the Anomalous Woman (for so they call the Most Blessed Virgin Mary), and never venerate the sacraments.' The new witch duly swears this with upraised hand but then the Devil tells her that this is not enough, for she must give herself to him, body and soul, for ever. The *Malleus* also quotes from an earlier work, John Nider's *Formicarius* (c1435), which says that the new recruit swore 'to deny the Christian religion, never to adore the Eucharist, and to tread the Cross underfoot whenever she could do so secretly.' From the same source the *Malleus* quotes a Swiss witch as saying that the neophyte entered a church on a Sunday with the leaders of the group and in their presence denied Christ and the Church: 'and then he must pay homage to the Little Master, for so and not otherwise do they call the Devil'.

Evidently, a written pact signed in blood was not always necessary, though a Basque witch burned in 1619 showed Pierre de Lancre the pact she had made with the Devil, scrawled in menstrual blood. A written pact which is still preserved is the one allegedly signed by Urbain Grandier (see GRANDIER) and produced against him in evidence at his trial in 1634, together with a reply signed by the chief princes of hell. The pact reads:

> My lord and master Lucifer, I acknowledge you as my god and prince, and promise to serve and obey you while I live. And I renounce the other god aud Jesus Christ, the saints, the Roman Church and all its sacraments, and all prayers by which the faithful might intercede for me; and I promise to do as much evil as I can and to draw all others to evil; and I renounce chrism and baptism, and all the merits of Jesus Christ and his saints; and if I fail to serve and adore you, paying you homage three times a day, I give you my life as your own.

In reply the lords of darkness promised him a happy life full of carnal delights for 20 years, after which he would join them in hell.

In England, Anne Chattox (see LANCASHIRE WITCHES) said that 'a thing like a Christian man, for four years together, did sundry times come to this Examinate, and requested this Examinate to give him her Soul; and in the end this Examinate was contented to give him her said Soul, she being then in her own house, in the Forest of Pendle.' The phrasing of this confession suggests another source of the firm belief in the pact, the tendency of lawyers to rejoice in set forms and due process, and their assumption that the Father of Lies must do so too.

The pact has little importance in the text-books of ceremonial magic. The *Grand Grimoire* does include an unimpressive ritual for making a pact with a subordinate demon named Lucifuge Rofocale in order to borrow money from him, but the grimoires are mainly concerned to dominate evil spirits, to quell them and reduce them to obedience, and the mentality of the sorcerer who bargains his soul away to obtain the Devil's services is foreign to their view of the overwhelming power of the master magician.

Pagan

Derived from Latin *paganus*, 'countryman', implying belief in a variety of Nature gods and spirits, and sometimes implying delight in Nature, the senses, the things of this world; generally refers to a believer in the polytheism of the ancient world, especially of Greece and Rome, but has been used in many ways, sometimes meaning one who is not a Christian, sometimes one who is not a Christian, Jew or Moslem, sometimes one who has no religion at all.

Ronald Sheridan

Pagoda

Buddhist sacred building, especially a tower, which may be connected with a temple or may stand by itself; usually rising in a series of tiers to a spire at the top, though in Ceylon it is bell-shaped and is said to represent the female breast; it frequently contains a statue of Buddha and enshrines holy relics.

Palestine
Small country at the eastern end of the Mediterranean, comprising parts of what are now the states of Israel and Jordan; the name comes from the Philistines, who occupied the southern coast; the Promised Land to which Moses and Joshua led the Hebrews, and the Holy Land of Christianity.
See ASTARTE; BAAL; JERUSALEM; JUDAISM; PHOENICIANS; SYRIA AND PALESTINE; YAHWEH.

Palindrome
Word which reads the same forwards as backwards ('eye', for example, or 'noon'); some magic squares were arranged to read the same in all directions, which was thought to give them additional power.
See MAGIC SQUARES.

Few, if any, physical mediums have been so thoroughly investigated as this peasant girl, whose extraordinary paranormal powers many eminent investigators endorsed but many others challenged as fraudulent

EUSAPIA PALLADINO

Harry Price Library

BORN IN 1854 at Minervo-Murge, near Bari in Italy, Eusapia Palladino was the daughter of Italian peasants. Her mother died at her birth and when she was 12 years old her father was murdered by brigands. Taken into the household of a Neapolitan family, who were interested in Spiritualism, as a nursery-maid, she soon showed signs of abnormal gifts. From then on her career led from one scientific investigation to another, almost up to her death.

Her phenomena consisted of the occurrences common to physical mediums. While she was said to be securely held or fastened, there would occur raps and bangs on the furniture and walls of the room; touches on the bodies of the investigators and telekinetic movements (movements without contact – see PSYCHOKINESIS) of various objects both inside and outside the cabinet. (A cabinet in this sense means simply a space enclosed within drawn curtains near the medium in which, it is alleged, the medium's 'power' is accumulated.) The cabinet curtains would sometimes bulge out and materializations appear, looking like the outline of 'hands' and 'heads' (known as pseudopods), together with other ectoplasmic forms. There were also isolated reports of fully-formed hands and even fully-formed phantoms.

Hereward Carrington, the American investigator, records an occasion when 'Eusapia asked me to enter the cabinet and hold the small table within it. It was light enough for me to *see* that nothing was opposite me, even though the curtains were more or less closed; yet some invisible being or force was strong enough to throw both the table and myself out of the cabinet completely – landing on the floor outside.'

The most notorious feature of Eusapia's strange personality was her incessant resort to trickery. Nevertheless, one of her most outstanding investigators, the French physiologist Professor Richet, stated that, in spite of her many frauds 'all the men of science, without exception, who experimented with her were in the end convinced that she produced genuine phenomena'. No other medium so well illustrates the difficulties and complexities of physical mediumship, and the history of her relations with the Society for Psychical Research can best demonstrate this.

The S.P.R.'s connection with Eusapia began through Professor Richet, who maintained a materialistic outlook in spite of his belief in the validity of paranormal phenomena. A great deal about his experiments with Eusapia will be found in his book *Thirty Years of Psychical Research*. In it Richet records that he had close on 200 seances with Eusapia. 'Even if there were no other medium than Eusapia in the world,' he wrote, 'her manifestations would suffice to establish scientifically the reality of telekinesis and ectoplasmic forms.' 'When I recall the precautions that all of us have taken, not once but twenty, a hundred, or even a thousand times, it is inconceivable that we should have been deceived on all these occasions.'

'Deliberate Fraud'

In 1894 Richet invited two S.P.R. members, F. W. H. Myers (see MYERS) and Sir Oliver Lodge, to take part in experiments with Eusapia at his villa on the Ile de Roubaud, a tiny island off the Mediterranean coast. On their return to England Lodge and Myers reported their complete acceptance of Eusapia's paranormal powers.

There was a disturbing sequel, however. Dr Richard Hodgson, who had established himself as the leading S.P.R. expert on fraudulent practices, had gone to America some seven years earlier to become Secretary to the American S.P.R. and to take control there of the work with the famous mental medium, Mrs Piper (see PIPER). While in Boston he had read Lodge's report on Eusapia and wrote back to the *Journal* challenging the testimony offered by Richet, Lodge and Myers, and stating that the experimental conditions described were inadequate to prevent fraud. Indeed, he indicated exactly how he thought such fraud would have been possible – by Eusapia freeing a hand or foot without detection by the investigators holding her.

Shaken by the criticism of the redoubtable Dr Hodgson, the Council of the S.P.R. invited Eusapia to visit England for renewed experiments, which Hodgson came from America to attend. The result of 20 seances held in Cambridge established Eusapia's fraud in the unanimous opinion of the participants, by means of exactly such a method of evading control of a hand or foot as Hodgson had postulated. Even Myers, who had been so completely convinced a short while before, stated that he could not now doubt that they had observed 'conscious and deliberate fraud of a kind which must have needed long practice to bring it to its present level of skill'. Lodge, however, remained unshaken and, in spite of Eusapia's admitted fraud at Cambridge, stuck to his insistence on the genuineness of the phenomena he had witnessed on the Ile de Roubaud.

Anxious to preserve the Society's reputation and to keep clear of the many frauds only too common among physical mediums, Professor Sidgwick, leader of the S.P.R., issued a pronouncement. It had been 'placed beyond reasonable doubt that the frauds discovered by Dr Hodgson at Cambridge had been systematically practised by Eusapia for years. In accordance, therefore, with our established custom, I propose to ignore her performances for the future as I ignore those of other persons engaged in the same mischievous trade.'

How had her fraud been detected? The answer was: by Hodgson freeing one of Eusapia's hands in order to observe just exactly how she eluded control. The adverse report which followed caused considerable

dissatisfaction among European investigators. It was argued that it had always been recognized, by all investigators, that Eusapia would cheat, given the opportunity, and that Hodgson by his deliberate avoidance of proper control had virtually encouraged her trickery.

Supernormal Force

In 1908, 13 years later, the S.P.R. unbent and a committee was appointed to investigate Eusapia anew. By this time Sidgwick, Myers and Hodgson had all died. Mrs Sidgwick, the then President of the Society, explained the change of front on the grounds that in view of the very thorough investigation of the medium abroad, the Council wished to collect further material in order to form an independent judgement.

The 'Naples Committee' consisted of the three most critical men, the most experienced in the investigation of physical mediums, in methods of conjuring and in detection of fraud, that the S.P.R. could muster. They were the Hon. Everard Feilding, Hon. Secretary of the Society; W. W. Baggally, an S.P.R. Council member, and Hereward Carrington, Research Investigator of the American S.P.R. for some years. They proceeded to Naples in what they described as a thoroughly sceptical if not hostile frame of mind, resulting from years of detecting fraud. But all three were converted to an emphatic belief in Eusapia's phenomena, brought about by the stringent conditions in which the phenomena had been observed. Their subsequent report records 'Eusapia was not detected in fraud in any one of the 470 phenomena that took place at the eleven seances.' They were 'compelled to ascribe Eusapia's phenomena to some supernormal cause . . . Our general opinion of these phenomena is that they were due to some supernormal force resident in the organism of Eusapia, though some few of them would appear to point to the action of an independent energy.'

Eusapia Palladino apparently levitating a table, while two investigators hold her hands and knees: it was recognized that she would resort to trickery whenever she was allowed to, but three experienced and critical researchers were driven to the conclusion that she could also produce 'supernormal' phenomena

Harry Price Library

But the vicissitudes of Eusapia's life were by no means over. In 1909 the converted Carrington arranged to take the medium to America and there occurred the most disastrous episodes of her entire career. In a series of seances, in far from satisfactory conditions, including an investigation by professors at Columbia University, she was caught resorting to her old tricks. Denunciations ensued, the Press took it up and turned it into a sensation, and challenges and wagers were handied back and forth. Carrington, however, maintained to the end his own conviction of the genuine character of Eusapia's phenomena in the *right* conditions.

In a disastrous setting of untrained and ill-assorted sitters and Press publicity, Eusapia's career was virtually at an end. In the eight remaining years before her death in 1918 she gave some recorded seances, but they were mostly negative and could not compare with her earlier powers.

The vast literature on Eusapia is full of interesting comments on her strange psychology. Certainly no more intriguing and illuminating example can be found for studying the problems of physical mediumship.

PALM

THERE IS an Arab saying that the palm has as many uses as there are days in the year, and certainly anyone who has been to North Africa will know how important the date palm, *Phoenix dactylifera*, is to those who dwell in desert regions. Its fruits are eaten and remain edible for a long time; oil can be produced from the kernels, which also provide food for livestock; an intoxicating drink can be made from the sap; the leaves are used for thatching, walling and fencing, for matting and baskets; rope is made from the stringy material surrounding the crown; and when the tree dies its trunk provides timber.

It is also a very distinctive tree and became a stylistic pattern for columns in ancient Egypt, and relief embellishment further north, as on the temple of Solomon: 'He carved all the walls of the house round about with carved figures of cherubim and palm trees' (I Kings 6.29).

The word Phoenicia used by the Greeks and Romans meant 'land of palms', and some coins of ancient Tyre and Sidon show this tree. Many Jewish coins do the same, the first being that issued in 175 BC, in the

Christ's entry into Jerusalem, from a 14th century manuscript: the palm was also traditionally one of the four woods from which the cross was made, and was said to have formed the piece to which Christ's hands were nailed

time of Judas Maccabeus. Later, after the conquest of the Jews and the overthrow of Jerusalem by Titus in 70 AD, the Emperor Vespasian struck a coin which showed a woman weeping beneath a palm, so much was the tree the emblem of Palestine. Now, however, palms are scarce in the Levant and Palestine.

The Bible relates how 'branches of palm trees' (the huge individual branch-like fronds) were carried on special occasions, as in Revelation 7.9, where they become a symbol of martyrdom: 'And after this I looked, and behold, a great multitude . . . standing before the throne . . . clothed in white robes, with palm branches in their hands'. It was in the time of Judas Maccabeus, when the Temple was restored, that it first became customary to carry palm fronds in procession. The fronds – known as 'lulab' or 'lulav' – would be interlaced with myrtle on the right side and citron on the left, and after being carried at the Feast of the Tabernacles were preserved at home where they brought luck and protection in the coming year. In an earlier palm festival the Jews had made cabins of the fronds outside their townships, in which they passed a holiday week notable for family reunions, in memory of the 40 years of camp life in the wilderness, before they reached the Promised Land. Among Christians the carrying of fronds – and the English 'palm', which is the pussy willow – on Palm Sunday is a recollection of that day when Jesus entered Jerusalem and the people waved palms and strewed his path with them. Today in many Christian Mediterranean countries the palm frond is represented by a cross of palm pieces carried in the hand or stuck into one's hat.

Early Christian martyrs believed that angels brought palm fronds to carry their souls up to heaven. It later became the custom to make a fire of palm fronds on All Souls' Day; the smoke was supposed to assist souls released from purgatory to reach heaven.

Emblem of Victory

Pilgrims would often carry a staff of palm and were consequently known as palmers. This explains Helena's question in Shakespeare's *All's Well That End's Well* (Act III, Sc. 5) 'Where do the palmers lodge, I do beseech you?' The palm was also a symbol of victory, as is apparent in a number of other Shakespearean quotations. In *Coriolanus* (Act V, Sc. 3) Volumnia says in scorn:

> And bear the palm for having bravely shed
> Thy wife and children's blood . . .

There is a Christian myth linking the palm with St Christopher. Originally named Offero, this giant of a man was told by a hermit that if he wished to see Christ, he should assist the weak. Offero made himself responsible for carrying people over a dangerous river, using a palm staff as a support. One stormy night a child asked to be carried over. Offero found his small burden becoming heavier and heavier but managed to stagger across. Then the child bid him thrust his staff into the ground; and when he had done so, it put out leaves and fruits. At this, Offero, realizing whom he had carried, became converted; he changed his name to Christ-ofero, or Christopher, meaning 'Christ-bearer'.

The palm figures in another legend of the life of Christ, for it was supposed to be one of the four trees from which the cross was made as specified in an old verse:

> Nailed were His feet to Cedar, to Palm
> His hands,
> Cypress His body bore, title on Olive
> stands.

In countries where it was not a native the palm became valuable as a talisman: a piece of its wood or leaf would subdue evil spirits; a cross made of its leaves kept off lightning; fever would abate if the leaf was chewed.

Palm was said to keep mice from grain stores, and even to be a specific for fleas. To do this one had to place a palm leaf behind the portrait of the Virgin Mary on Easter Sunday at the first stroke of the resurrection bell, and say: 'Depart, all animals without bones'. This kept off fleas (and presumably lice) for a year – a great boon in former times. To dream of a palm tree means luck and success, especially if the tree is in flower. In the language of flowers, palm stood for victory.

PALMISTRY

The palmist stresses the importance of the markings and formation of the hands as indications of character, and believes that in these the past and future may be read

The belief that man's destiny is imprinted on his hands has a long history; prophets of the Old Testament believed that God 'set his seal' on men in this way, and even today it is argued that an accurate interpretation of the configurations of the hand can enable a man to recognize, and change, his fate

HANDS HAVE FASCINATED man since prehistoric times. Able to shape tools, make impressions in clay and trace signs in the dust, they must have seemed magically endowed, possessions that gave him a power over Nature that was denied to animals.

Later, man came to regard his hands not only as instruments of power, but also as mirrors of his destiny, a prehistoric book of fate in which he could discern, through an intuitive sensibility, more than his reason could make known to him. The first steps had been taken in the art of palmistry or chiromancy, a method of divination through studying the lines, mounts, valleys and other configurations on the palms, together with the shape, size and texture of the hands themselves.

A highly developed subject in India, which was perhaps its birthplace, palmistry was known in China, Tibet, Persia, Mesopotamia and Egypt, and flowered, more or less in its present form, in Greece. The Athenian philosopher Anaxagoras (500–428 BC) is said to have practised the art, saying, 'The superiority of man is owing to his hands.' Aristotle (384–322 BC) added that 'The hand is the organ of organs, the active agent of the passive powers of the whole system.'

The art still continues to flourish throughout the East. The Arabs, Chinese and many gypsies add solistry, or foot reading, to the more usual hand reading while onychomancy, simply studying the finger-nails (see FINGERS), is held to be enough by some people. It is probable that graphology, assessing character by studying handwriting, was an offshoot of palmistry. During the Renaissance these skills were considered a legitimate part of natural science, even when condemned by the Church. Nor did ecclesiastical prohibitions prevent many dignitaries of the Church from making use of all occult methods, black or white.

Previous page An 18th century painting by Jean-Baptiste Le Prince: the belief that the hands are 'mirrors of destiny', in which a person's character and future are reflected, has flourished for centuries

Mind and Body

The tradition that every line, star, point, cross, square, island and triangle in the hand is significant has therefore been perpetuated for countless generations, and the modern palmist, like other practitioners of the art before him, believes that there is a relationship between these physical features and man's nature. The claim by the 20th century German psychologist Ernst Kretschmer that there is a connection between physique and psychotic illness, and the increasing conviction among medical men of the psychosomatic nature of many diseases, supports the view that there is an interaction between body and mind.

The occultist goes further and says that there is a constant interplay, not only between the physical and the mental, but also between these and the spiritual. The palmist stresses the importance of the apparently haphazard markings and formations of the hands as indications of character, but believes in addition that, in these, the past and the future may be read.

There are those who regard palmistry as a rational science, and others who believe that clairvoyance must be brought to bear when an interpretation is made. A number of ancient books concerning this art exist, and many modern ones, both profound and popular. There are also societies which instruct students in palmistry.

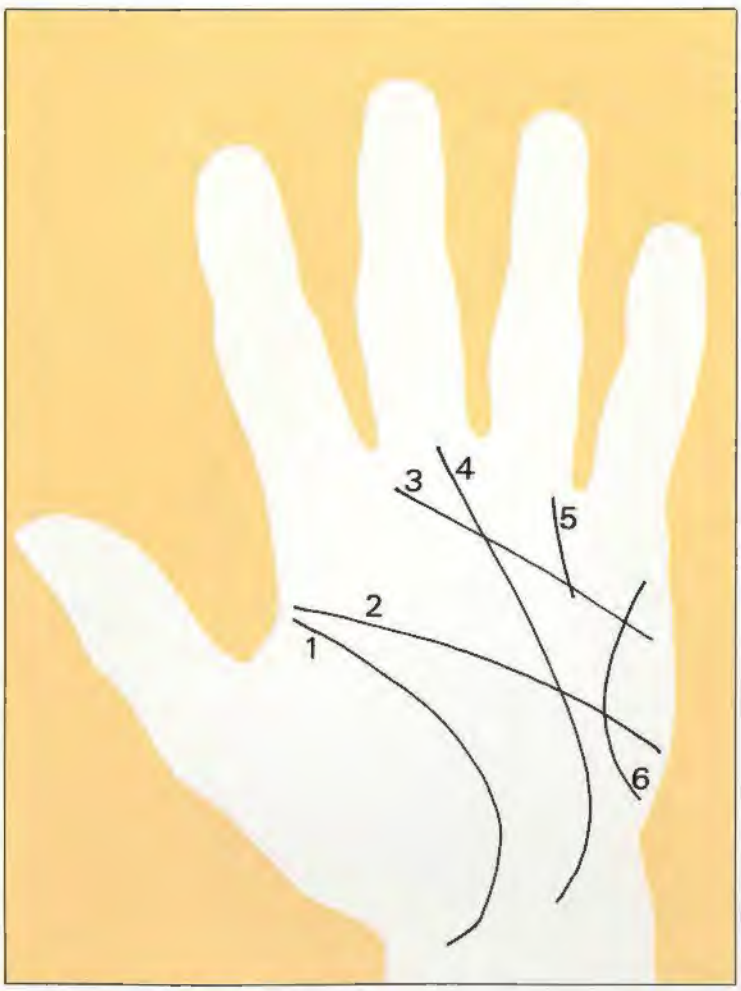
The superficial reader of hands is content to flatter the person who consults him by stressing such virtues as courage, straightforwardness and warmth of heart; he speaks of sadnesses experienced only in the past, and paints a picture of a successful and happy future. This is generally all that is obtained from the gypsy woman who reads palms while begging for a silver coin. But every now and then, a passing gypsy will suddenly be visited with the gift of seeing into the future, and will be impelled to give a quick reading that may prove startlingly true. She will refuse to take a penny for it. Materialists will dismiss the matter as a hoax, but it is unlikely that such an old and trusted art is without some foundation in truth. It is interesting that today, when serious palmists take impressions of the hands they read, and the findings are typewritten and kept for verification, striking accuracy of both character-reading and prediction is sometimes obtained.

Palmistry may be studied under three headings. Firstly, correlation between the hands and physical or mental states might be called medical or therapeutic chiromancy, and some palmists are extremely good at diagnosing the nature of an illness. Secondly, correlation between the hands and character could be called psychotherapeutic chiromancy. The palmist will describe the consultant's character in detail, praise the good qualities and point out the weak ones. Thirdly, there is correlation between the hands and the past, the present and the future. This is divinatory chiromancy. What the palmist has to say about the past may be verified, the present is of course clear, but that which is predicted for the future may well be taken with several grains of salt.

The danger so far as prediction is concerned is that the consultant may accept that a tragedy is inevitable and may allow this to prey on his mind. Some people are so suggestible that they themselves may unconsciously bring about a predicted disaster. Therefore a high-minded palmist will never foretell misfortune or death without very carefully qualifying the reading and showing how the tragedy may be averted.

When preparing to read a hand it is necessary to be analytical, and each line, mount and so on should be described separately; but in the actual reading it is essential to interrelate all these features. Each line should be studied in conjunction with all other markings on the hand, or the reading will be out of focus. In addition, both hands must be brought into relation with each other, for the left represents a person's inherited disposition, while the right reflects what he makes of himself; that is, his positive or negative reactions to his fate.

The titles and placing of the lines, bracelets, mounts, valleys or plains, of stars, points, squares, triangles and islands, must be mastered by the student of palmistry. The diagrams opposite and on the following page give only a brief indication of their significance; a detailed study of palmistry is necessary to appreciate the vast amount of information that may be obtained from reading hands.



THE PRINCIPAL LINES

1. ***The Life Line:*** *General picture of the subject's destiny and the dates of outstanding events.*
2. ***The Head Line:*** *Intellectual capacities.*
3. ***The Heart Line:*** *All that concerns the sentiments.*
4. ***The Fate or Destiny Line:*** *This should be checked carefully with the 'life line' as it indicates the subject's pattern of life.*
5. ***The Apollo or Sun Line:*** *Artistic trends, chances of success.*
6. ***The Intuition Line:*** *Insight.*

THE SECONDARY LINES

1. ***The Girdle of Venus:*** *The passions.*
2. ***The Cross Line:*** *Power to govern.*
3. ***The Lines of Union:*** *Marriage, children, divorce.*
4. ***The Martian Lines:*** *Military glory, personal triumph.*
5. ***The Travel Lines:*** *Journeys, discoveries.*
6. ***The Mercury or Health Line:*** *Bodily, mental and spiritual well-being.*
7. ***The Three Bracelets of Health, Wealth and Happiness***

Because a person's inherited character and disposition are reflected in the shape of his hands and fingers, the texture of the skin and the shape of the finger-nails, chirognomy, the study of hand formation, is an essential part of palmistry.

Large, straight and well-shaped hand: *Expansive personality, lively and possibly aggressive.*
Long and slender hand: *Fastidious and gentle personality.*
Pudgy hand: *The 'priest's hand' – mystical and unctuous.*
Thin and dry hand: *Nervous, intellectual, ascetic, touchy, tenacious.*
Hard and firm hand: *Energetic, sporting, good memory, tending to violence.*
Damp hand: *Lazy, unstable but kindly.*
Hot hand: *Vivacious, bountiful, but lacking in depth and sincerity.*
Cold hand: *Taciturn, secretly generous.*

The size, formation and flexibility of the thumb, the shape of the individual fingers, and their length in relation to the palm of the hand, are all significant.

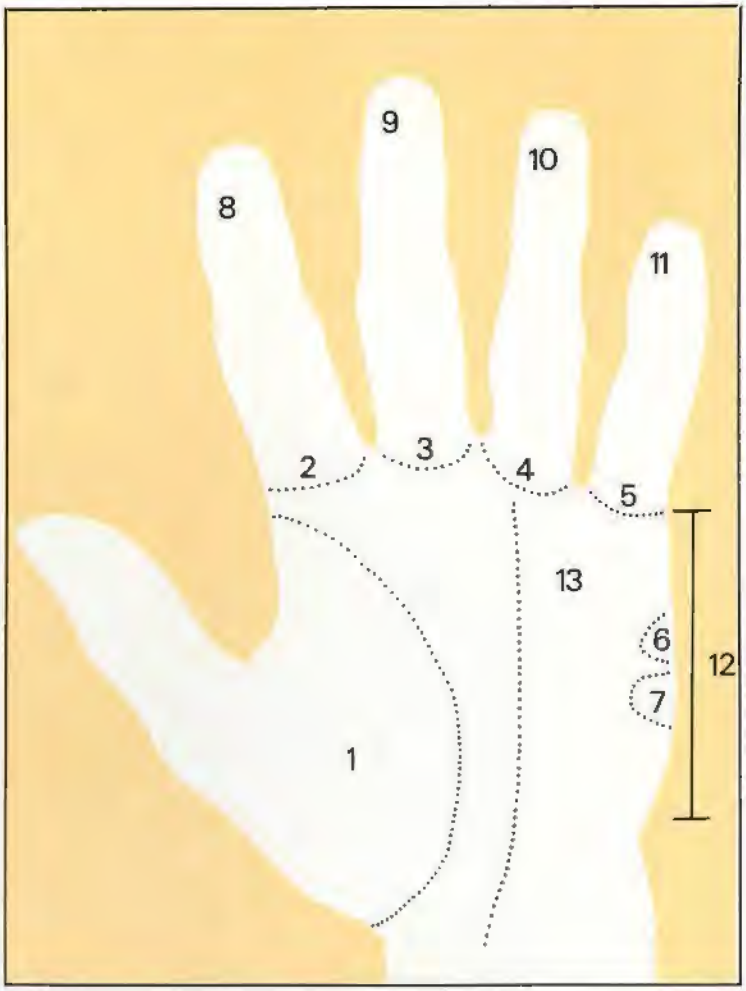
Large thumb: *Strong-minded, energetic, given to command, liking work, self-controlled.*
Thumb bent well in towards the palm: *Moderate, tending to be mean.*
Thumb bent outwards: *Open-natured and generous.*
Thumb bent out and backwards: *The 'killer's thumb', danger of brutality.*
Long fingers: *Polite, excitable, anxious, delicate, aesthetic.*
Short fingers: *Impatient, sensuous, creative, good-hearted.*
Pointed fingers: *Impatient, sensuous, creative, illogical.*

Finger-nails vary widely in shape and are said to reflect a number of different character traits. The care of the nails does not affect their basic type in any way; whether they are carefully manicured or broken by work, their significance remains the same.

Long: *Gentle and kind, discreet, keeper of secrets.*
Almond-shaped: *Idealistic, tactful, serene and courteous.*
Long and thin: *Visionary, irritable, delicate in health.*
Rectangular: *Practical, sensible.*
Long and large: *Timid.*
Short: *Critical, scientific.*
Very short: *Lacking self-control, fanatical.*
Short and large: *Morbid, sad.*
Short and straight: *Rigid, jealous.*
Short and rounded: *Envious, covetous.*

THE REGIONS OF THE HAND

1. ***The Mount of Venus:*** *Love, instincts, vitality, sensuality, fecundity, bounty.*
2. ***The Mount of Jupiter:*** *Religion, philosophy, ambition, leadership.*
3. ***The Mount of Saturn:*** *Stolidity, resignation, scepticism.*
4. ***The Mount of Apollo:*** *Artistry, exhibitionism, success, fantasy.*
5. ***The Mount of Mercury:*** *Finance, travel, inheritances, mental agility.*
6. ***The Mount of Mars:*** *Aggression, courage, fidelity, physical strength.*
7. ***The Mount of Luna:*** *Imagination, instability, clairvoyance.*
8. ***The Finger of Jupiter:*** *Domination, leadership.*
9. ***The Finger of Saturn:*** *Stability, conservatism, jealousy.*
10. ***The Finger of Apollo:*** *Artistic genius, musical, theatrical, cheerfulness.*
11. ***The Finger of Mercury:*** *Egotism, avarice, dissimulation, astuteness.*
12. ***Range of Percussion:*** *Signs concerning marriage, children, divorce.*
13. ***Quadrangle of Heart and Head:*** *Equilibrium, harmony, peace.*



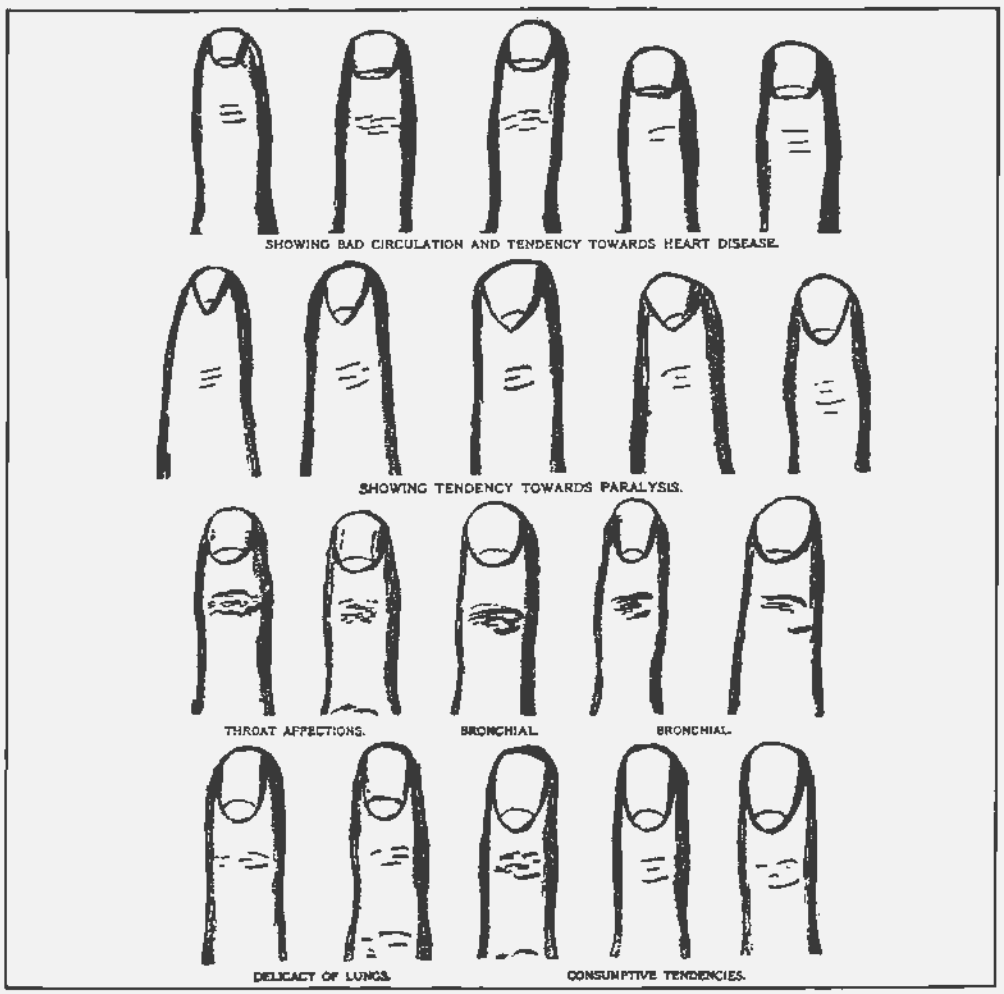
A doctor may be able to tell, from a patient's physique, the type of illness he is likely to suffer, and in the same way the palmist claims that he can detect tendencies towards cancer, tuberculosis, asthma, heart trouble and so on, by studying the physical characteristics of the hand. The validity of such a claim is debatable, although much supporting evidence is offered by palmists who specialize in diagnosis. They also claim to substantiate or complement the findings of modern psychologists, and certainly, if specific physical characteristics indicate a proneness to specific physical illnesses, they may well do the same where psychoneuroses are concerned.

The occult theory that the physical body is extruded or solidified from an etheric pattern-body called the astral (see ASTRAL BODY) suggests that the hands express in their form and configurations the subtle mental and spiritual essence, or core, of an individual. The driving power of the unconscious may be said to determine the outer or bodily appearance, and the palmist sees this force making itself apparent in the hands, as the phrenologist sees it in the configurations of the skull.

A neurotic or nervous temperament is generally reflected in a small dry hand, either long and triangular in shape or with distorted contours. The palm will be very lined, as will the thin, pointed fingers, and the Heart Line will be fragmented. A person with this temperament will tend to change occupations frequently, and to be emotionally clinging, but capricious in love relationships. He or she is likely to encounter tragedy of some kind, and to terminate marriage by divorce.

A person with a bilious temperament generally possesses a rectangular or square hand that is thin, firm, muscular and warm, with yellowish skin. The lines are clearly marked and brown in tint, the fingers are long and spatulate and the thumb big. The Head Line will be straight. The individual concerned will have a tendency to gastric

The overall shape of the hands is believed to indicate the basic disposition of the person concerned ***Below, left to right*** **An intuitive hand; an intellectual hand; a practical hand; a sensitive hand**



Besides the lines on the hands, the fingers and nails can be analysed, and the nails are thought particularly significant for physical health *Right* Diagrams from Cheiro's *Language of the Hand*, showing types of illness associated with various types of finger-nail

troubles. Intelligent and enterprising, he will probably be successful although he is likely to encounter setbacks. Audacious, he will be impetuous or crude in love relationships. He will dislike discipline, and is likely to marry for money rather than love. Nevertheless, this temperament is associated with a reasonable and just nature.

A hand that is large and short, 'sticky', red and hairy with a firm Mount of Venus, indicates a sanguine temperament. The thumb will be short and the hand will show not very numerous deep red lines. A person with this type of hand will be impulsive, unreflecting and active in many ways, but will tend to be superficial in all undertakings. Optimistic and happy-go-lucky, he will enjoy life. Although someone of this disposition may frequently lose his temper with his marriage partner and children, he is very forgiving. Vain and easily taken in by flatterers, he enjoys public acclaim. He may suffer from circulatory and cardiac illnesses.

Knowing the Future

An individual with a lymphatic temperament will have long, soft white hands with short fingers, the joints of which are somewhat dislocated, and large nails. There will be few lines, but those that there are will be well marked if pale. There may be red spots on the back of the hand. Cold, calm, patient and persevering, this kind of person has a gift for organization and will make steady progress in life. He will face difficulty and danger calmly, although he dislikes fighting and quarrels, preferring the good things of life. Dogmatic so far as religion is concerned, he rarely seeks divorce.

The hands of a young person will reveal the direction his life is likely to take, and will also indicate future choices and difficulties. Generally the left hand is thought to indicate an individual's hereditary disposition, while the right hand is said to show what choices will be made, and what defeats and successes lie ahead, although some palmists do not admit this division of information between the two hands.

By studying his hands, a young person may be guided to choose a suitable profession. As a result of learning about his character traits, his predilections, propensities and strong and weak points, he is able to orientate himself in a positive way towards family, partners and society; such knowledge gained from the hands is invaluable. Understanding the nature, force and durability of his passions can help him in choosing a wife, and foreknowledge of financial success or poverty enables him to face the future thankfully or bravely as the case may be.

For the mature man or woman the past can be reviewed by means of the hands, and errors investigated, understood and forgiven. The present can be illuminated, and if it is found to be unsatisfactory changes may be indicated that will lay the foundations for a more promising future. The opportunity to profit by past mistakes, and to perfect the character, is always there.

In old age studying the hands can recall past memories; thanks can be offered for dangers past, hurdles overcome and successes gained. The hand should reveal depths, serenity and an ever-expanding vision of the wholeness of life, of that which is the Eternal.

In France in the 19th century, Mme Adèle Moreau translated the wisdom of palmistry onto a set of decorative and instructive cards. Such a debased method of telling the future was frankly called a game and was not intended to rival the art of chiromancy. The game can still be bought from many tobacconists in Paris, and the book that is sold with Mme Moreau's cards is a worthwhile addition to the large body of literature on palmistry, as it contains many hints on the correspondences between the configurations of the hand and other occult systems.

Significant Handshake

A palmist will start interpreting the characteristics of a client's hand almost from the moment that they first meet. To start with, he notices what kind of hand he, or more usually she, possesses, and what kind of handshake they exchange. Is the hand firm and friendly, or is it weak or flabby? The first key to the client's personality is there, indicating that she is strong or weak, nervous or assured, pampered or hardworking.

Having made these observations, the palmist holds the consultant's hands in his, and studies their shape. If they are long, a gift for detail and deliberation is indicated, while if they are small she is likely to be

1st June 96

Facing page Diagrams from Cheiro's *Language of the Hand* showing (*top left*) the hand of a suicide; the steeply sloping head line is said to indicate a person who might kill himself on impulse *Top right* The palm of a convicted murderer has a head line that 'takes possession' of the heart line, masking all generous impulses or kind thoughts *Below left* People with 'psychic' hands are said to be visionary and idealistic: impression of Annie Besant's hand; *Below right:* Sarah Bernhardt's hand; the star on the mount of the sun, connected with the line of the sun, denotes fame and celebrity *Centre* Lines are deeply marked at birth: impression of a baby's hand, taken 24 hours after he was born *Right* 16th century palmistry consultation

intuitive and impetuous. But if the client constantly withdraws her hands and gesticulates gracefully, it means that she will be successful at social gatherings; but if her gestures are violent she is likely to be aggressive and highly strung.

A woman who clenches her hands is a restless, frustrated but self-reliant and dynamic person. If she has a way of extending her little finger elegantly, this is a sign that she is moody. If she flutters her hands she is most probably feather-brained and anxious; if she twists and wrings them she is quick to make decisions, but always nervous. If her hands remain relaxed she is a confident and practical person with many interests, but she may be a little childlike or over-trusting.

The woman who unconsciously tries to conceal her hands, or the man who plunges his deep into his pockets, both have secrets to conceal; they may be extremely shrewd about money matters and are likely to change their views on life frequently.

Sign of Strength

The way the client holds her fingers is another key to her character. Close together suggests a leader or a career woman, while someone who holds them slightly apart is primarily a good friend, and has a trusting nature. Unconventional or extravagant people spread their fingers wide, while those whose hands are held in a claw-like position are avaricious and untrustworthy.

The basic character is revealed in the left hand, on which the inherited pattern is shown. (Although palmists have debated whether the order of inspection should be reversed if the client is left-handed, no final decision has been reached.) A series of small lines and chains on the Life Line tells of physical weakness, but may also indicate a varied, nomadic or unstable background. A double line gives added strength to the one that is duplicated. Triple lines are rare, but when they occur they can indicate genius, passion, fame and riches; but if surrounding lines or marks show counter-indications, deceitfulness or obsessional sexuality is likely. A meandering line suggests that the client lacks a clear goal in life, or that she may be the victim of troublesome minor illnesses or worries.

The way in which the Life Line terminates is significant. A forked terminal may mean feebleness in old age, which is to be expected, but it may also indicate lack of security because of improvidence in earlier years. If it ends with many tiny lines, financial loss or some other kind of tragedy may be forecast.

However the depressing future foretold by these indications may be mitigated if the client deliberately strengthens herself both physically and mentally. Her success in doing this will be reflected in the ever-changing configurations on her right hand. Regular inspection will show that once practical steps have been taken towards improvement, harmful lines and marks, or distorted mounts, will disappear completely or be modified.

Once the palmist has interpreted the innate qualities and tendencies shown in his client's left hand, he will read the right one, making comparisons with the other from time to time. He will see whether the right hand shows modifications for better or worse, and give advice as to what kind of action his client should take.

The Seal of God

Plain hands showing scarcely any marks are rare, but do occur occasionally. What can be a strange and alarming blankness to the person concerned does not indicate death, life in a mental hospital, or an isolated existence. Nor does it mean that she is without significance. I have in fact seen a hand like this, and know that the owner led a long and fruitful life although she was physically handicapped from birth.

The Bible contains many references to hands. God is said to have shaped man from the dust of the earth with his hands. Adam put forth his hand to take the fruit of the Tree of the Knowledge of Good and Evil, and Cain turned his hand against every man. It is said that God 'seals up the hand of every man, that all men may know his work' (Job 37.7) and of wisdom that 'Long life is in her right hand; and in her left hand are riches and honour' (Proverbs 3.16). David cried to Saul: '. . . why does my lord pursue after his servant? For what have I done? What guilt is on my hands?' (I Samuel 26.18). The third angel of the Apocalypse cried: '. . . If anyone worships the beast and its image, and receives a mark on his forehead or on his hand . . .' (Revelation 14.9).

The prophets ascribed the signs on hands to the imprint of God, placed there so that men could learn to understand themselves and recognize their destiny as God's instruments for establishing the kingdom of heaven on earth. This could mean that the powers of destruction, atomic or otherwise, will not prevail. God has set his seal upon men's hands and because they have been marked or destined by him good must triumph in the end.

FURTHER READING: The classic work on palmistry is *Cheiro's Language of the Hand* (Arco Books, 1968 reprint). See also M. Anderson's *Palmistry* (Weiser, 1980).

The goat-footed deity of the Arcadians, Pan was said to wander through woodland glades accompanied by dancing nymphs; a shepherd god, he was also credited with the ability to cause sudden terror among both herds and men

PAN

PERHAPS the most appealing introduction to the worship of Pan, the strange deity of the Greek countryside, is the Homeric Hymn to the god. It is imbued with an idyllic charm, a joyful salute to the folklore god of flocks and herds, whose old home was in remote Peloponnesian Arcadia, surrounded by mountains.

The poet begins by appealing to the Muse to tell him about Pan, son of Hermes, with his goat's feet and his two horns, a lover of noise. This strikes a traditional note at once for, although genealogies vary, Hermes and Pan were both shepherd gods of Arcadia. The god, continues the poem, wanders through the woodland glades with dancing nymphs who tread the sheer hill crests, invoking Pan, the long-haired and shaggy deity whose haunts are the snowy ridges, mountain peaks and rocky ways. He goes through dense thickets, now drawn to gentle streams, now climbing up to the topmost peak from which the flocks can be watched. Often too he darts across the mountain slopes as a keen-eyed hunter.

The Arcadians themselves were famous as hunters and it was natural for their goat-footed god to represent an occupation that was so familiar to his worshippers. It was also natural for them to describe the herdsman god as playing his pipes in the evening when the sport was over, vying with bird songs. At times the clear-toned mountain nymphs are with the god, moving nimbly, and singing their songs, that echo around the mountain top, by a spring of dark water, while Pan joins in the dancing. He wears a lynx-pelt on his back as he delights in the songs in a soft meadow, where the crocus and the fragrant hyacinth are mingled with the grass.

This passage is reminiscent of a choral ode from the *Helen* of Euripides (translated by Richmond Lattimore):

> I was down by the shining blue
> water, and on the curl of the grass
> there in the golden glare of the sun
> laid out the coloured wash
> in the bed of the young rushes
> to dry. There I heard my lady
> and the pitiful sound as she cried out,
> the voice of sorrow, lament without lyres,
> a sharp voice of pain, of mourning
> as cries aloud for grief some nymph,
> a naiad, caught
> in the hills for all her flight, gives voice
> to pain, as under the rock hollows
> she cries out
> on Pan and his captured marriage.

The next part of the Homeric Hymn goes on to describe how the nymphs sing of the birth of Pan, of how Hermes, the swift messenger of all the gods, came to Arcadia, land of many springs and mother of flocks, to the land where his sacred place is as god of Cyllene. There he fell in love with Dryope, the daughter of Dryops, son of Arcas. Dryope bore him a son, a son who was a marvel to look upon from the time of his birth, with his goat's feet and his two horns and his noisy, merry laughter. But when the nursing

C. M. Dixon/British Museum

Originally the god of shepherds and hunters in Arcadia, Pan haunted woodland glades and thickets, and was the lover of nymphs: according to the Homeric Hymn in his honour, he was dear to Dionysus, the god of orgiastic release ***Above*** **Roman relief showing the return of Dionysus from the East; Pan is near the centre: Pashley sarcophagus, 2nd century AD** ***Left*** **Shepherds listen to Pan playing his pipes: 16th century dish from Siena**

mother looked upon his uncouth, bearded face she sprang up and fled in fear, abandoning her child.

Then Hermes took his son in his arms and there was boundless joy in his heart. Carrying him closely wrapped up in the skins of mountain hares, he went swiftly to the abodes of the immortal gods. (The hare, by the way, is a symbol of Pan on some ancient coins.) He set the child down beside Zeus and showed him to the other gods. They were delighted, Dionysus especially; and because the child gave them all such pleasure, they called him Pan which, according to the Homeric Hymn, is derived from the Greek word for 'all', *pas*. This derivation is also given by Plato; and it has further been suggested that the Orphic identification of Pan with the cosmos, 'the all', must have been caused by this particular piece of etymology.

'Panic' Terror

Pan had no part in the old traditional Olympian pantheon, and in the 5th century BC Herodotus spoke of him as one of the more recent Hellenic deities. No doubt he had been revered in the fastnesses of his native Arcadia long before his name and cult spread to other parts of Greece.

Pan was certainly a late arrival in Athens, where he was worshipped in a cave under the Acropolis, perhaps because he was supposed to have helped the Athenians at Marathon by casting 'panic' terror into the Persian ranks. Certainly Pan could cause sudden panic among herds, when the animals, seized inexplicably by fright, would rush away; and panic among armies was also thought to be clearly the work of Pan, as the name bears witness.

Herodotus tells how the fast runner, Pheidippides, was sent off to Sparta before the battle of Marathon. On the way he was accosted by Pan, who addressed him by name and bade him ask the Athenians why they neglected him when he was so kindly disposed towards them, had often helped them in the past and would do so again in the future. As soon as they could turn their minds to such matters the Athenians therefore set up a shrine to Pan under the Acropolis and established in his honour yearly sacrifices and a torch race.

Creation

Pandora

In Greek mythology, the first woman, created by Zeus to punish men after Prometheus had brought them the gift of fire; she opened the great jar or box in which all evils had been confined, so letting them loose to plague the world; her name, which means 'All-giving', suggests that she was originally an earth goddess. See PROMETHEUS; WOMAN.

Pantheism

From Greek *pan*, 'all', and *theos*, 'god', the belief that all is God and God is All, the sum total of everything that exists; it implies that the apparent diversity of the universe conceals a unity, which is God, the Absolute, or the One; it also implies that evil, suffering, change, limit, are as much parts or aspects of God or the One as good, immutability, infinity, eternity.

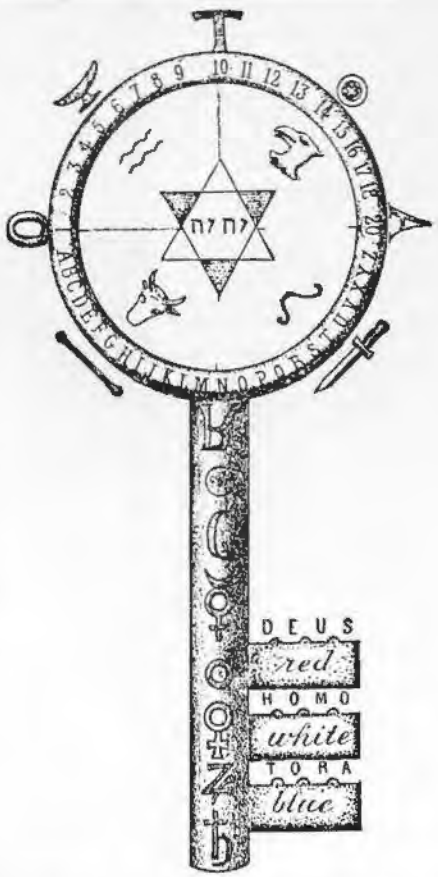
A French doctor with a passion for occultism, 'Papus' was the influential author of a number of books on the Cabala, the Tarot and astrology

PAPUS

DR GÉRARD ENCAUSSE, better known as 'Papus', was the virtual creator of the widespread popular interest in occultism that emerged in France during the late 1880s. It is noteworthy that this coincided with the period, roughly between 1884 and 1891, when Mme Blavatsky and the Theosophical Society were attracting a large and enthusiastic following in Britain (see BLAVATSKY; THEOSOPHY). The Theosophical movement had its devoted supporters in France, but never on the same scale as in English-speaking territories. The Society was organized on an international scale, while the new occultist movement in France was specifically French.

In the past the French, like the British and to a lesser extent the Germans, had interested themselves in mesmerism, phrenology and above all Spiritualism. Papus and his followers gave occultism a broader dimension by providing a literature that dealt with such subjects as the Cabala, the Tarot and astrology.

Encausse, who wrote under the pseudonym Papus – his actual identity was never a secret – was a prolific author, a tireless lecturer, and a publicist and popularizer rather than a mystic in the traditional sense. He was not a 'commercial' occultist, although his books may have produced a fair income. He was a successful physician, although his preoccupation with occultism, which almost amounted to a mania, may have been to his financial detriment.



Frontispiece to Papus's *The Tarot of the Bohemians*: published in 1889, this book influenced many subsequent writers on the Tarot

Gérard Encausse was born in Spain in 1865 of a Spanish mother and a French father, a chemist. The family returned to Paris in 1869 and the boy was educated there. He started his medical studies in 1882 but long before he qualified was spending much of his time at the Bibliothèque Nationale where he studied magical and alchemical literature.

He was an early member of the French section of the Theosophical Society, which was founded when Mme Blavatsky visited Paris in 1884–5, but he soon resigned because he disliked the emphasis on Eastern occult teachings. Very few of the new generation of French occultists who appeared on the scene a decade after the death of Eliphas Levi (see LEVI) in 1875 ever did more than flirt with Theosophy. These young men, led by Encausse and his friend Stanislas de Guaita (1861–97) were above all students of the Cabala and posthumous disciples of Levi. Because Levi claimed to have discovered a cabalistic correspondence between the 22 letters of the Hebrew alphabet and the 22 Major Trumps in the Tarot pack, the supposed esoteric significance of the Tarot fascinated them (see PATHS; TAROT).

The year 1888 is not without its importance in modern occultism. As 'Papus', Encausse published the first edition of his *Traité élémentaire de science occulte*, a work of popularization which had an enormous success in France and was subsequently translated into English, German, Spanish, Russian and Czech. In October 1888 he founded the monthly journal *L'Initiation* in collaboration with Stanislas de Guaita and well-known literary figures such as Joséphin Péladan, Catulle Mendès and Villiers de l'Isle Adam. All this coincided with the establishment in the same year of de Guaita's Cabalistic Rosicrucian Order with a Supreme Council of Twelve.

Oswald Wirth, later a well-known writer on esoteric Freemasonry and the Tarot, recalled that 'having nothing to govern, the Supreme Council remained in a state of expectant inertia'. Papus founded the Independent Group for Esoteric Studies, which soon attracted a membership of several hundreds, and became the main source of recruitment for de Guaita's Order.

Whatever Papus and his contemporaries knew about the Tarot was derived from stray hints in Eliphas Levi's books. However, Levi had never published a Tarot manual, and Papus filled the gap in 1889 with his famous *Le Tarot des Bohémiens*, which was to influence dozens of subsequent writers on the subject. His monumental *Traité méthodique de science occulte* (1891) contains an excellent review of contemporary ideas about occultism in France.

In about 1891 he took over the direction of the Martinist Order, which had been founded in 1887 by Henri Delaage, an obscure occultist. Its title refers to Louis Claude de Saint-Martin (1743–1803), the 'Unknown Philosopher', who is still revered as an esoteric teacher by French occultists (see MARTINISTS).

Gave Away Masonic Secrets

The Order, which rapidly recruited a very large membership under Encausse's energetic leadership, became pseudo-Masonic. His efforts to establish an official connection with regular French Freemasonry were frustrated. He then contrived a link with the spurious Masonic Order of Memphis and Misraim and converted his Martinist Lodges into unofficial bodies for the indiscriminate communication of Masonic secrets to members of both sexes, and for the study of Masonic rituals, symholism and history.

By about 1912 the Order had close ties with Theodor Reuss's Ordo Templi Orientis (Order of the Temple of the Orient). Aleister Crowley (see CROWLEY) was head of the British section.

Encausse took longer than usual to qualify as a doctor because of his many other interests. However, when he finally presented his thesis for the degree of doctor of medicine in the University of Paris in 1894 the examining professor said to him: 'Monsieur Encausse, you are no ordinary student. You have written books, under your own name or under a pseudonym, which have made you famous.'

Encausse was a successful, although by orthodox standards, unconventional physician. There are well-attested stories about his uncanny diagnostic powers, which appear to have owed more to clairvoyance than to normal medical knowledge. It was typical of him that he should have been a loyal friend and supporter of the famous Nizier Philippe, the Lyons 'healer' and miracle-worker. The latter undoubtedly possessed extraordinary abilities but was nevertheless prosecuted upon a number of occasions for illegal medical practice.

Encausse's fame, both as an occultist and a physician, reached Russia, which he visited three times between 1900 and 1906. He was on terms of intimate friendship with the Tsar and Tsarina, both of whom had a penchant for occultism. There were rumours that he had a malignant influence upon the Tsar and his wife but these do not appear to have any foundation.

Encausse served with distinction in the French army medical corps during the First World War and died at the age of 51, of a pulmonary infection, on 25 October 1916. During his comparatively short career, which spanned a period of only 30 years, he helped hundreds and thousands of Frenchmen to acquire at least a superficial knowledge of various aspects of occultism. In relation to the contemporary intellectual scene Encausse was essentially an 'underground' figure. Nevertheless, in relation to the social history of modern occultism, which has yet to be investigated by academic historians, he is of major importance.

ELLIC HOWE

The eternal outsider, detested by the orthodox physicians of his time, Paracelsus has since been recognized as the 'first modern medical scientist'; he was also a mystic whose writings and personality have fascinated generations of occultists

PARACELSUS

Portrait of Paracelsus: his unorthodox views and his egotistical and tetchy personality infuriated the medical establishment of his time

PHYSICIAN AND PHILOSOPHER, and traditionally an initiate and magus, Paracelsus is one of the most controversial figures of the first half of the 16th century. Born at Einsiedeln, Switzerland, in 1493, his full name was Phillipus Aureolus Theophrastus Bombastus von Hohenheim. The extent to which his enigmatic personality has intrigued medical and cultural historians is reflected by the vast literature about him that has been published during the past 40 years. However, there are two contrasting views of Paracelsus, those of scholars, and those of recent generations of occultists.

His father, Wilhelm Bombast von Hohenheim, studied medicine at Tübingen in Germany, and then moved from Einsiedeln, where he practised medicine, to Villach in Carinthia, Austria. It was there that Paracelsus spent his boyhood.

Nothing definite is known about Paracelsus's early medical training, but he may have received his doctorate at the famous medical school at Ferrara in northern Italy in about 1515. The young physician then began the extraordinary journey that lasted, almost without interruption, until his death at the age of 48. His early wanderings, which continued for about ten years, took him successively to Rome, Naples, Sicily, southern Spain and Portugal, Paris and London, which he is supposed to have visited briefly in 1519. He then travelled to Stockholm, Moscow and Greece. Paracelsus eventually arrived at Salzburg in 1524, was for a short time at Strasbourg, and then accepted an appointment as town physician and Professor of Medicine at Basle in 1526.

His connection with this city was fortuitous. There had been talk of his unusual skill as a physician, and he was summoned there to treat the famous scholar-printer Johannes Frobenius, whose right leg was gangrenous. The local doctors could only suggest amputation but Paracelsus was able to save the limb.

He arrived at Basle with a reputation for great medical ability, unorthodox views and a tetchy personality. He at once met with opposition from the local apothecaries, whose scientific knowledge was at best primitive, and from the town's medical establishment, whose members were as conservative as Paracelsus was unorthodox. The atmosphere was not improved when Paracelsus circulated a printed leaflet in which he announced that he would lecture for two hours daily – not, he advertised, on the basis of out-of-date authorities, but on that of his own experience.

Medicine from the Stars

He promised yet another innovation, namely lectures on surgery. Until then this had been the exclusive province of self-taught barber-surgeons who had no proper medical training. The fact that he lectured in German instead of Latin was yet another novelty that infuriated conservative opinion. Paracelsus was giving a new and revolutionary dimension to medical teaching and vested interests were united in their

Paracelsus regarded medicine as an art based on four foundations: a philosophical approach, medical astrology, alchemy, and the moral and personal purity of the physician. 16th century German medal

dislike of both the man and his methods. To make matters worse he never hesitated to show his contempt for his opponents.

After only 11 months at Basle, he was obliged to leave in a hurry and went to Alsace. This was the beginning of the second stage of his strange career as an itinerant physician. Indeed, during the following 13 years until his death in 1541 he settled briefly in at least 62 different places in Germany and Austria.

He wrote incessantly, although few of his major works were published during his lifetime. Of the 24 publications printed between 1529 and 1541 no fewer than 16 were astrological 'prognostications'. However, he was not an astrological prophet in the usual sense, since he was concerned mainly with astrological medicine and the possible relationships between weather and climate and human illnesses.

A well-known passage from his *Paragranum*, written after he left Basle, illustrates his contempt for his fellow-practitioners and their archaic methods: 'Avicenna, Galen, Rhasis, Montagnana, and all the rest of you, after me and not I after you! You people from Paris, Montpellier, Swabia, Meissen,' and half a dozen other places, 'after me and not I after you! Even in the most distant corner there will not be one of you on whom the dogs will not piss. But I will be the king and mine the kingdom . . .'

Jolande Jacobi remarked with good reason in her *Paracelsus: Selected Writings* (1951) that he 'is today celebrated as the first modern medical scientist, as the precursor of microchemistry, antisepsis, modern wound surgery, homoeopathy, and a number of other ultra-modern achievements.'

Paracelsus was above all a physician; he had trained in many schools and his opinions were formed through experience in many countries. He regarded medicine as an art based on four important foundations: a philosophical approach, astronomy (meaning medical astrology), alchemy (as a servant

of medicine rather than in the sense of the attempt to change base metals into gold) and the personal and moral purity of the physician himself. Furthermore, he believed that a man should study medicine and become a physician only if he felt a genuine vocation for the work and its demands.

Practical Mystic

Most important of all was his view that Nature heals and that the physician can only assist the course of Nature. Therefore he must know the correct ways of helping and be able to avoid the wrong ones.

Although there is an enormous amount of information in Paracelsus's books his style is often so involved and obscure as to be almost incomprehensible. This applies particularly to his non-medical works such as *De Occulta Philosophia* and *Archidoxis Magica*, hermetic writings to which, as Jolande Jacobi remarks, we have lost the key. There were two sides to Paracelsus's character: the practical physician who was a highly-trained observer, and the mystic who trod paths that are excessively difficult for most people to follow.

Paracelsus wrote the first comprehensive work on the causes, symptoms, diagnosis and therapy of syphilis. He proposed that epileptics should be considered as sick persons and not lunatics possessed by demons. He studied bronchial illnesses in mining districts and was one of the first people to recognize the connection between an industrial environment and certain types of disease. His range of interests was impressively wide. He concerned himself with such subjects as the curative effects of natural baths, pharmacy, the beneficial effects of plenty of light and fresh air in the sick room, and the necessity for physicians to learn surgical techniques and replace the unskilled barber-surgeons. Curiously enough he had little interest in anatomy; this involved the dissection of corpses while he himself was primarily concerned with living human beings.

During his lifetime Paracelsus was the eternal outsider, a stormy petrel who was detested or ignored by the conservative. Nevertheless, he must already have been to some extent a legendary personality when he died in poverty at Salzburg on 24 September 1541; nothing else would explain the fact that his manuscripts were still being printed long after his death, some as late as 1618.

There is a recent tradition in occultist circles, and particularly in German-speaking countries, that there is still a place for 'Paracelsian' medicine. This takes the form of certain homoeopathic concoctions which probably owe little or nothing to Paracelsus.

ELLIC HOWE

PARADISE

A good place, blessed and happy, heaven is the final beatitude, the ultimate goal

The Avalon of Arthurian legend, the Greek Elysian Fields and the Norse Valhalla are all concepts of paradise; in Christianity heaven is 'the eternal, blissful abode of all those among the dead whose lives have earned such reward . . .'

HAPPINESS was associated with enclosures rather than open spaces in the ancient Middle East, for deserts and hills, the wind and the sun, were generally too harsh to man. When he thought of a pleasant place, he thought of an oasis or garden, where he could relax in the shade with ample water and fruit. Given the resources, he might create such a place for himself.

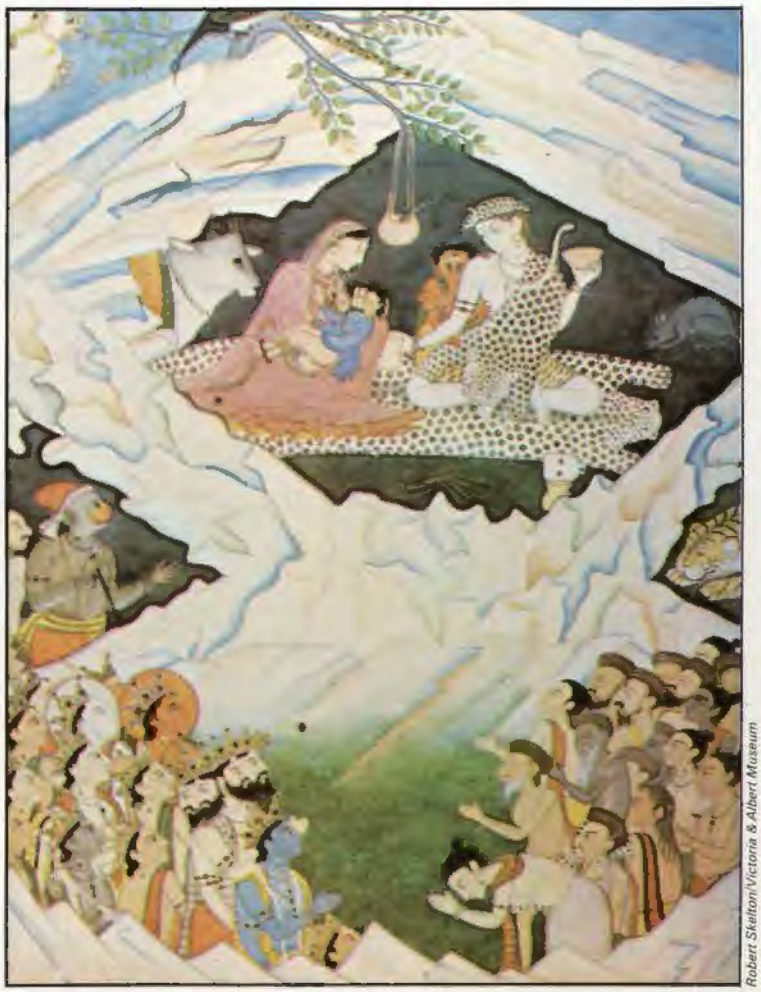
The word 'paradise' is of Old Persian origin. It means an enclosure, and especially a royal park or hunting ground, a piece of land made more agreeable than its surroundings by cultivation. The Greek translators of the Old Testament, about the middle of the 3rd century BC, employed the word once or twice in that sense, for example in Ecclesiastes 2.5: 'I made myself gardens and parks, and I planted in them all kinds of fruit trees.' But their most momentous use of it was in referring to the garden of Eden, the divinely appointed home of Adam.

This appears in Genesis, chapter 2. After creating the world, God plants the garden 'in Eden, in the east'. He places Adam in it and creates the first woman, Eve. The name 'Eden' may be Babylonian. Among the luscious vegetation, God's garden contains the Tree of Life, and the Tree of the Knowledge of Good and Evil. A river flows through it and splits up into four streams.

Michael Holford/Victoria & Albert Museum

Right **In its Mahayana form Buddhism has a graded series of paradises though, because man's ultimate achievement is release from the bondage of personality, existence in these heavens is not regarded as an ultimate goal: the exception, in Chinese and Japenese Buddhism, is the 'Pure Land' or paradise established by the Buddha Amida, where existence is devoid of pain, sadness, hunger or anxiety. 18th century miniature**

Following page **The garden of Eden, the earthly paradise of Adam and Eve, is partly paralleled in non-Hebrew mythologies; the belief in some kind of definite 'otherwhere' or 'otherworld', and legends of a time when human beings were carefree and innocent both connect other paradises with this one: garden of Eden, by Jan Breughel; in the Victoria & Albert Museum**



Robert Skelton/Victoria & Albert Museum

Robert Skelton/Victoria & Albert Museum

Life in this earthly paradise is instinctively innocent, with the Lord as a close companion. It is no lazy idyll: Adam must till and keep the garden, with Eve's aid. God forbids them to eat of the Tree of Knowledge. When they disobey, they are expelled. The reason given (Genesis, chapter 3) is that if they stayed, they might eat the fruit of the Tree of Life also, and live for ever. This would have been permissible before; now it is not. Henceforth men must drudge to live. Women must be subject to male dominance and bear children in pain. Meanwhile the garden goes on existing but an armed angel at the gate keeps fallen humanity out.

While the Judaeo-Christian Fall of Man (see FIRST MAN) is in some ways unique, the garden has partial parallels in non-Hebrew mythologies. Two motifs, in particular, connect other 'paradises' with this one. First, Genesis gives the Hebrew version of a widespread idea – the idea of a definite place, an 'otherwhere' or even an 'otherworld', which is part of the universe we know, yet different in quality from the part we live in: a good place, blessed and happy.

Second, Genesis directs attention to the many legends of a lost Golden Age. Long ago, human beings were carefree and guiltless. They were immortal, or at any rate felt no reason to fear death. They lived without sickness in a kindly climate, and never had to work hard. Gods dwelt familiarly among them. For whatever reason, the Golden Age is no more. The gods have withdrawn. Death and disease and wickedness have poisoned life.

But in some mythologies the two themes converge; the paradisal good place not only exists, it is a fragment of the golden world that remains inviolate. If we could reach it we could still find there the delights and divine companionship of the Golden Age.

In classical myth, the Golden Age was the epoch when the Titan Cronus, or Saturn, was supreme god (see CRONUS; TIME). After his son Zeus ousted him, the world declined. But Cronus went on reigning in exile, in the regions of sunset. There, for the Greeks, was the 'good place', out over the Atlantic behind a barrier of water. There lay the Isles of the Blest where, in Hesiod's words, 'the bounteous earth beareth honey-sweet fruit fresh thrice a year'. There lay the plain of Elysium 'at the world's end' where, according to Homer, 'living is made easiest for mankind, no snow falls, no strong winds blow and there is never any rain'.

Celtic myth looked in the same direction. The Isle of Avalon (before its re-location at Glastonbury) was a warm western Elysium, sometimes described in language borrowed from classical literature. Irish seafaring romances, such as *The Voyage of Bran* tell of an enchanted archipelago beyond the horizon, including an Island of the Blest which is larger in extent than Erin itself, a place 'without grief, without sorrow, without death'.

Medieval Irish legend drew the pagan and Christian paradises together. The usual Christian belief was that the earthly paradise of Genesis was in a remote part of Asia. Some Irish Christians, however, located it in one of their own legendary lands beyond the Atlantic, and gave it a Celtic atmosphere. The greatest of all their voyage-romances tells how St Brendan sailed in quest of it, and finally arrived on its borders. The author of *St Brendan's Voyage* probably knew that the world is round, and he may have harmonized his fancies with orthodoxy by imagining that Brendan reached Asia by sailing west (see BRENDAN).

Paradise and Heaven

Adam's lost abode remains, humanly speaking, empty. Other paradises are variously peopled. The Golden Age dream of freedom from the curse of death is recurrent. The citizens of paradise are, as a rule, immortals. In the Babylonian epic of Gilgamesh, the hero, grief-stricken at human evanescence, goes to an island-otherworld expressly for the secret of immortality. He meets Utnapishtim, the chief survivor of the flood, who is indeed exempt from death. But Gilgamesh achieves nothing by his visit.

In more familiar mythologies, such places as Elysium are likely to be the homes of gods, demigods or fairy-folk, all undying. When human beings do enter, we hear (in the oldest stories) of only a chosen few transported there while alive, and endowed with immortality as a special gift. Homer names Menelaus, husband of Helen of Troy. A better known instance is King Arthur who is said to have gone to Avalon after his last battle, and to be still living there (see ARTHUR; GLASTONBURY).

Classical Greece carried the idea a step

Life in the earthly paradise of the garden of Eden was instinctively innocent, with the Lord as a close companion

Facing page Regions above the clouds are allotted to the various gods of Hinduism; gained by a combination of correct morality and correct ritual, these celestial realms are 'consolation prizes' not the ultimate reward, and although a soul may dwell in them for aeons it must leave eventually to continue its pilgrimage in this world; Mt Kailasa (*far left*) one of the mountains of paradise, is Shiva's heaven, and Vaikuntha (*left*) is the paradise of Vishnu *Right* According to Islam, every Moslem will eventually reach a heaven, and no infidel will: the Koran promises the faithful a paradise of gardens, rivers and shady trees; men who go there will enjoy unlimited food and wine, and virtually unlimited harems: 15th century painting depicting the prophet Mohammed's ascension to heaven

farther. Pindar describes the Isles of the Blest as inhabited by a select few of the noble dead, with Cronus as their king. Here the Blest have actually died; the Golden Age motif, though still present in the person of Cronus, has receded somewhat; the Elysian realm is becoming a sort of heaven.

Within the mainstream of Greek religion, this idea remained tentative. But farther afield, similar beliefs are asserted with more conviction. Sometimes the good place, the 'otherwhere', has little or no explicit Golden Age aura and is more essentially a home of the dead. Where admission is a reward of virtue we approach the concept of heaven in its full Judaeo-Christian meaning: the eternal, blissful abode of all those among the dead whose lives have earned such a reward and of no others; the final beatitude; the ultimate goal.

The approach, however, is by degrees. At the more naive mythical levels, the good place may be simply the place of the dead in general. Everybody goes there, to an improved version of earthly life. The spirit realm of the Tumbuka, in Malawi, is an underworld where the departed are always young and never hungry or sad. Such beliefs occur also in New Guinea and New Caledonia. Some American Indians, the Ojibways and Choctaws for example, have kindred hopes about the region of sunset, or a happy hunting-ground in some secret country. These places are paradises and the homes of the dead, but scarcely heavens, because they are not selective. The goodness of the good place is not a reward.

When selectivity does come in, it may still not take an ethical form. Admission may depend upon social rank. In the Leeward Islands in the Caribbean, aristocratic spirits go to 'sweet-scented Rohutu' and commoners go to 'foul-scented Rohutu'. In Peru, the mansions of the sun were reserved for the Incas and their nobles. Even when conduct is a passport, and the good place has to be earned, the demands are not always moral. Entry may depend on having performed a ritual, or gone through an initiation.

The motif of achieving the good place for one's afterlife through merit appears crudely in the Norse Valhalla, which was reached by martial prowess. Further refinement of selectivity accompanies the development of imaginative power, which tends to locate the good place in the sky rather than on earth. Celestial dwellings for the dead are nearly always selective; the wicked and ignoble seldom go upward. In Egypt during the 3rd millennium BC, the pharaohs hoped to join the sun god and attend him on his journeys through space. While this is another instance of privilege through rank, early texts show that the god's attitude to a deceased ruler could depend partly on his virtues. Later, when similar hopes were extended to lesser men, this idea of judgement became more prominent (see BOOK OF THE DEAD; JUDGEMENT OF THE DEAD).

In the ancient Vedic religion of India the monarch of the dead was called Yama, and he reigned in the outer sky, a realm of light, over all the worthy departed. Their life was an enhancement of earthly life (as in most paradises of myth) with music, sexual fulfilment, and many more pleasures of the same type, and with no pain or care.

Hinduism allots regions above the clouds to Indra, Shiva and other deities. Each is a place of beauty and sensual joy, to be gained by a combination of correct ritual and correct morality. Buddhism inherited such schemes from Hinduism. In its advanced Mahayana form it has a graded series of paradises in a vague, non-astronomical sky. Ecstasies become more spiritual as earth is left farther below. The ascent is by way of virtue and holy meditation.

Salvation in the Sky

It is important to grasp that these quasi-heavens of Hinduism and Buddhism still belong to a mythological order of ideas. They are not ultimate, nor are they central to the philosophy of either religion. The goal of the highest quest is not personal happiness, but total release from the bondage of personality — Nirvana (see NIRVANA). The celestial realms, therefore, are mere consolation prizes. They appeal to those whose minds are not ready to transcend personal desire and descriptions of them are poetic, not doctrinal. They are also temporary. The soul may dwell in them for aeons, but if it goes there at all, it has not completed its pilgrimage and must eventually leave. The sole exception is in a popular form of Chinese and Japanese Buddhism, the Pure Land sect (see AMIDA; JAPAN).

Only in the Mediterranean world does the good place acquire dogmatic status as the final reward of all mankind's spiritual strivings, with salvation consisting in its attainment, damnation in its loss. Heaven in this full sense is associated with Hebrew monotheism and ethical seriousness; with Hellenic firmness of outline and appetite for truth.

As long as Greece had no positive doctrine of immortality, and dismissed the dead as shades, Elysium could survive as a fantasy without raising major issues. But from the 6th century BC onward, the mystics of the Orphic cult (see ORPHEUS) were asserting such a doctrine and for those who accepted it, the island-paradise would no longer serve. An abode for the blest on the familiar earth was out of keeping with Orphic ideas, which proclaimed salvation as a release from matter as we know it, and from earthly bondage.

A more exotic home was offered to the right-living initiate. The Orphics adopted the word Elysium and altered its meaning, speaking of 'Elysian Fields' in an underworld of strange brightness, a happy resting-place for pure spirits. But besides this – in Orphism apparently and in later Mystery cults undoubtedly – there was also a disposition to look upward. Gradually the good place was transferred to the sky, as in Asia.

The 'heavens' which the teachers of mystical doctrines drew into their systems were at first simply the upper regions. The prevailing astronomy made them concentric spheres, the spheres of the sun, moon, planets and fixed stars, rotating around the earth. Now, by becoming involved with

Left Elysian Fields of classical Greek mythology as a paradise, a relief by the Renaissance artist Andrea Riccio *Right* The motifs of celestial city and paradise-garden are combined in this painting from a Bulgarian monastery, illustrating Jesus's saying that many will join Abraham, Isaac and Jacob in heaven (Matthew 8.11): St Peter unlocks the gate with a golden key

Sonia Halliday

notions about the soul's ascent, 'heaven' acquired a paradisal and more-than-paradisal sense as well as an astronomical one. The Mysteries (with Egyptian influence from the cult of Osiris) and the gnostic schools of the early Christian era envisaged purified souls as rising. Instructed in the right passwords, the adept eluded the planetary demons of middle space. He soared (by grace of his chosen saviour, such as Mithras) to a superior heaven outside the visible system. Here he lived blissfully with the gods and fellow-initiates, for ever.

Heaven on Earth

Meanwhile, in the contemporary Hebrew world of ideas, two trends had emerged. When most of the Old Testament was composed, Israel's religion had no clear notion of personal immortality. Its only paradise was the lost garden. Heaven, as elsewhere, meant the sky, with the added concept of a pre-eminent heaven beyond, where God sat enthroned among his angels.

Judaism, as it grew after the exile in Babylon, slowly came to adopt a more cheerful outlook. Probably under Zoroastrian influence, it spoke of a future resurrection of the dead, a last judgement, a world to come. No unanimity on these matters was reached, not has it ever been. Rabbinic tradition, however, has usually resisted world-spurning metaphysical speculations. It has its own place, Gan Eden, where the righteous will dwell after the resurrection. Gan Eden is, in effect, Adam's paradise restored. It will be revealed and opened on earth. Its citizens will go there as living people, not shades.

The Greek doctrine of a disembodied existence for souls, between now and the resurrection, never fitted entirely easily into Judaism, which is vague about any celestial heaven; though its teachers and mystics have sometimes spoken of heaven as a vast celestial extension of Gan Eden already in existence. The uncanonical book of Enoch includes a vision of 'resting-places of the righteous' in a realm of angels above the sky. Judaism, today, does teach the soul's immortality. But it has always shown a tendency to keep its feet on the ground, and hope for a future paradise on earth.

In the time of Jesus, such hopes were bound up with apocalyptic and Messianic dreams. The Lord's Anointed would appear, life would be transfigured, the dead would be raised, the earthly Kingdom of God would bring paradise regained . . . for the righteous. Jesus employed apocalyptic language himself, but to convey a message of spiritual revolution: the kingdom, he declared, is 'within you'. This teaching opened the way to a fusion of Hebrew and Hellenic motifs.

For the first Christians, the resurrection of Christ was proof of the coming resurrection of all the dead. When that happened, the Last Judgement would allot them their destinies according to their deserts. The book of Revelation looks ahead not only to the Judgement, but to a material New Jerusalem for the resurrected saints. This, like the Jewish Gan Eden, will be the second paradise; Christ is the second Adam.

But when the resurrection and judgement did not come quickly, a question arose as to what was happening to the dead meanwhile. Christ himself had promised the penitent thief, one of the two criminals who were put to death with him, an immediate paradise (Luke, chapter 23), which must therefore be in existence. In the Christian apocalypse there is already a heaven apart from earth. It is, as ever, the celestial dwelling place of God. The New Jerusalem, when it comes, will come 'down out of heaven'. Until then the souls of the blessed have their heavenly places near God, where, a perfect society, they await final reunion with their bodies.

Christianity compiled its heaven from both Hebraic and Hellenic sources. From Judaism it adopted the region of the sky where God and his angels dwelt. From Greece the Christians took the celestial machinery, the spheres outside one another, the spiritual journeyings. The idea of seven heavens, with the seventh as proverbially the most exalted, is also Greek. Dante's *Paradiso* portrays the souls of the saved appearing in the spheres appropriate to them – those of the sun, moon, planets and stars. The true home of them all, however, is heaven proper, above the cosmic system.

The Place Where God Is

While it carried the concept of heaven to its loftiest heights, Christianity never resolved certain queries. If the souls of the saved went to heaven at once, what would be the point of the future Last Judgement? It could only confirm a destiny already fixed. St Augustine maintained that until the end of the world, spiritual life in heaven was an interim state, a foretaste, an answer which may have owed a debt to a tradition inherited via Judaism from Zoroastrianism.

Nor have Christians agreed about the qualifications for entry. Even baptism is not universally insisted upon, despite the words of Jesus that: '. . . unless one is born of water and the Spirit, he cannot enter the kingdom of God' (John 3.5). Luther dismissed salvation by works in favour of salvation by faith. Calvin (with a curious reversion to the pagan Elysium) taught salvation by arbitrary divine choice. Islam, in its own version of the Judaeo-Christian scheme, distinguished seven heavens and various hells, temporary or permanent; and it made everything depend on faith. Every

C. M. Dixon/Victoria & Albert Museum

In Chinese belief, if the souls of the just were not sent back immediately to a new life on earth they might go to the dwelling place of the Immortals: 18th century porcelain dish showing Shou-Lao, god of long-life, Fu-Hsing, god of happiness and Lu-Hsing, god of salaries, crossing the seas to their Palace of Immortality; originally human beings, they were deified as a result of merit or good fortune

Moslem, however wicked, would get to a paradise of some kind sooner or later, and no infidel would.

What happens in heaven? The paradises of mythology offer ardent, fairly civilized sensual delights, but Islam is the only major religion which does so. The Koran promises the faithful a reward suited to male Arab tastes. Their home will be a sort of splendid oasis – a true 'paradise' in the ancient sense – with gardens, rivers and trees. Men will wear silken robes and lie on couches, with unlimited fruit and wine, and virtually unlimited harems.

With increasing culture, however, Moslem thinkers have joined Jews and Christians in a more abstract opinion. Heaven is the place where God is; so the final happiness is the beatific vision of God, the source of all good, and therefore completely satisfying.

There is no logical flaw in this conception of a Supreme Good from which the soul would never willingly turn away. But in practice it is hard to imagine a convincing heaven, because any perfection that we can specifically think of would pall. The German philosopher Schopenhauer observed that imaginative authors are more successful with hells than with heavens, because their own lives furnish materials for the former, but not the latter.

Copernican astronomy also raised difficulties. Heaven could no longer be simply a good place above the sky. However, its removal from the visible cosmos – from space and time as known to humans – turned out to bring certain advantages. Disengagement from time meant that such problems as tedium were less forbidding. Life in heaven need not be a monotonous going-on-for-ever. It might be something else, beyond present comprehension, but different.

Abstraction had already gone far in the time of William Blake, who denounced as barren the 'allegoric heaven' of the Churches. Progressive thought in and after the 19th century often dismissed it altogether ('pie in the sky' was the classic term of derision) and talked of building a heaven on earth. This, however, could only be figurative.

Aldous Huxley has suggested that paradisal ideas arose from heightened states of consciousness, which can be induced by drugs. On this showing, the religious apparatus is valid, but not literally so. It symbolizes a genuine, transcendent experience, which human beings can rightly pursue.

G. Tomisch

Parchment

Writing material made from the skins of animals, usually sheep or goats; from roughly the 8th to the 14th centuries it replaced papyrus, until itself superseded by paper; recommended in the grimoires as the proper material on which to inscribe magical symbols and talismans; the parchment should be made by the magician himself.

See RITUAL MAGIC.

Fire, as the symbol of the deity, is sacred to the Parsees, whose religion is based on Zoroastrianism; believing that fire and earth should not he defiled, they expose the bodies of their dead to flesh-eating vultures in 'towers of silence'

PARSEES

CONCENTRATED mainly in several towns of western India, in the Bombay region, and also in Pakistan, where they settled in far fewer numbers, Parsees consider themselves to be descendants of small groups of people who emigrated from Persia in the 8th century AD in order to avoid forceful conversion to Islam, and to retain Zoroastrianism, their ancient religion (see ZOROASTRIANISM). The details of their escape from Persia and perilous sea voyage to India are largely legendary. It is believed that they first landed on the island of Diu off the south coast of Kathiawar, and that from there they sailed to Gujarat and obtained the local ruler's permission to settle at a place near Sanjan on the Gujarat coast. The first group of refugees was later joined by others who fled from the increasing oppression and religious intolerance of the first caliphs of the Abbasid family.

From Sanjan, Parsees spread subsequently as settlers and merchants both northwards to places such as Navsari, and southwards to the region of the present Bombay. Wherever they settled they established fire temples and by about 1300 AD there were Parsee colonies in various parts of western India. In the early 14th century Moslem invaders defeated the Hindu overlords of the Parsee of Sanjan, and the latter had to flee once more. After various vicissitudes they settled at Bansda.

Royal and Ancient

It is believed that in the 15th century the Parsee community in India was strengthened by further emigrants from Persia, and that these new arrivals brought about a revival of religious practices abandoned in the Indian environment. At that time there were also conversions of Hindus to the Zoroastrian faith, but in later times such proselytizing activities ceased and the Parsees did not admit any new converts tu their community. The first references to Parsees by Europeans are contained in accounts by Portuguese writers of the 16th century, who mention a class of merchants and shopkeepers of Persian origin living in the towns of western India.

A great opportunity for the Parsee traders came with the establishment of European business enterprises. Some of them entered the service of foreign companies, and others developed trade in Western goods on their own account. Parsees had begun to settle in Bombay under the Portuguese (1530–1666) and several Parsee families attained high positions in the town which ever since, and throughout the period of British rule, has been their main stronghold. The Parsees, more than any other community of Indian traders, were responsible for the development of the trade of Bombay, and particularly the trade connections with China, which Parsee merchants visited as early as 1756. Next to Bombay the port of Surat became an important Parsee centre, and early in the 18th century they also spread along the Malabar coast and some families established themselves in Madras. Less inhibited than Hindus by social and ritual restrictions, the Parsees found it comparatively easy to make contact with Europeans, and they were among the first to adopt a Western style of living without, however, abandoning their religious faith and their cohesion as a distinct community.

Popperfoto

Descendants of small groups of Persians who travelled to India in the 8th century AD to avoid conversion to Islam, the Parsees still retain their own traditions and religious customs, and their own family law which is distinct from that of Hindus and Moslems: a saffron mark symbolizing happiness and the goodwill of the household is placed on the brow of a visitor to a Parsee home

A minor threat to that cohesion had appeared in the 18th century over the matter of calculating the calendar. Because of the long separation between the Parsees of India and the small Zoroastrian community remaining in Persia, a discrepancy had developed in their calendars, and the Parsees were one month behind their co-religionists in Persia in commencing their New Year. For a long time little notice was taken of this fact, but in 1746 a Persian came to Surat and together with a group of Parsee priests introduced the calendar as observed by the Persian Zoroastrians. The members of this group called themselves *Kadmis*, 'ancient', whereas the bulk of the Parsees, who became known as *Shehenshais*, 'royal', stuck to their old dates. A division into two sects arose from this schism over the calendars and at times they engaged in angry disputes and discouraged intermarriage between their members. Later amicable relations were restored, but the main annual festivities are still observed on different dates. The Shehenshai sect greatly outnumbers the Kadmis, but some very prominent families belong to the latter.

When the ancestors of the Parsees first settled in India they spoke Persian, but being a small community they gradually adopted the language of their host country and became speakers of Gujarati. Pahlavi, the language of the Sassanian period of Persia (3rd to 6th centuries AD), was retained as a ritual language but the Pahlavi texts, which the priests had to learn by heart, were no longer fully understood. There are also Zoroastrian texts written in modern Persian and in Gujarati.

The influence of the Indian environment also affected the social organization of the Parsee community. Little is known of its internal government during the centuries following the arrival in India, but by the beginning of the 18th century it was – on the model of a Hindu caste – controlled by a *panchayat*, an assembly of a certain number of leading men. It is believed that a properly constituted panchayat was first formed in Bombay after the islands passed into British hands, when the number of Parsees had begun to increase greatly. The panchayat exercised considerable influence, not only in Bombay but also in several towns of Gujarat where Parsees had settled. As Bombay grew in importance under British rule this city became the Parsee headquarters, and whenever any dissensions or differences of opinion arose the advice of the panchayat was asked for and followed. In religious matters, however, the priests of the small town of Navsari held their own as the supreme authority.

Hindu Influence

Towards the end of the 18th century, the panchayat sought and received confirmation of its power from the British authorities, and in the course of the 19th century it initiated a number of reforms designed to eradicate practices which had grown up in imitation of Hindu and Moslem customs, but which were deemed to conflict with the purity of the Zoroastrian religion.

With the gradual extension of the British legal system to all aspects of Indian life the panchayat became obsolete as a legislative body. In order to codify Parsee customary law relating to marriage and succession, a Parsee Law Commission was instituted, and its findings were incorporated in a number of Acts which were passed by the Legislative Council of India in 1865. With this, the Parsees' status as a separate community with its own family law, distinct from that of Hindus and Moslems, was formally acknowledged.

Although the Parsees have adjusted themselves to some extent to Hindu ways of living, they retained until recent times certain items of dress which set them apart from other communities. Only those who were entirely Westernized abandoned their traditional style of clothing. They conformed to Hindu dietary habits in that they ate neither beef nor pork, but there was no prejudice against the drinking of alcoholic beverages. Like Hindus they regard eating as a religious act, during which the orthodox do not engage in conversation.

Each Man Must Take Sides

The original roots of Zoroastrianism lie in a cultural environment similar to that of Vedic Hinduism, but the character which it assumed in its formative period bears the imprint of its prophet and founder Zarathustra (whom the Greeks called Zoroaster), a priest who lived in eastern Iran sometime between 1000 BC and 600 BC. The Parsees refer to him as Zartusht. He was a reformer who attacked the old Indo-Iranian religion, particularly the practice of cruel animal sacrifices, and advocated a break with the worship of the old gods. Legend tells of his retreat into the mountain fastnesses of Iran, where he strove for enlightenment in a state of ecstatic trance, and saw in a vision Ahura Mazdah, the supreme spirit of good, who is diametrically opposed to Ahriman, the spirit of evil (see AHRIMAN).

A belief in the opposing powers of good and evil, who fight for domination over human beings, reflects the dualistic trend in Zoroastrianism, but already there were certain contradictions in Zarathustra's teaching, and Ahura Mazdah appeared standing in one sense above the contrast between good and evil. The modern Parsees refute the characterization of their religion as dualism and describe their faith as pure monotheism. They are certain of the final victory of good over evil, but each man has to decide where he stands in the struggle between Ahura Mazdah and Ahriman.

The sacred scriptures of the Zoroastrians are known as the *Avesta*, parts of which stem from different times. The original texts were written in Avestan, an extinct language understood by only a few Parsee scholars, while the commentaries were written in Pahlavi. Belief in the existence of the one supreme deity Ahura Mazdah, now usually referred to as Ohrmazd (or Ormuzd) and credited with the creation of the spiritual and material worlds, is a basic element in Parsee doctrine (see OHRMAZD). He is the source of all blessings and good things and Parsees address themselves to him in all their prayers.

Ohrmazd stands at the pinnacle of a hierarchy of celestial beings which consists of seven *Amesha spentas*, 'holy immortals', and 30 *Yazatas*, 'adorable ones'. These divine beings have been compared to archangels and angels, but their status is higher and they are more independent than the angels of Christianity. They are the rulers, fashioners, protectors and preservers of the creation of Ohrmazd, and Parsees make offerings to them and invite them to visit their houses. The 30 Yazatas preside over natural objects and give their names to the days of the month; Zarathustra, alone among human beings, is now regarded as one of them. These celestial beings interact with mankind and it is through their aid that man learns to know Ohrmazd, to dispel demons and to prosper in this world.

The most prominent among them are Mihr (the ancient Iranian god Mithra – see MITHRAS), Srosh and Rashu. They are the judges of the dead, each with a specific function. Mihr administers justice at the heavenly court, and exposes those guilty of having broken a promise. He saves the souls of truthful persons when they come to the Bridge of Judgement, where he and Srosh await the departed. Rashu holds in his hand the golden balance on which he weighs the good and evil deeds of the souls.

Towers of Silence

Distinct from these prominent celestial figures are the hosts of unnamed *fravashis*, guardian spirits who have left the heavenly sphere and chosen to move to the world of humans where they assist men in the fight against evil. The Parsees believe that each man has a guardian spirit, who leaves him at death to return to the company of the fravashis; but he remains a link between living and dead, and is begged to convey offerings to the departed.

Parsees have often been referred to as 'fire worshippers', but they resent this description and point out that though fire is an important element in their cult, it is a symbol of the deity and not an object of worship. As among the Vedic Hindus, fire occupied a central position in all rituals of the ancient Zoroastrians, and it was not always easy to distinguish between the concepts of the fire as such and the divinity presiding over it.

Among the Parsees today fire is held to be sacred, and the so-called 'fire temples' are buildings for the preservation of the sacred fire. In Gujarat they do not differ greatly from the dwelling houses of the wealthier families. Inside they have an outer and an inner hall. In the centre of the latter is a solid stone stool and on this stands an urn of copper, brass or silver, in which burns the sacred fire fed with sandalwood and other kinds of wood.

There are three types of sacred fires. The lowest grade is consecrated fire in a dwelling house or small family temple; this is the hearth fire which a Parsee never allows to die. If he changes his place of residence he carries his fire with him to his new abode. Fires of greater sacredness burn in temples which should be built wherever numbers of Parsee families are living. They are made of fires taken from a priest's house and the houses of three families of other classes, a process of consecration accompanied by the recitation of sacred texts.

The fire of the highest grade burns only in the most important temples, of which there are less than a dozen. At least 16 different fires are needed to prepare this fire, and ceremonies and rites of consecration are complicated and expensive. A sword and maces hang on the wall of the temple, and there is a brass bell which the priest rings at each watch when he performs a ceremony near the sacred fire.

Only priests may enter the sanctuary where the fire is burning, but many devout laymen pay frequent visits to a fire temple, particularly on the four days in the month which are sacred to fire. The worshippers, both men and women, bring offerings of sandalwood and money. In return the priest gives them ashes from the sacred fire, and these they apply to their forehead and eyelashes. Many of the smaller Parsee communities have no temples, but assemble for prayers in the open.

Towers of silence are the most famous sacred buildings of the Parsees; believing that corpses should not defile either earth or fire, they place the bodies of their dead in these structures, where they are exposed to the sun and to flesh-eating vultures

The most famous sacred buildings of the Parsees are the so-called 'towers of silence'; large structures of stone or brick situated on hills and usually surrounded by gardens. In these the bodies of the dead are exposed to the sun and to flesh-eating vultures, for according to Parsee belief corpses should not defile either earth or fire. These roofless towers consist of an outer wall some 300 feet in circumference and a deep pit lined with masonry. Dead bodies are laid on a stone platform which is divided into three rows, the outermost for men, the next for women, and the innermost for children. The construction of a tower of silence is accompanied by elaborate ceremonies, and after the first dead body has been deposited, the tower is closed to all, including Parsee priests, with the exception of the corpse-bearers who enter it through a high iron door. When a body has been placed on the appropriate stone slab, the bearers leave and the vultures soon descend upon the corpse and tear the flesh from the bones. Whatever remains is thrown into a central pit filled with sand and charcoal.

Parsees living in small rural communities which lack such funeral towers, and all those living in East Africa and other countries overseas, bury their dead in coffins. Wherever there are funeral towers a special ceremony in honour of the departed is performed on a day comparable to the All Souls' Day of Christianity. Parsees go there to offer prayers for dead relatives and friends, and those who have lost a relative during the year spread carpets and hold a feast in the yard or garden round the tower.

There are several festivals which are celebrated on specific dates. One of these is the Sun Festival, which is traceable to the Persian worship of the sun, now personified by Mihr. During another of these feasts, held in honour of the water spirit, Parsees go to the seashore or to a riverbank, and throw coconuts, sugar and flowers into the water. Women, who have made a vow to do

so if their affairs prosper, make sweet cakes, some of which they send to friends, and throw the rest into the sea or into a river. On a festival known as the Fire Feast Parsees go to a fire temple, with offerings of sandalwood, and pray before the fire. The rich distribute money to the priests and to poor Parsees who gather there. The so-called Animal Festival is the culmination of a month in which Parsees show special kindness to animals, feeding stray dogs with milk, and cattle with grass. During this time the very devout abstain altogether from animal food, while others observe this type of abstinence on four specific days. Besides these principal feasts there are six seasonal festivals, each of which lasts five days, during which all members of the local community meet on terms of equality and join in a common feast.

Purification Rites

Every religious rite has to be conducted by a priest, and there is a hereditary priesthood that is completely distinct from the laity. All Parsee priests in India are believed to be descended from a priest who is supposed to have been among the original settlers in Sanjan. Different branches of the original family have been allocated to districts in each of the Parsee settlements, in which members of one branch alone may serve as priests. In each of these districts there is a high priest whose office is hereditary and passes from father to eldest son. He does not leave his headquarters to visit the priests under his charge, but hears and settles any complaints against his priests that are brought before him.

While members of the class of priests may engage in secular business, no one born into a family of laymen can become a priest and officiate at religious rites. Until recently it was not customary for the daughters of priests to marry laymen, but the sons of priests were free to take wives of lay status. Members of the priestly class who are full-time priests are supposed to have beards and to dress entirely in white. Those who engage in secular work, shave their beards and wear colours, are disqualified from performing the higher priestly offices.

The functions of a priest include reciting prayers in the temples, and in the houses of laymen, performing the rites for the dead, and conducting ceremonies such as weddings and initiations. There are two orders of priests, known respectively as *Herbad* and *Mobed*. Among the modern Parsees these represent two stages in a ranking system, the Herbad being junior and inferior to the Mobed. But in the Sassanian period of Iran there was a distinction in kind and function between the two classes of priests. The Mobed were the magicians, who had specific functions at animal sacrifices, and the Herbad were the fire priests, found mainly in south-western Iran. In the 3rd century the two classes became fused, and the Parsees have no trace of the original distinction between Herbad and Mobed.

The son of any Parsee priest can become a Herbad if he has learnt by heart a large number of chapters of the *Avesta*, and various parts of other scriptures. He must then undergo a ceremony of purification. Two priests and several male friends and relatives take the novice to the purifying place, which is an open enclosure strewn with sand. A dog, cow's urine, holy ashes, pomegranate leaves, sticks of a special kind and some bathing vessels are required for the elaborate rite which is to be performed there. A confession of sins, and lengthy prayers for purity of mind and deeds are part of the ceremony. Afterwards the novice is taken to a fire temple where he spends nine days and nights in retreat. He then returns to his home, but after a short time undergoes a second purification. At the end of this he is clothed in pure white garments and presented with flowers. The final ordination, which must be conducted by a high priest, then follows.

When a youth has been a Herbad for two or three years, and has learnt additional parts of the scriptures, he may be ordained as a Mobed or full priest. This includes undergoing further purification rites as well as reciting sacred texts. When the ordination has been completed the new priest is fully qualified to perform all sacerdotal functions. From then on he must never be bareheaded and never shave his head or face. He is supposed to retain his state of purity and eat no food cooked by a person who is not of priestly class.

All the main phases in a Parsee's life are marked by rites and ceremonies. Between the ages of seven and nine boys and girls are initiated into the Zoroastrian faith. The ceremony consists of investing the child with a sacred shirt and a sacred cord, and this is followed by a ritual bath and offering of prayers by a priest. Both betrothal and marriage are the occasion of elaborate ceremonies. At least two priests are required for the wedding rite, and they pronounce the marriage blessings in Old Persian and in Sanskrit. The questions addressed to bride and bridegroom are in Persian and so are their answers. Parsees have not permitted polygamy since 1865, but a widowed or divorced person may remarry.

Bowing to the Dead

Parsee funeral rites are relatively simple. The basic principle is to dispose of the dead body with the least possible risk of harm to the living. As a precaution all deaths are held to be caused by infection, and care is taken that people should come into as little contact as possible with the dead bodies. When death is approaching, a prayer of repentance should be said by the dying person or, if he is unable to do so, by a priest or a relative on his behalf. A short time after death the corpse is washed, and dressed in a clean set of clothes which are destroyed afterwards.

The corpse is then given into the charge of two persons who place it on stone slabs, or the earthen floor, on the ground level of the house. Priests say the prayers for the dead before the corpse is taken out, and a dog is brought to look at the face of the deceased in order to drive away evil spirits, a custom that recalls the great respect paid to dogs in old Iranian religion. The two attendants then carry the corpse out of the house and hand it over to four bier-carriers, who must be Parsees. If the distance to the tower of silence is considerable a wheeled vehicle may be used for the transport of the corpse; where wooden bullock carts were used for this purpose they were afterwards broken up and the pieces buried.

The funeral procession is headed by the corpse-carriers; behind them walk the priests followed by the relatives. At the tower of silence, all bow to the dead, but only the

bier-carriers enter the tower, and deposit the body on the appropriate place. The clothes are torn off and the body is left to the vultures.

Three days after the funeral a ceremony of prayers is held in the house of mourning and the following morning white clothes, drinking vessels, fruit and wheatcakes are consecrated to the dead in the local fire temple. There is a belief that for three days after death the soul of the departed remains within the precincts of this world, and that at dawn after the third night following death it reaches the Bridge of Judgement which connects this earth with the unseen world. There the soul's fate is decided, and the relatives of the deceased try to influence this decision by the recitation of prayers addressed to the celestial judges. The righteous are believed to enter into a state of bliss in a heaven peopled by divine beings, and those whose deeds have been evil are confined to a place of darkness and suffering.

According to Zoroastrian belief punishment in hell does not last for all eternity; there will be a final renewing of the world, when evil will be overcome and the entire creation assume the quality of Ohrmazd, the source of all goodness and happiness. The dualism of good and evil is considered capable of ultimate resolution, and the world view of the Parsees is basically optimistic.

Unlike Hinduism, which extols asceticism and favours a pessimistic attitude to life, the ideology of the Parsees is basically life-affirming, and its dualistic trends do not imply a confrontation of mind against matter. The flesh is not regarded as evil, celibacy is abhorred, and there is more equality between men and women than in either Hinduism or Islam. The life-affirming element in Zoroastrianism is consistent with the role of the Parsees as the most progressive ethnic element, economically and materially, in the whole of India. Their contribution to the development of commerce and modern industry, scholarship and art is out of all proportion to their numbers.

PARSIFAL

PARSIFAL is one of the leading characters of Arthurian romance. His name appears as variants of Perceval in French and English, Parzival in German. In the basic story Perceval's father has been killed about the time of his birth and his mother takes refuge with her son in the mountains of Wales. Perceval grows up to be strong and handsome but quite ignorant of the ways of the world and of the rank to which his parentage entitles him. One day he meets a band of Arthur's knights and goes off with them. At Arthur's court he astonishes everyone by both his personal beauty and his uncouth manners. After many perils, he learns all the skills and courtesies of chivalry.

In a bewildering variety of stories, not all of which are mentioned here, the rude and rustic youth becomes the hero of the quest for the Holy Grail. The earliest version is the *Conte del Graal*, a poem by Chrétien de Troyes written c 1180, which tells the story of Perceval's adventures at the castle of the Fisher King, his failure to ask the right question about the Grail, and his return to Arthur's court, where he is reproached by the Loathly Damsel (see GRAIL). Perceval swears the Quest: he will search till he finds the castle again, he will ask the question, he will not spend two nights in the same place till all is accomplished.

Chrétien then breaks off to recount the adventures of Gawain. When we next meet Perceval, five years later, he is in sorry state. He has done many deeds of prowess, has sent 60 knights as prisoners to Arthur; but he has failed in the quest and has forgotten God and never been to church. It is

Parsifal experiences many adventures in his search for the Grail before finally achieving spiritual maturity: in a vision he sees the New Law based on the teachings of Christ, represented by a young woman riding a lion, and the 'first Law that was put aside as soon as Jesus Christ had introduced the New', symbolized by an old woman riding on a serpent: illustration in a 14th century French manuscript

Bodleian Library Colour Filmstrip

In a bewildering variety of stories Parsifal, who is a beautiful but uncouth young man when he first arrives at Arthur's court, becomes one of the chief figures in the legend of the quest for the Holy Grail: Illustrations from a 13th century manuscript show Parsifal with Hector (*above*) after the two knights have exhausted each other in combat and (*left*) praying with Galahad, the best knight in the world. In the French *Queste del Saint Graal* Galahad was the only one fully to penetrate the mystery of the Grail

Good Friday and he does not know it. A group of penitents chide him for being in arms on a holy day. On their advice, he goes to a hermit who lives nearby. Very repentant, he confesses he has done 'nothing but evil' for five years, and has done nothing to obtain pardon. The hermit, who turns out to be his uncle, tells Perceval his sin lies in his unwittingly having caused his mother to die of sadness. From this came his failure to ask the question and all the trouble thereafter. The hermit explains that the Fisher King's father is he who is served with the grail, sustained for 15 years on the sacred host alone carried in the vessel. He enjoins the good knightly life on Perceval who does penance and receives communion.

Here Chrétien's unfinished story ends. Various authors attempted 'continuations'. In one, Perceval comes a second time to the castle and succeeds in mending, save for one small crack, a broken sword. The Fisher King had wounded himself while trying to repair this sword, which had belonged to the evil Lord of the Red Tower, the slayer of the Fisher's brother. Perceval undertakes a mission of vengeance, finds a smith who repairs the remaining crack and kills the Lord of the Red Tower. On his return, the Fisher King is cured and reveals himself as Perceval's uncle. The young hero is crowned as his successor and when at length he dies the Grail is carried up to heaven.

The French prose romance *Perlesvaus* (c 1200) has a remarkable ending which tells of Perceval's visit to an enchanted island, a Christianized version of a pagan Welsh 'otherworld'. Here dwell men of incredible age, with hair and beard 'whiter than new fallen snow (and yet) young of face . . . they all seemed to be of the age of thirty-two years'. Astounding things occur in this monastery-like community: an armed knight lives in a cask of glass, a golden chain and crown descend from the ceiling, a pit opens in the floor and 'the greatest and most dolorous cries that anyone ever heard' issue from it. The two 'masters', who know all about Perceval and the Grail, tell him that he cannot leave unless he promises to return as soon as he sees a ship with a sail bearing a red cross. If he does, he will have the crown and be king of a nearby island, 'very abundant in all good things'; if he does not rule as well as the present king, who has been 'chosen to reign in a greater realm', he will be sent to the Island of Suffering, the cries from which he has just heard. Perceval agrees and – the Fisher King having died in the meantime – returns to the Grail castle where a voice tells him that 'the Holy Grail shall appear here no longer but within a short time you will know well where it will be'. One day the ship of the red cross appears and Perceval sets sail. In the words of the American scholar R. S. Loomis: 'The author declares that never did earthly man know what became of Perceval and that the history speaks of him no more. But, of course, he has already informed us of Perceval's destination, namely, the isle of the ageless elders, and has intimated clearly that there he will find the Grail.'

In the *Queste del Saint Graal*, a prose work probably written between 1215 and 1230, the hero is Galahad, the ascetic knight and perfect Christian who alone is pure enough to follow the quest to its ultimate and most sublime end. The *Queste* asserts the supremacy of the loftiest spiritual values over the worldly virtues of chivalry and courtly love. In it Perceval plays a secondary but still important and flattering role. Only he and Bors prove worthy to accompany Galahad to the Grail castle where a marvellous Mass is said: Christ himself administers the sacrament from the Grail and the Fisher King is cured by a drop of blood from the Holy Lance. Later, Galahad achieves the final ecstasy of gazing into the Grail and dies as Grail and Lance ascend to heaven. Perceval dies a year later and Bors returns home alone.

The Hatred of God

Of all the versions, the one to which readers today will most warmly respond is probably the monumental poem *Parzival*, written between 1200 and 1212 by Wolfram von Eschenbach, a poor Bavarian knight of very individual outlook and mode of expression. The work brings together a host of characters and themes illuminating Parsifal's own personality and progress.

In the first part of the poem, apart from the fact that Wolfram describes the deeds and fate of Parsifal's father, the outline broadly follows the sequence of events as told by Chrétien. But there are many important differences in detail and attitude.

Of these the most significant are Parsifal's marriage to Condwiramurs instead of a passing affair with a lady named Blanchefleur and his questioning of God, instead of mere forgetfulness and neglect. Throughout his adventures, Parsifal remains devotedly and passionately in love with his wife. The poet continually reminds us of this – there is, for instance, a remarkable passage in which drops of blood on the snow recall Condwiramurs' complexion to Parsifal's imagination – and the hero is reunited with his wife and sons when the quest is accomplished. And until he meets the hermit Trevrizent, his uncle, Parsifal again and again asks 'What is God?' He does so when his mother tells him the Almighty is lord of the little birds as well as of men; he does so, very differently, when his humiliation at failing to ask the right questions at the Grail castle plunges him into doubt and despair. To Gawain he says: 'Alas, what is God? Were He almighty, He would never have exposed you and me to such disgrace, could He rule with power. I have devoted myself to His service because I was hopeful of His grace. Now I will forswear His service: if He hates me, that hatred I will bear.' This strikes a very 'modern' note, as far from the mystifying enchantment of the romances as it is from the exalted otherworldliness of the Galahad *Quoste*.

Wolfram is a realist with a vivid imagination, almost, you could say, a Christian humanist. The core of the poem is Trevrizent's long discourse, the burden of which is that compassion is the heart of the good life and pride, thinking or unthinking, the greatest sin. Throughout the poem the characters develop. Cundrie, for instance, the Loathly Damsel, who in the earlier scenes is even fiercer in her reproaches than in Chrétien's verses, appears towards the end as a figure recalling Mary Magdalen. She kneels before Parsifal and foretells that he will be Lord of the Grail which, on finding the castle again and curing the King with his question, he truly becomes. Warm human relationships and the love of man and woman join with knightly perfection and the spiritual maturity of the love of God to achieve a sane and happy balance of the claims of this world and the next.

C. DE HOGHTON

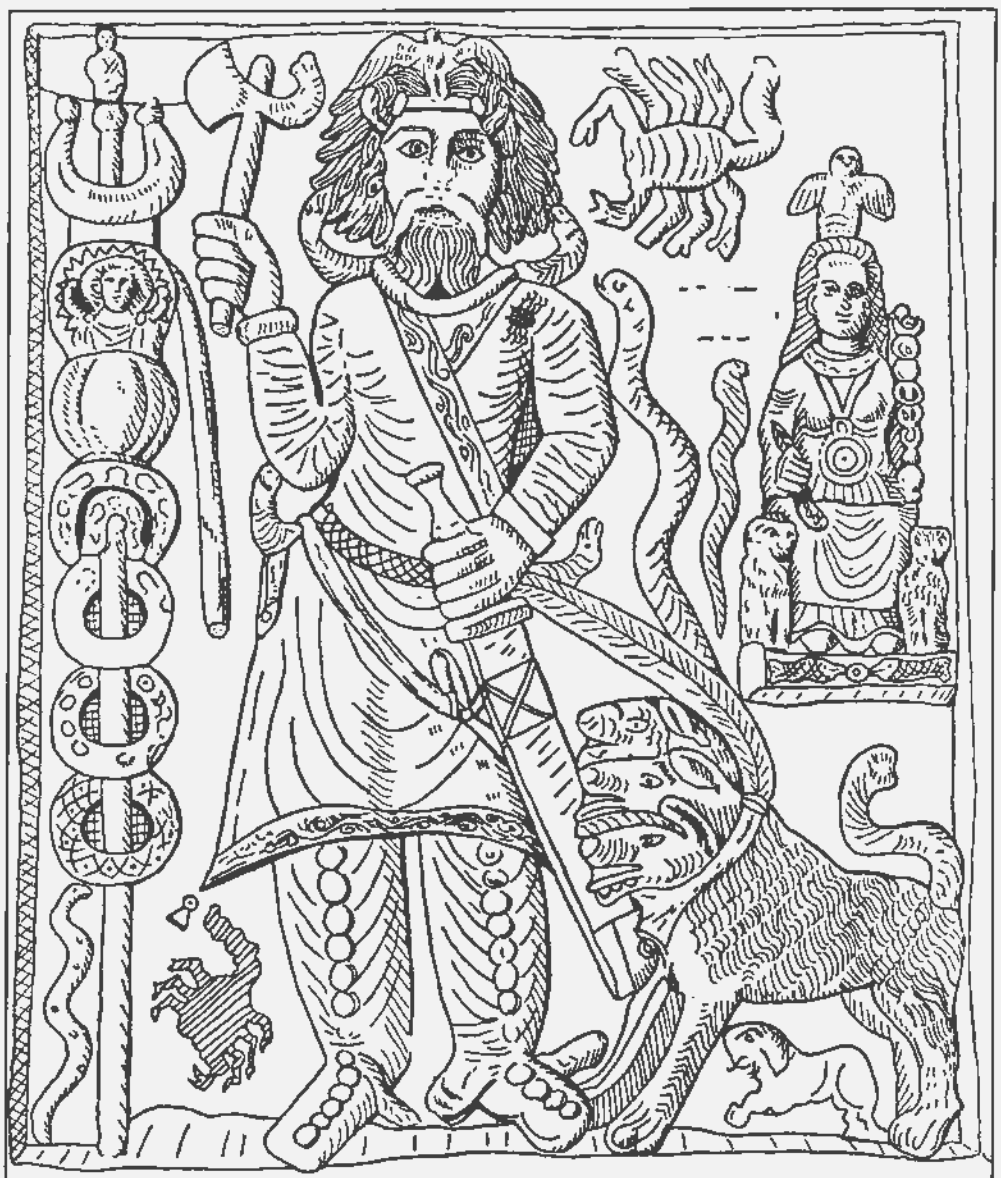
The expression 'a Parthian shot', meaning a remark which is made with deadly effect at the moment of departure, derives from a tactic used by the Parthian mounted archers, the Parthian Empire achieved an extraordinary fusion of religious beliefs drawn from Iranian, Semitic and Greek traditions

PARTHIANS

THE CRUSHING DEFEAT inflicted by the Parthians on the Roman army at Carrhae in 53 BC alerted the Roman Republic to the powerful enemy on the eastern frontier of their Empire. The mounted archers, with their 'Parthian shots', now became familiar figures in Western literature. In 40 BC the Parthians actually invaded the Roman provinces of Asia Minor and Syria, capturing Jerusalem among other places. Though forced to withdraw, for another two centuries they remained a constant threat to Rome's empire in the east.

The Parthians, although they established an empire that extended from the frontiers of Syria in the west to those of Bactria (northern Afghanistan) in the east, are a little-known people. This obscurity seems to have resulted largely from the policy of the Sassanians who, having overthrown the Parthians in c 227 AD, were concerned to damn or obliterate their memory. Modern research is gradually recovering information about the Parthians and their achievement in the synthesizing and dissemination of Eastern and Western cultural traditions, particularly in the matter of religion.

Originally a tribe of Iranian nomads known as the Parni, the Parthians acquired the latter designation with Greek and Roman writers by seizing the satrapy (district) of Parthava in c 247 BC. Their leader, named Arsaces, founded a dynasty of kings known as the Arsacids. Their new kingdom was wrested from the Seleucid government, which had inherited the Middle Eastern part of the empire of Alexander the Great. The Seleucid rulers continued Alexander's policy of Hellenizing the peoples he had conquered. This policy meant the establishment of Greek political and cultural institutions, including religious cults.



The fusion of different beliefs that characterized Parthian religion is reflected in this limestone relief; the chief figure is a god in Parthian dress holding an axe, a typical attribute of Semitic and Hittite weather gods. The three-headed dog on his left is reminiscent of Cerberus, guardian of the Greek underworld

A very important question concerning the Parthian attitude towards the many religions current in their empire is that of their policy towards Zoroastrianism. This native Iranian religion, which was to be vigorously supported by the Sassanians, had existed in Iran since the 6th century BC. It seems to have been accepted in a modified form by the Achaemenian rulers, whose imperial dynasty was overthrown by Alexander the Great. The defeat of this native dynasty and the Hellenizing policy of Alexander and the Seleucids seem likely to have imperilled Zoroastrianism, or at least hindered its progress. The rise to power, therefore, of an Iranian dynasty, such as the Parthian Arsacids, would appear to have been providential for Zoroastrianism.

The issue, unfortunately, remains obscure, for the original native religion of the Parthians is unknown, and the position of Zoroastrianism at this time is uncertain. There is a tradition that a Parthian king, Valakhsh or Vologases, collected together fragments of the 21 books attributed to Zoroaster, which had survived Alexander's destruction of the Iranian prophet's works. However that may be what evidence there is seems to indicate that the Parthians inherited and maintained what has been called 'a general Mazdayasnian religious predominance'.

This means, in fact, that they continued the religious situation that existed under the Achaemenians. For under these rulers, while Zoroaster's Ahura Mazdah (see OHRMAZD) was worshipped and Arta, the principle of cosmic good order, was exalted, the Iranian deities Mithra and Anahita were also acknowledged, contrary to the teaching of Zoroaster, and the Magi, the ancient Persian priestly caste, extended their influence. The Parthians were Mazdah worshippers and respected the Magi; several of their monarchs incorporated references to Arta and Mithra in their names. They were also fire worshippers and a royal fire burned continually before each Arsacid king.

In contrast to the Magian custom of exposing the bodies of the deceased on 'towers of silence' (see PARSEES), the established Parthian means of disposing of the dead was by burial. The bodies were usually placed in terracotta coffins, curiously shaped and somewhat resembling 'bath-tubs' or 'slippers', which has caused them to be so designated by modern archeologists. These clay coffins were often decorated with the figure of a soldier or a nude goddess, who is probably to be identified with Anahita. Funerary equipment of various kinds, including utensils, weapons, jewellery and figurines, were placed in the graves, possibly for the post-mortem needs of the deceased.

The Parthians evolved a remarkable kind of mortuary architecture. Tombs took the form of brick or stone rectangular buildings, within which were vaulted chambers containing series of *loculi*, narrow recesses that housed the sarcophagi. At Dura and Palmyra these multiple tombs were often built as towers, containing several storeys: the Palmyrenes called them 'houses of eternity'. The loculi were generally closed with a sculptured bust of the deceased.

The syncretism that characterized the religion of Parthia is strikingly presented in its iconography. An impressive memorial to this is the colossal tomb of Antiochus I of Commagene (69–34 BC). As the inscriptions on the giant statues show, the following identifications of Greek and Iranian gods were made: Zeus-Oromasdes (Ohrmazd, the later designation of Ahura Mazdah); Apollo-Mithras-Helios-Hermes; Artagnes (Verethragna, god of war)-Heracles-Ares.

Silver dish, 2nd century AD, showing Dionysus with Ariadne and Hercules: the combination of Greek subject and style with central Asian motifs such as the chariot wheel in the form of a solar disc, is an example of the different cultural elements in Parthian art

British Museum/C. M. Dixon

Meeting Place of Many Faiths

The most amazing of all instances of Parthian religious syncretism, however, is a carved slab from Hatrah. It shows as its chief figure a bearded male deity in Parthian dress, armed with a heavy sword. Serpents entwine his body and neck, and a small eagle or falcon with outstretched wings surmounts his head. In his right hand he holds an axe, which was a typical attribute of Semitic and Hittite weather gods. To his right is the standard of Hatrah, bearing various symbols including the lunar crescent and the head of the sun god. To the left of the god is a three-headed dog, reminiscent of Cerberus who guarded the Greek underworld. Above, to the right, a small enthroned figure of a goddess, probably Atargatis, is shown, with accompanying bird, lion and fish symbols.

No inscription identifies the main figure. The axe and the three-headed dog associate him respectively with the sky and the underworld; the eagle might also signify celestial attributes. The figure seems to be a Parthian version of the lion-headed monster, whose image has been found in many Mithraic sanctuaries. The serpents and scorpions, in this context, would represent signs of the zodiac. This Mithraic figure was identified with Zurvan-Ahriman, a sinister Iranian deity personifying the destructive aspect of Time (see TIME; ZURVAN).

Besides such evidence of the syncretizing of Iranian, Semitic and Greek religious traditions in Parthia, there are also indications of even wider tolerance of foreign faiths. In eastern Parthia there were sympathetic contacts with Buddhism and Hindu cults, while in the western parts Jewish communities flourished, which were permitted to proselytize. Christianity also was established early in Parthian lands, and there are even legendary letters from Christ to Abgar V, ruler of Edessa.

Life is a journey, the soul treads a 'way' to heaven which is both a route and a method, the strait and narrow path is the one which leads to salvation, and the dead travel the dangerous roads of the afterworld

PATH SYMBOLISM

HAPPY is the man who finds wisdom, says the book of Proverbs (chapter 3) for 'her ways are ways of pleasantness and all her paths are peace'. The path or road or way is a frequently used symbol, appearing in several well-worn English phrases. There is 'the path of duty' for instance, or 'the primrose path of dalliance' which Shakespeare contrasts in *Hamlet* with 'the steep and thorny way to heaven'. Someone who is ill may be 'on the road to recovery', someone who has died has 'gone the way of all flesh'. You can 'fall by the wayside', be 'led up the garden path' or be 'on the right track'.

The image of 'the open road', running freely on across hill and dale, and so meaning adventure, release, freedom from the cramped confines of conventional society, appealed particularly to writers in the later 19th and 20th centuries. There is an example in one of Robert Louis Stevenson's poems – 'My mistress still the open road and the bright eyes of danger' – and another in G. K. Chesterton's rolling English road made by the rolling English drunkard. The hero of H. G. Wells's novel *The History of Mr Polly* escapes from the cage of his job and his marriage, and takes to the open road. In *The Wind in the Willows*, by Kenneth Grahame, the Toad expands on the theme when he shows his new caravan to Rat and Mole. 'There's real life for you, embodied in that little cart. The open road, the dusty highway, the heath, the common, the hedgerows, the rolling downs! Camps, villages, towns, cities! Here to-day, up and off somewhere else to-morrow! Travel, change, interest, excitement! The whole world before you, and a horizon that's always changing!'

The course of human life is often pictured as a journey, as in Christina Rossetti's poem *Up-Hill*:

> Does the road wind up-hill all the way?
> Yes, to the very end.
> Will the day's journey take the whole long day?
> From morn to night, my friend.

The journey is usually a spiritual one, a pilgrimage, a quest for the soul's salvation, as in Bunyan's *Pilgrim's Progress*, where Christian gains heaven, the Celestial City, after an arduous journey through a symbolic landscape in which it is dangerous to stray off the path or take the wrong turning. In the journey of the spirit the difficult road is the right one to take: 'For the gate is wide and the way is easy, that leads to destruction . . . the gate is narrow and the way is hard, that leads to life' (Matthew, chapter 7). The same sentiment occurs in the famous tag from Virgil, *facilis descensus Averno*, 'easy is the descent to hell'.

Psalm 23 is probably the best-known example of journey symbolism in the Old Testament: 'The Lord is my shepherd, I shall not want . . . he leads me beside still waters . . . he leads me in the paths of righteousness . . . Even though I walk through the valley of the shadow of death, I fear no evil . . .'

The word 'way' means both a road and a method. Jesus said, 'I am the way, and the truth, and the life; no one comes to the Father but by me' (John, chapter 14), and the Christian way to heaven is to 'follow Christ', with a double imagery of both treading in his footsteps and accepting his message. In the Middle Ages the monastic life was sometimes called the *via regia* or 'royal road', the highway to salvation of constant contemplation of God, the spiritual road which runs straight and true, on which there are no detours.

The Paths of the Dead

The double meaning of 'way' as both a route and a method is not confined to western ways of thinking. In India the word *marga* means both a path and a means of reaching a goal. There are many different paths to salvation, suited to people in different stages of spiritual development. *Karma-marga*, for instance, is the path of doing good works,

Aboriginal bark painting from Australia, showing the path to be taken by the soul on its journey to the otherworld; the idea that after death the spirit must follow difficult and dangerous paths is very widespread

Axel Poignant

bhakti-marga is the method of love and devotion to the divine, *kriya-marga* is the way of ritual, of building temples and making images of the gods. Similarly, *yana* in Mahayana (great course) and Hinayana (lesser course) basically means 'path'.

The Milky Way owes its name to the old belief that it is a track in the heavens (though alternatively it was often thought of as a river), frequently regarded as the road along which the dead travel to the otherworld. That in the afterlife there are paths which the departed must tread is a widespread idea. For example, the Guarayo Indians of Bolivia said that after death the soul has the choice of two paths. One is broad and easy, the other narrow and difficult, and it is this second path which the soul should choose. It leads to a river, across which the soul must be ferried by a huge alligator, and to a second river, crossed on a tree trunk. Later the soul must negotiate a dark land by the light of a burning straw, it must pass between the clashing rocks which can be mastered only by a password, and eventually, if it survives all the perils of the journey, it will come to a lane of flowering trees and hear birds singing and live happily for all eternity.

On the other side of the world, in ancient Egypt, some coffins of c 2000 BC portray a map of the journey which the dead had to make by one of two routes, one by land and the other by water, to the mysterious country of Ro-Setau (see BOOK OF THE DEAD). In India, there is a Hindu theory that after death the soul of a man who is totally sinless rises along the *deva-yana*, 'god-path', through fire to day, from day to the lighted side of the moon, from there to the part of the year lighted up by the sun in its northward journey, and then by way of the year, the sun, the moon and lightning to paradise. A soul which is not entirely without sin but is still exceptionally virtuous takes the *pitri-yana* or 'father's path' through the moon, the atmosphere, wind, clouds and rain to a lesser paradise, from which it will eventually be reborn as a person of high rank.

The Strait and Narrow

I beheld, then, that they all went on till they came to the foot of the Hill Difficulty; at the bottom of which was a spring. There were also in the same place two other ways besides that which came straight from the gate; one turned to the left hand, and the other to the right, at the bottom of the hill; but the narrow way lay right up the hill, and the name of the going up the side of the hill is called Difficulty. Christian now went to the spring, and drank thereof, to refresh himself and then began to go up the hill . . . The other two also came to the foot of the hill; but when they saw that the hill was steep and high, and that there were two other ways to go; and supposing also that these two ways might meet again, with that up which Christian went, on the other side of the hill; therefore they were resolved to go in those ways. Now the name of one of those ways was Danger, and the name of the other Destruction.

Bunyan *The Pilgrim's Progress*

The paths which the soul must take after death have a parallel in the symbolic travels of the candidate for initiation, who experiences a 'death and rebirth'. 'At first one wanders and wearily hurries to and fro, and journeys with suspicion through the dark . . .' (see INITIATION).

The Twenty-Two Paths

There are also paths in the astral otherworld of modern western occultism, 22 of them, corresponding to the 22 letters of the Hebrew alphabet and the 22 major trumps of the Tarot pack (see ALPHABET; TAROT). These paths are shown as lines running from one sefira to another on the diagram of the cabalistic Tree of Life (see CABALA). Since the Tree represents the emanations from the divine being which created the universe, the paths leading down from the sefira Kether at the top of the diagram are stages in the process through which the universe came into being. Conversely, if the paths are trodden in the reverse order, starting from the sefira Malkhuth and climbing upwards, they are the way of the soul's ascent to the divine and the steps of the magician's quest for power.

Each path belongs to one of the Tarot trumps, whose symbolism contains the key to the path's nature, but no two people are likely to interpret the symbolism of the Tarot cards in exactly the same way and, even in broad terms, there are rival systems of interpretation. Nor is there agreement about the positioning of the trumps on the Tree, partly because the correct placing of the Fool is in doubt.

No brief account can do justice to the richness of ideas which can be drawn from the Tarot but, following one system of interpretation, the aspiring occultist's ascent begins with the 22nd path, which corresponds to the card called the World. This path leads up from Malkhuth to the threshold of the astral plane in the sefira Yesod. The card shows a woman dancing and is a symbol of joyful release, the entry into a higher plane of being. The next path is that of the Day of Judgement, a symbol of aspiration, with the dead rising from their graves in the hope of ascending to the higher life of heaven. Next comes the path of the Sun, the shining light of true intelligence dispersing the darkness of conventional wisdom and received ideas. The process continues in the path of the Moon, the card of illumination in the night, light penetrating the dark underworld of the mind.

The card called the Stars shows a figure pouring water onto the earth and into a pool. The water is the water of life and the path is that of intuition, the wellspring of life in the depths of the mind. The Falling Tower

means the destruction of a false system of ideas, the discovery, as Paul Case puts it (in *The Tarot*), 'that the structure of knowledge built on the foundation of the fallacy of personal separateness is a tower of false science.' (There is a pun on 'fallacy' here, as the Tower is a phallic symbol.)

The trump called the Devil stands for power, egotism and unbridled lust. Temperance is another symbol of rising from a lower plane to a higher, the card showing liquid being poured from a silver cup into a golden one. Death, the skeleton reaping with his sickle, stands for death and new life, the 'killing' of the civilized, constricting influences on a man's mind and the burgeoning of the driving forces from the unconscious. The Hanged Man, the most famous card in the pack, is another phallic symbol and continues this process. Hanging limply upside down on his gibbet, he shows a reversal of values and the destruction of the false outer, conventional self. But he has released the 'sperm' from which new life will come with the conception of the true self.

Justice, the next card (though in other systems Strength is placed here), is a symbol of rest and equilibrium, the attaining of a balance between the warring opposites of human nature. The Wheel means time and fate, the remorseless ebb and flow of the tides of destiny. The true self, which has been a foetus in the womb of Justice, is here born, to become part of the revolving wheel of existence. The solitary Hermit, in sexual terms an emblem of masturbation, is a sign that the true self is approaching maturity, that the adept has discovered the Master in himself. Strength, according to Aleister Crowley, is the formula of 'the Beast conjoined with the woman', implying a perverse discipline of submission to the abnormal and the repellent.

The paths of the Chariot and the Lovers cross 'the abyss' which separates the three highest sefiroth from the rest, the gulf between man and God. The Chariot is a symbol of ecstasy and triumph, the Lovers of the reconciliation of opposites in a higher unity. The Pope or Hierophant represents the spiritual authority of the magus, the great adept, the Emperor is a symbol of temporal power and authority, and the Empress stands for the teeming world of Nature and the transition from finite to infinite, from multiplicity to the One.

The last three paths lead to the highest sefira, Kether. The Female Pope or High Priestess is the gateway to heaven, the knowledge of the divine, the destruction of all duality of thought. The Juggler or Magician stands for singleness of purpose, the destruction of all duality of action. And finally the Fool, the holy madman, is man as God.

ST PAUL

The Pilot of Christianity

Seeking to present a gospel acceptable to Graeco-Roman society, the great missionary figure of early Christianity transformed the original belief in Jesus as the Messiah of Israel into an esoteric doctrine of a divine-saviour

DURING THE PAST CENTURY St Paul has been transformed from the most important apostle to the most controversial figure of Primitive Christianity. There is a certain irony in this situation; for Paul, despite his high reputation in the Church, was originally a controversial figure and his authority as an apostle was seriously questioned by other Christians of the time. It is the paradox of this original uncertainty about Paul's status and his subsequent great renown that has caused scholars to look critically at the traditional view of the beginnings of the Christian religion.

In seeking to understand Paul and the part he played in the infant Christian movement, it is necessary first to evaluate our sources of information. The primary source is Paul's own writings. Of those attributed to him in the New Testament expert opinion is generally agreed in recognizing the following as genuine: the epistle to the Romans, the two epistles to the Corinthians, those to the Galatians, Philippians and Colossians, the first epistle to the Thessalonians and the little personal note addressed to Philemon. They were written in Greek during a period from about 48 to 60 AD. Since these writings take the form of letters and are often concerned with specific issues that had arisen in the communities to which they were addressed, they have a spontaneous character. In them Paul often throws out ideas on matters of belief and practice which he does not follow up. Many of these ideas are pregnant with theological suggestion; but sometimes, when set together, they appear to be mutually contradictory. However, it must be remembered that when Paul wrote, some 20 years only had passed since the crucifixion of Jesus, and as yet there was no Christian theology. Paul was, in fact, unconsciously laying the foundations upon which the theologians of the Church were later to build the great doctrines of the faith.

The other source is the Acts of the Apostles, which was written towards the end of the 1st century AD. It seeks to show how

Victoria and Albert Museum

Two 12th century plaques showing episodes from St Paul's adventurous career: he escapes by night from Damascus, let down from the city walls in a basket *(left)*, and he disputes with Greeks and Jews *(above)*. A Jew by birth, Paul's first language was Greek, and he believed himself divinely chosen to preach Christ to the Gentiles: in doing so, he produced a version of Christianity which shocked the original Jewish Christians of Jerusalem

Christianity, guided by the Spirit, started from the small community of original disciples resident in Jerusalem, and spread throughout the Roman Empire until it was preached by Paul in Rome itself. The author of Acts was concerned to idealize the past, and he ignores or is evasive about the conflicts in which Paul was involved. His picture of the progress of Christianity has two phases: the first and shorter is the initial Jerusalem phase, of which St Peter is the leading figure; the scene of the second lies outside Palestine and has Paul as its hero. On a number of points the account of Paul in Acts differs from the evidence of Paul's own writings, of which it makes no apparent use. The most serious difference concerns Paul's initial contacts with Christianity.

According to Acts, Paul took a leading part in the persecution of the Christians of Judaea and Samaria following the martyrdom of Stephen (8. 1–3). Not content with venting his animosity against these members of the new movement, he obtained authority from the high priest to arrest Jewish Christians living in Damascus. But on the road to the Syrian city he experienced a devastating vision of Jesus which left him blind. Brought to Damascus, his sight was restored by a Christian named Ananias, and he embraced the Christian faith and was baptized. Returning to Jerusalem he was accepted, after some hesitation, by the Christians there and boldly preached the faith that he had previously persecuted. When the Jews tried to kill him, the Jerusalem Christians sent him to Tarsus in Cilicia, which was his native city – Paul was in fact a Jew of the Diaspora (scattering of the Jews) whose first language was Greek.

In his epistle to the Christians of Galatia, Paul gives a very different account of his conversion. The context in which he gave it is highly significant. He was writing with great urgency and concern to those in Galatia whom he had converted to Christianity, because he had learned that they were being won over to a different form of Christianity – Paul calls it 'a different gospel' – which was contrary to the one that he had preached to them. Since this other 'gospel' constituted a challenge to the authenticity of his own 'gospel', Paul felt obliged to explain the source of his, in order to vindicate its authority.

He asserts that his gospel or version of Christianity had no human source: 'For I did not receive it from man, nor was I taught it, but it came through a revelation of Jesus Christ' (Galatians 1.12). This assertion leads Paul on to explain how he had been converted and entrusted with his mission – and in doing so he emphasizes, significantly, his absolute independence of the original apostles at Jerusalem:

> For you have heard of my former life in Judaism, how I persecuted the church of God violently and tried to destroy it; and I advanced in Judaism beyond many of my own age among my people, so extremely zealous was I for the traditions of my fathers. But when he who had set me apart before I was born, and had called me through his grace, was pleased to reveal his Son to me, in order that I might preach him among the Gentiles, I did not confer with flesh and blood, nor did I go up to Jerusalem to those who were apostles before me, but I went away into Arabia; and again I returned to Damascus. Then after three years I went up to Jerusalem to visit Cephas, and remained with him fifteen days. But I saw none of the other apostles except James the Lord's brother. (In what I am writing to you, before God, I do not lie!) Then I went into the regions of Syria and Cilicia. And I was still not known by sight to the churches of Christ in Judea; they only heard it said, "He who once persecuted us is now preaching the faith he once tried to destroy" (1. 13–23).

This account of Paul's conversion contradicts that of Acts, and Paul's own statement must naturally be preferred. However, the true importance of the passage resides in Paul's interpretation of his conversion. For he declares that it was due to the direct intervention of God, for the specific purpose of revealing 'his Son to me, in order that I might preach him among the Gentiles'.

Spectrum Colour Library/G. Tomsich

A little further on in the same epistle (2. 7–8), Paul makes a similar claim, but this time with reference to the teaching of another Christian leader. He asserts that he 'had been entrusted with the gospel to the uncircumcised', while 'Peter had been entrusted with the gospel to the circumcised'.

A Gospel for the Gentiles

These two passages show that Paul recognized that his version of Christianity was different from that of Jesus's leading disciple Peter. This difference lay in the fact that his version was designed for non-Jews, whereas Peter's was for the Jews. The implications of this distinction are very great. For Peter's gospel was obviously the original version of the Christian faith, yet it was regarded by Paul as not being suitable for Gentiles. His own gospel, which he admits was later and wholly independent of 'those who were apostles before me', he claims, by way of contrast, to be of divine origin and specifically intended for Gentiles.

In other words, Paul reveals in this letter that already, within two decades of the Crucifixion, two interpretations of Jesus were current in the Church. The first was associated with Peter, and was doubtless based upon that disciple's memories of Jesus and his teaching. The other derived from Paul's own spiritual experience, which he believed constituted a personal revelation to him by God. The fact that Paul claims that his gospel was designed for the Gentiles must mean that it presented Jesus in such a way as would be appreciated by those educated in the ideas and modes of thought current in Graeco-Roman society.

An evaluation of the differences between these two versions of Jesus is essential to the understanding of the origins of Christianity. Unfortunately it is made exceedingly difficult both by the obliteration of the original Christian community and its records in the catastrophic destruction of Jerusalem by the Romans in 70 AD, and by the nature of Paul's own writings. However, by a careful analysis of what evidence has survived it is possible to reconstruct the main outlines of both interpretations.

The original disciples recognized Jesus as the Messiah of Israel. They believed that he would shortly return with supernatural

Paul's missionary journeys established Christian communities in many parts of the eastern Mediterranean. When the Church in Jerusalem was destroyed in 70 AD, it was the Gentile Christians who re-established the faith on the basis of Paul's teaching *Left* Paul's last journey took him to Rome; on the way, his ship was severely storm-tossed and the cargo was thrown overboard in an attempt to save the vessel: 16th century, Italian *Top right* The ruins of Salamis in Cyprus; Paul preached here at the outset of his missionary campaign *Bottom right* The reputed prison of Paul at Philippi in Macedonia, from which he was released by 'a great earthquake'

power to earth, to complete his Messianic task which had been strangely interrupted by his martyr's death at the hands of the Romans. These disciples did not regard their faith in Jesus as constituting a new religion apart from Judaism, and they continued to live as zealous orthodox Jews. Although they exalted Jesus as the Messiah, they regarded him as human; for Judaism was strictly monotheistic and the Messiah was not held to be divine.

Gnostic View of Christ

Paul's version of Christianity was fundamentally different. It diverged from the Jerusalem 'gospel' on two basic issues: the nature of Jesus and the meaning of his death. To the original disciples Jesus was a human being chosen by God to be the Messiah of Israel; his execution by the Romans was a martyrdom for the cause of Israel's freedom. How different was Paul's conception is immediately evident in the following passage from his first epistle to the Corinthians (2. 6–9):

> Yet among the mature *(teleioi)* we do impart wisdom *(sophia)*, although it is not a wisdom of this age or of the rulers of this age *(archontes tou aionos)*, who are doomed to pass away. But we impart a secret and hidden wisdom of God, which God decreed before the ages *(aiones)* for our glorification. None of the rulers of this age understood this; for if they had, they would not have crucified the Lord of Glory *(ho Kyrios tes doxes)*.

On analysis, this passage, which contains Paul's most explicit statement about the purpose of the Crucifixion, reveals an amazing complex of esoteric and non-Judaic ideas. First, it is significant that, in addressing his Gentile converts in Corinth, Paul uses the Greek word *teleioi*, 'mature' or 'perfect', because it was a term current in the pagan Mystery religions for those fully initiated. The expression *archontes tou aiones* implies that Paul was thinking in terms of astral Gnosticism, a system of religio-philosophical thought current in Graeco-Roman society (see GNOSTICISM). It presupposed that the lives and destinies of mankind in this world were ruled by spiritual beings *(archontes)*, who inhabited the planets. Above this planetary sphere were others, rising to the zenith where dwelt the 'Supreme Mind' or 'Father of Light'.

Victoria and Albert Museum

The people of Lystra in Asia Minor identified Barnabas with Zeus and Paul with Hermes, and attempted to offer sacrifice to the horrified apostles: cartoon by Raphael

The human situation envisaged by Paul in the above passage, and implied by many references elsewhere in his writings, was clearly of this kind. He imagines that before a series of world-ages *(aiones)*, of which the present is the last, God planned to save mankind from their subjection to the archontes. The plan took the form of deceiving the archontes by sending into the world a pre-existent divine being, designated the 'Lord of Glory', who was incarnated in the person of Jesus of Nazareth. Not recognizing his true nature, the archontes crucified Jesus, and thereby forfeited their hold over mankind. The implications of Paul's brief but pregnant statements were worked out by later Christian theologians into what became the classic form of the doctrine of salvation.

Paul thus identified Jesus as the incarnation of the 'Lord of glory', and he interpreted his crucifixion as the climax of God's plan of salvation. He makes the archontes responsible for this crucifixion, without reference to the Roman and Jewish authorities who actually carried out the historical crucifixion. By so doing, Paul transformed the original belief in Jesus as the Messiah of Israel into an esoteric doctrine of a divine saviour, whose death had delivered mankind from their enslavement to the planetary powers. Such a presentation of Jesus was intelligible to Graeco-Roman society. And, in the same context, Paul taught a doctrine of baptism and holy communion that made Christianity akin structurally to the Mystery religions (see BAPTISM; MYSTERY RELIGIONS).

In thus interpreting Christianity Paul believed, as we have seen, that he was inspired by God for the salvation of the Gentiles, to whom the 'gospel to the circumcised' was both unintelligible and offensive. When, however, the original Jewish Christians at Jerusalem realized the nature of Paul's teaching, they were shocked and vigorously repudiated it. They refused to recognize Paul as an apostle (he had never been an original disciple of Jesus), and they sent out emissaries to Paul's converts to present their own 'gospel' as the authentic version of the faith.

Paul's position in this conflict was basically weak because he had to acknowledge the Jerusalem leaders as 'those who were apostles before him', whereas they could reject him as a late-comer to the faith. The situation became so difficult for Paul that finally he went to Jerusalem to try to secure some measure of agreement. The disastrous outcome is related in Acts (chapter 21). James, the leader of the Jerusalem Church, imposed on Paul a test of his Jewish orthodoxy. While engaged in proving this, he was set upon by a Jewish crowd in the Temple and rescued by the Roman guard. A period of trials and imprisonment was followed by Paul's being sent to Rome to be tried by the Emperor. The outcome of the trial is unrecorded.

After his arrest, it seemed that Paul's version of Christianity was fated to disappear and that the Jerusalem Christians would keep the movement within the confines of Judaism. But the Jewish revolt against Rome in 66 AD, which finally resulted in the overthrow of the Jewish nation and the destruction of Jerusalem in 70 AD, eliminated the Jerusalem Church. After 70 AD the Gentile Christians reestablished the faith on the basis of Paul's teaching. His letters were carefully sought out and preserved, and the Acts of the Apostles was written to commemorate his achievement. Although memories of the historical Jesus as the Jewish Messiah were preserved, it was Paul's presentation of Jesus as the Saviour God, who died and rose again, that became the foundation of orthodox Christianity.

PEACOCK

THE PEACOCK is native to southern Asia and beliefs about it are widespread in that region, especially in India where, since 1963, it has been recognized as the national bird. As far back as the *Rig-Veda*, the Hindu collection of sacred writings dated c 1200 BC, it was recorded that the steeds of the god Indra possessed hair like peacock's feathers. The peacock has an important place in Hinduism and the national epic, the *Ramayana*, relates that when the gods transformed themselves into animal forms in order to escape the demon Ravana, Indra, the god of thunder, rains and war, became a peacock. In recompense the bird was endowed with a thousand eyes in its feathers, the capacity to rejoice when the rains came and the power to kill snakes; obviously it had been observed that the bird attacks serpents, and displays and calls noisily at the beginning of the rainy season.

Various names signify that the peacock dances joyfully on seeing clouds or hearing thunder. The term for one of the 108 postures of the classical Hindu dance signifies 'sportive like the peacock'. A number of divinities are portrayed mounted on the bird – in India Brahma and his wife Sarasvati, in Indo-China the warrior god Skanda and in Japan Kujaku-myoo (Mahamayuri), who protects from calamity and is besought to send rain.

The association of the peacock with rain also spread throughout Europe, where as far west as Ireland its calls are believed to forecast rain. The 15th century *Hortus Sanitatis* declares that it is a sign of rain when the peacock 'mounts on high' and Michael Drayton (1563–1631) wrote of 'the strutting peacock yawling 'gainst the rain'.

Protective Powers

From the knowledge that the peacock kills snakes there developed in India the belief that its bile and blood acted as an antidote against poison; smoke from its burning plumes was held to dispel venom and, in the Punjab, those bitten by snakes smoked its feathers. Travellers were recommended to carry a peacock to ward off snakes. In England during the 15th century the Eastern notion of the antipathy between the peacock and snakes became elaborated into the assumption that the bird's raucous call frightens away serpents and all venomous creatures.

Besides providing antidotes to poison, various parts of the bird were regarded as effective in curing many diseases and disabilities ranging from tuberculosis, forms of paralysis, asthma, catarrh and headaches to barrenness. Among Hindus and Moslems peacock feathers are believed to ward off evil, especially evil spirits. Umbrellas of the plumes were carried by persons associated with royalty and one is still held over the pope on important occasions. In India the mere sight of the bird is believed to bring good luck and to bestow peace of mind.

In Chinese and Japanese art the peacock has decorative and symbolical significance; it is often depicted together with the peony. A defeated Chinese general of the Chin dynasty who took refuge from his enemies in a forest is said to have been so grateful to the peacocks for not betraying him that he conferred peacock feathers on those showing special bravery in battle.

The Bird of Hera

The reference in the Old Testament to 'apes and peacocks' sent to Solomon (I Kings 10.22) cannot be taken seriously, as the translation is guesswork. However, peacocks are known to have been kept in Babylon. Aristotle mentions the peacock which, like the cock, was called 'the Persian bird', and a reference in a play by Aristophanes may imply that a Persian ambassador brought a gift of peacocks. Alexander the Great imposed heavy penalties on those who killed Indian peacocks.

The birds were depicted on Greek coins. They were sacred to Hera, and a myth relates how the goddess set the hundred-eyed giant Argus to guard her husband's mistress, Io; when Zeus sent Hermes to charm and kill Argus, Hera used the giant's eyes to ornament the peacock's tail.

Although through its connection with

Roman mosaic of a peacock from Ravenna: originally the sacred bird of Juno, and of her Greek equivalent the goddess Hera, the peacock was taken over from pagan art to become a common Christian subject, being used as a symbol of the Resurrection

C. M. Dixon

The peacock has an important place in Hinduism *Left* Nepalese statue of Sarasvati, wife of Brahma and goddess of music, speech and learning, seated upon a peacock, her traditional mount *Right* The peacock was a creature of good luck: its feathers warded off evil while other parts of the bird could dispel poison or cure disease. Moghul painting of a princess in a garden with two peacocks

rain, and hence fertility, the peacock was generally regarded as auspicious, there were exceptions to this view. In Java it was associated with the Devil and in Mosul in northern Iraq the Yezidis, who held that the Devil was not evil, called him the Peacock Angel. According to a Persian poet, the bird's 'hideous feet' remind it that it can never attain paradise. There is a somewhat similar anecdote in the *Physiologus*, which contains stories collected in Egypt in early Christian times. It states that the peacock, on seeing his feet and realizing how they contrast with his beautiful plumage, screams: so the Christian should avoid pride and lament his sins. In the medieval bestiaries this theme was elaborated: it was stated that as the peacock on awakening cries out because it has dreamed it has lost its beauty, so the Christian should fear lest he lose his virtues. These and other beliefs were included in Chester's *Love's Martyr*, where he mentions the admiration of Alexander the Great for the bird:

> The proud sun-bearing peacock with his feathers
> Walks all along, thinking himself a king,
> And with his voice prognosticates all weathers,
> Although God knows but badly he doth sing;
> But when he looks down to his base black feet,
> He droops and is ashamed of things unmeet.

The peacock was taken over from pagan into Christian art and appears very commonly in Christian iconography. It was early adopted as the symbol of the Resurrection, possibly because after moulting it was seen to become clothed again in splendour; there are examples in the Roman catacombs. St Augustine stated that its flesh was incorruptible. From this may have arisen the belief that peacock feathers preserved objects from decay if placed with them. In many medieval paintings angels' wings are composed of peacocks' plumes.

Thousands of animals and birds were said to have been slaughtered daily to supply the kitchens of Asoka, the great Indian emperor of the 3rd century BC, but he issued a decree that no more than two peacocks should be supplied – one of the earliest royal edicts in the interests of the conservation of wild life. In Latin literature there are many references to peacocks being included in the fare at banquets; they were bred on islands out of the reach of predators and the eggs were hatched under hens. Peacocks were also served at banquets in England and elsewhere in Europe. Indian medical works recommend the flesh as very wholesome but speak of it as astringent and saline; the present writer found it indistinguishable from chicken.

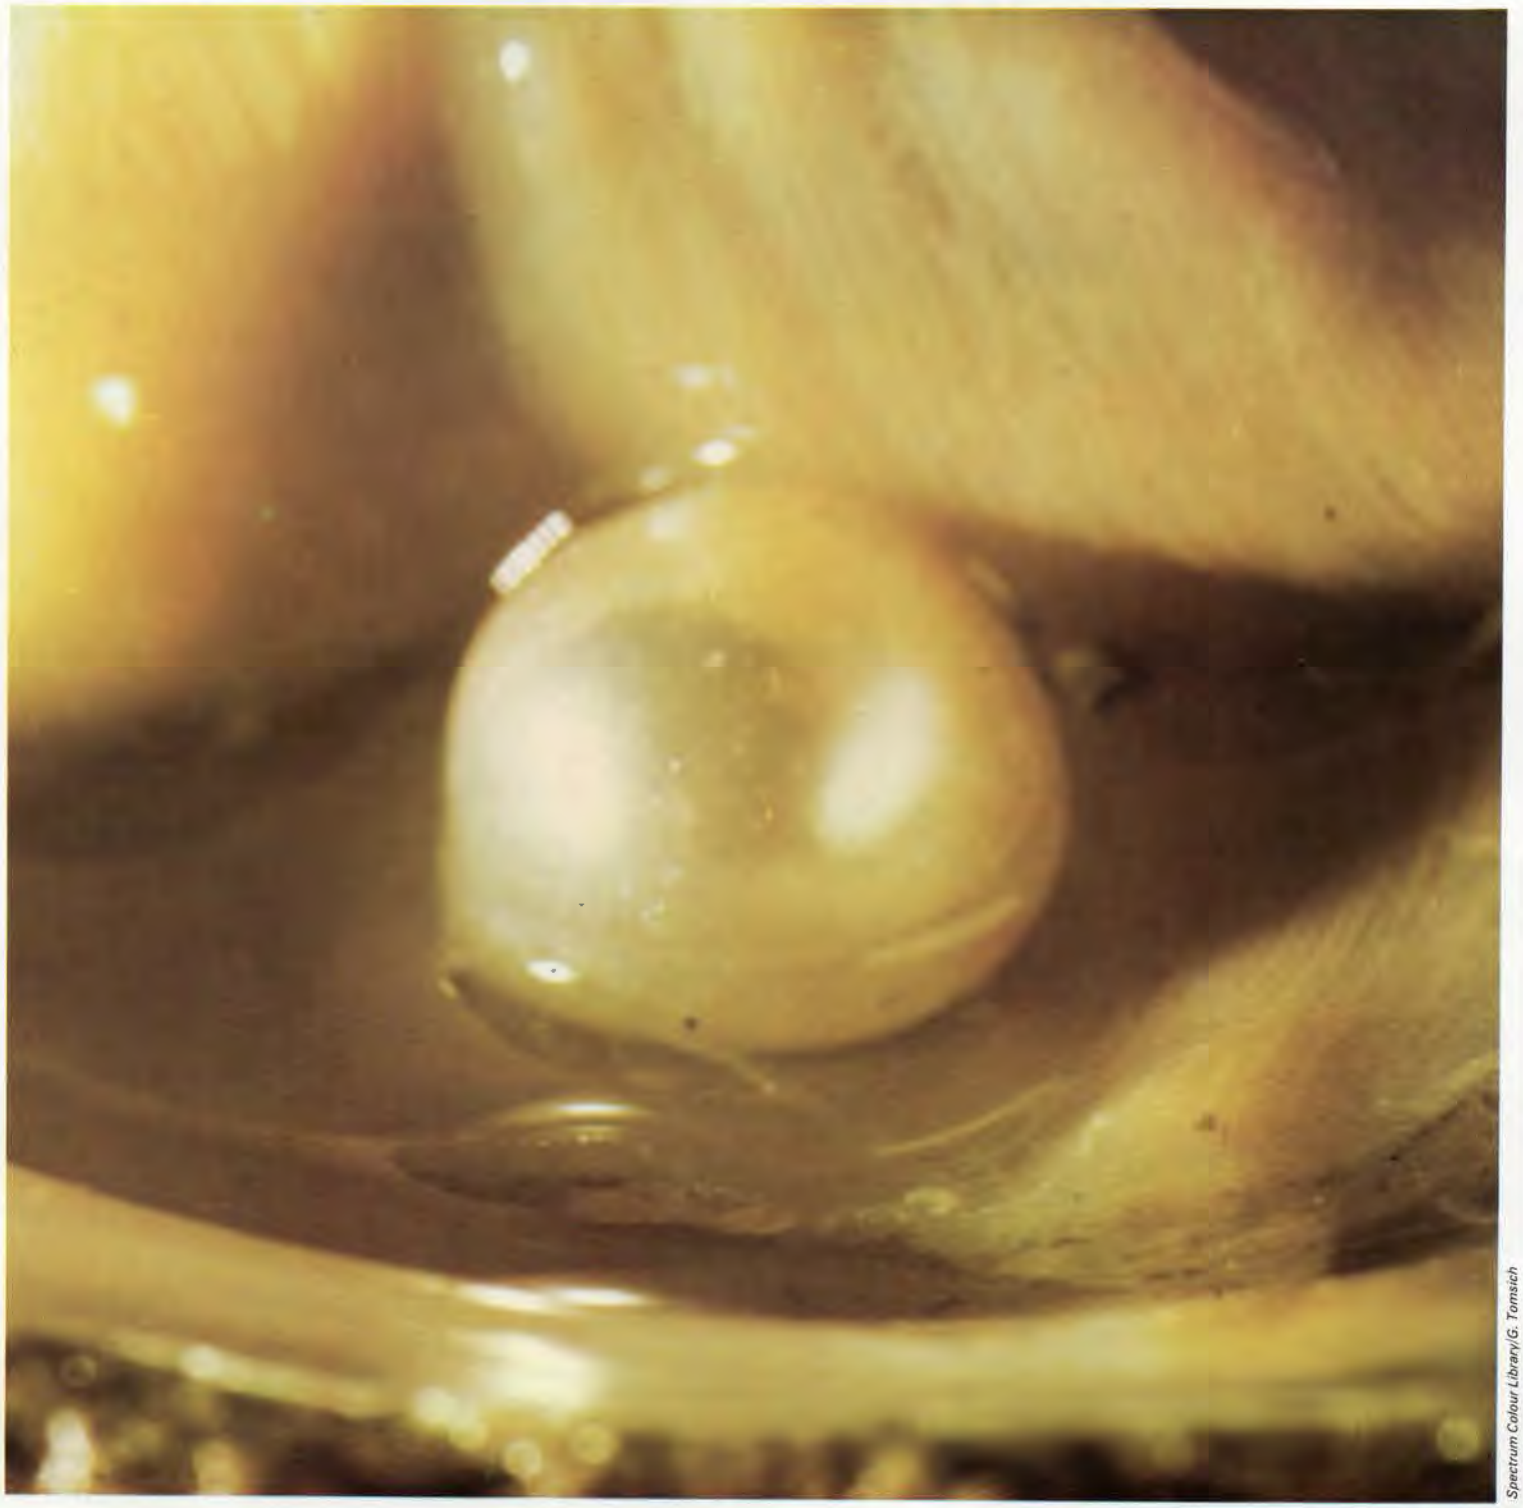
PEARL

THE MYSTERIOUS 'seed' of the oyster, the hidden treasure of the sea, the pearl is among the most beautiful and desirable of all Nature's creations. Throughout history pearls have been associated, by reason of their appearance, with the raindrop and the tear. In ancient China pearls were thought to be liquid globules expelled from the mouth of the sky dragon, the traditional rain god, and even in the West, as Pliny and Dioscorides indicated, they were believed to be the product of raindrops that had fallen from the sky into open oyster shells, where they became solidified. Alternatively, pearls were said to be found in the foreheads, brains and stomachs of elephants, and the Hindus valued such discoveries very highly as amulets. The pearl has long been associated with royalty and in the ancient East monarchs were powdered with gold-dust and seed pearls at their coronations. In England pearls encrusted the crowns of the early Anglo-Saxon kings.

Not until the Middle Ages did pearls find their way into Europe in large quantities, being brought home by the returning Crusaders as spoils of war. The wives of the nobility wore huge ropes of pearls and they were sewn onto the gowns of great ladies to form pretty patterns. In England the popularity of the pearl attained its highest peak in the Tudor period, when it adorned the gowns of nobleman and noblewoman alike. Queen Elizabeth I is known to have expended the then enormous sum of £3000 upon the pearls that had belonged to Mary Queen of Scots.

There is a long-standing belief that there exists an affinity between pearls and their wearers, the one reacting upon the other. It was once held, for example, that pearls would cloud if their owner fell sick, or would lose their lustre completely when he died. In the Orient there was a tradition that pearls lost a hundredth part of

The pearl hidden within the heart of the oyster became an emblem of the soul, the precious jewel within the rough outer casing of the body; because of its purity it was also associated with Christ and the Virgin Mary



Spectrum Colour Library/G. Tomsich

their lustre with every passing year.

In the past the pearl was believed to possess medicinal properties. Because it was 'hard like the heart' and existed in the heart of the oyster shell, it was recommended for heart disease, and it was administered to madmen in powdered form to clarify their minds. A solution of pearls dissolved in lemon juice was highly recommended for the treatment of epilepsy and hysteria. Pearls 'bruised and mixed with milk' were supposed to dissolve stomach ulcers, improve the quality of the voice and preserve chastity. Because it was supposed to possess properties that added lustre to the skin, powdered pearl was extremely popular among aristocratic ladies in 16th century France.

Cleopatra drank a toast to Antony consisting of a dissolved pearl, which was more costly by far than the immense banquet she had provided in his honour. Sir Thomas Gresham was inspired to toast his queen, Elizabeth I, in pearls at the City banquet after her famous visit to the Royal Exchange; this display of extravagance aroused these lines from Thomas Heywood:

> Here £15,000 in one clap goes.
> Instead of sugar, Gresham drinks the pearl
> Unto his queen and mistress.

The pearl was the favourite jewel of Venus, and the ancient Roman would bedeck his hair with these gems to ensure success in love. Pearls were a necessary ingredient of the love philtre, for which purpose they had previously to be dissolved in an acid.

Pearl Binder

A pearly queen's costume might contain over 60,000 pearl buttons, sewn on by hand to form traditional and symbolic designs. This style of dress was first introduced among London costermongers in the late 1880s

In the voluptuous Orient the pearl became a symbol of sensual delight. The Moslems believed that the faithful could look forward to an eternity of bliss in the arms of a beautiful houri, secreted within the heart of a pearl. The 'pearl among women', one of the seven royal treasures of the King of Kings of pre-Buddhist China, was a girl who had attained the beauty of a goddess.

Pearls for Tears

At the same time the pearl has religious associations. The concept of a precious gem enclosed within a rough outer shell made it an obvious emblem of the soul. Because of its purity it is also associated with Christ and the Virgin Mary, while heaven itself is guarded by pearly gates. A similar association of ideas can be seen in the concept of the pearl as symbolizing the mystic centre of the personality. The Third Eye of Buddha was a pearl and represented the highest essence of wisdom.

In terms of popular superstition the original idea of the pearl as a symbol of the tear has never been lost; as late as the end of the last century a widow's mourning ring was customarily set with pearls. In Europe, as in the far East, a gift of pearls continues to bring tears although the curse does not apply if the pearls form part of an ancestral inheritance. In the symbolism of dreams, pearls mean disillusionment and sorrow, and to dream of a broken necklace portends a broken life and disintegration.

As a birthstone the pearl has far happier associations, for it not only endows the wearer with the power to cure fevers and overcome irritations but it also inspires love. It can be worn by practically everyone not born under the signs of Aries or Virgo, but because it governs the zodiacal house Cancer the pearl is the specific birthstone for those who are born in the month of June.

PECULIAR PEOPLE

THIS EVANGELICAL denomination derives its name from several texts in the Authorized Version of the Bible, notably from 1 Peter 2.9: 'But ye are a chosen generation, a royal priesthood, an holy nation, a peculiar people . . .' In this older usage, 'peculiar' means 'special', not 'odd'; the New English Bible translates the phrase as 'a people claimed by God for his own'. Also sometimes known at first as the 'Plumstead Peculiars', the sect was founded in 1838 by William Bridges. Its teachings were spread, especially in Essex, by John Banyard.

The Peculiar People held – and, to a limited extent, still hold – beliefs which distinguish them from most of the Protestant bodies. In particular, their unconditional acceptance of the divine inspiration of every word of the Bible (not in itself unique) led them to interpret literally the injunction in James 5. 14,15: 'Is any among you sick? Let him call for the elders of the church, and let them pray over him, anointing him with oil in the name of the Lord; and the prayer of faith will save the sick man . . .' In this repect, the Peculiar People were nearer to Roman Catholic than to Protestant practice, but in other ways they resembled the 'enthusiastic' branches of evangelical Christianity (see ENTHUSIASM). The women members of the sect wore small black bonnets; the men wore dark clothes and, for some reason, did not grow moustaches. No musical instrument was used in their worship, but hymns were sung with great fervour; the elder conducting the service would give out each verse of the hymn in turn, and when he and the other worshippers felt moved to do so, they would sing the same verse again and again – some hymns being, in any case, many verses long.

The Peculiar People's Hymn Book is one of Christendom's most remarkable hymnals. It contains 1058 hymns (including a few doxologies and graces). Many of these would be familiar to worshippers in other denominations but some have, to modern ears, a special quaintness. One such starts with the line 'How prone are professors to rest on their lees', each verse of it ending with the phrase 'Remember Lot's wife'. Another, headed 'An affectionate hint respecting public worship', rebukes those who arrive after the service has begun:

> Shall chapel doors rattle and umbrellas move,
> To show how you the service disapprove? . . .
> A little less indulgence in the bed –
> A little more contrivance in the head –
> A little more devotion of the mind –
> Would quite prevent your being so behind!

This hymn is 20 verses long – perhaps so that late-comers may at least have arrived before the end.

One outstanding figure in the history of the Peculiar People was Bishop William Heddle, who was born in 1846 and went south to Essex, from his native Orkney, to earn his living. (The men of the Peculiar People have always been working men, occupied in ordinary trades and respected by their neighbours.) After some time as an employee in Maldon and Chelmsford, he set up as a credit draper and outfitter. He went on foot through Essex, with packs strapped on his back and chest, until he could afford to buy a horse and cart. During this period he worshipped at a Congregational church and taught in Sunday school; but he was constantly troubled by a lack of certainty of salvation. One day, travelling near Orsett, he had a conversion experience: he felt 'drop into his heart' the words of a text, 'He tasted death for me.' He repeated the words, cried 'Thank God!' and that night (as he told his son, who survives him) 'couldn't sleep for joy'.

William Heddle became so powerful and tireless a leader of the Peculiar People that eventually they elected him their bishop. At the age of 60 he was thought to be dying. In accordance with the principles of the sect, no doctor was sent for, but he was anointed and prayed over. He recovered, and lived until 1948, when he was almost 102.

Since Bishop Heddle's death, most of the Peculiar People have joined with other denominations in the Union of Evangelical Churches, and their distinctive practices, such as the refusal to consult doctors, have fallen out of use. Some of the original congregations, however, and some of the older members – numbering a few hundred in all – preserve, in remote Essex villages, the special character of the denomination.

PELICAN

Bodleian Library Filmstrip

In medieval times the pelican was believed to peck its own breast to supply its young with blood, and therefore became a symbol of parental affection and self-sacrifice: an illustration from a 13th century English bestiary incorporates this popular motif

THE LORE of the pelican has so little relevance to the actual behaviour of the bird that it might refer to a mythical species. Its chief interest is in illustrating the origin of an important symbol from confused ideas. The pelican was familiar in Egypt as a large bird opening its wide gape to enable the young to feed from the fish brought in its pouch; but the symbolical pelican's significance was mainly borrowed from the vulture. In the Bible vultures are not clearly distinguished from eagles. Thus in Exodus 19.4 we should read: 'I bore you on vultures' wings' rather than 'on eagles' wings' and in Deuteronomy 32.11: 'Like a vulture . . . that flutters over its young, spreading out its wings.' As the Hebrew words for 'vulture' and 'compassion' are very similar, an association was established between large birds and parental care which was apparently transferred to the pelican. The notion that the pelican feeds or revives its young with its own blood may perhaps be traced to vultures being seen to bring bloody morsels to their chicks.

The *Physiologus*, an early Christian compilation which wove together biblical ideas with Egyptian mythology concerning animals, contained two stories elaborated from these notions. One relates that the pelican loves its young very much but these, when they are large enough, strike at their parents. The old birds retaliate and kill the chicks; but soon they are overcome with compassion and the mother comes on the third day, opens her side and sheds blood on them, restoring them to life. It is also stated that in order to foil the snake the pelican makes its nest in a lofty situation and builds a hedge around it. The snake, representing the Devil, puffs his venom on the nest and kills the young. When the pelican returns she flaps her wings against her sides, drawing blood which rains down on the chicks and resuscitates them.

Christian writers used these stories to illustrate their teaching. St Jerome interpreted them as showing how those dead in sin were made alive through Christ's blood shed on the cross, and down the centuries emphasis was laid on the parental affection of the pelican. The representation in carved wood or stone and in stained glass windows of the bird pecking her breast to supply her young with blood became frequent in the Middle Ages as a symbol of Christ and the Eucharist. Such symbolism had special importance during centuries when few could read but the pelican also acquired considerable prominence in literature. In the 13th century St Thomas Aquinas wrote:

> Pelican of piety, Jesus, Lord and God,
> Cleanse thou me, unclean, in thy most precious blood.

John Skelton (c 1460–1529) also made use of the symbolic pelican in his verse:

> Then said the pelican,
> When my birds be slain,
> With my blood I them revive.
> Scripture doth record
> The same did our Lord,
> And rose from death to life.

Shakespeare could assume that his audiences would understand allusions to the symbolic pelican. King Lear, for instance, recalling the story of the bird's ungrateful young, refers to Regan and Goneril as 'pelican daughters'. But for centuries the 'pelican in her piety', as the heraldic representation of the bird was called, continued to be a symbol of the noble virtue of heroic self-sacrifice.

E. A. ARMSTRONG

Penance

In Christian theology, contrition for sin and a punishment inflicted for it, imposed by the sinner himself or by a priest; the Church gradually developed a system in which a sinner confessed privately to a priest, who might impose a penance on him and grant him forgiveness; the penance may be to say certain prayers or perform certain devotions or acts of self-denial or self-mortification.

See SACRAMENTS.

Penates

In Roman religion, household spirits who were 'gods of the food cupboard', guardians of the family larder; they were worshipped in association with the Lares and the hearth; food was offered to them at mealtimes, and on special occasions, such as birthdays, they would be given cakes, honey, wine, incense or sometimes a pig.

See ROME.

British Museum

PENTAGRAM

THE STAR with five points is traditionally a weapon of power in magic. Its symbolism is based on that of the number 5, which stands, among other things, for the living world of Nature, the four elements and the quintessence or the four directions and the centre; for the senses and the union of the sexes; for man as microcosm, man as the ruler of Nature, as the miniature image and potential master of all things (see FIVE).

The pentagram with one of its points projecting upwards can be imagined as a man's body with arms and legs extended, and is a symbol of the dominance of the divine spirit (the one upward point) over matter (the other four points). A reversed pentagram, with two points projecting upwards, is a symbol of evil and attracts sinister forces because it overturns the proper order of things and demonstrates the triumph of matter over spirit. The two upper points suggest the horns of the Devil. 'It is the goat of lust attacking the heavens with its horns,' said Eliphas Levi, 'a sign execrated by initiates of a superior rank.' The rituals of the Golden Dawn (see GOLDEN DAWN) allowed it to be used 'if there may arise an absolute necessity for working or conversing with a Spirit of an evil nature.'

Pentagrams are recommended in the European magical textbooks for keeping evil spirits at bay, demons being naturally frightened of a symbol whose five points stand for the wounds of Christ on the cross. Pentagrams should be drawn in the rim of the magic circle and outside it. According to the *Lemegeton*, the magician should wear the Pentagram of Solomon embroidered on his robe, or should draw it on parchment and carry it in his hand during a magical ceremony. This pentagram, with one point upwards, is drawn inside a circle. The name Tetragrammaton, the supreme name of the God of the Old Testament (see NAMES), is written inside the circle and the names of power Hallya, Ballater, Soluzen, Bellony, Hally are written inside the star.

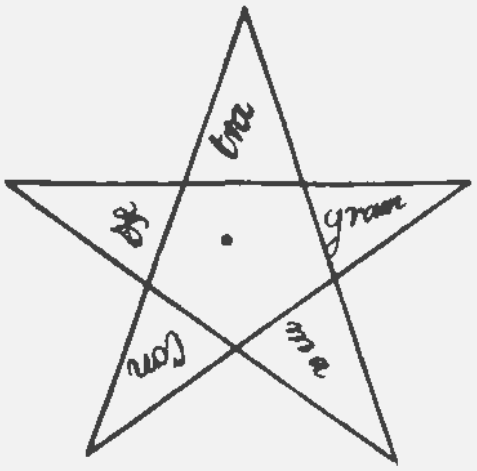
Modern magicians also make use of

pentagrams for invoking good influences or banishing evil ones. In *Transcendental Magic*, Eliphas Levi says: 'The pentagram, which in gnostic schools is called the blazing star, is the sign of intellectual omnipotence and autocracy. It is the star of the magi; it is the sign of the Word made flesh . . .' This is because it adds the 1 of godhead to the 4 of matter, and the name of Jesus or Pentagrammaton adds S, the letter of the Holy Spirit, to the four letters of the Tetragrammaton. When Levi attempted to conjure up the ghost of Apollonius of Tyana (see LEVI), his altar had a pentagram carved on it, and when a shrouded figure appeared before him, he placed one hand on the pentagram for protection.

The Golden Dawn's 'Lesser Ritual of the Pentagram' involved taking a steel dagger in hand and facing east, and then drawing an imagined pentagram on one's body. The operator touched his forehead and said Ateh (thou art), touched his breast and said Malkuth (the kingdom), touched his right shoulder and said ve-Geburah (and the power), touched his left shoulder and said ve-Gedulah (and the glory), clasped his hands in front of him and said Le-olam (for ever), and then holding the dagger between his fingers, pointing up, said Amen. (He had now made the sign of the 'cabalistic cross', combining the four directions and the centre.)

Next, he brought the dagger to the centre of the pentagram and pronounced the Tetragrammaton, imagining his voice carrying out to the east of the universe. He repeated the ritual facing south, west and north in turn and pronouncing the names Adonai, Eheieh and Agla respectively. Then he returned to his starting point, completing the circle of the ritual by touching the dagger to the centre of the first pentagram. With arms outstretched he said: 'Before me Raphael, behind me Gabriel, at my right hand Michael, at my left hand Auriel; before me flames the pentagram, behind me shines the six-rayed star.' Finally, he repeated the rite of drawing the cabalistic cross.

When one point projects upwards the pentagram may be used for invoking good influences and banishing evil ones, but a reversed pentagram, with two points projecting upwards, is a symbol of evil



Here the pentagrams were used to invoke good influences. A banishing formula followed the same ritual except that the lines of the pentagrams were drawn in reverse order. The invoking formula could be used as a morning prayer and the banishing one as an evening prayer. The banishing formula was also considered effective 'against impure magnetism' and for getting rid of distracting or disturbing thoughts. Israel Regardie comments (in *The Tree of Life*) that: 'The blind performance of this ritual . . . is quite useless, and is a waste of both time and energy. The imagination, simultaneously, should be stimulated to create these Pentagrams about the Magician on the Astral Plane in glowing figures of fire, so that through the streaming lines of light and power, representative of the spiritual being, no lesser entity of any kind dare make its way . . . The blazing five-pointed star is like the flaming sword which debarred Adam from the Edenic paradise.'

The Golden Dawn also had a much more complicated 'Supreme Invoking Ritual of the Pentagram'. The rituals were adopted, with minor alterations, by members of the Golden Dawn who later founded their own occult societies, including Aleister Crowley and Dion Fortune (see CROWLEY; FORTUNE).

The words pentagram and pentacle are sometimes confused. A pentacle (or pantacle) is not necessarily connected with the number 5. Pentacle probably comes from an old French word for 'to hang' and means a talisman or, by extension, any symbol used in magical operations.

The gifts of the Spirit described by St Paul, which included prophecy, healing and 'speaking in tongues', are sought by Pentecostalists as evidence of the baptism of the Holy Ghost; such dramatic demonstrations of Spirit power still characterize their meetings

PENTECOSTALIST MOVEMENT

MODERN PENTECOSTALISM began in a small Bible school, known as Bethel College, Topeka, Kansas, at the beginning of 1901, when Charles F. Parham, the head of the College, and a number of his students received the baptism of the Holy Spirit; it was signalized in some of them by their bursting forth into utterance in unknown tongues. It is the emphasized belief in the experience of the baptism of the Holy Spirit, made manifest in some dramatic, ecstatic manner (usually by speaking in tongues), and in the continuing operation of the gifts of the Spirit, as described in the New Testament, which marks off Pentecostalism from other Protestant evangelical, fundamentalist groups.

Pentecostalists consider that all believers will experience the Spirit baptism, which is seen as endowment with power for God's service (as suggested in Acts 1, 4–8). This baptism is expected to take place after the believer has been 'born again', as Pentecostalists call the occasion of conversion, and is confirmation of his previous regeneration and sanctification. All the articles of their faith are supported by biblical proofs, for Pentecostalists accept the Bible literally, and believe it to be divinely inspired and incapable of error.

In the central points of their faith Pentecostalists share much with all evangelical Protestants. The immediate precursors of the Pentecostalists were the members of the various Holiness movements in the United States, many of whom had broken away from Methodism (see HOLINESS MOVEMENT). The Holiness groups emphasized the experience of sanctification as a second blessing following conversion. It was to this teaching that Pentecostalists added the teaching of the baptism of the Holy Spirit (and, subsequently, the gifts of the Spirit). The idea of Holy Spirit baptism existed before it was made explicit by the Pentecostalists, of course, and there is scriptural warrant for the teaching. It was in demanding manifested proofs of such baptism that the Pentecostalists added an element that Holiness groups had ignored or rejected.

A Message to Mankind

It is practically certain that Spirit baptism marked by speaking in unknown tongues was preached by Parham in 1900, before the onset of that experience among his students, the first of whom received this dramatic baptism on the first day of the new century, 1 January 1901. (Remembering that Pentecostalists live in the expectation of the coming of Christ, and that tongues came to be seen as a sign of his coming, this circumstance is not without significance.) As a considerable number of the students received the baptism, the group at Topeka now began to see itself as having not only a special mission but a special message for mankind. Some claimed to see visions of tongues of fire during the group meetings in which several people spoke in unknown tongues. They saw themselves as newly empowered to go out and preach the gospel; and although they were undoubtedly over-optimistic about the significance of their experiences and the nearness of the second advent of Christ, their evangelism in the Mid-West brought into being groups who espoused the new teaching even if they did not, as yet, think of themselves distinctively as Pentecostalists.

Members of small Holiness churches were among the first converts to Pentecostalism, but not all Holiness believers accepted the Pentecostal phenomena as authentic. It was among Holiness preachers, however, that Pentecostalism made its first significant impact; and when it was espoused by preachers in the Church of the Nazarene in Los Angeles, Pentecostalism obtained a footing from which it was soon to develop as an international movement. Many of its early converts in the rapidly growing city were Negroes, and the first meeting room was a derelict former Methodist mission in

the Negro quarter in Azusa Street – a name still celebrated among Pentecostalists. Scenes of great enthusiasm occurred there, and crowds were drawn to the meetings at which the Holy Spirit was said to be acting so powerfully. From that time, 1906, Pentecostalism spread rapidly in Los Angeles and other groups met in Chicago, New York and Texas. Word of the new developments quickly spread through Holiness and other evangelical meetings throughout the country.

The Welsh Revival

An independent development in Wales, now known as the Welsh Revival of 1904–5, prepared the ground for the reception of Pentecostalism in Britain. During its course visions and miraculous healings were claimed, and speech in unknown tongues occurred. Many evangelicals, and particularly those who had been originally influenced by the preaching of Dwight Moody in his missions in Britain, and those associated with the Keswick Conference (founded in 1875) were aroused by the events reported from Wales. Although by no means all of the evangelicals in the denominations, nor even the independent Holiness meetings, were unsceptical about the claims of Pentecostalists, the Welsh Revival was seen as a distinct operation of the Holy Spirit – not least impressive because of the decline in criminal cases in areas affected by the revival. For some, however, the Welsh Revival stimulated interest in the news from America when this reached England some months later.

The principal disseminator of Pentecostal teachings in Europe was an Englishman, T. B. Barratt, who was pastor of the City Mission, a Methodist church in Oslo. Barratt was in the United States in 1906, attended Pentecostal meetings, became convinced of the truth of the teachings and received the baptism of the Holy Spirit. Before the end of the year he had led some members of his congregation in Oslo into the same experience. News of Norwegian Pentecostalism spread rapidly, and in March 1907 Barratt was visited by the Rev. A. A. Boddy, the Rector of Monkwearmouth, near Sunderland. Boddy had seen the Welsh Revival at first hand and had been very much impressed. He now rapidly espoused Pentecostal teachings, and held long meetings in Monkwearmouth where his parishioners prayed for the descent of the Holy Spirit.

Barratt visited England later in that year, and the news of Pentecostalism was now widely disseminated. Groups began in various places, and although many of those who sought Pentecostal experience remained in their own denominations (particularly in the Anglican Church), others began to meet separately for more enthusiastic forms of worship and spontaneous prayer and praise than could be readily accomodated in the established denominations. Although some prominent Holiness leaders opposed the new movement, it won a considerable number of converts from Holiness people and in the independent Bible schools of Holiness persuasion. In the rest of Europe, particularly as a result of Barratt's work – he was an indefatigable traveller in the cause he espoused – the movement gained sizeable groups of followers. It had its greatest successes in Sweden, Finland and Germany.

Store Front Churches

The most rapid expansion of the new movement, however, occurred in its country of origin, the United States. Here there was a climate of much greater religious tolerance, propitious conditions for new organizations to grow and a much more general receptivity to new ideas in religion. Because Pentecostalism arose as a spontaneous movement, without the continued guidance of any one leader but rather on the basis of devotional practices that were added to widely accepted Protestant evangelical ideas, it did not long remain as one movement. It lacked internal and organizational coherence, and was quickly taken over by local leaders and congregations who, whilst they had in common their belief in Holy Spirit baptism and the availability of the gifts of the Spirit, might easily differ on other doctrinal matters or ethical prescriptions, and most particularly on church organization.

Some of the churches that became Pentecostal were run, and even owned, by the preacher himself. Others were controlled by their lay congregations. Yet others evolved administrative organizations and central headquarters. Though it is appropriate to refer to the Pentecostal movement as one phenomenon, it must be remembered that the movement always consisted, even at the

beginning, of many different groups, and eventually of separately organized and entirely independent denominational organizations. The largest of the movements that developed in the United States, and which established many branches overseas, was the Assemblies of God, which today has hundreds of thousands of members all over the United States, and which maintains a large printing press and a university of its own. In contrast there are uncounted tiny missions, many of them springing up suddenly in the back streets of large cities, and often disappearing again. Perhaps the majority of the 'store front' churches in the Negro and Puerto Rican districts of New York, Los Angeles and other large American cities are in practice Pentecostalist.

Stunts and Sex Appeal

Some colourful movements have emerged within Pentecostalism. One of these was the Holiness organization of A. J. Tomlinson, known as the Church of God (Tomlinson) – a designation necessary to distinguish it from the many organizations that call themselves simply 'Church of God'. This movement, arising in Tennessee and North Carolina, grew rapidly in the United States, and also acquired a large following among West Indians. The Church split on two occasions, the second time on A. J. Tomlinson's death in 1953 when his two sons, Milton and Homer, quarrelled. The majority followed Milton, but Homer Tomlinson also headed a Church of God, proclaimed himself bishop, and later declared himself king of the world and leader of the Theocratic Party. He travelled the world crowning himself king in over 100 nations.

Scarcely less startling was the career of Aimée Semple McPherson, a revivalist who settled in Los Angeles in 1918. There she built the Angelus Temple, in which she produced dramatic services: sex appeal and stunts were her methods of drawing in large crowds. She once drove onto the stage of her church on a motorcycle, braked to a sudden halt and shouted, 'Stop! You're driving straight to hell!' On another occasion she suddenly disappeared, reputedly kidnapped and held to ransom: a cynical Press believed that she had in fact run off for a short holiday with one of the radio technicians on the staff of her church. Her movement survived her death, and still claims tens of thousands of adherents in the United States and some in Europe.

It would be unfair to suggest that these bizarre organizations are characteristic of Pentecostalism, however. The vast majority of those who congregate in Pentecostal churches are devout, respectable and sincere believers, many of whom lead lives of exemplary probity. It is certainly the case that the movement is somewhat susceptible to emotionalism, and this was particularly so in its early days. At the long meetings scenes of intense excitement occurred, and before the movement acquired stable organization and evolved instruments of control, some of the gatherings of Pentecostalists were undoubtedly marked by excesses of one sort or another. This was particularly so in the backwoods areas of the Mid-West and South of the United States. Parham himself, the first Pentecostalist, was a man of very dubious sexual reputation – although it must be added that he quickly lost influence in the movement. Perhaps more important than emotional aberrances of this kind were the misunderstandings that arose in the early days

concerning the phenomenon of glossolalia or speaking in tongues.

There seems to be no doubt that at some meetings people simulated this inspired utterance given by the Holy Spirit, to sully the reputation of others or to get their own way in matters concerning the congregation. Business matters were sometimes settled, and marriages prompted, by supposed utterances of inspired character. Perhaps more commonly, individuals who felt that they had been given great power by the Holy Spirit in the matter of languages believed that they were summoned to undertake missionary work in foreign places. There are stories, although their absolute authenticity cannot be guaranteed, even though they are told by Pentecostal historians themselves, of people actually going out to foreign stations to preach, convinced that they had been given the necessary linguistic abilities by the Holy Spirit – only to find that they had deceived themselves.

Discipline Enforced

Episodes such as these were probably very rare in the history of Pentecostalism in Britain. Most of the early converts were already well grounded in the Bible, in Holiness meetings or in the orthodox Protestant denominations. Undoubtedly at the beginning the use of the gifts of the Spirit (particularly the gift of tongues) was much less adequately regulated than later became the case, but for many people the Pentecostal movement represented an inspiration to return to Christian belief and behaviour. The early leaders of British Pentecostalism – the Welsh brothers George and Stephen Jeffreys, Donald Gee, Howard and John Carter, Thomas Myerscough and J. Nelson Parr – were vigorous and respected Christians, and even though their meetings were marked by a fervour not seen in the older denominations, they firmly applied St Paul's prescription that all things should be done decently and in order. As the British Pentecostal denominations became established, the number of utterances in tongues at one meeting became restricted to two or three, and the interpretation of tongues (by the gift of interpretation given by the Holy Spirit) was demanded. It also became the established expectation of Pentecostalists that all Spirit utterance should conform to and confirm the word of the gospel. The ministers of these denominations, whilst emphasizing that the Holy Spirit should never be quenched (the sin of the orthodox Churches), stressed the affinity of the Spirit to standards of discipline and decorum.

The Pentecostal Churches have undoubtedly become increasingly similar to older denominations in their worship, even though it is still possible, particularly at prayer meetings, to see weeping, groaning worshippers and the occasional prostrate figure, in some Pentecostal meetings in Britain. Baptism of the Holy Spirit remains a dramatic occasion for observers, and an ecstatic one for the individual concerned. The gifts of the Spirit (described in Corinthians, chapter 12) are, with the baptism, the central, distinctive features of Pentecostal belief; Pentecostalists, therefore, necessarily believe in divine healing and miracles.

There has, however, been a tendency to imply that the 'discernment of spirits' – by which authentic gifts of the Holy Ghost are distinguishable from simulations – is a gift particularly possessed by ministers. There has also been a notable tendency to suggest that the gift of prophecy is more concerned with 'forth-telling' than with 'fore-telling'.

The Pentecostal movement drew most of its early converts from among the poorer sections of industrial nations. Apart from the United States, where it quickly gained followers in the rural areas of the Mid-West, the South and in California, its principal centres have been urban. Emotionally oriented movements normally have the widest appeal among the least educated and most socially and economically deprived sections of the population. Such people are characterized by a greater readiness to accept sanctioned circumstances of emotional release by responsiveness to a charged atmosphere, and willingness to believe in exceptional dispensations from the normal operation of cause and effect, by contrast with more sophisticated and materially better placed sections of the public. Pentecostal meetings also provide intense, emotional and reassuring situations for those for whom the wider society has little to offer: and these tend to be the less privileged groups.

Appeal to Immigrants

Pentecostalism appears to be particularly attractive to immigrants, both from the countryside to the cities and from one country to another. This appeal no doubt partly stems from the fact that it offers situations in which disturbed emotions are given sanctioned (and sanctified) expression, for immigrants frequently undergo problems of adjustment and experience feelings of inadequacy. The acting out of tensions and obsessions may be facilitated by permissive religious groups, more particularly of course in the less formally organized and more spontaneous Pentecostal assemblies. The promise of divine help and power – and in some respects its manifestation – in Pentecostal assemblies, may enhance the movement's appeal to the immigrant. As friendly groups with a powerful ethic of self-help and emphasis on highly idealized virtues, they may also materially help the immigrant to improve his position.

It may not be pressing matters too far to suggest that the very emphasis on speech – the gift of tongues – has a unique appeal for the immigrant. For a man who has imperfect command of the language of his new environment (whether it be merely the city for the countryman, or the new country for the foreigner) the idea of a higher power, and a more effective form of speech, has an obvious appeal. It symbolizes the felt needs of the immigrant. In the light of this it is not surprising that the most vigorous sects among West Indian immigrants to Britain have been Pentecostal, that very large numbers of Italian immigrants to America and Brazil, even though Roman Catholics, espoused Pentecostalism in those countries, and that considerable numbers of Chilean and Brazilian migrants from the countryside to the city have, in the last two decades, became Pentecostalists.

Growth in Catholic Countries

Pentecostalism has grown steadily rather than dramatically in the advanced countries of the world, but because so many separate sects practise Pentecostalism, definitive figures are impossible to obtain. Conservative assessments in 1979 suggested that there were around seven million members throughout the world. In Western Europe there are certainly several hundred thousand. In recent years there has been considerable growth in Italy, partly as a result of the conversion of the families of Italian immigrants who accepted Pentecostal teachings in the United States and Brazil. It is claimed that there are a great many Pentecostalists in Russia, but numbers are uncertain. The most rapid growth of Pentecostalism has been in Latin America. Some authorities consider that more than 14% of the population of Chile are now practising Pentecostalists, whilst the numbers in Brazil are estimated as between four and five millions. The extent to which many of these new adherents are firmly and exclusively Pentecostalist is uncertain, but the movement's influence has certainly grown phenomenally in these Catholic countries in recent years.

Although not part of the Pentecostal movement in the traditional sense, mention must be made of the new charismatic movement that has begun in the last decade in the orthodox Churches of Christendom. Groups meeting in Catholic, Anglican, Methodist and Baptist churches and sometimes inter-denominationally, have increasingly experienced the outbreak of tongues, and belief in the phenomenon of the baptism of the Holy Spirit has grown among people who differ in educational background and social position from the adherents of the older Pentecostal denominations. It is too early to say whether this 'renewal movement', as it is sometimes called, will be contained within the Churches, whether it will last or die away, or whether it may yet give rise to new independent groups; but certainly the orthodox Pentecostalists see the outbreak of speaking in tongues among established Catholics and Anglicans (including some members of the clergy) as a vindication of the position that they long ago espoused.

PERFUME
Michael Holford

The power of perfume was once thought capable of keeping the plague at bay, and spirits were attracted or repelled by appropriate odours. Even now its ability to arouse emotion makes it a useful auxiliary to the art of love

THE SENSE of smell was used in the past far more than it is now, for it was an important tool of the hunter and, equally important, served to tell when danger threatened – the source of the common phrase 'to smell danger'. There is also some reason for the belief that human beings once had the ability to identify one another by scent; even now Europeans will often claim to detect an unpleasant odour among coloured people, while the latter may insist that the white man's body reeks of decay.

As a result, smells still carry strong emotional overtones; indeed St Hilarion, one of the desert fathers, claimed that he could detect a person's vices by the smell of his garments. Because of its compelling power, perfume has sometimes been considered a form of sorcery. It began its association with the supernatural powers as an adjunct to religion: its history in this connection can be traced back some 5000 years to the burnt sacrifices offered by ancient priests as food for their gods. The smoke arising from burning carcases is extremely repugnant and it was no doubt with the object of rendering the operation more pleasing to both man and god that the custom of perfuming the temples by the burning of incense was first introduced. This is affirmed by the word perfume itself, which comes from the Latin and means, literally, 'through the smoke', being originally applied to fumigation as well as to scent. As late as 1560 an English writer recorded a case of sickness in which a woman 'died of the plague and they perfumed the house with grains of juniper'.

Perfecting the Human Body

In early times offerings of incense were restricted to the temple priests, their use for secular purposes being prohibited. The main ingredients were then myrrh, cinnamon and other scented plants, and resinous gums.

Among the ancient Egyptians the religious and secular aspects of perfume were combined, for it was used in conjunction with

Because of its compelling power, perfume has sometimes been considered a form of sorcery

The burning of perfumes has been a feature of worship for some 5000 years: the sweet smell was thought to render the sacrifice more acceptable to the deity

the embalming of the dead; the soul in fact was thought to ascend to heaven upon a cloud of incense smoke. Because perfume was assumed to have the power of perfecting the human body, it became one of the aims of ancient perfumers to discover scents which seemed to be natural emanations from the body itself. In Egypt young gallants used as many as 15 different kinds of scent to lure the fair sex, and beautiful women concealed tiny globules of aromatic substances in their hair.

The Hebrews on their escape from captivity in Egypt took with them a knowledge of incense and perfumes, much of which centuries later found its way to Europe. Among the Greeks the cosmetic use of perfumes involved the application of specific types to the various parts of the body. The nobleman of Rome used mint for his armpits, palm oil for his jaws and marjoram for his hair.

Those who make gifts of perfume at Christmas no doubt forget that the very first Christmas present consisted of frankincense and myrrh (as well as gold) given to the infant Christ; both these precious aromatic gums are used in incense. It is a sad commentary upon Christian civilization that it was not until the conclusion of the Dark Ages, when the returning Crusaders reintroduced the sensual delights of the East to Europe, that perfume became re-established in the West.

During the Renaissance, Italy became the principal manufacturer of perfumes, later

Victoria and Albert Museum

forfeiting the initiative to France, which has maintained its supremacy in the trade ever since. Lack of sanitation and the absence of personal hygiene during the 16th and 17th centuries rendered the use of perfumes a necessity among those who attempted to maintain some semblance of a civilized existence. In Shakespeare's London the apothecaries of Bucklersbury were famous for their herbs and simples and aromatic spices, and the perfumed dandies of the court were said to smell like 'Bucklersbury in simple-time'.

Fumes had long formed an adjunct to medicine. Temple smoke was highly recommended by the Greeks for respiratory disorders, and before the introduction of chimneys in England in the 15th century, wheezing old gentlemen swore by the prophylactic qualities of hearth smoke, at the same time inveighing against the foul smelling fumes of the newly utilized sea coal, which made them choke. In 16th century Europe relics of this same attitude could still be observed in the lighting of seasonal bonfires at the onset of winter: the fumes were intended to clear the land of demons and witches and drive pestilence from the cattle.

Fumigation of Fiends

Disease was thought to strike through the medium of an evil vapour, and so during the recurrent attacks of plague the physician would tend his patients masked in a grotesque snout filled with sweet-smelling herbs and spices: bunches of aromatic herbs were burned on huge fires with the object of clearing the air and without the slightest consciousness of imitating an ancient sacrificial rite. It was customary to sprinkle perfumed water about sick rooms and upon clothing, and judges were presented with posies to sniff as a safeguard against contracting 'jail fever' from the prisoners brought before them. Domestic fumigation by smoke came under censure from Dr John Caius, who in 1552 vigorously attacked 'the foolish smokings of shirts, smocks and kerchiefs' which was then a popular hygienic safeguard.

Since pleasant smells were the attributes of holiness, foul ones were necessarily thought to belong to Satan, who reeked abominably, as might be expected of one whose abode lay deep within the bowels of the earth. The clouds of sulphurous fumes which lingered for hours in any house which had received a visit from the infernal regions necessitated the use of powerful deodorants before it could again become tenable; but in those cases in which a demon was said to have taken up occupation within the body of a human being, it was foul smells rather than pleasant ones which were introduced as a counter-measure. In 1586 when the exorcist Edmunds attempted to expel a devil from a hysteric, he first forced his patient to drink salad oil, 'his head afterwards held over a bowl of burning brimstone – and further dosed with asafoetida and other stinking gear'. Possibly it was under the inspiration of some primitive version of the doctrine that 'like cures like', that foul odours were considered efficacious for the expulsion of a foul fiend. In yet another case, in 1665, a possessed woman subjected to fumigation was made to inhale a fetid infusion of boiling herbs, the treatment being discontinued only after a mouse had leaped from her mouth. In obstinate cases a portrait of the Devil would be sprinkled with holy water and afterwards thoroughly fumigated.

Tobacco smoke, regarded by most smoking addicts as aromatic, came under withering attack from King James I of England in his *Counterblast to Tobacco*; this specialist in demonology suggested, however, that the fumes might be useful to 'chase out devils'. On the other hand there were many who were firmly of the opinion

John Webb/Tate Gallery

Left **Evil smells were formerly believed to be a direct source of infection: the doctor who attends to a plague victim therefore holds an impregnated sponge to his nose, while servants burn aromatics to clear the air** ***Above*** **A dove symbolizing the Holy Ghost carries a censer in its beak, in Rossetti's painting *The Damozel of the Sanct Grael***

Of the Virtue and Efficacy of Perfumes

Let no man wonder how great things suffumigations can do in the air; especially when they shall, with Pliny, consider that, by certain vapours exhaled from proper suffumigations, aerial spirits are raised; also thunder and lightnings, and the like: as the liver of a cameleon being burnt on the house top, will raise showers and lightnings; the same effect has the head and throat, if they are burnt with oaken wood. There are some suffumigations under the influences of the stars, that cause images of spirits to appear in the air, or elsewhere: for if coriander, smallage, henbane, and hemlock be made to fume, by invocations spirits will soon come together, being attracted by the vapours which are most congruous to their own natures; hence they are called the herbs of the spirits . . . Also, the lungs of an ass, being burnt, puts all poisonous things to flight; and the fume of the burnt hoof of a horse drives away mice; the same does the hoof of a mule; and with the hoof of the left foot flies are driven away. And if a house, or any place, be smoaked with the *gall* of a *cuttle-fish*, made into a confection with red storax, roses, and lignum aloes, and then there be some sea-water or blood cast into that place, the whole house will seem to be full of water or blood.

Francis Barrett *The Magus* (1801)

that tobacco smoke was more attractive than repellent, some fishermen even insisting that its smoke lured fish into their nets. On the east coast of Scotland the aroma of very old brandy was supposed to have a similar effect.

Fumes have always played a prominent part in the magical arts from the time of the priestess of the Delphic oracle, who is said to have breathed fumes before reaching a state of prophetic frenzy, to the priests of modern India who inhale the aromatic smoke arising from a burning sacred plant. Javanese mediums observe a similar rite and in Haiti perfumes are used in Voodoo ceremonies.

Perfumes and fumigants have a prominent role in European magic. During the preparation of a magic circle, herbs and other aromatic substances were cast upon a charcoal fire burning in a small brazier in order to attract spirits, who would then take on visible shapes by enveloping themselves in the smoke. When it was necessary to summon devils coriander, hemlock and sandalwood were used together with henbane, which was a powerful narcotic and helped to induce a state of temporary insanity.

Ghostly Odours

Perfumes have an established place in psychic realms, particularly in ghost lore. Who has not heard some old ghost story in which the returned dead have made known their presence by a waft of the well-loved scent with which they were intimately associated in life? John Aubrey, the antiquary, recorded the materialization of an apparition at Cirencester, 'which being demanded whether a good spirit or bad returned no answer but disappeared with a curious perfume and a most melodious twang'.

Perfume as an expression of mood and personality is a valuable auxiliary to the arts of love; in fact it belongs high up on the list of aphrodisiacs. By acting upon the olfactory nerves it stimulates the brain, arousing powerful emotions of sympathy and sensual attraction. In the South Seas today a garland of flowers is an expression of erotic desire and in the same way there exists no more powerful token of passion in the language of love than an expensive perfume.

Alternatively, odours have sometimes been used to achieve the reverse effect. During the Middle Ages monks and nuns when beset by lustful thoughts sought refuge from the Devil's wiles by sniffing camphor, a custom which inspired that favourite maxim of the Salerno medical school:

> Camphor if smelled
> A man will geld.

To the sensualist perfume opens the way to indescribable joys. It was one of the supreme delights of Mohammed, and the Islamic paradise was impregnated with exotic scents. In more recent times the male of the species has begun once again to make judicious use of toilet waters, scented shaving lotions and deodorant sprays, not merely with the object of offsetting the less pleasant odours of his two million sweat glands or even to add to his attractions as a sexual partner, but for highly laudable aesthetic considerations.

Cologne Before a Battle

Some people consider that perfume exerts an influence upon thought itself, equating, for example, pure mountain air with vigour, solitariness and the heroic. In the folklore of flowers, those with heavy scents are generally considered unlucky since they fill the mind with thoughts of death. That perfume clears the brain is suggested by the fact that Napoleon Bonaparte used to immerse his head in eau-de-Cologne before commencing a battle.

The whole world has been ransacked in its time to provide the ingredients of the perfumer's art. Animal life makes its contribution in the form of the secretions of civet cats and musk deer, the sperm whale has supplied its ambergris and the beaver has surrendered its castoreum. Aromatic barks and spices and oils from the crushed stems, petals and leaves of flowers have all supplied their distinctive odours. Rose petals provided not only the couches of the luxurious sybarites of Roman times but when distilled as rose-water bathed the hands and faces of courtesans and queens. Some 17,000 odours have now been distinguished, some good and some bad; and a system of classification has recently been evolved by a chemist, Dr Septimus Piesse, by which the acuteness of a particular scent is equated with a note on the musical scale. The perfumer can then more easily tell which perfume 'notes' will harmonize or clash.

In the symbolism of dreams perfume means romantic happiness, but it could with equal facility be named 'eternity'. The nostalgic power of scents is well known, and has even on occasion been exploited by psychiatrists to revive the buried memories of their patients.

PERSEPHONE

IN THE LITERATURE of Greek mythology Persephone appears most often as the young daughter of Zeus and Demeter, who was carried off by Hades or Pluto to be his bride. Her name has various forms: Persephoneia, Phersephone, Persephassa, Phersephatta, Periphone according to literary or spoken dialect. No etymology has been found for it in Greek in any of the various forms. It is therefore likely that it was pre-Greek and was difficult for Greeks to pronounce. The classical Latin Proserpina seems to be a simple mispronunciation.

Homer calls her 'dread Persephone' and makes her the wife of the lord of the underworld, terrible herself and sender of terrifying ghosts and apparitions, like Hecate with whom she was sometimes identified. She controls the appearance of spectres, including that of Tiresias in the *Odyssey* (book 11) when Odysseus consults the oracle of the dead. In this book, indeed, she seems more truly ruler of the underworld than Hades himself. As such she perhaps descends from a pre-Greek goddess who would have been, like the Sumerian Ereshkigal, mistress of the underworld. Hesiod in the *Theogony* is the first to call her daughter of Demeter and alludes to her rape. But the superb myth of her abduction and of Demeter's angry grief appears for the first time in the Homeric Hymn to Demeter.

Persephone was playing as a maiden away from her mother on the Nysian plain in a meadow with the daughters of Ocean. As they were gathering flowers, she came upon the narcissus, a marvellous radiant flower, and reached for it with both hands. Then the earth suddenly opened and Aidoneus (Hades) sprang out with his golden chariot and immortal horses. He caught her up and carried her away across the world and down to the infernal regions while she lamented and cried shrilly upon her father Zeus. But no one heard her except Hecate in her cave and the sun god Helios, until Demeter too heard when it was too late. Demeter was led by Hecate to Helios, who alone had seen how her daughter had disappeared, and the sun god tried to comfort Demeter by saying that Aidoneus, brother of Zeus, was no unworthy husband.

A Pomegranate Seed

Demeter in her wanderings arrived at Eleusis, disguised as an old woman. There she nursed the king's child, warming him in the ashes of the fire to make him immortal, until she was discovered doing so by the queen. She then revealed herself as a goddess and a temple was built for her at Eleusis. There the goddess of crops sat mourning, making a dreadful year for mortals during which nothing grew. Finally Zeus sent Hermes to order Aidoneus to restore Persephone, so that the human race should not perish. Aidoneus obeyed but gave Persephone a pomegranate seed to eat. Hermes brought her back to Demeter in the chariot of Aidoneus. Demeter, as she held Persephone in her arms, felt a misgiving and asked her whether she had tasted any food down below. If she had done so, she must spend a third of every year among the dead (the idea of being bound to the underworld by having eaten food there is widespread). Zeus confirmed that she should spend this period of time in the underworld and the rest among the gods.

The Nysian plain has a name that is otherwise associated with Dionysus, whose sacred mountain was Nysa. But this is the name in cult and myth of any mountain sacred to Dionysus, not a geographical name. For this reason some scholars have argued that Aidoneus in the Hymn is another name for Dionysus, who had connections with the underworld. The place where Aidoneus's chariot vanished downward is variously given according to local cults of Persephone. In Attic cult it was Erineos, the place of the wild fig tree by the river Cephisus near Eleusis. This tree had a connection with the subterranean Dionysus. Though the Homeric Hymn has a special link with the cult of Demeter at Eleusis, Enna in the heart of Sicily became in later literature a favourite scene for the rape, for it had a native Sicilian cult of the infernal powers.

Less well known is the myth of Theseus

The queen of the underworld, Persephone *(right)*, was also the daughter of the corn goddess Demeter. She was abducted by her uncle, Hades, who carried her away to his infernal kingdom in his golden chariot: *(below)* *The Rape of Persephone* by C. Schwartz

Michael Halford

Figured plate of the 5th century BC, showing Hades and Persephone banqueting; Persephone may have been descended from a pre-Greek goddess of the underworld

and Pirithous, who made an expedition to the underworld hoping to bring up Persephone as a substitute for the lost wife of Pirithous. Nonnus, an epic poet of the 5th century AD, retails, perhaps with some additions, an Orphic myth outside traditional lore. Persephone, kept at home by her mother but desired by all the gods, was conveyed to Sicily and there guarded by dragons, until Zeus himself, taking the form of a dragon, seduced her. She became the mother of Zagreus, the earlier form of Dionysus, whom the Titans tore to pieces.

Commentators have pointed out that the myth of Persephone is the sacred story that accompanies the ritual of sowing corn. Demeter is the corn mother, representing the seed corn that is stored underground during the deadening heat of summer, until it is brought out again in the autumn, is sown, and sprouts. The sprouting is the return of Persephone the Maiden. Demeter and Persephone are in a sense one, as the growing corn that vanishes and reappears.

Petrel

Sea bird, named for St Peter because it flutters across the waves with its feet touching them, as if it was trying to walk on the water; this may account for the belief that it is unlucky to kill a stormy petrel, from which the same belief may have spread to its larger relative, the albatross; the petrel is also related to the shearwater, sometimes called 'damned soul' because it flies to and fro over the sea, apparently never resting.

The Indians say that unless a man is morally upright he cannot use peyote; for the cactus which brings visions is regarded as a teacher, healer and saviour of their race

PEYOTE CULTS

TODAY the peyote religion is the principal cult among North American Indians in the United States, although it exists in many variants. It appears to have begun, at least in the form in which it now flourishes, about the year 1870, since when it has spread rapidly from Texas and the South-West among the Plains tribes and into Canada.

There is some evidence that a religious cult centring on the use of peyote, which is the button of a cactus plant native to Texas and northern Mexico, existed in pre-Columbian times, but whether the contemporary peyote religion is directly derived from those practices is disputed. What is certain is that hallucinatory substances were used in ritual practices by Indians observed by the Spanish invaders, and also that there was considerable non-ritual use of peyote. It was used as protector in war, perhaps to confer invulnerability, and it was carried in the 'war bundles' (collections of objects believed to have magical power) of tribes such as the Comanches and Shawnees. Among the Mescalero Apache rival shamans used peyote in their 'witching' practices, but there was no cultic use of the plant. But the peyote cult as it developed after 1870 includes many elements of which there is no earlier record, and this may be said without referring to the more explicitly Christian elements.

The term peyote has been used of a number of plants and sometimes peyote has been confused with mescal. But the mescal bean (*Sophora secundiflora*) is quite distinct from the peyote button (*Lophophora Williamsii Lemaire*), a small spineless cactus, of which the flowering tops are used in the peyote cult. The exact properties of the peyote button have been subject to dispute; some regard it as both a narcotic

and an intoxicant. It is non-habit forming. In some American states it has been prohibited, in others early prohibition has later been lifted. Some writers have maintained that peyote was a 'giver of visions', others have disputed this and suggested that peyote simply enhanced perception, particularly of colours. Nausea sometimes follows its use, but some users find that it gives a sense of exhilaration, mental ease and a feeling of greater mental capacity. The Indians themselves attribute great power to the button, and those who practise the cult regard it as a healer, and perhaps even as a saviour of the Indian peoples.

Religion of the Oppressed

Although it seems likely that the peyote cult in its modern form originated in the 1870s, its history is well-documented only from 1890. This was the year of the great Ghost Dance, a native movement which spread across the American plains from the west of Nevada. There Wovoka, an Indian messiah, had prophesied the return of the ancestors and the old way of life if Indians would but dance for several successive nights particular steps that had been revealed to him in a vision. The Ghost Dance had been carried from tribe to tribe by messengers, and the severely deprived Plains tribes, living in reservations and defeated in war against the whites, seized the new message of hope eagerly. The buffalo herds, on which they had lived and which had been of fundamental economic and religious importance to them, had been destroyed, and their way of life had collapsed. The messianic message was a call to action for thousands of hopeless tribesmen. Out of their common condition emerged a new sense of what it meant to be, not a tribesman, but an Indian. (See also GHOST DANCE.)

The fervour with which the Ghost Dance was performed led to trances and visions concerning the destruction of the whites. However, when the ancestors failed to return, despair and disillusionment followed. The way was now open for a less ecstatic cult that could build on the new inter-tribal sense of identity of the Indian peoples. Peyotism emerged as the new faith and many were quickly drawn to it. It did not promise an apocalypse, but was a more withdrawn response to distress.

Many elements of cult practice may already have been in existence before the coming of the Ghost Dance to the Wichita agency in Oklahoma in 1890; it was here that James Mooney, the government ethnologist, first saw the peyote cult in 1891. Certainly one of the prominent leaders of the Ghost Dance, Nishkuntu (Moon Head), also known as John Wilson, a part Delaware, part Caddo and part French Indian, became the individual who can be most specifically identified as a founder and disseminator of the new faith. Though peyotism did not originate with him, and its mythology goes back much further, the spread of the contemporary cult and some of its principal characteristics are connected with his name.

The Kiowa form of the peyote cult differs from the rite as disseminated by John Wilson, however, and may be more original. The central myth concerning peyote is usually recounted in the version accepted by the Kiowa. The story is of two lost warriors of the tribe who were sought by a relative, usually a sister. When she failed to find them and lay down exhausted on the ground, realizing that she too was now lost, she dreamed a dream that in the morning she would find help at hand. On waking she found the peyote plant. Severely hungry, she ate the peyote button and at once had a vision that enabled her to find her brothers. The myth of peyote as a saviour of the Indian is supported by stories of this kind.

All-Night Songs

Peyote cult ritual varies considerably from tribe to tribe, and perhaps from meeting to meeting. Despite the emergence of a church organization, uniformity has never been established. Particular practitioners have their own versions, and meetings are called for different purposes in different areas. Meetings are normally called by a sponsor who wishes to obtain healing, or to express gratitude for recovery from illness,

Smithsonian Institution

The Ghost Dance, by developing a new inter-tribal sense of identity among the Indian peoples, opened the way for the peyote cult, a more passive response to oppression ***Above right*** **Arapaho 'ghost shirt' believed to render the wearer immune to bullets** ***Below right*** **Peyote plant: the cult is 'in many ways a religion of withdrawal and submission' which 'encourages resigned contemplation'**

or to celebrate a child's birthday, to obtain a prophecy or to manifest piety. In the tribes among whom peyotism was first established, women are often excluded from meetings. Among those who have acquired it more recently, and where it has a more Christian appearance, they are usually admitted, even though they do not always fully participate. Indians of all tribes are welcome at meetings, and visits from different tribes are common, since one of the features of peyotism that has continued since its early days is the eagerness of its practitioners to learn from others.

The sponsor of a meeting meets the expenses, and often supplies the peyote itself; he invites the Chief (or Roadman) who presides over the ceremony, and who may conduct it with variations according to some vision that he has received. An altar is prepared, traditionally in a tepee or tent, and objects of symbolic importance are placed upon it. Of particular importance are the drum, the staff and feathers. The all-night ceremony begins with smoking and praying to the earth-creator, and this is followed by a ritual of blessing around the ceremonial fire. The consumption of four (or sometimes more) peyote buttons by every participant is the most important act of the ceremony, but the night is taken up by the singing of songs. Each individual sings four, choosing a friend to drum for him, whilst he holds the staff. In some cases ritual songs are sung by the Roadman. Songs sung by individuals have, perhaps increasingly, some resemblance to Christian hymns. At midnight a special song is sung, and water is brought and drunk. The meeting then returns to singing until dawn, when water is brought again, by a woman, and four morning songs are sung by the leader.

The principal object of meetings, however, is contemplation, and there is a strong ethical implication to the eating of peyote. It is frequently said that a man cannot use peyote unless he is 'straight'. Sometimes it is asserted that peyote causes vomiting and that this is a way in which men learn wisdom. Invariably, peyote is regarded as a teacher, and if the meaning of the ceremonies and the songs is difficult to articulate, it is said to be so because only by knowing the 'peyote road', by long experience of the cult, and by having a clean heart and living the life of a devoted man can an individual learn the peyote message. The peyote road can be a severe one: John Wilson, for example, exhorted his followers to abstain from alcohol, fighting, gambling, sexual excess, witchcraft and love magic. There is a strong sense in which peyotism provides a new ethic and offers social integration for a demoralized people.

The spread of the peyote religion among the tribes has been fairly fully traced. Like the Ghost Dance, its dissemination was facilitated by the American policy of collecting different tribes together on the reservations. The Kiowa and Comanches were early practitioners of the cult. John Wilson spread the cult among the Caddo, Wichita and Osage, and a more conservative variant of the cult was maintained (in strong opposition to John Wilson) among the Delaware. The Winnebago in Nebraska and the Iowa tribe were visited by peyote practitioners before the First World War, and the movement spread among the Ute. It made steady advance among the Taos Indians, and by the Second World War was spreading among the Crow and Blackfoot in Canada.

The Navaho for a long time remained relatively untouched by peyotism, although they certainly knew of it from quite an early date from their contact with the Ute shamans. The reason for their lack of interest appears to have been the relative comfort of this largest of all American Indian peoples. Unlike other tribes they had lost little of their traditional lands; they had never been forced onto the reservations; and as sheep farmers, they were unaffected by the disappearance of the buffalo. After the imposed programme of stock reduction (because of over-grazing) in the 1930s, some Navaho undoubtedly experienced a period of economic distress and hopelessness. It was after this time that peyotism first made a significant number of converts among them until, today, it has become a thriving cult with thousands of Navaho adherents.

Among the Navaho, as among many other tribes, peyotism was at first opposed by traditionalists who saw the peyote cult as a departure from true tribal culture. Today peyotism meets opposition both from conservative tribalists and from the small group of more educated Indians who have adapted more fully to white standards and see it as evidence of backwardness.

Peyote Christianized

Even though it cannot be claimed as a remnant of indigenous Indian culture, there is no doubt that peyotism is a native religious movement. Some of its advocates have said that the white man has the Bible (or Jesus) and the Indian has peyote. Others have attempted to assimilate peyotism to Christianity in various ways, and present it as a variant of the Christian faith.

It met the opposition of the Department of Indian Affairs at an early date, and the consumption of the drug was prohibited by a number of states (Oklahoma in 1899, California, Nevada and Utah in 1917, and several other states at later dates). In response to this pattern of persecution, the votaries of peyote saw the necessity of organizing themselves as a recognized Church, a pattern that had been successfully established by the Indian Shaker Church in Oregon some years before. A group of Oto registered the Firstborn Church of Christ in 1914 in Oklahoma.

A larger, inter-tribal movement was established in 1918 as the Native American Church. This organization, in contrast to the Firstborn Church, emphasized the use of peyote as its explicit purpose in an article which declared: 'The purpose for which this corporation is formed is to foster and promote the religious belief of the several tribes of Indians in the State of Oklahoma, in the Christian religion with the practice of the Peyote sacrament as commonly understood and used among the adherents of this religion . . . The organization became a national organization in 1944, and an international organization (to embrace Canada) in 1955.

The movement has accelerated the trend towards the Christianization of peyotism. Peyote is said to be used as a sacrament; the Trinity is invoked; the Bible is placed on the altar, and various scriptural references to a Comforter and the use of herbs and roots are invoked in defence of peyotism. Some apologists use Romans, chapter 14, verses 1–3, as a particular defence, implying that Indians are weak and cannot take the strong meat suitable for white Christians.

Certainly peyotism is in many ways a religion of withdrawal and submission. It encourages resigned contemplation, and the maintenance of an Indian tradition and an Indian way of life. By exhorting sobriety, high moral standards and personal decorum, it offers the Indian dignity in defeat, and simultaneously serves as an agency of adjustment to the dominant white culture. For people with little access to, or little faith in, white medical practice, it offers a system of curing which has at least continuity with traditional practice, much as it may differ in detail. The primary function of peyote itself is undoubtedly the provision of solace and the escape into dreams from the particular miseries of a demoralized people and a dying indigenous culture.

In the curve of a hill, in the lofty rigidity of a tree, in fruit such as the many-seeded fig, symbols of sexual potency have been recognized, as indeed they may be seen in man's own handiwork; the main purpose of phallic symbolism is to inspire man or Nature to increase and multiply

PHALLIC SYMBOLISM

IT WAS ONCE widely believed that a magical power resided in the male and female organs of sex. The powers of reproduction were thought to be among the fundamental potencies of the universe. From earliest times men have been aware of the numinous mystery of sexual intercourse and have idealized the sexual apparatus as the seat of pleasurable experience, the fount of all creative activity, and the origin of all the manifold pageantry of the life around them. They made images of the sexual organs in realistic or symbolic forms, and treated them both as objects of reverence and the source of fecundity and increase, and as the power behind paternity, motherhood, fertility, food and seasonal cycles. Some authorities believe that these images may have been worshipped even before homage was paid to the gods themselves.

But these representations are not just material substitutes for the objects depicted. A distinction must be drawn between a symbol and a sign. The latter, such as the familiar traffic sign, is fixed and limited, and has no relevance beyond the purpose immediately intended. A symbol, on the other hand, is a sign with a profound meaning, which covers a much wider range of significance, and in many cases is believed to be occultly linked with what it represents. Symbols are products of the unconscious

The organs of generation, male and female, were often modelled in disproportionate size to stress their power and importance: Etruscan figure in bronze, 4th to 3rd centuries BC

mind and connect almost magically with various levels of reality.

Phallic symbols are close to what psychologists call archetypal forms; they relate not only to individual but to past racial experience. It is felt that many such phallic symbols arose spontaneously in varied guises in dreams and trances, and came to be embodied in folklore, mythology and religion.

From prehistoric times men have made clay idols, wooden figures and metal sculptures, depicting the primary sexual attributes of their chief deities. The walls of many old Egyptian temples have phallic carvings, and the Greek historian and traveller Herodotus described phallic statues of Osiris in Egyptian villages in his day, in the 5th century BC. In certain ancient Egyptian ceremonies the figure of the male deity was carried in procession with organ erect. Such ithyphallic statuettes were modelled on a smaller scale and popularly used in various rites as talismanic figurines to cure disease, obtain children, cure impotence or bring good luck.

Similar representations are found in the early centres of civilization in Central and South America. Phallicism is found in profusion in the religious life of India, notably in the stylized representations of the male and female principles known as the *lingam* and the *yoni*. China and Japan are no less prodigal in their portrayal of the sex organs, both separately and in union. Phallicism is also widespread among certain tribal religions in West Africa, and was prominent in the religious life of Arabia before Islam. The prophet Mohammed was said to have destroyed dozens of obscene idols when he conquered Mecca, in a determined campaign to obliterate all traces of the older religion.

Wherever phallic worship prevailed, ritual dances were enacted, hymns were sung, and the sacred symbol adored as the supreme deity of the pantheon. Temple prostitutes were in attendance to serve the devotees, and on certain occasions the act of intercourse was dramatized by the high priest and priestess, to imitate the principal divine function. At appointed times and seasons of the year phallic emblems were consumed at a ritual supper. Bread was baked in the shape of the male or female organ, or the female breast, or the two organs conjoined in union, and these were eaten by the worshippers or carried home to the family in order to increase or induce their power of fertility. Even the more civilized Greeks used phallus-shaped cakes at their sacred festivals, such as the *Thesmophoria*.

It was inevitable that where the power of the sexual element was uninhibitedly recognized, it should be raised to divine status and represented by gods and goddesses. Such divinities of sexuality are found in many religious systems: in Egypt there were Isis and Osiris; in Canaan, Baal and Ashtoreth; in India, Shiva and Shakti. Among the Greeks and Romans there were Aphrodite or Venus, Priapus, Pan and several others. These deities took under their special care the fertility of crops and cattle, and the fecundity of women. Temples dedicated to them contained the 'organs of generation', both male and female, often modelled in disproportionate size to emphasize their importance. Where male deities were depicted they were often shown with the phallus erect.

A Catalogue of Symbols

Evidence of phallic symbolism is found long before man became 'civilized'. Prehistoric man was surrounded by the unpredictable vagaries of Nature; and as he developed his knowledge of agriculture and animal husbandry, he became increasingly aware of the need to ensure the fertility of his fields and livestock. And so he began to evolve the earliest magical symbolism to achieve their increase.

The catalogue of symbols naturally grew with the development of his civilization. The phallus, being the direct instrument of increase, and the womb, being the receptacle wherein life was incubated, naturally became the two principal symbols.

Apart from these obvious emblems, many others were adopted, on an analogous association of ideas, from natural phenomena – from the sky, the life-giving rain, the pregnant earth, the rounded hills, from rivers and mountain cascades, from plants and fruit and flowers. Fruit-bearing trees that gave proof of their fertility, such as the fig with its myriad seeds, were almost universally upheld as representing sexual abundance. Again, the many-petalled lotus and the rose express a much more sophistical

The feeling that the sex organs are dirty and disgusting has not been shared by most of the world's population. 'The powers of reproduction were thought to be among the fundamental potencies of the universe', and to represent them in images was to invoke them to activity. A figure of him in this form frequently stood outside houses to guard them

stylization of such symbols; in Eastern and Western traditions respectively both have been elevated to the status of almost religious and mystical importance (see FIG; LOTUS; ROSE).

Biblical Euphemisms

The animal kingdom has also made its contribution. Because of their shape and smoothness the fish and the snake naturally brought to mind a phallic comparison (see FISH; SERPENT). The cowrie shell and the conch whose ridges, convolutions and pink interior suggested the vulva, were widely used to symbolize that feature of the female body. Among the birds, the dove and the sparrow with their frequent love-play, and among the domesticated animals horned beasts like the bull, the ram and the goat, because of their aggressive virility, became the special exemplars of fecundity (see BULL; DOVE; GOAT).

The Bible is replete with phallic symbolism, and with allusions to the male and female reproductive organs and the process of procreation. Like other ancient scriptures the Bible has suffered greatly at the hands of its editors who, with misplaced intent, bowdlerized the more suggestive passages and removed many references of direct sexual significance. But their revisions were not always able to conceal the original meaning.

Translators into the modern languages have further subjected the biblical texts to modification, in deference to the prevailing sentiments regarding the propriety of having the holy Scriptures contain references to the excesses of oriental libidinousness; for certain terms of dubious significance, they have preferred the more innocuous alternatives. It has been suggested that words like 'loins' and 'rock' are euphemisms, and refer to the phallus; 'groves' and 'high places' refer to places of cult prostitution; 'knowledge' often means sexual intercourse.

The pillar or pole had a phallic connotation, and there are several references in the Old Testament to such objects found in the sacred groves dedicated to phallic rites. Ceremonial worship in such groves included the insertion of a pole into a stone socket, to symbolize the union of the two sex principles. These rites were deplored by the prophets as a menace to the worship of Yahweh, and many attempts were made to root out such Canaanitish abominations.

Some authorities have held that the ark of the covenant, the wooden chest that was housed in the Holy of Holies in the Temple of King Solomon, contained a number of cult objects among which was a symbolic image of the masculine and feminine sexual organs in union. Such representations are found in several ancient religious sculptures. The ancient Greeks celebrated the Eleusinian Mysteries (see ELEUSIS), of which not much is known. What seems clear is that there was a ritual ceremony in which certain things 'not to be mentioned' were born in sacred procession in a closed basket. Some said that the basket contained a model of the male organ locked in union with the female organ of the goddess Demeter.

A great deal of sexual symbolism has been ascribed to architecture, in particular to religious buildings, and phallic origins have been traced in the columns and capitals, the round towers, the spires and minarets, while the female organs have been seen as

British Museum/C. M. Dixon

the basis of the arch and the keystone. While it may be objected that such parallels are exaggerated, there does seem to be some justification for this view in the obvious shape of certain architectural features. Although it may be difficult to concede that every dome represents the female breast or every pillar the virile member, some structural components do strongly suggest phallic affinities. Besides these symbolizations, there are other details that are quite plainly sexual in character. In Ireland until comparatively recently there were carvings of females with very exaggerated sexual organs called *Sheila-na-gig*, and these frequently formed the keystone of the arches on church doors. Most of them were removed during the 19th century, and some have been placed in museums. Such figures are also known to have existed in various English churches.

A Freudian Interpretation

Phallic symbolism was also carried over into spheres of life where its character was not at once apparent. The shape of the organs was stylized in elongations and points, and in ovals and circles. Freudian psychology seemed to confirm the sexual connotation of such symbols, and in general sticks, crosses, poles, knives, fish and trees represented the penis; while pits, caves, wells and gardens represented the female genitals. Naturally, many such representations were dismissed as being based on fanciful resemblances, but the underlying motivation in most cases has been clear on closer examination.

Modern students find evidence of sexual symbolism not only in those resemblances found in Nature and in the visible and material artefacts made by man, but also in the behaviour of men and women, in their speech, in their social conduct, in their games and pastimes (the maypole is a conspicuous example), their hidden revelations, as in dreams, and in their intellectual and artistic activities such as art, music and even philosophy. There is hardly a facet of life to which a sexual meaning has not been attributed.

In the past the intention of all phallic images was largely magical in character. They were not made for amusement, or for sexual instruction or marital inspiration, like a pornographic device or a 'pin-up'. They were primarily meant to fulfil an occult function. In some cases the reason behind such reproductions was to inspire man or Nature to bring down upon the community abundance and increase for men, animals and plants. As such it was a form of imitative magic, to induce heaven to respond in the manner suggested by the symbol and invoke the supernatural powers so that they would bestow the blessings of fertility upon the earth.

These symbols, either the phallus or vulva, separately or in union, were likewise used as a means of averting the Evil Eye and the effects of envy and malice, or to ward off evil spirits whose presence might bring danger to the household, and in general any evil influences or ill-luck that might be around. Until recently shops in China had erotic prints hanging on the wall to prevent fires.

Ronald Sheridan

In India the male and female elements in the universe were personified as Shiva and Shakti, whose generative powers 'cross and recross to form the basic building bricks of the entire cosmos' *Left* Ithyphallic figure of Shiva in his creative aspect *Above* Wall painting from a Roman brothel in Pompeii

The Great Divide

In some esoteric religious cults the whole universe is thought to be ultimately resolved into two basic elements which are sexual in character. The Taoists of China, for example, speak of Yang, the male principle, and Yin, the female principle, which permeate everything, for without these two elements nothing can subsist.

In Indian religion the Tantrics (see TANTRISM) similarly postulate these two dual elements in divine form as Shiva and Shakti, the male and female deities whose generative powers, sent forth in the form of radiant energy, cross and recross to form the basic building bricks of the entire cosmos. Shiva and Shakti are inherent in all things, and nothing can exist without their presence (see SHIVA). Nothing was more exalted than the sexual function, and the act of union was woven into the creeds of many sects as part of the divine purpose underlying all creation. All existence was thought to be contingent on the act of sex, and some Cabalists, amongst others, held that the universe existed only so long as the sex act was being performed and that if at any time it was stopped, the whole panorama of the universe would come to a standstill and melt away.

It has also appeared to some people that there was a close internal correspondence between the sexual organs and the cosmos, and therefore a cosmic significance was read into the sexual act, making it a kind of mystery which could be symbolically enacted on earth to create a corresponding activity in the higher supraterrestrial planes. Since man was part of the cosmic pattern, and in fact the chief representative of the cosmos in its entirety, it was thought possible for him by means of certain actions to activate the cosmic forces. This is the basis of the curious phenomena of sexual mysticism wherever it is taught and practised.

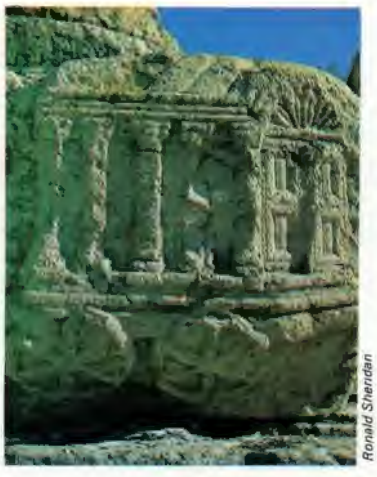
Philadelphia Experiment

The Philadelphia Experiment was alleged to have been conducted by the U.S. Office of Naval Research in 1943. At the heart of the tale lie the principles of Einstein's as yet unproved Unified Field Theory. The Experiment is said to have successfully applied these principles to the U.S.S. *Eldridge*, with the result that the ship became invisible, disappeared from Philadelphia and reappeared only minutes later in Norfolk, Virginia. In their 1979 book *The Philadelphia Experiment* authors William Moore and Charles Berlitz investigate the story.

Phantasms of the Living

Spectral appearances of people who are alive, distinguished from the ghosts of the dead; frequently reported appearing to close friends or relatives of the person seen at a time of crisis in that person's life (just before the moment of death, for instance) or to herald some disaster; to see your own 'double' is widely believed to be a sign that your death is imminent.

See ASTRAL BODY; DOUBLE; GHOSTS; MYERS; SPONTANEOUS PSI EXPERIENCES.



Ronald Sheridan

Pharisees

Described by the historian Josephus as 'a body of Jews who profess to be more religious than the rest and to explain the law more precisely': they attached great importance to strict observance of the written law of Moses and the traditional law which had grown up around it; though attacked as pedants and hypocrites in the New Testament, they seem to have been admired by most Jews.

PHILOSOPHERS' STONE

ALCHEMY drew many of its basic ideas from late classical spirituality, as manifested, for example, in gnostic and Neoplatonic doctrines, and after the triumph of Christianity advocates of these ideas found it necessary to work 'underground'. To camouflage their ideas they resorted to an obscure symbolic language in committing their theories to writing which remains largely incomprehensible to us (see ALCHEMY).

Alchemical texts were not written to provide outsiders with information. Only those who had grasped the fundamental knowledge by the grace of God, and who had been instructed personally by the more experienced, could expect to find confirmation and additional instrnction in these books. Those not initiated had little chance of attaining the goal of the art. For them the process of transmutation, veiled in obscure symbolic imagery, remained a series of mysterious and virtually unworkable chemical operations which were supposed to make it possible to turn base metals into silver and gold. In fact only a few of the instructions, especially in the older treatises, relate to chemical operations. The bulk of them are spiritual processes of purging and purifying. But the alchemist was not merely talking in allegories. The true adept was not ashamed to work with chemicals in his laboratory, in order to see the concrete realization of his theory of the progressive spiritualization of matter. It is this parallel concept of both a spiritual and a material process, regarded as perfectly natural by the alchemists, which causes us to classify alchemy as one of the magical arts. For in alchemy no one asks how the spiritual perfection of the adept is supposed to bring about the purification of the substance he is treating. Our scientific logic simply does not apply to the alchemist's mode of thought.

In the older texts the Philosophers' Stone, *lapis philosophorum* or *lapis philosophicum*, is the final object of all the operations. By a curious paradox they also frequently use the same expression for the substance with which the work has to begin, the *prima materia*, the material to be worked on. The beginning and the ending of the process are firmly connected, and the primary substance is often referred to as 'our stone', *lapis noster*, as if its ability to germinate and develop into the final substance was its basic property.

The *prima materia* was the subject of much speculation. It is described as a substance which is common and easily obtained but only the initiated recognize it. A 17th century text says: 'I shall tell you of a stone which is not a stone . . . It is like thick curdling milk, but it is not milk, like mud, but not like any other mud. It resembles a green poisonous thing, because frogs crouch beneath it, but it is not a poison, it is a medicine. In sum, it is the earth from which Adam was fashioned.' The alchemist Heinrich Khunrath (1560–1605) referred to the primary substance as 'Adam's slimy earth'.

Hermann Kopp, a German historian of alchemy, says: 'Substances from the mineral kingdom, different plants and saps, the secretions and excretions of the animal world, even the most disgusting things were subjected to a thorough examination . . . They tried milk, but with little faith, and then saliva to see if that was the *materia prima*, and frequently made use of human faeces and urine in their operations.' It is not clear what was really involved but the authors of the old texts probably imagined it to be some form of primeval slime, from which all the phenomena of Nature had developed.

Making the Stone

Once the alchemist had chosen a substance on which to work, it had then to pass through various stages before it could be deemed to have all the qualities of the Stone. In describing the process the texts frequently differ in detail but roughly the same general pattern of operations was usually recommended. First, the substance must be reduced to a liquid, or dissolved in a liquid called 'mercurial water', for only in this state was it capable of change. This stage in the process was called solution or liquefaction.

Next, the material was embedded in 'the belly of the earth', in horse dung, whose gently fermenting heat caused it to darken in colour. This was the *nigredo*, sometimes symbolically represented by a raven, and the material underwent putrefaction in the same way as a buried corpse. The disintegration was followed by a process of reversal during which the material lost its dark hue and became lighter. This was the *albedo* or 'whitening', which might be symbolically expressed as the black raven turning into a white dove. The 'spirit', or matter dissipated by evaporation, must be returned to the transformed substance in the process called reduction. The white material was treated with 'philosophical milk' and turned yellow.

This was a critical stage in the operation for the process of reduction could easily go wrong, and all the previous efforts were wasted. However, if it was successfully achieved, the material in the alchemist's vessel turned red (*rubedo*) and was said to 'turn to blood', like 'a red dragon tearing itself to pieces'. The liquid material was now required to regain its former solid state, but at a much higher spiritual level, in a process known as fixation or coagulation. Many texts recommend the application of heat from the 'philosophical fire' and an additive of 'gold yeast' (a mixture of sulphur, gold and quicksilver) at this point.

The final stage, after all the other processes have been completed successfully, is the formation of the Philosophers' Stone itself. From it the elixir of life can be produced, and it can be used to turn lead into gold. Alchemical texts differ in the number of stages into which they divide the operation, some reckoning four essential steps, some seven, some 12, but the underlying procedure is usually roughly similar.

On the other hand, Johannes Isaac Hollandus, an alchemist active at the turn of the 16th and 17th centuries, recommended that the purified parts of the *prima materia* (which he calls 'vitriol') should be oxidized at a moderate temperature, preferably in a sealed vessel, until they turn red. The oxide is then dissolved in distilled vinegar and evaporated, this operation being repeated several times. The purified residue is treated in a retort: yellow vapours rise up and are condensed, followed by a red 'oil' and finally by white vapours. The pure white salt left at the bottom of the retort is impregnated with its own distillate, and this process is repeated until a mass emerges which is 'firm, but fluid like wax and as penetrating as oil'. This is the Stone which ennobles metals and as an elixir can cure all ills.

This description is clearly more concerned with genuine chemical processes and less with symbols of spiritual purification. It dates from the time when alchemy was about to split into speculative 'hermetic philosophy' on the one hand, and chemistry as we know it on the other. The important nigredo or 'blackening' stage has already disappeared, and it is precisely this stage which offers such interesting possibilities of interpretation in the light of Jungian psychology. Originally, the alchemist's material seems to have undergone a process which was regarded as a 'descent', followed by an 'ascent' to a degree of perfection higher than its initial state. The 'resurrection' is described in glowing symbolic terms in the older texts and the descent was evidently regarded as a necessary precondition for it. There seems to be a gnostic view here, of matter as basically anti-spiritual and needing to be destroyed to

Directions for making the Philosophers' Stone were frequently couched in a symbolic language so obscure that it has largely defied interpretation ever since ***Below*** **Illustration from Elias Ashmole's** ***Theatrum Chemicum Britannicum*** **(1652), showing the fixed (toad) and volatile (serpent) elements in the process, with the eagle and the drops of water as symbols of distillation and purification** ***Right*** **Another 17th century illustration: the hybrid creatures show opposites which must be separated in the process to grow the tree of purification**

release the divine spark, the captive spiritual principle hidden within it. In alchemical texts down to the 15th century no distinction is made between the spiritual and chemical processes intended to achieve this. The adept's efforts were directed towards discovering in the chemical transformation a reflection and confirmation of his own spiritual progress.

The Red Lion

It was only in later centuries that the idealistic side of alchemy grew less important and gave way to chemical operations intended to produce synthetic gold. Descriptions of the Philosophers' Stone now became clearer and more intelligible. It is said to have a powerful but pleasing smell. Descriptions of the colour vary. In a work attributed to the mysterious 'Basil Valentine', *On the great stone of the ancient magi*, it is described as follows: 'Its colour ranges from transparent red to dark brown, from the colour of a ruby to that of a garnet, and it is incredibly heavy.' In *De signatura rerum naturalium* Paracelsus describes the Philosophers' Stone as exceedingly heavy, like a brilliant ruby (hence the symbol of the red lion), and as transparent as crystal. It is not hard, however, but as supple as resin and it will shatter like glass. When pulverized, it looks like saffron.

Johannes Baptist van Helmont, a 17th century alchemist and scientist from Brabant, describes the Stone as a heavy powder of saffron hue, which sparkles like glass that has not been completely pulverized. *The Stone of the Philosophers*, a much quoted book by George Starkey, an English adept of the 16th and 17th centuries, says: 'Having thus completed the operation, let the vessel cool, and on opening it you will perceive your matter to be fixed into a ponderous mass, thoroughly of a scarlet colour, which is easily reducible by scraping, or otherwise, and in being heated in the fire flows like wax, without smoking, flaming, or loss of substance, returning when cold to its former fixity, heavier than gold bulk for bulk, yet easy to be dissolved in any liquid, in which a few grains being taken its operation most wonderfully pervades the human body, to the extirpation of all disorders, prolonging life by its cure to its utmost period.'

The similarity between so many descriptions of the Stone suggest that either the individual authors copied from each other, or that some substance with remarkable qualities really did exist and, because it was real, was described in the same way. It no longer seems to be a matter of symbols of spiritual purification but of actual chemical processes which gave results. In the 16th century and later alchemical instructions became increasingly practical and, in the process, lose some of the exciting fascination of the older symbolism. Perhaps there really was at that time some remarkable medicine now forgotten, but the other attribute claimed for the Stone, its ability to turn molten lead into gold, is entirely contrary to our modern way of thinking. It is possible that we are confronted here with a 'parachemical' phenomenon, in which the mind of the adept himself, in a state of ecstatic rapture, caused chemical changes which would otherwise be inconceivable.

If alchemy had been concerned only with the transmutation of base metals into gold, we might well dismiss it as an aberration. Untreated ores are often quite plain, powdery, amorphous substances which show their true brilliance only when they have been skilfully smelted. An error of judgement may have caused metallurgists long ago to try to 'improve' the metals even more, to give them an ever-increasing brilliance and resemblance to gold. But in the more important of the older sources the main concern of the alchemist is not to make synthetic gold. He was concerned with the spiritualization of both himself and his material, with a gradual and toilsome progression towards a great spiritual objective.

The alchemists employed what seem to us strange methods but they were guided by noble motives in their search for the Philosophers' Stone, which was thought to function as a tangible spark of divine creative power in the midst of unpurified matter. One cannot but respect the adept's aspiring labours and relentless application in a quest which demanded all his resources. *Ars totum requirit hominem* was a celebrated maxim: 'the art requires the whole man'.

HANS BIEDERMANN

PHOENICIANS & CARTHAGINIANS

British Museum/C. M. Dixon

A DEGREE OF MYSTERY invests both the name and origin of the Phoenicians. *Phoenix* was a Greek word meaning 'purple-red' and 'palm tree'. The Greeks seem originally to have applied the name 'Phoenician' to the inhabitants of the coastal lands of the eastern Mediterranean, between the Nahr-el-Kabir and Mount Carmel. It is not certain whether the name referred to the darker complexion of these people in contrast to the lighter colouring of the Greeks, or to the fact that palm trees were a distinctive feature of their land. Phoenicia was also the home of the celebrated purple dye, made from the murex mollusc, which was highly prized in the ancient world. The Roman form of the name was *Poeni*, which was also used to designate the Carthaginians who had originated from Phoenicia. The Phoenicians, however, called themselves 'Canaanites' and their land was 'Canaan', so well known from the Hebrew Bible.

According to Greek writers, the Phoenicians had originally lived in the Persian Gulf area, but had migrated westwards at a remote period and settled on the Mediterranean coast. This account of their origins has not been confirmed by modern archeology. There is, indeed, much evidence of migrations of Semitic peoples from Arabia and the Persian Gulf into Syria and Palestine during the third and second millennia BC. But it would appear also that Semites were living in this area from at least the third millennium, and they cannot be distinguished from any 'Canaanite invaders'. We have, therefore, to consider the Phoenicians as Canaanites, that is, as Semitic inhabitants of the coastal area of the eastern Mediterranean. The term may also be used in a special sense after about 1200 BC, for as a result of the settlement of the Israelites and Philistines about this time in the district later known as Palestine, the area of Canaanite political independence became limited approximately to the territory occupied by the four chief Phoenician cities of Tyre, Sidon, Byblos and Aradus.

The Father of Men

Since the Phoenicians were Canaanites, the earlier form of their religion can now be studied from the ritual and mythological texts discovered since 1928 by excavation of the Canaanite city of Ugarit, close to the modern Ras Shamra. The Ugaritic texts reveal that the Canaanites of the 15th and 14th centuries BC worshipped a number of gods. The presiding deity was El, described as 'the Father of Men', who was regarded as benevolent and merciful. He was 'the Creator of Created Things', and 'the Bull'; the latter title doubtless indicated strength and virility. He is depicted on a stele as a bearded man, seated on a throne, and shown

The Phoenicians were energetic traders and colonizers who readily adopted foreign gods and foreign art styles *Left* Ivory found at Nimrud, from furniture intended for export to Egypt where the lotus was a sacred plant: 8th century BC *Right* Stele from Carthage, the principal Phoenician colony, showing animal sacrifice and offerings at an altar

British Museum/C. M. Dixon

with a tall crown adorned by a pair of bull's horns. A worshipper, probably a king, stands before him, making an offering.

Although El was the supreme deity, the most active god of the Canaanite pantheon was Baal (see BAAL). He was represented as young and vigorous, armed with an axe and a spear, symbolizing lightning. These weapons indicate his original name and nature – he was Hadad, the weather god. 'Baal' was a title meaning 'lord', and signified ownership or sovereignty of the land. The use of this title denoted the deity's connection with the fertility cult of Canaan; as the weather god he brought the winter rains that fertilized the land. In the mythological texts Baal is described as 'the son of Dagon', the corn god, and at Ugarit their temples were adjacent.

Closely associated with Baal was the fertility goddess Anat, who in later forms of Canaanite-Phoenician religion was called Astarte (see ASTARTE). On a stele found at Bethshan, Anat is described in Egyptian hieroglyphs as 'Antit, Queen of Heaven and Mistress of all the gods'. She seems also to have been known as *Qodshu*, which could be interpreted as 'sacred prostitute' and refer to the licentious fertility rites which were practised in her sanctuaries. Anat or Astarte was generally depicted in art as nude, with the sexual attributes emphasized.

Among the texts recorded on the tablets found at Ugarit is a long mythological poem which tells of the conflict between Baal and Mot, the personification of drought and sterility. The theme was probably inspired by the annual struggle between vegetation and drought. Baal was apparently conceived of as the spirit of vegetation as well as a fertility god. In the poem, Baal is slain by Mot and descends into the underworld. His death is mourned by El; and Anat seeks for his corpse, which she finds and buries with lamentation and the appropriate funerary rites. There is doubtless some connection here between the actions of Anat and those of the Egyptian goddess Isis in her quest for Osiris (see ISIS; OSIRIS). Anat takes revenge on Mot by killing him and treating his body as grain, winnowing, parching and grinding it. Baal eventually returns from the underworld, and Anat announces that rain will come again and the

British Museum/C. M. Dixon

parched earth will revive. This mythological text was doubtless related to an annual ritual commemorating the death and resurrection of vegetation (see DYING GOD; VEGETATION SPIRITS).

Evidence found at Ugarit and other sites shows that the Canaanites were attracted to other religions. Ugarit itself was a cosmopolitan port, where many languages were spoken and where Egyptian, Mesopotamian, Hittite, Hurrian and Aegean-Mycenean influences were current. A notable memorial of Aegean-Mycenean religion is an ivory carving of the fertility goddess known as the *Potnia Theron* or 'Mistress of the Animals', which was found in a tomb. The stele unearthed at Bethshan, depicting Anat-Astarte, also shows on either side of the goddess the ithyphallic Egyptian god Min and the Canaanite god Reshef, who holds an ankh, the Egyptian symbol of life. In this connection, too, there are the Egyptian mummiform sarcophagi found at Sidon, one of which bears the funerary inscription in Phoenician of Eshmunazar, a king of Sidon probably in the 6th century BC. This readiness to accept foreign deities was also a feature of Carthaginian life. The acceptance, however, often took the form of identifying the foreign deity with a Canaanite, Phoenician or Carthaginian deity, which led to confusion of conception: thus the Baalat ('lady') of Byblos was identified with the Egyptian Isis or Hathor; and Melkart, the patron god of Tyre was assimilated with the Greek Hercules.

As the titles Baal ('lord') and Baalat ('lady') were used in conjunction with some other designations to denote the patron deity of some particular place, so other titles were used. A notable instance is the name Melkart, for the chief god of Tyre: it was composed of two words meaning 'ruler' or 'king', and 'city'. As Baal Melkart, this god became one of the leading deities of Carthage, the daughter city of Tyre. More difficult to explain is the name of Sidon's patron-god, Eshmun. It has been suggested that the name derives from *shem*, 'name', meaning 'the Name' above all others. Eshmun was assimilated to the Greek healing god Asclepios. He appears to have had chthonic (underworld) attributes, which would account for his close association with the fertility goddess Astarte.

Exporting Religion

Carthage, which was destined to become Rome's great rival in the Mediterranean world, was traditionally founded in 814 BC by colonists from Tyre; it was one of many Phoenician settlements on the western Mediterranean coasts. Its position, in command of the straits between North Africa

and Sicily, was one of great strategic opportunity, which it exploited to build up a commercial empire. Carthage steadily outgrew its mother city in size and importance, and even after its final destruction by Rome in 146 BC, Punic culture lived on and the old Punic gods continued to be worshipped under Roman names.

The Phoenician colonists took their native religion with them to North Africa, and it formed the fundamental pattern of Carthaginian religion. Some differences, however, did develop at Carthage, particularly with regard to the status or character of certain gods. Thus, although Melkart, the patron god of Tyre, was accorded a special position in the daughter city and an annual offering was sent to his temple at Tyre, two other deities had greater prominence at Carthage. They were Baal Hammon and Tanit Pene Baal. The origin of the former is obscure, though it has been suggested that 'Hammon' means 'altars of incense' or more plausibly, that it derives from 'Ammon', the name of the Libyan god of the Siwa oasis, whose oracle Alexander the Great once consulted. This Ammon was identified with the ancient Egyptian god Amun and the Greek Zeus.

The goddess Tanit, although her full title 'Pene Baal' meant '(Tanit) Face of Baal', seems to have had precedence over Baal Hammon, with whom she was often associated. Tanit was undoubtedly the Carthaginian counterpart of the Phoenician fertility goddess Astarte, for the latter does not appear independently of Tanit in the Carthaginian area. In Roman Carthage, Tanit was identified with Juno Caelestis, which indicates that she was also associated with the heavens. The crescent and the disc naturally suggest her connection with the moon. The emblem of the hand, with palm turned outwards, probably symbolizes protection and benediction, and anticipates the famous Islamic amulet of the 'Hand of Fatima'. But essentially mysterious is the 'sign of Tanit', which could be interpreted as a schematic figure of the goddess with arms raised in blessing, or as a Carthaginian transformation of the ankh, the Egyptian sign of life.

Centuries of Child Sacrifice

One of the most significant but sinister discoveries made on the site of Punic Carthage was that of the 'topheth' within the precinct of Tanit. The Hebrew word *topheth* occurs in an account of the reforms carried out by King Josiah at Jerusalem (2 Kings 23.10): 'And he defiled Topheth . . . that no one might burn his son or his daughter as an offering to Molech'. It used to be thought that 'Molech' was a Phoenician god, but recent research suggests that it was a term for child sacrifice practised in Canaanite-Phoenician religion. The topheth of Tanit has provided grim evidence of the longevity of the rite at Carthage, in fact from the 8th century BC to the Roman destruction of the city in 146 BC. Thousands of urns were found there containing the calcined bones of small children and birds and small animals – these latter were possibly substitute sacrifices. Small stelae, marking the burial places of the urns, mostly had dedications to Tanit Pene Baal and Baal Hammon. The purpose of these child sacrifices was probably either propitiatory or to promote fertility.

Among other Phoenician gods worshipped at Carthage were Eshmun of Sidon and Reshef. The cult of the Greek goddesses Demeter and Persephone was introduced in the 4th century BC, and after the Roman conquest the Punic deities were generally identified with the Roman deities deemed to be equivalent in character and status. The grim fanaticism that characterized both Phoenician and Carthaginian religion has been thought by some scholars to have left its impress upon ancient African Christianity.

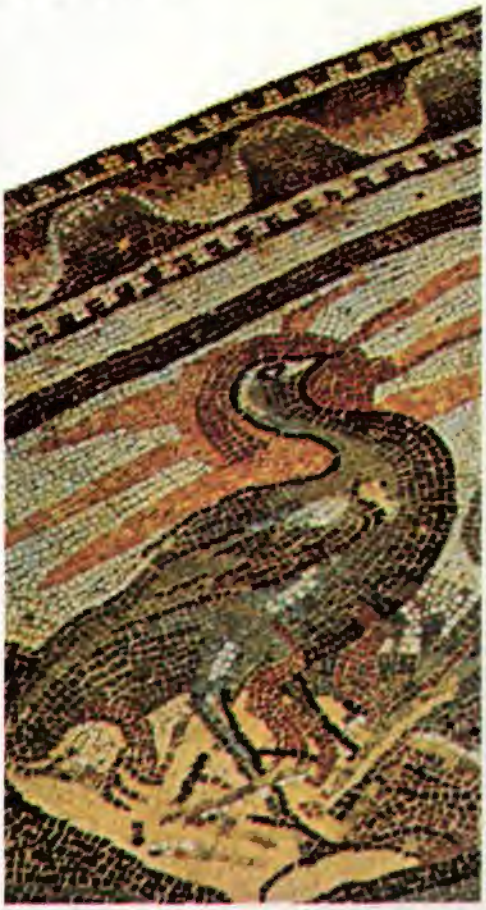
PHOENIX



Axel Poignant

The priests of Heliopolis maintained that the phoenix arrived from Arabia every 500 years, bearing its predecessor embalmed in a ball of myrrh: phoenix on a Sicilian mosaic

FOR A MYTHICAL CREATURE, the phoenix is familiar enough; it is used in everyday life as a trademark, it rises from stylized flames on heraldic bearings, it enriches the poet's language, and appears briefly in history. What its legend is and means, on the other hand, has largely been forgotten as the symbol gains wider and wider currency.

The phoenix, according to the most developed forms of the story, is a bird about the size of an eagle, brilliantly coloured in plumage; it is either purple with a golden collar, or a dazzling mixture of red, gold and blue. It is the only one of its kind, and lives in Arabia; at the end of an epoch, as it feels death drawing near, it builds a pyre of the sweetest spices, on which it then sits, singing a song of rare beauty. The rays of the sun ignite the nest, and both this and the bird are consumed to ashes. From the ashes there arises a worm, which eventually grows into a new phoenix. The bird's first task is to gather the remains of its parent and, accompanied by a throng of other birds, to fly to Heliopolis (the City of the Sun) on the Nile. Here the priests of the sun receive it with great ceremony; it buries its parent in the temple, and returns to Arabia.

The roots of this story first appear in ancient Greek literature, in Herodotus's account of Egypt (c 430 BC). When he was at Heliopolis, he was shown the bird in pictures; and its very name may be due to his confusing it with the date palm on which it is often depicted, which is also *phoenix* in Greek. It was a red-gold bird about the size of an eagle, and the priests said that it arrived there every 500 years bearing its predecessor embalmed in a ball of myrrh, which it buried in the temple of the sun. Later writers give other details, such as the bird's rebirth as a worm from its dead parent's body, and the accompanying flight of birds. There was, however, some doubt as to the length of the true interval between the arrival of two phoenixes: Aelian (c 170–235 AD) mocks the priests who do not know when it will arrive and 'have to confess that they devote their time "to putting the sun to rest with their talk", but do not know as much as birds'. Tacitus reports: 'Regarding the length of its life, accounts vary. The commonest view favours 500 years. But some estimate that it appears every 1461 years . . .' The particular phoenix which had come to his attention as a historian was that said to have arrived in the reign of Tiberius; but since the previous one had been welcomed at Heliopolis under Ptolemy III, and 'as between Ptolemy and Tiberius there were less than 250 years some have denied the authenticity of the Tiberian phoenix, which did not, they say, come from Arabia or perform the traditionally attested actions.' Pliny rejects it out of hand; although it was displayed in public, 'nobody would doubt that this phoenix is a fabrication'.

It is only in the 4th century AD that the idea of a fiery death is to be found, in two complete poems on the phoenix, by Claudian and Lactantius. This description of the bird's death is taken from Claudian, in Henry Vaughan's translation:

> He knows his time is out! and doth provide
> New principles of life; herbs he brings dried
> From the hot hills, and with rich spices frames
> A Pile shall burn, and Hatch him with his flames.
> On this the weakling sits; salutes the Sun
> With pleasant noise, and prays and begs for some
> Of his own fire, that quickly may restore
> The youth and vigour, which he had before.
> Whom soon as Phoebus spyes, stopping his rayns
> He makes a stand, and thus allayes his pains . . .
> He shakes his locks, and from his golden head,
> Shoots one bright beam, which smites with vital fire
> The willing bird: to burn is his desire,
> That he may live again; he's proud in death,
> And goes in haste to gain a better breath.
> The spicie heap fir'd with celestial rays
> Doth burn the aged Phoenix, when strait stays
> The Chariot of th'amazed Moon; the pole
> Resists the wheeling, swift Orbs, and the whole
> Fabric of Nature at a stand remains,
> Till the old bird a new, young being gains.

With this superb description of the traditional death of the phoenix, our picture of the legend is complete. Where did such a tale come from, and are its details part of the clues as to its origin or mere decoration? Herodotus's account of the phoenix as a sacred bird at Heliopolis sets us in the right direction: for in the Egyptian mythological texts, such as the Book of the Dead, which are concerned with the soul's safety in the otherworld and are often magical and obscure, the bird *bn.w* or bennu appears, with many of the attributes of the phoenix. This creature is one of the prime movers of the world: prototype of the individual soul, it arises from the Isle of Fire in the underworld and flies to Heliopolis to announce the new epoch, in which the sun itself is renewed. Because the sun, too, had been envisaged as a bird which made its daily journey from east to west, so the bennu came to be identified with Khepera (Khepri) himself, the rising sun.

Companion of the Sun

The texts on the bennu itself fall into three groups: those concerned with resurrection, those identifying it with Re-Osiris and the rites of the dead, and those identifying it with the planet Venus. The three groups are linked by the solar theme, and a new idea of the bennu appears, as a bird accompanying the sun on its daily journey. In the Apocalypse of Baruch (2nd century AD), Baruch is shown by an angel the sun as it sets out on its daily journey, accompanied by the phoenix, 'a bird as large as nine mountains'; and at twilight the same procession returns. The phoenix is weary, 'Because he holds back the rays of the sun, because of the fire and heat which last throughout the day . . . if his wings did not form a screen against the rays of the sun, no living being would survive.' This legend reappears in a slightly different form in the story of the bird called heliodromos or 'sun-runner', and other variations linger in the medieval descriptions of the phoenix.

In the Egyptian texts, the bennu is shown as a heron-like creature, which does not correspond to the eagle-like bird described by Herodotus; but it is possible that the original bennu was a falcon-like creature which was only later confused with the heron. Its colouring, gold, red, pink and blue, is that of the phoenix. Among the few details of its habits, we learn of the flight of birds which escort it at a respectful distance; perhaps a simile for the stars following Venus at eventide. A sarcophagus bears the inscription 'I am the bennu who begets himself and gives incense to Osiris.' The identification with Osiris, the god of resurrection, which is found elsewhere, strengthens the idea of the bennu as self-reviving. Finally, the bennu is associated with the new epoch or great year in the same way as the phoenix. The cycle of 1461 days (Tacitus's 'years' is an error) is exactly the length of four solar years including Leap Year day. All in all, there can be little doubt that the phoenix of Herodotus and classical tradition is indeed the same creature as the bennu of Egyptian myth.

Yet even the bennu's solar associations are not quite enough to account for the strange phenomenon of the phoenix's fiery end. Here a modern naturalist comes to our aid: Dr Maurice Burton, in his researches

into the habit of 'anting' has pointed out the parallel between this and the resurrection in flames of the phoenix. In 'anting', which is common among various species including rooks, the bird performs a series of almost ritual movements, often involving glowing cinders or actual flaming twigs, which give the impression that it is using fire and smoke to drive ants out of its feathers. Closer investigation shows that this is not the case, and the real reason for this behaviour is unknown. However, a bird emerging from the flames in this way might easily suggest revival by fire. The only weakness in this theory is that the habit has not so far been observed in any of the prototypes of the bennu and phoenix: eagle, heron and falcon.

Death in a Nest of Spice

The legend of the phoenix was widespread in the Middle Ages: but medieval curiosity about the natural world was limited. Accepted authority was preferred, and the authority on bird and animal lore was the work known as the *Physiologus* or Naturalist. This small collection of descriptions was steadily enlarged between the 6th and 13th centuries and became known as the bestiary or Book of Beasts. The most important change was that the original text was turned into a moral tract by the addition of an explanation in theological terms of the natural events. The entry for the phoenix, as expected, reminds us of the Resurrection. First the version by which it meets a fiery end is given, and is used as an argument for the truth of the scriptural account of the Passion: 'If the Phoenix has the power to die and rise again, why, silly man, are you scandalised at the word of God . . .?' The alternative version is then given (ignoring the contradiction), according to which the bird's body decays in a nest of spices and a worm emerges to grow into a new phoenix.

The bestiary was very popular, and many variations developed, both orthodox and unorthodox. In one version, the phoenix is confused with the eagle, but the most interesting is that of the bestiary of the heretical Waldensian sect that flourished in France and Italy in the 12th century. This revives an aspect of the legend which was rarely touched on: the phoenix's sweet song on its pyre, which was taken to symbolize man's duty to praise God. Although this fable is very like that of the swan that sang so beautifully before it died, it is a very old attribute of the phoenix, and found in Roman writers. In the most unusual of all the bestiaries, the 'Lovers' Book of Beasts', the phoenix masquerades as a salamander, and can only be identified by the illustration, which shows it as a bird.

From theology, the phoenix migrates to literature. The cold sceptical eye of the 17th century ejected it from the canon of natural history, but poets, seized on it as an exotic symbol of the unique – which quickly became debased to the merely rare – and phoenixes abound in their eulogies of

Victoria and Albert Museum/Michael Holford

Pair of phoenixes on a Chinese tapestry: renowned for its song, the Chinese phoenix is a heavenly emissary which appears when the land enjoys the gods' favour

monarchs and other great men of the world, and in the lines inspired by the great beauties of the day. In this century, W. B. Yeats, thinking of his love Maud Gonne, could revive the myth's magic as he scorned 'a score of duchesses surpassing womankind' for her sake, saying 'I knew a phoenix in my youth, so let them have their day.' Florian, the 18th century French writer of fables, gave the myth a new charm by placing it in a homely setting. One day the phoenix appears in the forests of France, where all the birds are overcome with envy and admiration – all, that is, save the turtledove; she sighs as she gazes at the phoenix, and when her mate asks her the reason for this, answers: 'I can only pity him; he is the only one of his kind.' On a more complex and subtle plane are two symbolic recreations of the legend in poems by Sidney Keyes and Herbert Read. In Keyes' poem, the phoenix stands for corrupting pride, while in sharp contrast Read sees it as an archetype of life's continuation.

Outside this Western tradition there is the Chinese phoenix. As with the bennu bird, the equation between *feng-hwang* and phoenix is not absolute. The feng-hwang is not unique: feng is the male bird, hwang the female. But in other respects it resembles the Western phoenix. It is renowned for its sweet song and is accompanied by crowds of birds. It is a heavenly emissary which appears when the land enjoys the gods' favour, and is not seen in times of war, just as in Roman Egypt the phoenix was a good omen. The idea of the rarity of the bird is complicated by reports that if you play the flute, almost invariably the creature will appear to accompany you, and when friends gather in a garden in the cool of the evening to play music together, it will often join them. The feng-hwang, however, is really part of the otherworld, as one of the four spiritual creatures, symbol of the empress and of the element fire. It bears on its body the characters for virtue, righteousness, humanity, sincerity and integrity; it will eat no living thing, not even grass; and of all four spiritual creatures – tortoise, *ki-lin* (unicorn), dragon and feng-hwang – it is the feng-hwang which is the most exalted.

RICHARD BARBER

Two scholars were hounded from their own country for suggesting that man's physical constitution determined his character; the phrenologists limited their investigations to the head while physiognomists extended their study to the whole body

PHRENOLOGY & PHYSIOGNOMY

A MAN considered to have 'shifty eyes', 'a suspicious manner' or 'an arrogant walk' may on these counts be assessed and judged by others, for it seems natural to believe that from the outer we can tell the inner man. Even modern scientists contend that they can classify human beings according to physical type and that each physical category possesses a distinct set of behavioural characteristics. The forerunners of these more objective methods of assessing character by studying physique were phrenology and physiognomy.

Phrenology holds that a man's character is determined by the interaction of various organs of the brain, all of which have a specific physical location in the head. The size of these organs can be detected by a trained phrenologist from the shape of the skull: by feeling a certain area of the cranium the expert can tell, for example, how well developed is his subject's 'organ of combativeness'; in this way he can decide whether his is a passive or an aggressive personality. Physiognomy extends the principle of assessing human personality according to physical indices to the entire man – the formation of any part of the body might tell the physiognomist about the man beneath.

At the turn of the 18th and 19th centuries, when new 'sciences' like that of mesmerism (see MESMER) mushroomed overnight, such means of 'weighing' mankind attracted the attention of dedicated investigators. Both phrenology and physiognomy owed some part of their 19th century vogue to the publication of the *Physiognomical Fragments* of J. K. Lavater, a Swiss divine who saw in the human body the reflection of the soul within (see LAVATER). It was phrenology, however, which caught the popular imagination, and the founder of 'that science teeming with the amelioration of society and the happiness of the species' was a natural scientist, whose science was the centre of strenuous conflict, seeming as it did to overturn the accepted version of man's place in the universe.

Franz Joseph Gall (1758–1828) and his disciple J. K. Spurzheim (1776–1832) demonstrated in themselves the conflict which took place between what appeared to be the claims of pure science and those of inherited belief. During the 1790s Gall was so fashionable a physician in Vienna that he could afford to turn down the post of doctor to the Emperor's court. At this period his mind – like that of Mesmer before him – turned to speculations of his student days. Gradually he evolved his personal theories of human nature, assisted after 1804 by Spurzheim. They linked their investigations into the construction of the brain to speculations about the springs of human conduct. Gradually, the various 'organs' of phrenology were discovered by more or less arbitrary means. For example, Gall located his 'organ of self-esteem' by examining the head of a beggar who blamed his pride for reducing him to poverty. In Gall's system, 33 organs were located in the head – Spurzheim was to add a further four – and all were given names and numbers. There were said to be three classes of organs: those controlling basic characteristics; those governing 'sentiments' like benevolence and mirthfulness; and a class of purely intellectual capacities, such as the ability to measure size or appreciate the sequence of cause and effect. The phrenologists' conclusions were summed up in a poem called *The Craniad*, published in 1817:

> In every human character 'there be'
> Organs and faculties full thirty-three
> Distinct in kinds, and differing in extent –
> But natural, constant, marked and permanent.
> Within some heads they're large, – in others small,
> But all possess them, and possess them all.
> They act in various ways, – alone, combined,
> And hence the varied character of *mind*.

Before Gall and Spurzheim there had been several attempts to localize the functions of the brain. Galen and his followers had

taught that the brain was the seat of the soul; and in the early 13th century Albertus Magnus had divided the skull into three segments, giving to the forehead the control of judgement, to the top of the skull that of imagination, and placing that of memory in the back of the head. But the more specific formulations of Gall and Spurzheim caused consternation: in 1802 Gall's lectures were banned, and three years later the pair were forced to leave Austria. They spent some time travelling round Europe expounding their theories, and eventually settled in Paris, where in 1808 they presented a memorandum to the French Institute and in 1810 began jointly to publish their *Anatomy and Physiology of the Nervous System*. Soon after the publication of the first volume, Spurzheim broke with Gall, who remained in Paris, and began to concentrate his energies on the English-speaking world.

Undermining God's Role

Why were two respected men of learning hounded out of their home country and forced to become wandering scholars? The answer lies in the shattering implications of Gall's theories if applied consistently to human affairs. He argued without equivocation that a man's physical constitution determined his character. The view of human nature which this implied was both elitist and profoundly pessimistic. It was not an attitude calculated to endear him either to those interested in upholding the powers of God over man or to the Romantic panegyricists of human reason who flourished in Gall's lifetime. On the other hand, Spurzheim was responsible for popularizing the doctrines of his master, and in so doing presented a more rosy picture of human nature than did the austere Gall.

Their different approaches were noted by a follower of Spurzheim, who wrote that Gall 'visited the prisons, the hospitals, the schools and the churches of Vienna; and he found organs which he did not hesitate to name as the organs of *theft*, *murder* and *cunning*, *benevolence* and *religion*. He considered the actions of men, whether good or evil, as necessarily flowing from the organization they received from nature, without adverting to the primitive power their organs were designed to exercise in a healthy and unvitiated state . . . Spurzheim had the merit of pointing out the primitive powers of the different organs, and discriminating between the institutions of God and the *abuses* of those institutions.' In other words, for Spurzheim's followers, man was essentially a divine creation, and phrenology revealed the physical embodiment of God's laws which all must follow to earn divine approval. The fear that man might prove neither to be the arbiter of his own destiny nor the privileged creature of a Supreme Being was lifted. It was even argued that the cranial 'organs' would be improved by leading an exemplary life; phrenology was extolled as an infallible means of judging men and visions of phrenological Utopias, in which a man's suitability for high office could be scientifically assessed, passed into common currency.

This was a far cry from the original theories of Gall, whom Metternich thought the greatest mind he had ever known, and whose honesty was such that he left sections of his brain charts blank, because he had not yet discovered what faculties they controlled. Spurzheim's messianic version of phrenology found a ready-made place in the welter of mesmerism, Spiritualism and Utopian social theories which passed popularly for 'progressive thought' in the mid-19th century. The process of popularizing began in Scotland, where the hard-headed medical man employed by the *Edinburgh Review* to castigate Spurzheim's work was alarmed by the speedy appearance of the foreign savant in the Scottish capital. Spurzheim publicly dissected a brain and began to make converts. He also found time to record a phrenological assessment of the Scots (the words in italics denote phrenological 'organs'): 'Scotland contains several races of inhabitants. The genuine highlanders are *entire feelings*: accordingly, I would consider them as the warmest friends, or the most dangerous enemies, always acting by strong feelings. They have *adhesiveness*, *combativeness*, *destructiveness*, *secretiveness*, *self-esteem*, *approbation*, *firmness* and *individuality* strong: many have *cautiousness*. The upper part of the forehead is mostly narrow, *tune* is good – *order* is almost wanting . . .'

Mary Evans Picture Library

In the 16th century Jerome Cardan maintained that personality could be judged from the lines on the forehead *Facing page (left to right)* Heads of a peaceful and successful man, a quarrelsome and murderous man, an infirm man, and a man of prowess in war; from the *Metoposcope* by Cardan *Above* Phrenological diagram of the areas of the head in which character traits and mental abilities are located: for example, contrariness in section 12, benevolence in section 13

Through the efforts of Spurzheim's supporters, notably the Scottish advocate George Coombe, phrenological societies sprang up throughout the United Kingdom. By the 1830s there were at least a dozen British societies; over 60 books and pamphlets were in circulation, and the cause was attracting large financial bequests. George Coombe proved an active successor to Spurzheim after the latter's death in 1832 whilst on a visit to Harvard University. As one ardent phrenologist wrote at the time: 'Philosopher after Philosopher, Phrenologist after Phrenologist may die – but Phrenology *can never perish* – IT IS EVERLASTING, LIKE THE OTHER TRUTHS OF GOD.' Indeed Coombe's celebrity eclipsed that of Spurzheim: Victoria and Albert had him examine the heads of the royal children. But it was in America that Coombe's propaganda bore the most remarkable fruit.

In Europe phrenologists remained devoted to lecturing and exposition. But in America there arose a legion of 'practical' phrenologists, who functioned as psychiatrists and witch-doctors when they were not simple travelling showmen, combining phrenology with mesmerism and salesmanship. One practitioner exhibited a giant and a dwarf

as added attractions. Another was 'His Royal Highness Prince Luximon Ray, M.D.', who distributed the 'Grand Hindoo Poetical Chart'. On a slightly higher level, American phrenology was represented by the Fowler brothers, publishers of all manner of 'advanced' literature. An alliance with mesmerism begot 'phrenomagnetism', a method of healing in which the operator placed his hand on the particular phrenological organ he wished to influence and exerted his 'mesmeric' power. Certain vehement phrenologists claimed their speciality as the road to complete health.

Phrenology has left its mark in surprising places. Its supporters have included the poets Walt Whitman and Edgar Allan Poe and the biologist Alfred Russel Wallace; and when Darwin wrote *The Origin of Species* he acknowledged a phrenological work published in 1845 called *Vestiges of the Natural History of Creation* as a source of inspiration. This apparently unlikely line of descent suggests that the underlying message of phrenology was contained in Gall's original insight, which was easily forgotten beneath the pile of later accretions but was the reason for the conflict between the phrenologists and their opponents. Gall believed that the mind of man himself could be studied through the newly-evolving techniques of rationalist science, and that objectivity must be attempted with regard to man's place in the cosmos as much as in the study of newts. In this way, Gall's stumblings in the dark have proved to be the forerunner of experimental psychology.

This 19th century cartoon reflects the widespread popularity of phrenology; Queen Victoria had the heads of the Royal children examined, and it was hoped that through phrenology a man's suitability for leadership and high position could be assessed

Radio Times Hulton Picture Library

Physiognomy has bequeathed a similar legacy. Unlike phrenology, physiognomy was never an organized movement, although the physiognomical works of Lavater enjoyed a wide public throughout the 19th century. But it was not until Mary Olmsted Stanton published her *System of Practical and Scientific Physiognomy* in 1890 that the aspiring physiognomist had anything resembling a system to follow. Mary Stanton's vast work – from which virtually all subsequent physiognomical systems are derived – betrays its debts to the phrenologists in its preoccupation with the structure of the head. Around 40 phrenological 'organs' are recognized, and a dozen more located. But Mary Stanton goes further than her predecessors; an 'organ' might be correctly identified, but this 'organ' is itself produced by the physical functioning of the body. Thus the kidney system evolves the 'organs' of conscientiousness, integrity and morality. The immense complications of such theorizing probably account for the relative lack of interest in 'Scientific Physiognomy', which constantly degenerates into the arbitrary application of adjectives to parts of the body.

The 20th century has seen a revival of serious scientific interest in the possible effects of physique on character. In 1921 the psychologist Ernst Kretschmer published a study of a group of mentally abnormal people in which he attempted to correlate their physical structure with the type of their mental disease. More recently William Sheldon has divided humanity into three broad categories of physical type – 'ectomorphs', 'mesomorphs' and 'endomorphs' – of which each group exhibits broadly similar traits of personality. It is interesting that this classification corresponds to that made made by some phrenologists into 'mental', 'motive' and 'vital' types. The verdict of present-day science on phrenology and physiognomy must remain a mixture of acclaim and criticism.

PICATRIX

A FAMOUS 11th century Arabic magical compendium is commonly known by the corrupt title *Picatrix*. The Islamic magical tradition was largely based upon much earlier Hellenistic Greek sources. Thus when *Picatrix* and similar Arabic works reached the West, mainly by way of Latin translations made by Moorish scholars in Spain during the 10th and 11th centuries, elements of the ancient Hellenistic Greek civilization returned by an indirect route. *Picatrix* and other compilations of the same kind were avidly studied by the important hermetic scholars who flourished during the Renaissance era, including Marsilio Ficino, Pico della Mirandola, Johannes Trithemius and Cornelius Agrippa.

All this would be of merely antiquarian interest were it not for the fact that the innocent little books that are still being published about 'Your Lucky Birth Stone' owe something, although very remotely, to works such as *Picatrix*. Books of this kind and, in particular, popular astrological publications reflect the survival of beliefs current even before the Christian era.

Until the invention of printing in the 15th century works like *Picatrix* only survived in the form of a limited number of manuscript copies. The availability of printing led to the dissemination of countless works belonging to the near or distant past. However, the reputation of *Picatrix* was so black that it was never printed even in Latin, let alone in a vernacular tongue, in hermetism's heyday during the Renaissance. Indeed, the text of *Picatrix* has not been available in any modern language until its publication in Germany in 1962.

Picatrix certainly contains a vast lore relating to esoteric cosmology, astrology, the preparation of talismans and the necessary incantations to make them effective, also those prescribed for the worship of planetary spirits, but it is all expressed in a highly-obscure and jumbled manner. Hence the work is of greater interest to cultural historians than to modern occultists.

National Gallery/Michael Holford

Pieta
In Christian art, a representation of the Virgin Mary holding the dead body of Christ after it had been taken down from the cross; portraying Mary's grief for her dead son and contrasting with the image of the Virgin and child.

Pietism
Generally, a religious attitude which stresses emotion and behaviour rather than intellect, a tendency to regard depth of feeling and personal devotion as more important than creeds and doctrines: specifically, a movement organized by Philipp Jakob Spener, a German Lutheran, from c1670, often derided for what was regarded as its excessive and affected piety.

PIG

SINCE IT PROVIDES the staple food of many peoples but is the tabooed flesh of others, the pig occupies the paradoxical position of being both loved and loathed at the same time, if not in the same place. It was first domesticated by the Chinese and later at an unknown date by the English and other European communities. The European variety is descended from the wild boar, modified by crossing with Asiatic breeds, and has inherited some of the occult qualities of its turbulent ancestor (see BOAR).

The domestic pig has never ranked very highly in popular esteem, for not only is it the Buddhist symbol of indolence and the European symbol of licence, but to the ordinary mind it represents gluttony and obstinacy. Yet the pig is undoubtedly a noble animal and was deservedly an object of worship in Crete, while in Greece it was sacrificed to the gods at the time of the planting of the corn.

In ancient Egypt the pig represented the spirit of Osiris at sowing time and the spirit of Seth at the harvest. It was regarded as unclean, and the swineherds who attended it were not allowed to enter a temple and not permitted to marry outside their own ranks. Pig meat was eaten by the Egyptians only at the Midwinter feast, and the pig could only be sacrificed at the full moon. As a possible relic of this tradition there are those who still believe that a pig must be slaughtered when the moon is waxing or otherwise it will shrink in the pot.

British Museum/Michael Holford

Egyptian green glazed model of a sow and her piglets: the pig is an uncanny animal and often the subject of taboos. In northern Europe pork was the food of kingly hospitality and the otherworld feast but Jews and Arabs consider it unclean meat, for reasons lost in the past

The eating of pig is taboo to both Jew and Arab and it was also long out of favour in Scotland and in parts of northern Ireland. One possible explanation for this custom is that the pig had originally been the symbol of a social group – its totem –and was regarded as the tribal ancestor: thus to eat a sacred pig could be fatal to the interests of the tribe. A further reason for the prohibition of certain kinds of food is the belief that one becomes what one eats. The fastidious individual who accepts the doctrine that one assimilates the habits of the pig by eating pork is naturally disinclined to adopt this type of diet.

In the past, both Hebrew and Arab have been prepared to accept martyrdom rather than eat pork and in 16th century Spain anyone with a distaste for this meat stood in permanent danger of arrest by the Spanish Inquisition as a secret adherent of Judaism. His Catholic Majesty Philip II of Spain gave signal proof of Christian orthodoxy during the period he lived in England by consuming vast quantities of

A Gift for the Beast

A group of boys stranded on an island sense an unknown menace and offer a pig's head to it

He paused and stood up, looking at the shadows under the trees. His voice was lower when he spoke again.

"But we'll leave part of the kill for . . ."

He knelt down again and was busy with his knife. The boys crowded round him. He spoke over his shoulder to Roger.

"Sharpen a stick at both ends."

Presently he stood up, holding the dripping sow's head in his hands.

"Where's that stick?"

"Here."

"Ram one end in the earth. Oh – it's rock. Jam it in that crack. There."

Jack held up the head and jammed the soft throat down on the pointed end of the stick which pierced through into the mouth. He stood back and the head hung there, a little blood dribbling down the stick.

Instinctively the boys drew back too; and the forest was very still. They listened, and the loudest noise was the buzzing of flies over the spilled guts.

Jack spoke in a whisper.

"Pick up the pig."

Maurice and Robert skewered the carcass, lifted the dead weight, and stood ready. In the silence, and standing over the dry blood, they looked suddenly furtive.

Jack spoke loudly.

"This head is for the beast. It's a gift."

The silence accepted the gift and awed them. The head remained there, dim-eyed, grinning faintly, blood blackening between the teeth. All at once they were running away, as fast as they could, through the forest towards the open beach.

William Golding *Lord of the Flies*

bacon, as a result of which he became ill.

To the Celts and Teutonic peoples pork was the food of kingly hospitality and otherworld feasts. Both the Anglo-Saxons and the conquering Norman aristocrats enjoyed pork; evidence of the popularity of the pig as food among all English classes in the past. But never has the pig had more eloquent a champion than the writer Charles Lamb who declared in his *Essays of Elia*: 'There is no flavour comparable I will contend to that of the crisp, tawny, well watched not overroasted crackling'. Pork was customarily served at Christmas time in England in the past. At Queen's College, Oxford, a boar's head with an orange in its mouth is traditionally brought to the table with great ceremony at the season of goodwill. A similar custom is observed in Scandinavia at Ynle, when a loaf made from the last sheaf of the harvest is baked in the shape of a boar.

Hunted and Tortured

Christian teaching has allocated a conflicting role for the pig, in that it represents the principles of both good and evil. St Anthony was the patron saint of swineherds: to him young pigs were sometimes dedicated, and even today the smallest pig of the litter is called a 'Tantony pig'. On the other hand the pig has become a token of evil largely due to the accounts in the New Testament of demons expelled by Christ from their human abode immediately entering the bodies of the Gadarene swine. The whole situation remains complex, because the pig could be either the personification of Satan or, alternatively, his victim. The Black Boar, one of the less familiar of the Devil's guises, occurs in the folklore of New England and Ireland.

Demon pigs were familiar to English peasant life; the two best-known examples being the Winwick and Burnley pigs of Lancashire, whose effigies may be seen carved on the walls of the respective parish churches. The pig was extremely vulnerable to the Evil Eye and it was as the victim of diabolical assault that it occupied a place in the annals of English witchcraft. Arising from some confusion of the old idea of torturing a witch by remote control through her victim, and the doctrine that by sacrificing a living animal it would be possible to save the others, a sick pig was actually burned alive in Huntingdon in 1833, and in Lincolnshire it was once the custom to score the back of a living pig with red-hot poker to preserve the remainder of the litter.

The pig fared equally badly at the hands of medieval lawyers. Inspired by the Law of Moses which decreed: 'When an ox gores a man or a woman to death, the ox shall be stoned and its flesh shall not be eaten', a sow and her young pigs were condemned to death in 1457, the piglets receiving a last minute pardon 'due to their extreme youth'.

The pig also fell victim to the huntsman. Until disafforestation caused their extinction, wild boars were hunted for sport by the nobles. Among the English agricultural class pig-racing was long in vogue, and involved a wild chase through the countryside after a pig whose tail had been coated with soap.

Before the publication of George Orwell's *Animal Farm*, it was only in the fairground that the intellectual superiority of the pig was recognized. A learned pig was exhibited at St Bartholomew's Fair in the early 18th century, advertised as 'The pig of knowledge, being the only one ever taught in England'.

In China and in Europe the pig is a good luck talisman, yet among many fishing communities the animal itself is regarded as extremely unlucky, and even the use of its name is taboo. There are occasional reports of fairy pigs emanating from the Isle of Man, and at Andover in Hampshire a spectral pig is said to be seen on New Year's Eve.

The long-standing association between the pig and the wind is confirmed by the countryman's superstition that a pig has the power either to see or smell the wind and is thus a useful weather prophet. In parts of the United States hogs are supposed to detect the approach of a tornado. It was long a custom in Ireland to drive a pig into the house on May morning for luck, yet oddly enough a pig that enters a house at any other time is an omen of poverty.

PILGRIMAGE

The Journey To Holiness

Bibliothèque Nationale

Detail from a 15th century French painting of the People's Crusade, a disastrous mass pilgrimage of 1076, led by Peter the Hermit, to help free the Holy Land from the Moslems

IN THE MOST FAMOUS lines of the *Prologue* to the *Canterbury Tales*, Chaucer refers to the restless religious longing which overcomes the devout man in spring:

> When the sweet showers of April fall
> and shoot
> Down through the drought of March to
> pierce the root . . .
> Then people long to go on pilgrimages
> And palmers long to seek the stranger
> strands
> Of far-off saints, hallowed in sundry
> lands . .

These words express succinctly a feature of the religious life of man in practically all ages and all parts of the world – the desire to go on a pilgrimage.

The word pilgrim itself is derived from the Latin *peregrinus*, and means simply a wanderer or stranger. Although 'pilgrimage' *(peregrinatio)*, means literally no more than 'wandering about', the word has come to mean wandering with a purpose, and a pilgrim is one who temporarily abandons his or her normal pursuits in order to seek the spiritual and moral benefits believed to he obtainable in some particularly holy place. A palmer, on the other hand, was one whose whole life was spent in wandering from place to place.

Wherever there have been holy persons or holy places, there have been pilgrims to visit them. Perhaps the first problem to consider is why some places and some people are regarded as more 'holy' than others. It seems that in the religious history of mankind, the world of men and the world of the supernaturals – gods, spirits, demons, ghosts – have been believed to exist for the most part in parallel. However, there are certain points at which the parallel worlds meet, points at which supernatural power comes, as it were, to a focus. Sometimes the original reason for such belief in the concentration of power is unclear. But certain places – for instance, mountains, caves, rivers and springs – were very early thought of as dwelling-places of the supernaturals,

There are certain places which are felt to be points of contact between the natural and supernatural worlds, places where supernatural power comes to a focus and can be most effectively felt by worshippers. One of them is Jerusalem, a holy city in three different religions *Right* Christian pilgrims in Jerusalem: 'the Bordeaux pilgrim' is known to have made the journey from France as early as the 4th century *Centre right* The Wailing Wall, which contains stones from the Temple *Bottom right* David's tomb

Picturepoint, London

where power was intensified; and when early man worshipped, he did so in such places. Later, when temples were constructed, they too were thought of as the homes of the gods to which they were dedicated, consecrated by the presence of the deity within them. Holiness – supernatural power – is contagious, and anyone wholly dedicated to the service of a deity partakes of this same quality.

There were also sites at which a deity was believed to have revealed himself or herself. sites connected in some way with holy history, shrines of the great departed and places at which oracles were delivered and interpreted. Any of these might serve to mediate the power of the supernaturals to ordinary people: hence they were sought out, and became places of pilgrimage.

The reasons which prompted people to become pilgrims doubtless varied greatly. On the one hand, there was the subjective desire to acquire power, merit and those other benefits (the expiation of past sins, for instance, and the healing of present diseases) which might be held to derive from exposure to the focus of holiness. On the other hand, there was the desire to worship and do reverence to the supernaturals themselves. Yet there were other motives than such purely personal ones. In some religious traditions, pilgrimage might simply be part of one's accepted religious duty; and although merit might well accrue the motive was social, rather than personal. Chaucer's pilgrims, for instance, had a collective, as well as an individual motive for making the journey in spring to the shrine of St Thomas.

In the ancient world, pilgrimages were very often connected with seasonal festivals, and especially with the New Year Festival, or its equivalent, at which atonement was made for the sins of the past year and the world was symbolically renewed for another cycle (see ETERNAL RETURN; NEW YEAR). It is not known exactly who attended such festivals in the ancient Near East – in Mesopotamia, Egypt, Israel – but the later practices of Judaism and Islam make it clear that the custom of visiting holy places, and particularly the great temples, at certain seasons of the year has deep roots. The pilgrimage to Jerusalem for the Passover ceremonies, for example, lasted until the destruction of the Temple in 70 AD.

G. Tomsich/Spectrum

With the catacombs and the tombs of St Peter and St Paul, Rome became and remains a great centre of Christian pilgrimage *Left* Crowds flock to St Peter's Square to receive the Pope's blessing *Below left* In this 19th century illustration, the faithful prostrate themselves before a statue of St Peter

Possibly the longest unbroken tradition of pilgrimage to one particular place is seen in the Moslem pilgrimage to Mecca. In pre-Islamic times the tradition of visiting the Kaaba was already well established, but under Mohammed pilgrimage *(hajj)* was elevated into one of the five pillars of the faith, and it has always been the religious duty of every Moslem who is able to do so, to go on pilgrimage to Mecca at least once in his or her lifetime (see ISLAM; MECCA).

Elsewhere in the ancient world, old places of pilgrimage now exist only as archeological sites – for instance, the hall in which the Mysteries of Eleusis were once celebrated, near Athens, and the sites of the oracles at Delphi and Dodona (see ELEUSIS; ORACLES). The function of some places of pilgrimage have been radically altered. The great pre-Christian temple at Old Uppsala in Sweden, for example, was once visited by great crowds of pilgrims at the seasonal festivals. In the 12th century the coming of Christianity led to the destruction of the temple with its images of Thor, Odin and Freyr, and the building of a church on its site; but the attraction had gone and, soon after, the capital of the Svea kingdom was moved elsewhere – an eloquent testimony to the secular significance of pilgrimage centres.

The Indian sub-continent has a vast number of sacred sites, which Hindus, Buddhists, Jains and others visit as often as circumstances permit. However, for the Hindu there is no qualitative difference between worship at the local shrine and the visit to a particularly important holy place. Worship, to the Hindu, is invariably a matter of individual concern, connected both with the reverence due to the gods or (more usually) the Supreme Being, and with the acquisition of individual merit. Pilgrimage raises both these concerns to a higher level, but does not really change them. To the Buddhist, although the motive of worship may in theory be unimportant (Buddhism denies the existence of a Supreme Being and classifies the gods as merely higher forms of universal life), the motive of the acquisition of merit is very much present. For Hindu and Buddhist alike, the gaining of merit leads to an improved status in the individual's next life, and thus ultimately to release from the wheel of rebirth.

Among the holiest of goals for Hindu pilgrimages are the seven great rivers, especially the Ganges (see GANGES); and of the cities on the rivers, probably the best-known is Benares (Varanasi), with its hundreds of temples, large and small, its ghats (places where the dead are burned), and its crowds of pilgrims at all times of the year. Every inch of the Ganges is sacred, but none more so than the holy places, Gangotri, Kedarnath and Badrinath, at the sources of the river's three main branches, the Bhagirathi, the Mandakini and the Alaknanda. The great Ganges pilgrimage begins at Hardwar, 'Hari's gate', and passes through Rishikesh, the town of ascetics, to the three sanctuaries. The entire pilgrimage, performed in May, June and July, covers over 600 miles, and although transport is available for much of the way, there remains a good deal which has to be undertaken on foot, often in very difficult conditions. Recently a Western youth who attempted the journey barefoot had to have both feet amputated as a result of frostbite. Of course, where there are difficulties to be surmounted, this only adds to the merit acquired, as well as serving as a necessary mortification and disciplining of the body. The best-known (though now seldom practised) pilgrim austerity is that which requires the seeker after perfection to measure his length along the entire road.

Other celebrated pilgrim cities of India include Mathura and Vrindaban, connected in legend with the boyhood and youth of the god Krishna, and Dwaraka, where Krishna left the world. Often there is a pilgrim route round the city, the following of which in its entirety *(parikrama)* brings especial merit. At individual shrines, it is common to circle them, keeping the shrine on one's right *(pradaksina)* – a custom which can be paralleled in the Christian West. Pilgrimages usually take place at festival times, though they may be undertaken whenever the time is auspicious. Certain festivals at certain places, such as

Hardwar, Allahabad, Ujjain, Nasik, draw vast crowds, and it has been claimed that the *Kumbh Mela*, held near Allahabad every 12 years, attracts larger crowds than are to be found at any other religious festival anywhere in the world. Another festival is the *Jaggantha* car festival at Puri, where the image of the god, mounted on an enormous car (whence our word 'juggernaut') is dragged through the streets by worshippers.

Compassion for the World

The Buddha himself neither recommended nor forbade the practice of pilgrimage, but shortly after his death, his relics were distributed and placed in monuments (*stupas*), which very soon became centres of pilgrimage. Indeed, the technical term for the first stage in Buddhist ordination (into the order of monks, or *bhikkhus*) is *pabbaja*, meaning 'going forth from the world' or, in a sense, becoming a pilgrim.

Today, the main centre of Buddhist pilgrimage in India is Buddh Gaya, the place at which the Buddha gained enlightenment. Outside India there are many Buddhist shrines, the best-known among them being the Temple of the Tooth – a relic of the Buddha preserved in an inner chamber on a golden lotus flower within nine caskets of gold – in Kandy, Ceylon. Also in Ceylon is perhaps the most universal of pilgrimage centres, Adam's Peak, with its sacred footprint, believed by Buddhists to be that of the Buddha, by Hindus to be that of Shiva, by Christians to be that of St Thomas, and by Moslems to be that of Adam.

In Christianity, the practice of going on pilgrimage began in the early Church, achieved great popularity in the Middle Ages, and is by no means forgotten – particularly by Catholics – in the modern world. The first goal of Christian pilgrimage was the Holy Land, and especially Jerusalem. Among the earliest records in post-biblical times is that of 'the Bordeaux pilgrim', who went to Jerusalem in 333 AD. Despite political difficulties in gaining access to the holy places (a factor which was one of the causes of the Crusades), the practice has continued to this day, though the modern pilgrim visits all the actual or supposed sites of sacred history, and not just the Holy City.

As the focus of Christendom shifted from Jerusalem to Rome, the presence in Rome of the tombs of Peter and Paul, and the

Michael Holford/Salisbury and Wiltshire Museum

catacombs, caused a corresponding shift in pilgrimage to these more specifically Christian sites. At the same time, the development of the doctrine of purgatory, and the belief that the individual's time in purgatory (or that of his relatives) could be lessened by acquiring merit, caused the growing practice of the granting of indulgences as a reward for faithful pilgrimage. Thus when the Papal Jubilee was celebrated in 1300, the indulgences offered on that occasion are said to have drawn more than 20,000 pilgrims to Rome. The early Christian Middle Ages also saw a vast – and frequently dishonourable – trade in sacred relics, theoretically repositories of divine power, but often in practice nothing more than, as the cynical Chaucer expressed it, 'bones and ragged bits of clout, relics they are, at least for such are known . . .'

Pilgrimage and the viewing, touching or kissing of such relics were closely connected, and the superior centres of pilgrimage gradually acquired vast stores of relics. In 1446 a German pilgrim to the shrine of Thomas

The East abounds with sacred places: for both the Hindu and Buddhist the merit gained in the act of pilgrimage leads to an improved status in the next life and 'thus ultimately to release from the wheel of rebirth' *Above left* Pilgrims at Benares beside the Ganges – the holiest of Indian rivers *Above right* The Temple of the Tooth in Ceylon where a relic of the Buddha is reverently preserved on a golden lotus flower within nine cases of gold

Becket at Canterbury recorded that '. . . we were shown the sword with which his (Becket's) head had been struck off. Then they also showed a remarkable piece of the holy cross, and one of the nails, and the right arm of the honourable knight Saint George and a single thorn from the crown of thorns, mounted in a monstrance.' Elsewhere in England, for instance at the celebrated shrine of Glastonbury, which was almost certainly a Celtic cult centre before being Christianized, stores of relics were kept and miracles of healing were recorded as late as the 18th century, long after the Reformation. (See also RELICS.)

Healing and Disillusion

Pilgrimage for the purpose of healing was common in the Middle Ages. The Venerable Bede told of the place where Oswald, King of Northumbria, fell in battle against the Mercians: 'Many people took away earth from the place where his body fell, and put it in water, from which sick folk who drank it received great benefit. This practice became so popular that as the earth was gradually removed, a pit was left in which a man could stand . . .'

It has become a commonplace of Church history that the excesses of popular devotion to sacred places and the relics of holy persons were among the causes leading to the Reformation. In the 16th century a chorus of protest was raised by the reformers, with Martin Luther at their head. In 1510 Luther went to Rome, on Church business but entirely in the spirit of pilgrimage, intent on making the very best of whatever spiritual benefit the city could offer him. His sense of disillusion grew, largely as a result of the sheer levity of many of the sacred proceedings. He did not then doubt that merit was to be gained; what he did doubt was that it could be transferred to the dead. There is a story that he ascended Pilate's staircase on hands and knees in the approved manner, hoping thereby to extract his grandfather from purgatory. At the top he stood up, and said to himself, 'Who knows whether it is so?' On such doubt was the Reformation based.

But the doubt of the reformers led directly to the distress of the faithful. In England, the shrine of Walsingham, reputed to contain a few drops of Mary's milk, was suppressed at the Reformation. Although Protestantism has always looked with disfavour on the custom of pilgrimage and the religious views on which the practice was based, the Roman Catholic world has continued to believe in the efficacy of holy places. Many of the old shrines have disappeared beyond recall; but others have been reopened – Walsingham, for example – and new shrines have arisen. The most celebrated of these is certainly that at Lourdes, in the French Pyrenees, where in 1858 a peasant girl, Bernadette Soubirous, saw visions of the Blessed Virgin (see LOURDES). All the classical features of the pilgrimage centre are there: manifestations of holy power, a sacred spring, and healing miracles. There are also similar centres of pilgrimage on the American continent, for instance at St Anne de Beaupré, near Quebec.

It seems that it is only the sceptical Western mind that is unable to accept the premises on which the case for pilgrimages rests. The intuitive religious mind believes implicity in the supernatural world, and in its manifestations in the world of time and space. Wherever those manifestations take place, man may profitably come to worship and pray and receive strength.

> There's no discouragement
> Shall make him once relent
> His first avowed intent
> To be a pilgrim.

To such a man or woman, the words of the great allegorizer of pilgrimage, John Bunyan, express part of the assured order of things.

MRS PIPER

ONE OF THE MOST remarkable mental mediums of all time, Mrs Leonora E. Piper (1857–1950) of Boston, Massachusetts, discovered her mediumistic gifts almost by accident. In 1884, being in ill-health, she consulted a blind healing medium named J. R. Cocke. At her second visit she passed into a trance, and wrote down a message for one of the sitters which greatly impressed him. She then held sittings privately in her own home, and was favoured by 'communications' from various of the 'mighty dead'. However, the messages which less illustrious 'communicators' gave to their friends and relatives on earth were sometimes so remarkable that Mrs Piper began to enjoy local fame.

In 1885 communications from the 'mighty dead' were replaced by those of a French doctor, 'Phinuit', who vouchsafed a great many details about his career on earth; some were contradictory, and none were verifiable. At a sitting Mrs Piper would pass into a deep trance; after a few minutes she would begin to speak with the gruff, male voice of Phinuit. Phinuit would give sitters accounts of the doings of deceased (and sometimes of living) friends and relatives, and would transmit messages from them, often with appropriate gestures.

Mrs Piper's reputation reached William James, Professor of Psychology at Harvard University. James went to sit with her, and received a good deal of information about, and allegedly from, members of his own family. He was sufficiently impressed to send some 25 other people to her under pseudonyms.

Richard Hodgson, a leading member of the British Society for Psychical Research, assumed charge of the investigation in 1887. Hodgson arranged for the careful recording of all sittings, and took the most extreme precautions against trickery. Sitters were introduced anonymously. Mrs Piper was shadowed by detectives for some weeks, but no evidence was found that she made inquiries into the affairs of possible sitters. Finally Hodgson and William James arranged that Mrs Piper should spend the winter of 1889–90 in England, where she knew no one, and could have no established agents. During her stay all her sittings were arranged and supervised by leading members of the Society for Psychical Research – Sir Oliver Lodge, Professor and Mrs H. Sidgwick, F. W. H. Myers and Dr Walter Leaf.

Despite all the precautions taken in England and America, Mrs Piper continued to get results. It was true that her chief 'control', Dr Phinuit, was altogether a shady character. At times his behaviour towards the sitters was extremely suspicious. He would 'fish' for information in the most blatant manner, and if given any would reproduce it himself without acknowledgments. If he made a mistake he would cover up in a childish and absurd manner. But when Phinuit was on form, he would, with hardly any hesitation, relay copious and largely correct 'communications' from the deceased friends and relatives of sitters, messages which would turn out to be very accurate even in tiny details.

In and after 1892 Phinuit was gradually superseded by a communicator called 'George Pellew'. Pellew, who had been killed a few weeks previously, had been a young man of philosophical interests, who came from an aristocratic Anglo-American family. He was known to Hodgson, and five years before had sat once with Mrs Piper. He had been introduced under a pseudonym. The 'G.P.' communicator showed a most intimate knowledge of the concerns of the living Pellew. Out of 150 sitters who were introduced to him, G.P. recognized the 30 who had been known to Pellew, and only those. He conversed with each of them in an appropriate manner, and showed an intimate knowledge of their affairs; only rarely did he slip up badly.

Masked Investigator

G.P., like Phinuit, would purportedly relay messages from deceased persons; but it now seemed to become easier for the deceased persons to 'communicate' directly by speaking or writing through Mrs Piper's organism. Writing in trance now became much commoner than it had been before; and sometimes communication by voice and by hand would go on simultaneously.

G.P. remained the principal communicator until early in 1897. During this period Hodgson had almost complete control over Mrs Piper's sittings, and very full records were kept. She was paid on the average about £200 a year. This sum secured her services for the S.P.R. without laying her open to the charge of being rich enough to employ agents.

During the period 1897–1905 a group of communicators became predominant who used such pseudonyms as 'Imperator', 'Rector' and 'Doctor'. They claimed, but were unable to prove, identity with the group of 'mighty dead' who had purported to communicate under the same pseudonyms through another medium, the late W. S. Moses. Sittings had to be limited in number owing to the state of Mrs Piper's health. Many sittings were conducted for purely didactic purposes; opinions as to the worth of the teachings varied considerably. Hodgson himself died unexpectedly in 1905, and the notes which he left behind were in undecipherable shorthand. The most extended records of this period are those of Professor J. H. Hyslop of Columbia University. At his early sittings Hyslop went to the length of wearing a mask to preserve his anonymity. None the less he received ostensible communications from his father and other deceased relatives which completely convinced him that Mrs Piper possessed paranormal powers.

Not long after Hodgson's death a communicator calling himself 'Richard Hodgson'

Although the honesty of Mrs Piper's mediumship was never doubted, many felt that the alleged 'communicators' were aspects of her own personality, 'fed' with information gained telepathically from the living

Psychic News

began to manifest at Mrs Piper's sittings. The status of the Hodgson communicator was later analysed without definite conclusions in a long paper by William James. During 1906–7 Mrs Piper visited England again, and she played some part in the experiments which became known as the 'cross correspondences' (see CROSS CORRESPONDENCES). On her return to America she was studied on behalf of the American S.P.R. by George B. Dorr, and then in 1909 by the noted psychologist G. Stanley Hall. The latter's methods seem to have hastened the end of her trance mediumship, which took place in 1911 during another visit to England. She continued, however, to produce automatic writing (see AUTOMATIC ART), and was studied again in 1924–5 by a young Harvard psychologist, Dr Gardner Murphy.

It was agreed by almost everyone who had any extensive first-hand dealings with Mrs Piper and her phenomena that she was completely honest, and that the alleged deceased persons who 'communicated' through her would not infrequently retail correct information about themselves, going far beyond anything which she herself could ever have come across. But as to how the facts should be interpreted there was widespread disagreement. Richard Hodgson and F. W. H. Myers became in the end convinced that the 'communicators' really were the spirits of deceased persons. But others felt it more likely that the alleged 'communicators' were simply aspects of Mrs Piper's own personality, 'fed' with information gained telepathically from living people. Her personality showed through the 'communicators' in many ways – for instance in their ignorance of science and literature, their interest in clothes and hats, and the kinds of common associations which they all seemed to possess. Yet the information given by communicators was not infrequently quite unknown to any of the sitters, so that the hypothesis of telepathy with the living has its difficulties.

PISCES

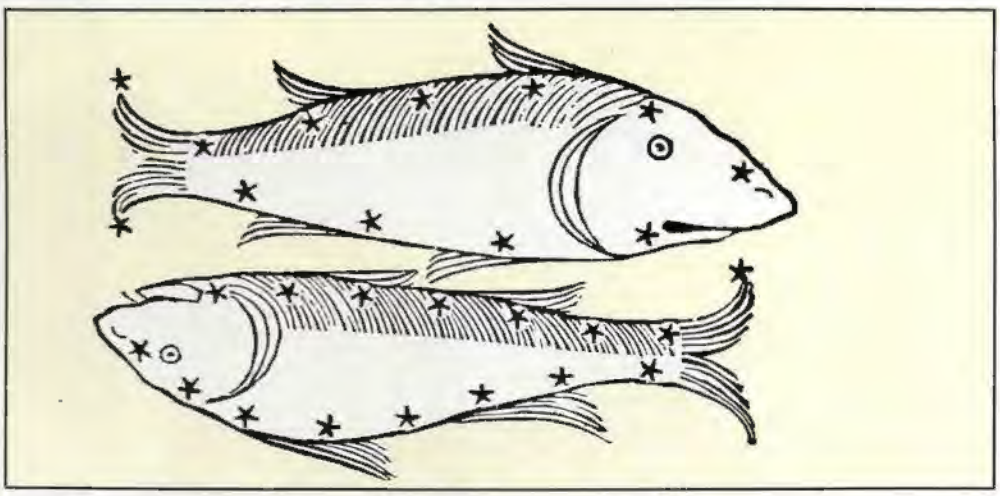
THOSE BORN between 19 February and 20 March fall under the sign of Pisces, the Two Fishes, the last sign of the zodiac. This sign may be of Egyptian origin, for there were two fishes among the Egyptian constellations, in the proximity of the Square of Pegasus, whereas the Babylonians described this part of the sky as either the Giant, the Tails, the Great Swallow, or by the name of a goddess. The ruling planet of the fishes was once said to be Jupiter, but from the 1840s onwards astrologers have become inclined to prefer Neptune as ruler of this sign. Pisceans, like Neptunians, do not mind being overcome by emotion, in fact, they enjoy it. They excel in any profession in which they have to act up to a situation.

Because of their genial, pleasure-loving temperament Pisceans will always make the best of any situation; and they more often find themselves in situations rather than deliberately contrive how things are to turn out. They often succeed as journalists, actors, or in any profession where it is an advantage not to keep too close to reality. They are kind, good-natured, generous, but often rather weak-willed.

Pisceans are attracted by strange and exotic places, and a few may even take the trouble to go there; a feeling for remoteness is thus the common element of the mystics, the travellers and the astronomers with whom this sign abounds. Typically they are not interested in having problems too clear-cut; they prefer to leave things vague and allow them to solve themselves. They are often and easily taken in by advertising rackets and other bogus 'opportunities'.

Versatility is another quality of Pisces; for though it is an advantage to have a family tradition, for example in music or architecture or acting, a Piscean often ignores pressures that urge him towards a particular career. Although he is most typically, 'the average sensual man', he is also more than that. Having decided that he will never 'set the Thames on fire', one may be astounded to find him suddenly doing something quite remarkable.

It is tempting to write off the Piscean as nothing more than a pleasant companion, only to discover later to one's surprise that he is quite capable of hard work and devoted service. He is normally too fond of gossip to be properly discreet in conversation, and with increasing age becomes too casual to dress with normal care. He gets on well with all kinds of people, however, and is therefore popular. He is supposed to err in the direction of Mr Micawber's weakness, always hoping that something will 'turn up', but perhaps the Piscean is not quite so casual as he is represented.



Pisceans, whose sign is the Two Fishes, are generally kindly people with a feeling for the mystical and the exotic

If you step inside a fairy ring in Sweden, you risk becoming a prisoner of the little people, but in Germany these bare circles in the grass are said to be caused by a dragon resting there; centuries before botany became a scientific study, man endowed the plants around him with magical properties

PLANTS AND FLOWERS

OUR EARLIEST ANCESTORS plucked and ate all kinds of plants, and came to realize how some had thorns or stings, while others appeared to soothe; some were good to eat, others unpleasant or deadly, and a few had curious effects if swallowed. And as man began to develop ideas about gods and spirits, about good luck and bad luck, he connected many of these ideas with plants – for if a plant could kill, intoxicate or soothe, it must have an inner power.

Doubtless the Neolithic people who lived in the early township at Catal Hüyük in Anatolia knew much about plants; certainly the Egyptians worshipped and enjoyed the Nile water lily or lotus before 3000 BC and the Sumerians knew a great deal about herbs by 2200 BC. In these early civilizations plants not only provided food but were almost the only known medicines and provided almost all cosmetics and dyes. Trees, outspanning human lives, were very early objects of veneration; indeed, like the oak, they might be the seat of deity itself, while evergreens such as fir were obvious symbols of immortality.

Curiously, many useful or beautiful plants have little or no links with myth and magic; while some insignificant plants such as vervain, for instance, are important. Few food plants are magical, although corn is the chief plant representing the annual return of summer, the defeat of winter, and the

Flowers are valued for their beauty and perfume, for real or supposed medical and magical properties, and as symbols which can be used to convey messages: this Chinese embroidery pattern, showing a heavenly spirit with flowers, has the meaning, 'May the owner receive the many good gifts of life'

Pearl Binder

Royal Botanic Gardens Kew/Michael Holford

successful production of food. It was used in the rites of Osiris and Adonis whose death was symbolized by the blood-red anemone.

Many herbs with real or supposed healing qualities inevitably have magical attributes and rituals attached to them to canalize their power. Apart from the genuine herbalists, those wishing for power encouraged the belief that they possessed it supernaturally, by working up rituals and giving an elaborate range of attributes to their materials of whatever origin.

Plant Protectors

Some plants were specially suitable for magic. The notorious mandrake, for example, the shape of whose root often resembled a human figure, was perfect for associative magic; it also possessed genuine anodyne qualities and, taken in excess, the ability to make people mad. Laurel was early discovered to produce frenzy if chewed, or its smoke inhaled, and hence became the chosen plant of many Greek oracles.

Actual utility or medicinal value, however, was not an essential attribute. The name *Potentilla* means 'little powerful one', yet *P. reptans*, the magically potent British creeping cinquefoil, is an insignificant and useless plant. But the five-fingered leaves of cinquefoils, noted since Egyptian times, made them powerful against evil spirits. Protection against sorcery and any manifestation of evil is one of the most important magical properties of plants. This is usually in general terms, as with garlic, which positively

Above **Some plants and flowers have been thought peculiarly sacred. Ivy (*left*) belonged to Dionysus and Bacchus, and is the plant of poetry, inspiration and ecstasy; as an evergreen, it is a symbol of life's continuance through the winter and, with holly, is connected with Christmas. The lotus (*centre*) is one of the great sacred plants of the East, associated with woman and fertility, and with immortality. Laurel (*right*) was the plant of Apollo, and poets, athletes and heroes were crowned with laurel wreaths *Below* Poisonous or narcotic plants are naturally connected with magic and witchcraft. Fumes from burning henbane (*left*) are recommended as an aid to summoning up demons. Hemlock (*centre*) is another poisonous plant and deadly nightshade (*right*) was taken by those who wished to foretell the future**

Ron Foord/NHPA

exudes magical propensities. Despite its reputed origin in the first left footprint made by Satan when he was thrown out of Paradise, garlic has many actual and supposed virtues as food and medicine. It is an example of a cure-all, or *theriac* as Galen called it. Protection is sometimes specific, like that offered to farm animals and their products by the lesser celandine – a piece of associative magic due to the teat-like shape of the tubers and the butter-colour of the flower.

One of the important protectors was hazel, used for wands and sceptres – symbols of magical and temporal power. In Scandinavia hazel was sacred to Thor, one of the plants sprung from lightning, and thus protective against it. Many plants were believed to keep off lightning: the humble houseleek, sacred to Jove, was at one time planted on cottage roofs throughout Europe. It also kept away fire and was reputedly a very positive protection against witches.

It was not always plants with medicinal qualities which served against witches. Herb Paris, *Paris quadrifolia*, is poisonous, bitter and emetic. Yet, doubtless because of its unusual regular cross-pattern – four leaves, a flower of four inner and four outer divisions, and in due course a shining black berry in the centre – it was specially effective against sorcery. It was the berries that were used for this purpose; no doubt to counter imperfections more readily, they were used in odd numbers from three to nine.

The slightly poisonous bitter-sweet or woody nightshade, *Solanum dulcamara*, was used in a similar way. Human beings and animals suspected of being 'overlooked' by the Evil Eye, or otherwise under a witch's influence, would have a garland of bittersweet hung round their necks. The herbalist Culpeper wrote how it was 'excellent good to remove Witchcrafts both in men and beasts: as also all sudden diseases whatsoever . . .'

Certain plants produce bad luck in some circumstances. The blackthorn and hawthorn are still widely considered unlucky if brought into the house – although in the proper place hawthorn is a lightning protector, a holy and healing tree. This further exemplifies the constant ambivalence of good and evil, because a solitary tree on a hillside would certainly be a 'fairy bush', and to do anything drastic to it, or even to sleep under it, would be fatal. Yarrow is another splendidly ambivalent plant, originally regarded as dedicated to the Devil, but with due care admirable for divination and keeping away evil, as well as having genuine herbal qualities. The elder tree was associated with bad luck, witches, and spirits who actually inhabited the tree; yet if properly handled, the elder was protective and indeed enabled one under certain circumstances to find out what witches were doing.

Flowers of Evil

Not surprisingly some of the really potent witch plants were poisonous or narcotic. Such was deadly nightshade, *Atropa belladonna*, one of the most poisonous of European wild plants. It was taken by those who

'Unless a grain of wheat falls into the earth and dies, it remains alone; but if it dies, it bears much fruit' (John 12. 24). Corn is the chief plant representing the defeat of winter and the return of summer, and hence the triumph of life over death: Christ in the cornfield, a painting on a plate by Jesse Austin, c 1840

Sonia Halliday

G. L. Carlisle

Victorian Valentine card, illustrating the 'language of flowers', each flower having its own hidden meaning: a posy had to speak volumes when a chaperone's presence prevented the open expression of romantic sentiments

wished to see spirits and foretell the future, made into potions to drive people mad or even to kill them, and was also believed to be one of the ingredients with which witches rubbed themselves when they wanted to fly (see FLYING OINTMENT). The name *Atropa* comes from Atropos, one of the Fates of classical mythology, who cut the thread of life. The name *belladonna*, meaning beautiful lady, was given to it because it dilated the pupil of the eye and so enhanced one's looks.

Henbane, *Hyoscyamus niger*, is a close relation of nightshade, almost equally poisonous but fortunately lacking the attractive berries. It not only looks very sinister but has a nauseating smell when crushed. It can cause convulsions and temporary madness, and so, like nightshade, was much used by witches. It has been a powerful plant for thousands of years: an Assyrian tablet records its value, if placed at the door, to keep sorcery from the house. Henbane had various magic uses. It was effective in love potions and could be used to assist the clairvoyant. The smoke that was given off when the plant was burnt enabled a witch to conjure up spirits. It was much used by physicians and herbalists from early times as a painkiller, especially for toothache, sometimes with serious consequences. The trance-inducing quality no doubt gave rise to the belief that if a child falls asleep near a plant of henbane he will not wake up. These poisonous, witch-favoured plants have now redeemed themselves, for some of them provide drugs which in the hands of modern doctors are of considerable value.

The old-fashioned broom used by witches for flying was a besom made from stalks of broom or birch, or heather twigs, tied to a stick. Another plant which was believed to be used by fairies and witches to ride on was ragwort or ragweed.

Some plants are associated with fairies and elves rather than witches, one being foxglove, or fairy weed. 'Fairy rings', too, were naturally the subject of widespread superstition. In England these bare rings of soil were considered the result of fairies dancing round. Such rings brought good luck to buildings in the same field, but it was usually unwise to step inside them: in Sweden anyone doing this fell in thrall to the fairies. It was most unlucky to tamper with a fairy ring. In Germany the bare earth was supposed to be the result of a red-hot dragon resting there, coiled in a curve; in Holland it was the Devil's churn that caused the ring. In France the peasants thought that enormous toads lived within these rings and there was a very widespread belief that treasures were buried inside the circles, to secure which the help of fairies or witches had to be enlisted.

Christianity naturally adopted certain plants, of which the minute weed pearlwort, *Sagina procumbens*, is an example. Especially in the Highlands, under the name *mothan* or *molus*, it was a very holy plant, and the first that Jesus Christ stepped on when he rose from the dead. Placed over the door, it stopped the fairies from entering; in the byre, it protected cows against fairies, while if a cow ate pearlwort the protection extended to the milk and any who drank it. It was placed below the right knee of a woman about to give birth, to keep the fairies from her and the child at a most vulnerable moment. Country girls would wet their lips with the juice to attract men, and place a piece in their mouths when they kissed, to ensure that their lover was always faithful.

On the whole, however, plants associated with magic or witchcraft were simply Christianized so as to channel beliefs around them in the right direction. A good example is the ragwort mentioned above, which became called *Herba Sancti Jacobi*, the herb of St James. It was no doubt linked with the saint because it is in full bloom on 25 July, St James's Day.

When St Patrick explained the Trinity to the Irish – three parts, one whole – he used the clover as example, and in doing so made use of a plant which had long been valued for protection against fairies and witchcraft. The rare four-leaved specimen is still regarded as very lucky but in older times it not only saved you from sorcery but enabled you actually to see fairies and pick out witches.

Some plants are now firmly associated with Christianity, whatever their antecedents; the Christmas holly and ivy are the chief examples. The lily is symbolic rather than magical, its whiteness and perfection representing purity and virginity and very suitably emblematic of the Virgin herself.

Several plants have a positive association with death, like the bean, thyme and foxglove, whose flowers were inhabited by the souls of the dead. Many plants betokened death, like a primrose blooming unseasonably in winter, or a single primrose or snowdrop brought indoors.

Marriage Magic

In the realm of domestic magic, plants play a considerable part. There were, for instance, a great many ways in which girls could find out who they were to marry and whether their lovers were faithful. One method was to place a four-leaved clover in a girl's right shoe. The man in her life would be the first she met – or, in an amusing twist, a man with the same name. John Aubrey records how, on St John's Day 1694, he was walking in a meadow when he saw two dozen well-dressed young women apparently weeding. He was told that they were looking 'for a coal under the root of a plantain, to put under their head that night, and they should dream who would be their husband'.

A sprig of myrtle placed in the prayer book at the page where the marriage service asks 'Wilt thou take this man . . . ?' would tell a girl if her lover would in fact marry her. The prayer book was put under the pillow on Midsummer Eve and slept upon. If the myrtle was not to be found in the morning, the marriage would take place; if it was still there, the young man was considered to be fickle.

Some of the rituals were supposed to conjure up a vision of one's husband-to-be, like the one in which the girl ran around her house three times with a willow branch in her hand, saying 'He that's to be my good man, come and grip the end of it'. At the end of the third circuit a spirit-form of the 'good man' would take hold of the branch.

To ensure that your lover or husband was faithful, you could dig earth from his footprints, place it in a pot and sow marigold seeds in it. Rosemary was woven into bridal wreaths as a token of fidelity; it was also believed to grow well for the righteous, and it is often said to flourish where the wife rules the household.

Fertility is of course one of the oldest and

most important of magical aims. In Roman times nuts were presented to newly married couples to ensure fruitfulness, and in France they were used to pelt the bride and groom as rice is still sometimes used today. The phrase 'going a-nutting' was a polite way to indicate love-making, and a good crop of hazel nuts is still linked with the expectancy of many births in the coming year.

In warmer climates the pomegranate is an ancient symbol of fertility, and so is the orange, which is why its flower is so often used in wedding bouquets. This fruit and its blossom also played a part in love charms, and one fascinating native recipe is recorded from Norfolk. A man who wanted to attract a girl had to prick an orange all over with a needle, and then sleep with it under his armpit. After this he would give it to the girl and make sure she ate it – apparently a sure way to guarantee her love.

The direct associations of a plant's appearance led to various beliefs. Due entirely to their testicle-like tubers, the orchid family were given a sexual symbolism, while the phallic 'lords and ladies' not surprisingly represented desire. The striped and speckled blue flowers of the eyebright endowed it with the power to cure the failing eyes which it supposedly resembled, according to the Doctrine of Signatures and the belief that 'like cures like'.

Some plants were associated with certain festivals, such as holly and ivy, the plant symbols of Christmas. The apple was a feature of many games played on Hallowe'en, mainly concerned with love divination. Candlemas, on the 2 February, was associated with the snowdrop. St John's wort and a great many other plants were ritually connected with St John's Eve and Day, which is also Midsummer Day. Flowers were frequently part of the decoration of early Valentines, the most popular flower in this connection being the rose.

The Language of Flowers

The rose is an important item in the 'language of flowers', where its basic meaning is 'love'. Meanings have been given to flowers since ancient times. By the 18th century the language of flowers was well developed, as this quotation from Lady Mary Wortley Montagu (1690–1762) demonstrates: 'There is no colour, no flower, no weed, no fruit, herb, pebble or feather that has not a verse belonging to it; and you may quarrel, reproach, or send letters of passion, friendship or civility, or even of news, without even inking your fingers.'

The Victorians, in an age which Osbert Sitwell has described as 'repressed but always respectable', kept up the language of flowers: it was necessary for a posy to speak volumes at times when the presence of the inevitable chaperone prevented the expression of romantic thoughts. Victorian books have interminable lists of the hidden meanings of flowers – not by any means consistent with one another.

By choosing, for example, various kinds of rose the lover could indicate some 40 different sentiments, such as 'Thou art all that is lovely', 'If you love me you will find it out', 'I am worthy of you', and even 'Beauty is your only attraction'. Among the flowers which had specific meanings were anemone, for refusal; apricot, for timid love or doubt; azaleas, for ephemeral passion. Bramble conveyed envy, the foxglove, insincerity, the gardenia, secret love, while grass stood for submission and phlox for a proposal. Combinations of flowers added complexity to the language.

The shift in importance from the god in the oak to the magic of the mandrake, and eventually to the sentimental floral dictionary of the Victorians, is a clear index of man's changing values. The disappearance of plant lore and magic, except among country folk and the less educated, is an indication of the advance of scientific knowledge in the 19th century and its destruction of the credibility of earlier beliefs. What little is left is often almost subconscious and apparently irrational. Thus nurses will still try to prevent visitors from bringing a bunch of red and white flowers into a hospital ward, not so much because they are aware of the symbolism of red standing for blood and white for death, as from a vague feeling that 'it's unlucky'. Superstition is still with us but without any knowledge of the folklore behind it.

PLATO'S MYTHS

ALL PLATO'S DIALOGUES are themselves stories. They are imaginary conversations, often with vividly drawn characters and settings so well presented that readers find them easy to imagine and remember. And they are full of stories of all sorts, and word-pictures which could sometimes be developed into stories which are designed to bring home to the reader the various points which Plato wants to make.

Plato knew that if you want people, not just to accept the conclusion of an argument as correct, but to believe something effectively and act on it, you must engage and convince every part and level of their psyche, including what we should call their imagination and feelings as well as their reason (and, for Plato, reason in its highest operation has in it a large element of what we should call imagination). It is not a matter of just assenting to the conclusion of an argument but of directly seeing or experiencing something, of a flash of imaginative intuition in which an eternal truth makes itself immediately present to the mind. These intuitions are rare and Plato seems to have thought that telling

G. Tomsich/SpectrumColour Library

Bust of Plato, in the Musei Capitolini, Rome: he included many 'myths' in his dialogues, including the story of Atlantis, as a way of engaging and convincing the imagination as well as the reason of his audience

stories would help, at least in the early stages of preparing the mind for them.

The stories he tells in the dialogues, which are usually referred to as Plato's 'myths', are of many different kinds and degrees of elaboration. Some of them are straight allegories, like the story of the birth of the love god, Eros, in the *Symposium*. At Aphrodite's birthday party in the heavenly palace of Zeus, the Spirit of Business Success having drunk too much, had a rest in the garden, and the Spirit of Poverty slipped in and induced him to make love to her, and so Eros was begotten; a strange intermediate being sharing the characteristics of both his ill-assorted parents.

A strange story which Plato uses in a subtle way is the myth told by Aristophanes, again in the *Symposium*. This tells how once upon a time human beings were spherical, with two faces, one on each side of the head, four arms and four legs. There were three sexes, male, female and hermaphrodite. They were strong and could move very fast by turning cartwheels, and they threatened to storm heaven in the arrogance of their strength. Zeus thereupon split each of them in two, and Apollo shaped and rearranged the halves into the sort of human beings we are today. Since then we have all been half-humans who go about looking for our other halves, and falling in love with them when we find them. Love (homosexual or heterosexual, according to the sex of the complete human one is really half of) is just the desire of wholeness, the desire to become a complete human being by reuniting the two halves.

In the *Statesman* there is a very odd cosmic parable, designed to show that there are two forces at work in the world, the divine reason and a sort of basic irrationality. It tells how in one cosmic period God spins the universe one way, and in the next it spins itself the other way and everything goes into reverse until God takes control again. Of course, none of it is intended to be taken literally, and the details cannot

Plato's Academy, a Roman mosaic: the philosopher is pointing to a globe. A myth in the *Statesman* tells how in one cosmic period God spins the universe one way and in the next it spins the other way, and everything reverses

be interpreted one by one allegorically – they are just part of the imaginary picture. This is also true of the greatest of Plato's myths, which are stories about the destiny of man and the origin of the world. There are four great stories, in the *Gorgias*, *Phaedo*, *Republic* and *Phaedrus*, which present imaginative pictures of man's life in the other world to which he rightfully belongs and where he returns when he is not incarnated in an earthly body. The story in the *Phaedrus* gives an imaginative explanation of why true philosophical lovers fall in love, and of how they should live and love in order to escape as quickly as possible from the wheel of reincarnation, and return finally to the divine world from which they came. In explaining this, Plato uses an image of immense power and great influence, that of the soul as a charioteer (the reason) driving two horses, a vicious one (the bodily passions) and a spirited but tractable one (the higher emotions).

The Divine Craftsman

The other three stories are all about the life of the individual soul between incarnations, when it is judged for its behaviour in this life, brought to a place of punishment or reward, where it remains for a very long time, and eventually is either reincarnated in another earthly body (human or animal) or escapes finally from reincarnation altogether.

In these stories Plato is concerned to get across imaginatively doctrines in which he certainly believed – that the soul is immortal (before birth as well as after death); that it rightfully belongs to a higher world, the world of pure intelligence and its eternal objects; and that we are morally responsible, and our fate after death will be determined by the way we choose to live here. But he does not commit himself to the details of his stories – they are just part of the imaginative picture. The basic ideas with which he operates, and many details of the geography of the other world, are taken from a sectarian religious tradition, probably not very ancient, the tradition of the religious groups called 'Orphic' (see ORPHEUS AND ORPHISM) and the Pythagorean philosophers.

Plato's myth about the origin of the world occupies nearly the whole of quite a long dialogue, the *Timaeus*. This is exceptional.

British Museum/John Freeman

One of Plato's most powerful and influential images is that of the soul as a charioteer (the reason), driving two horses (the bodily passions and the higher emotions). This Tarot card, the Chariot, is interpreted in a similar way by occultists, who take it as a symbol of the adept's conquest and yoking of the opposites in himself, through which he triumphantly rises towards the realm of the divine

Most of the myths are quite short, and the dialogues in which they occur are predominantly philosophical discussions. Plato seems to have put his account of how divine intelligence made the world (and he certainly believed that it did) into story form for two reasons; first, that one cannot give an absolutely certain and completely rational account of something like the physical universe, which is always changing. One can only tell a likely story about it. Purely rational discourse can only be about the unchanging realities known by pure intelligence. The other reason may be that divine intelligence is for Plato something mysterious. It is very difficult indeed for human beings to know what it really is; they can only make more or less inadequate comparisons to suggest what it is like. So in the *Timaeus* divine intelligence is compared to a perfectly good Craftsman who wants to share his goodness generously by making the best possible world according to the best possible model, the Real Living Thing, an organic unity or universe of immaterial eternal realities. The story tells how he set about making the physical world on this model, and how he coped as best he could with the built-in irrationality in all that is material.

The *Timaeus* was intended to be followed by another long story-dialogue, the *Critias*, of which we have only the beginning. This was to tell in full one of Plato's most famous stories, the story of Atlantis, which is summarized in the introduction to the *Timaeus*. The story relates how the great, rich, arrogant imperialist power of Atlantis invaded the civilized world from its island base in the Atlantic Ocean, and how it was defeated by prehistoric Athens, which Plato was going to represent as his ideal state of the *Republic* in action; the best possible human city, trained and led by philosopher kings, going out to defeat the forces of tyranny and set the whole world free. The story was to end with Atlantis sinking beneath the sea. Whether Plato knew (as he makes his speaker in the story say) some ancient tradition of a great disaster which set his imagination working can never be certain – some dim memory of the volcanic eruption which destroyed Thera (Santorin), and may have had more far-reaching consequences, might have survived, and he might have heard some tale about it; but he was quite capable of making the whole thing up himself. What is certain is that it would not have been a story mainly about Atlantis, but about an idealized ancient Athens which was also Plato's Republic, and that Atlantis itself would not have been any sort of ideal state, but an evil and aggressive power. (See also ATLANTIS.)

A. H. ARMSTRONG

'There have been few great philosophers whose life was as completely integrated with their thought as was that of Plotinus', who believed that only the perfectly good and wise man who lives on the level of Intellect can attain unity with the One or Good

PLOTINUS

PLOTINUS (205–270 AD) was the real originator of that last and most influential phase in the revived Platonism of the Roman Empire which we call Neoplatonism. It was he who gave the somewhat incoherent Platonism which he inherited enough shape, depth and vigour, not only to supersede all other still surviving forms of Greek philosophy and dominate unchallenged till the end of Greek intellectual paganism some three centuries later, but to have a deep and lasting influence on the thought of Christians, Moslems and Jews.

A good deal more is known about the life of Plotinus than about that of most ancient philosophers, because his disciple and editor, Porphyry, wrote a biography of his master which he prefixed to his edition (the *Enneads*) of the writings of Plotinus. Porphyry, naturally enough, concentrates on the period when he himself was with Plotinus, about six years nearly at the end of the master's life, and tells us next to nothing about Plotinus's family, childhood and education. It has generally been assumed that he came from Egypt, but even this is not absolutely certain; the one thing that seems to be certain, from his own writings and from what Porphyry tells us about him, is that he was Greek-speaking and completely Greek in education and outlook. He went to Alexandria to study philosophy in his 28th year, but could find no teacher to satisfy him till someone took him to the mysterious Ammonius. Ammonius was a self-taught philosopher whose pupils included the great Christian thinker Origen and his pagan namesake. Plotinus remained with Ammonius for 11 years. Then, because he wished to learn something about the

philosophy of the Persians and Indians, he joined the expedition of Gordian III against the Persians. But he never made any contact with Eastern sages: Gordian was murdered by his soldiers and Plotinus got away with difficulty to Antioch; then he went to Rome, and settled there permanently.

At Rome he became a much venerated philosophical teacher, with a circle of friends and admirers, some of whom came from the highest Roman society. After ten years' teaching, at the age of 50, he began to write the treatises which Porphyry after his death collected and arranged as the *Enneads*. He continued to write till his death. After Plotinus had been 19 years in Rome, Porphyry joined him and remained for six years.

In his last years Plotinus suffered from a painful and disgusting illness, which may have been a kind of leprosy. Eventually he gave up teaching and withdrew from the company of his friends and went to live in Campania, in the country house of an old friend of his who had died. It was there that he himself died, alone except for his doctor, Eustochius, a close friend and disciple. His last words were either 'Try to bring back the god in you to the divine in the All' or 'I am trying to bring back the divine in us to the divine in the All'. When he died his circle of friends had already broken up; it had never been a formal, organized society. So after his death there was no 'school of Plotinus', presided over by philosophers who claimed to be his successors.

Practising What He Preached

The description which Porphyry gives of his master in the last years of his life is very helpful to the understanding of the real spirit and intention of his philosophy. There have been few great philosophers whose life was as completely integrated with their thought as was that of Plotinus, at any rate in his later years. Even allowing for a certain amount of pious exaggeration on Porphyry's part, Plotinus seems to have lived up to his philosophical convictions (which were also, as for most philosophers of his time, religious and ethical convictions) to a quite unusual degree.

For Plotinus, philosophy was a process of waking ourselves up and discovering who we really are. The account which Porphyry gives of Plotinus in his 60's is of a man who has discovered himself as a soul existing eternally on a level higher than that of which we are aware in ordinary experience, conscious of belonging to and living its true life in the world of the Divine Intellect. This is the true reality on which the quasi-reality of our world of sense-experience depends. It is at once a living organism of which the parts are the Platonic Forms or Ideas and a living mind which is also a multiplicity of minds, each of which thinks, and so is, the whole. Plotinus, in one of his characteristic images, describes it as 'a thing all faces, shining with living faces' – and equally characteristically corrects the image immediately afterwards by saying that it is inadequate because it is looking at Divine Intellect 'from outside', instead of becoming it oneself and so seeing it. Because Divine Intellect is not in space or time it is eternally present and available to anyone who will make the effort required to turn to it and find his place in it, thereby discovering his true self.

But for Plotinus return to Intellect was only the indispensable preliminary to a higher stage. In his Platonism the world of Platonic Ideas which is Intellect is indeed the highest reality which we can think and know. We can think and know it because it is a definite, structured whole of parts, a one-in-many. But just for this reason, it cannot be the ultimate source of reality. It is only the first spontaneous but necessary expression, on a definitely lower level, of an infinite and absolute goodness and unity which, because it is infinite and absolute, cannot be thought or spoken about adequately at all. The goal of all human life is to reach unification, beyond thought of speech, with this One or Good which is the ultimate source of all things and to which all things in their way aspire, impelled by the love of it which it gave them in their creation. But only the perfectly good and wise man who lives on the level of Intellect can attain that goal, by sharing for a moment the mystical union, beyond its ordinary life of knowing, which Intellect eternally has with the One. The mystical union lies beyond philosophy, but one must go through philosophy to the end to get to it. Porphyry tells us that while he was with Plotinus his master attained to union with the One four times – he himself claims to have done so once.

In the Platonism of Plotinus, soul has many other functions to perform besides contemplating, though they should not hinder contemplation; and Plotinus did not allow his concentration on the higher world to distract his attention from other people and their needs in the lower one. 'He was gentle and at the disposal of all who had any sort of acquaintance with him,' Porphyry tells us. Soul for any Platonist is not only the contemplator of eternal reality but the principle of movement, life and growth, and of structure and order to the physical universe. It animates the material world, and everlastingly forms and governs it in accordance with the eternal realities which it contemplates. Apart from soul, bodies have no realities at all. Their 'matter' is a dark negativity, an absolute non-existence which is the source of evil in the lower world. But all bodies, and the material world as a whole, in so far as they are given life, form and ordered movement in time by soul, have a reflection of the glory of the intelligible world in them. The physical universe as a whole is the best possible image on its level of the eternally living world of Intellect. Soul, divine and human, cannot reject it but must operate in it on every level, down to the life and growth in plants and the formation of apparently inanimate bodies.

Plotinus never stopped teaching and writing, trying to bring others to see what he saw and understand themselves as he understood. But beyond that, without apparently any disturbance of his inner detachment and concentration, he had time for everybody and was ready to help his friends even in their most this-worldly concerns and needs. He made no fuss about religion, and was generally indifferent to external observances. Nor did he as a rule make much fuss about morality, though his personal principles were austere enough. He preached contempt for the body, and lived ascetically, but he was no inhuman ascetic or withdrawn solitary. To his circle he was not only a philosophical teacher but a spiritual and moral guide and a kindly and practical friend.

PLUTO

THE GOD commonly known as Pluto in Roman times, and later, was also and more often in earlier times called Hades (*Aides*), though that name has come to be used in modern languages for the underworld where he lived as lord of the dead. In Greek there is also the form Aidoneus, used by Homer in the *Iliad* and in the Homeric Hymn to Demeter; in Latin he is called Dis, a translation of the Greek Plouton which means 'wealthy', and Orcus, commouly derived from the Greek *horkos*, 'oath', because his name was used in oaths. He is also called the subterranean Zeus (Zeus *katachthonios*) as in the *Iliad* (book 9). Among the gods he is the most hated by men, who rarely honour him with cult, and the most separate from other gods. He remains nearly always in his own realm, the House of Hades. The name Hades is generally agreed to mean 'the unseen one'. Hades is the son of Cronus along with Poseidon and Zeus, but he is very little active in Greek myth.

According to Homer, when Zeus and the other Olympians had overthrown Cronus and his Titans (see CRONUS), Zeus divided the world between himself, Poseidon and Hades: Zeus had the sky, Poseidon the sea and Hades the misty darkness, while the earth and Olympus were common to all (*Iliad*, book 15). In the *Odyssey* Hades as a person is mentioned in Book 11 but always along with Persephone, and he does not appear. In the *Theogony* of Hesiod the underworld, including Tartarus is described. It is a vast abyss and the prison of the overthrown Titans. Its entrance in the far west is reached by Day and Night in turn as they travel across the sky to 'the awful home of murky Night' which never holds both at once. Somewhere near the entrance, 'there in front', stand the echoing halls of Hades, god of the lower world, where he dwells with Persephone. A fearful hound guards the house. Fawning with his tail and ears on all who enter, he never lets them go out again; he devours whoever he catches attempting to leave. He is evidently Cerberus.

C. M. Dixon

The one celebrated action of Hades, or Pluto, in classical mythology was the rape of Persephone, whom he carried off in his chariot to his grim underworld kingdom, the home of the dead and common destination of mankind

The Cap of Invisibility

There is only one famous action of Hades or Aidoneus in Greek myth: his breaking through the earth with chariot and horses to carry off Persephone (see DEMETER; PERSEPHONE). The narcissus, which Persephone tried to pluck, had special links with the underworld. Horses, too, had a connection with it in its most alarming aspects, and Hades is often called *klytopolos*, 'owner of renowned horses' – an attribute which calls to mind the word 'nightmare'.

Hades is active once more in a curious myth told in the *Iliad* (book 5). Hercules wounded him with an arrow 'at Pylos among the dead' and caused him so much pain that he went up to Olympus to have the arrow drawn out of his shoulder by the healer god Paieon and the wound treated with pain-killing drugs. The commentator Eustathius explains that Pylos here is not the town mentioned in Homer but the gate of the underworld. This passage again suggests that Hades was often believed to have his dwelling near the entrance of the underworld as a warden of the dead, which would suit one of his titles, *pylartes*, 'fastener of the gates'. But this pitiless guardian of the dead was simply strict and rigorous; he was not any kind of devil, and his realm, except for some places where notorious offenders were punished, was not a hell, but the common destination of mankind.

A mythical object which by its name was connected with Hades was the helm or cap of Hades, *Aidos kynee*. The name has the general sense of 'cap of darkness' or 'cap of invisibility'. The cap is worn by Athene in battle against Ares in the *Iliad* (book 5), by Hermes in battle against the giants and by Perseus in his attack on the Gorgons. In myth it is not worn by Hades, nor in Greek art is it shown on his head, nor is it certain that he really owned it or lent it. The connection of the cap with Hades remains obscure.

Hades or Pluto as one of the chthonic or underground powers has not simply the gloomy aspect which he wears in the epic tradition. He is not solely the lord of the underworld. This is obvious from the name Pluto, connected with *ploutos*, 'wealth', a word which originally meant particularly the wealth of crops which grow out of the ground and of precious minerals which lie beneath it. In this aspect he is thought worthy of cult by Hesiod: 'pray to Zeus beneath the ground', that is to Hades, as well as to Demeter. It was in this aspect again that Hades was associated in cult with Demeter and Persephone at Eleusis. Hades is called 'another Zeus' by Aeschylus in his *Suppliants* and as Zeus *katachthonios* he is mentioned in Homer with Persephone as enforcer of a father's curse. He is in this sense a power supporting life and the family. He has also a title Euboulos or Eubouleus, 'giver of good counsel'.

The entrance to the realm of Hades was seen in many caves and clefts to be found about Greece and also in parts of Italy settled by Greeks. The most famous in Greece were the cave of Taenarum in southern Laconia and a whole region of Thesprotia in the north-west. Thesprotia had rivers called Acheron and Cocytus and a lake called Acherusian, all of them names belonging to the mythical Hades, and also an oracle of the dead which in some traditions Ulysses visited when he had come to Ithaca and had to travel further on the Greek mainland. Pausanias remarks that Theseus and Pirithous invaded Thesprotia to carry off the king's wife. This looks like a version of their descent into Hades to carry off Persephone. The suspicion is confirmed by Plutarch, who says that the heroes went to Epirus to steal the daughter of Aidoneus, king of the Molossians, who had a wife called Phersephone and a dog called Cerberus.

The Greek colonists carried these stories with them when they reached the volcanic region of Campania. They discovered another mouth of the underworld in Lake Avernus, and applied the names of the infernal rivers to various streams. Aeneas, in the sixth book of the *Aeneid*, is shown entering the underworld from Italian Cumae under the guidance of the Sibyl, which he could not have been made to do without this new location for the Greek lore. Pluto, however, does not appear himself in the *Aeneid*, nor indeed in the story of Orpheus in the Fourth *Georgic*, though he is mentioned as terrifying and unyielding in taking back Eurydice, once Orpheus had looked back at her as he led her out of the underworld.

E. D. PHILLIPS

Pluto in Astrology

The most distant known planet from the sun – it takes almost 250 years to make the tour of the zodiac – Pluto was discovered only in 1930. Though it was named after the Greek and Roman god of the underworld, the name does not seem specially appropriate. Astrologers have suggested that Pluto ought to be the real ruler of Scorpio, or some say of Aries; but no rulership has been generally attributed to him.

The most common event signified by a transit or aspect of Pluto is that the Plutonian leaves home, goes out into the world, or sets up in business on his own account. Pluto's outstanding characteristic is emphasis, so that whatever is happening, for whatever reason, it will be the more striking on account of the aspect of Pluto; if it is a pleasant event signified by Jupiter, it will be made more notable, but if an unpleasant event brought about by Saturn, it will be the more grievous on account of the presence of Pluto. When Pluto dominates the horoscope, the subject is likely to be a striking personality, and if Pluto and Sun are both prominent he will always make his presence felt.

The combination of the functions of poet and magician is characteristic of early civilizations, and Celtic bards were particularly renowned for their powers: 'poetic' thinking underlies many human approaches to the supernatural

POETS

IT IS generally recognized that verse preceded prose as a form of expression in the literatures of the world. At a time when magic played a very important part in the life of early peoples and when they had constant recourse to spells and incantations to accomplish supernatural ends, these took the form of verse rather than prose. Poetry is more easily memorized than prose, and verse-spells, handed down from generation to generation, were in regular use.

While some of these early verse incantations were of a maledictory nature, most of the later ones (known in the Irish language as *orthai*) were apocryphal folk-prayers, with a blend of pagan and Christian beliefs. Their main purpose was to alleviate or cure human ailments.

Irish poetry, especially in the period from 600 to 1100 AD, is one of the most interesting literary phenomena that Western Europe has to offer, and was produced by a literary class that had practised its art for centuries in the bardic schools. These bards (poets) were the shadows, as it were, or successors of high-ranking pagan priests, or Druids (see DRUIDS), and it was natural that at least some of the bardic compositions had the flavour of the magical operations of the Druids.

In the Irish society of early times, continuing down to the 17th century, it was usual for a king or chieftain to have among his retinue a poet, whose duty it was to act as intermediary between the mysterious powers of Nature and his patron.

In Celtic societies poets were not clearly separable from Druids or magicians and often combined the functions of all three *Left* Scenes from the Eisteddfod or 'session' of Welsh bards in 1925: the herald sounds a summons (*above*); the bards touch the great sword of peace gripped by the Archdruid (*below*) *Right* The poet Virgil had a medieval reputation as a powerful magician: 3rd century mosaic

The main function of such poets was to sing the praises of their patrons, and much of their poetry has survived in manuscript. These laudatory compositions were often of a genealogical character, and had no magical connotation.

If, however, as sometimes happened, the poet was offended by lack of gratitude and fitting reward for his compositions, he was at liberty to write satires, according to ancient custom, upon the king or chief in whose service he was retained. It is clear that satires of this nature were not of the type which the word *aer* (satire) now connotes (largely ridicule and mockery), but were intended both to damage the patron's honour and to cause him physical harm. As James Carney has said: 'If an ollave (poet) satirizes a prince he is in effect telling him that the forces of Nature, with which he, the ollave, is in communion, are not satisfied: the result of the satire is an injury to the king's honour (which may show physically as blisters on his face) and possibly a blight on the land.'

Osborn Bergin states that at an early period 'the *file* (poet) or bard had been regarded as a dealer in magic, a weaver of spells and incantations, who could blast his enemies by the venom of his verse'. The early Celtic poets were not clearly separable from Druids and medicine-men, but often combined in one person the functions of all three, so they freely mingled natural and supernatural processes in the practice of their arts.

Rhymed to Death

There is an interesting account from an early Irish manuscript of the method by which a poet satirized a king who had refused him a proper reward. 'The poet himself with six others, on whom the six degrees of poets had been conferred, had to go at sunrise to a hilltop on the boundary of seven lands; and the face of each degree of them towards his own land, and the face of the ollave there toward the land of the king whom he would satirize, and the backs of them all towards a hawthorn which should be on top of the hill, and the wind from the north, and a slingstone and a thorn of the hawthorn in every man's hand, and each of them to sing a stave in a prescribed metre into the slingstone and the

Sonia Halliday

thorn; the ollave sings his stave before the others, and they afterwards singing their staves at once; and each was then to put his stone and his thorn at the butt of the hawthorn. And if it were that they were in the wrong, the earth of the hill would swallow them up. But if it were the king that was in the wrong, the earth would swallow up him and his wife and his son and his horse and his arms and his dress and his hound, a separate curse falling on each.'

The results of the maledictions of Irish poets were varied, according to different accounts in early literature. Pimples, blisters and blotches were raised on the offending patron's face, causing bodily disfigurement. There was no growth of grass, corn or leaves in Leinster after a poet's curse. In other cases, lakes and streams went dry, no fish were caught in river-mouths and plains were barren of produce.

Bo Almqvist, in his study of Old Norse verse magic, tells of some 200 Icelandic poets (16th to 19th century period), who were credited with supernatural powers. They could influence the elements by dispersing drift ice and stopping volcanic eruptions and storms; they could kill destructive animals, such as foxes, and procure seals, whales and fish; they could also force ghosts to disappear into the ground. Their verses were mainly directed against certain categories of people who had attracted special wrath and disgust, such as pirates, Danish merchants and iniquitous officials. As a result of the forceful abuse and violent satire, these people were believed to be struck by life-long misfortunes, strange diseases and sudden death. There are also references to the maledictory powers of early poets among the pre-classical Greeks and Romans, the Arabs, the Eskimos and the Ashanti.

Plague in Your Hearts

Two Irish cursing poems against rats:

Ye rats that have come down from the mountain
And have grown fat among the people,
May your jaws be weak when winter comes,
And strong, wise cats make havoc among you!
Since ye have gone out of control,
Hard may your sufferings be in the fire of pain!
Swim through the tide to Carricklare,
An island devoid of shelter;
There ye may find barnacles and fish –
Leave me, or I shall plant plague in your hearts!

Go, ye brood, across Carrickughtane,
And by short-cut to Milleenamona;
Spend the night at the house of Dan Lane,
A churl of ill-repute;
Tear his cap and rend his blanket;
Eat his shoes and take away his breeches
To make a winter bed in the outhouse;
He has corn stored since last year in his haggard;
So eat it during the autumn;
And if ye run short of food, take up your abode in his neighbour's house!

Poetry, song and music were widely believed to have power over animals and the forces of Nature, as well as men *Below* Orpheus charms birds and beasts with the sweetness of his singing *Right* The Pied Piper of Hamelin leading the town's rats to a watery death, from a 19th century German children's book. Cursing poems against rats are a feature of Irish folk poetry

Scala

Bane of Rats

The best-known early instance in Irish literature of the belief that poets could banish mice is to be found in a Middle Irish tale, *Imtheacht ne Tromdhaimhe*, which tells how mice had eaten an egg which had been saved up for the 7th century poet Senchan. 'That was not proper for them,' said Senchan; 'nevertheless there is not a king or chief, be he ever so great, but these mice would wish to leave the traces of their teeth in his food; and in that they err, for food should not be used by any person after their teeth; and I will satirize them.' Then follow stanzas in which Senchan threatens the mice with death, and they beg him to accept compensation instead. As a result of his verses, ten mice fall dead in his presence. The poet then said to them: 'It is not you that I ought to have satirized, but the party whose duty it is to suppress you, namely the tribe of cats.' He then pronounced a satire on the lord of all the cats. The intended victim, however, took revenge by carrying off on his back the poet, who was saved from death only through the intervention of St Kieran.

Poets in many other lands too, including Scotland, Greece and Rome, ancient Germany, Arabia, Finland and Iceland, were said to be able to banish harmful animals, especially rats, by means of magic verse. Many examples of this type of verse are to be found in modern Irish folk poetry, down to the present time. Some accounts tell how the poet who was summoned for the task wrote his extempore verse of banishment on a piece of paper, which he then laid at the mouth of the hole in which the rats lived. The poet would name the person (often someone whom he disliked) and place to which the rats had to go. The route was often across water and the designated destination was occasionally promised to be more suitable than their former abode. Stories have been told of how the rats were later seen emerging from the hole, led by a veteran, who carried in his mouth the paper on which the verse had been written. They then made their way across the countryside to the place mentioned in the verse. A further touch of detail is added when it is said that the blind rats among the company were led along by their comrades by means of a wisp of straw which they held in their mouths. The verse was sometimes referred to as *Salm na Mallacht* (the Cursing Psalm), and such rhyming maledictory verses were always in the Irish language and do not seem to have gone over into English.

The belief that poets could also banish creatures other than rats was current in Ireland. In olden times a king named O'Brien was afflicted by a maggot which had settled on his brow; whenever the king attempted to eat some food, the maggot descended and ate it all. A poet was finally summoned and, by the power of the

Mansell Collection

following verse, forced the maggot to emerge, and it was burned in the fire:

> You maggot on O'Brien's brow,
> Eat not the food in his hand;
> You black creature of the beetle's colour,
> Come down from the brow of the king of
> Ireland's princes!

Poets could show their magical power in other spheres also. A poet, who was making his way home over a rough road on a dark night, struck his shinbone against a stone which had fallen from a cairn. The poet stopped and angrily cursed the stone in the following terms:

> The dark moon, alas, has caused my foot to be cut;
> You jagged, sharp-edged rock, full of evil,
> May God's curse rend you and make you mend your ways!
> You have not let me pass you by late at night.

Next morning, every stone in the cairn had disappeared.

Finally, a story is related in Ireland of a poet who was badly received in a miserly house. When he had left, he composed a verse and wrote it on a piece of paper which he secreted over the lintel of the door. The result was that the churlish woman of the house and others who entered it during the day were forced to dance continuously, until the poet himself was summoned and removed the magic spell.

SEÁN Ó SÚILLEABHÁIN

The Poetry of Magic

Magic is related to poetry not merely by its feeling for the power of words but because it depends on what might be called poetic logic, as distinct from rational logic. The magician looks at the world through eyes which see all sorts of links and connections between things which, outwardly and rationally, are not connected at all. Magic relies heavily, as poetry does, on similes, analogies and symbols.

A minor but characteristic example is the presence of bat's blood as an ingredient in some recipes for witch's flying ointment. Why bat's blood, rather than some other sort of blood? Because witches wanted to fly about at night without bumping into things, which is one of the most obvious abilities of the bat. Similar parallels and links lie behind magical rituals, behind the use of the circle and the pentagram, behind the magical systems of correspondences and the symbolism of colours and directions. And the whole magical picture of the world, in the European tradition, is based on poetic analogies between man and the universe, and man and God.

The arts of divination rely on the same kind of logic. A simple case in point is the folk belief that if a candle is guttering, it means that the life of someone in the house is flickering to its close. In popular astrology, if at your birth the majority of planets were

'A Book of Verses underneath the Bough, a jug of Wine, a loaf of Bread – and Thou beside me singing in the Wilderness – oh, Wilderness were Paradise enow!': Edward FitzGerald's *Rubaiyat* on the life-giving beauties of poetry

Sonia Halliday

in zodiac signs associated with the element of fire, you are likely to be credited with 'fiery' characteristics – warmth, brightness, cheerfulness, aspiration, excitability. The author of a well-respected astrological textbook says that people who have a preponderance of planets in water signs are likely to be 'wet', 'sloppy' or 'drips'. This is not regarded as mere wordplay by traditional astrologers because they have inherited the magical belief, not infrequently shared by poets, that a link between two things in the human mind means that there is a real connection between them in the universe. In all forms of divination the world is regarded as a whole, a pattern, so intricately enlaced that the lines on a hand, the fall of lots and other outwardly random events can provide clues to the nature of the pattern.

This way of looking at things is not confined to magic and divination but has powerfully influenced religious attitudes to the supernatural as well. The concept of man as made in the image of God, or the belief that the virility of the bull influences not only the fertility of herds but also the growth of crops, or the parallel between the crops resurrected in spring, the dying and rising deity of vegetation, and the dead buried in earth to find a new life beyond the grave – these are only a few among many examples of 'poetic logic' applied to the major religious concerns of mankind. The principle of mimicry, on which so much magical and religious ritual is based (see IMITATIVE MAGIC), rests on a poetic analogy between the simulated and the real, between man's activities and those of the universe.

Religion and magic also share with poetry a sense of the profound importance of inspiration, of the glow of illumination in the mind, the sudden grasp, whole, of something previously perceived in fragments or not perceived at all: and this is not with a feeling that inspiration is merely an interesting psychological phenomenon but in the firm conviction that inspiration reveals the truth. The Nuer people of Africa believe that 'God created the world and everything in it out of nothing, by thinking or imagining it, as one creates a poem' (see NUER) and this view of creation is found in many other parts of the world. Sacred scriptures are generally claimed to be divinely inspired, with the implication that only through a revelation from God could their human authors have grasped truths which must always be beyond the reach of reason. Poets and seers, oracles, priests, shamans and holy men have been, and still often are, believed to have access through inspiration to truth not available to the less gifted and less fortunate, to levels of reality deeper and far more significant than the surface world of appearances can reveal.

POISONING

In an age when little was known about the properties of dangerous drugs, the witches with their brewing of love potions and abortifacients were often blamed for deaths; in many cases the supposed victims of witchcraft probably died purely from a poisoned mind

TWO OPPOSING PRINCIPLES, the force of life and the force of death, are embodied in the images of the healer and the witch. In the Christian era, when all forms of magical healing were stigmatized as heresy, the two images became merged. It is doubtless for this reason that the virtues of the wise-woman of the past have been forgotten, and that today she is remembered more for her poisons than for her love potions, as an abortionist rather than as a nurse.

The rise of the witch mania in Europe was to some extent a by-product of the revolutionary urge to sweep away all the outmoded relics of the superstitious past. On the one hand, the physicians, newly freed from ecclesiastical restraint, demanded the authority to regulate their own affairs and furthermore to impose an embargo upon all lay medical practitioners, while on the other the Church was beginning to see a threat to its supremacy in the survival of magical practice.

The combination of the two pressures led to the imposition of laws against witchcraft which condemned the village healers, herbalists and midwives to constant harassment as poisoners, abortionists and witches. Their situation was always precarious, despite the fact that due to the deficiencies of the medical profession they were in constant demand for the treatment of the sick and the poor. Their knowledge of botanical medicines was probably far superior to that of the physicians, among whom the subject was not studied scientifically until the close of the 16th century. The wise-woman's potions, accompanied by the appropriate incantations, were directed to the cure of the impotent and the barren, while in her capacity as midwife she was able to assist or terminate pregnancy.

All medical practitioners walk the tightrope of power, at the same time the object of reverence and hatred. The wise-woman who was equipped with the means of killing as well as curing was extremely vulnerable

In 1630 the Commissioner of Health of Milan, who had been observed wiping his ink-stained hands on a wall, was immediately denounced for spreading plague poison

to the charge of infanticide or abortion, and to accusations in the event of a death occurring under mysterious circumstances.

With the advance of chemistry in the 16th century, toxic mineral drugs such as antimony, arsenic and mercury were coming into vogue and deaths from poisoning were now included among the normal hazards of medical treatment. Due to his strongly entrenched position the orthodox medical man stood in little danger of condemnation as a poisoner, unlike the lay healer.

There is some evidence to suggest that the medical profession had a vested interest in branding their non-established rivals, the magician healers, as witches and poisoners, and that by so doing they hoped to drive out their more firmly established competitors. Under the common law of England medicine was then open to all who chose to practise it, but quacks were often prosecuted as witches and poisoners. Thomas Gale, Queen Elizabeth's Sergeant Surgeon, asserted that at two London hospitals, St Bartholomew's and St Thomas's, large numbers of the sick had been 'brought to their mischief by witches, by women, and by counterfeit worthless fellows that take upon themselves the use of art, not only robbing them of their money, but of their limbs and perpetual health.'

Roman Catholics as well as Protestants joined in the attack. In 1554 Bishop Bonner began to take an interest in the activities of certain midwives who were said to be exercising 'witchcrafts, charms and sorcery'. Even the ecclesiastically licensed midwives openly practised magical arts, and were described by their critics as closer to paganism than to Christianity.

The prevailing doctrine of witchcraft branded the magician healer as the Devil's agent, and declared it to be her mission to destroy life, not only by magic but by poisonous substances, by infanticide and abortion. The eminent demonologist John Nider was convinced that midwives, in attempting to secure abortions, administered dangerous drugs to the mother, and when these failed stabbed long needles into the brain of a new-born child. The supposed object of child murder by witches was twofold: to obtain bodies for the manufacture of poisons and unguents which could then be used to destroy their fellow human beings, and to a lesser extent, to procure offerings

Poisoning has always had a close connection with witchcraft and the powers of darkness ***Facing page*** **'Thou mixture rank, of midnight weeds collected, with Hecate's ban thrice blasted, thrice infected': the play scene from** ***Hamlet,*** **by a noted Victorian painter, Daniel Maclise** ***Above*** **Simon Forman, an astrologer and wizard of the 17th century, who was employed by the Countess of Essex to supply potions: he may have been involved in the murder of Sir Thomas Overbury (*below*)**

for Satan. It is doubtful, in fact, whether such horrors ever took place outside the morbid imagination of prosecutors. Nevertheless, spurred on by the need to save the unbaptized child from the fiery hell to which theology had consigned it, the interrogations of the witch-hunter, combined with torture, produced what was then considered satisfactory evidence of such a conspiracy.

The Doctors' Scapegoats

The pharmacopoeia of witchcraft incorporated the common run of botanical recipes from woodland and hedgerow which were readily available to anyone with murder or abortion in mind. Deadly drugs were obtainable which could be dispensed to a client, the most notorious poisons being hemlock, hemp and henbane. In unskilful hands an aphrodisiac like cantharides could cause an agonizing death. Among the more general types of abortifacients were the potentially poisonous pennyroyal, rye ergot and oil of tansy. The function of these remedies for an unwanted pregnancy was to reduce the health of the mother to such an extent that the foetus would be expelled from her body. Should the mother die, however, as was often the case, the midwife was extremely vulnerable to a charge of murder or witchcraft, or both.

Renaissance physicians, not unnaturally, took every opportunity to cast the blame for their failures upon their unprofessional rivals, the witches; a policy for which there was ecclesiastical sanction, for the Inquisitor Bernard de Como had laid down the doctrine that all diseases beyond the curative power of medicine must be due to sorcery.

In view of the undeveloped state of medical knowledge in the late 16th and early 17th centuries, it was beyond the capacity of most physicians to determine what was or was not a poisonous substance. Mercury, arsenic and antimony were recognizably poisonous, but so it appears was air pollution; the demonologist William Perkins included in his category of witch crime that of attempting to murder the human race by poisoning the air. Plague-spreading was also classed as poisonous activity, the most notorious case of this kind occurring in Milan in 1630, when the Commissioner of Health of that city, who had been observed wiping his ink-stained hands on a wall, was

Mansell Collection

immediately denounced for spreading plague poison. Skilled questioning, reinforced by torture, secured a complete confession of guilt, together with the names of accomplices, and those responsible were torn with red hot pincers and burned at the stake.

Despite the declaration of the French magistrate and witch-finder, Pierre de Lancre, that there were in existence two types of witches (the poisoner belonging to a separate branch of the black art), there is little to indicate that poisoning and witchcraft were practised by different types of magicians. The principal target of the poisoner's arts has always been the husband or wife who has outlived his or her desirability and usefulness, or the heir who stands between the poisoner and an inheritance. Women were the main offenders, as Reginald Scot makes clear in his *Discovery of Witchcraft* (1584), in which he declared 'women to have been the first inventors and practitioners of poisoning and more naturally addicted thereunto than men'. Elizabeth Francis, one of the first women to be tried under the English Witchcraft Act of 1541, admitted to the ownership of a diabolical cat-imp called Satan which had prescribed a drug to procure an abortion.

Mass Murder and Black Magic

The English witch trials produced several instances of poisoning, or at least suggestions of this crime, usually at the expense of an unwanted spouse. A woman found guilty of murdering her husband was liable to suffer death at the stake for the crime of petit-treason. In 1652 the diarist John Evelyn witnessed the burning alive of a woman, sentenced for husband murder, on a blazing tar barrel at Smithfield before a vast crowd.

A remarkable outbreak of mass poisoning associated with witchcraft, known as the Chambre Ardente case after the court which was set up by Louis XIV to investigate it, occurred in France towards the end of the 17th century. Poisons, love philtres and black magic rituals involving child sacrifice were resorted to by those who wished to be rid of an unwanted marriage partner or to secure the affections of a fickle lover. The facts came to light after a fortune teller named Marie Bosse had been overheard by a police agent to say: 'What a lovely occupation is mine. Nothing lower than duchesses, marquesses, princes and lords. Three more poisonings and I'll retire. My fortune is made.' The ensuing investigation, which was accompanied by savage torture, uncovered a vast conspiracy involving the greatest in the land, notably the King's former mistress, Mme de Montespan (see also BLACK MASS).

A ring of poisoners had apparently supplied lethal potions to a network of witches and abortionists all over France, resulting in the murder of an unknown number of unwanted husbands, children and babies; some 2500 babies were said to have been disposed of, the bodies being secretly buried in a garden at Villencouve-sur-Gravois. In a typical case a wife who wanted to be rid of her elderly husband soaked his shirt in a preparation containing arsenic, which

Of Witches' Poisons

The poisons used by witches are compounded and mixed from many sorts of poisons, such as the leaves and stalks and roots of plants; from animals, fishes, and venomous reptiles, stones and metals; sometimes these are reduced to powder and sometimes to an ointment. It must also be known that witches administer such poisons either by causing them to be swallowed, or by external application. In the first instance they usually mix some poisonous powder with the food or drink: in the second they bewitch their victim, whether man or woman, while he is sleeping by anointing him with their lotions, waters, oils and unguents which contain many and various poisons. They anoint the thighs, or belly, or head, throat, breast, ribs, or some other part of the body of the person to be bewitched, who being asleep feels nothing; but such is the potency of that unguent that, as it is slowly absorbed by the heat of the sleeper's body, it enters his flesh and penetrates his vitals, causing him the greatest bodily pain . . . They have also a third method of administering poison, namely, by inhalation: and this is the worst of all kinds of poison, for by reason of its tenuity it is readily drawn in through the mouth and so quickly reaches the heart.

brought the skin up in blotches resembling syphilis. Affecting concern, she then dutifully treated these with salves which instead of allaying the inflammation introduced a slow poison.

The full investigation of the scandal revealed much that was criminal but even more which, in the light of what is now known about the role of torture in witchcraft interrogations, seems highly dubious. The confessions of the principal witch and abortionist Catherine Deshayes, known as La Voisin, and her confederates in Devil worship, child sacrifice and the performance of a Black Mass were extracted only under barbaric torture. The nobles involved in the affair predictably escaped torture and execution, but La Voisin, together with a considerable number of minor abortionists, poisoners and innocent people, suffered death at the stake. The Chambre Ardente investigation was summarily brought to an end by the intervention of the King in 1680 and was followed by the outlawing of fortune tellers in France and the introduction of legal controls over poisons.

Death From a Poisoned Mind

All advances in the art and mystery of the apothecary tended to place in the hands of the unscrupulous charlatan lethal substances which could be turned to good account if he was prepared to take the risk of setting himself up as a poisoner. Simon Forman, a medical man of dubious reputation who retailed aphrodisiacs and lethal potions from his consulting rooms at Lambeth in London in the early years of the 17th century, was employed by Lady Essex for the [illegible] purposes of rendering her

That poison was one of the chief weapons of the witch became an established part of popular lore, partly as a result of the attitude of ecclesiastical and medical authorities to the activities of local wise-women and healers, who were branded as agents of the Devil
Previous page **Witches in a hayloft, concocting a potion, with a snake adding its venom: an early 19th century cartoon by Rowlandson**

husband sterile and her lover even more amorously inclined. Finding a certain Sir Thomas Overbury in the way of her intrigues, she conspired to poison him, with arsenic and cantharides, using as go-between a Mrs Turner who was afterwards hanged for the crime. Despite the exposure of the scandal, Lady Essex was too highly placed to be executed and after a period in the Tower received a pardon from the King.

In Harris's *Life of James I* there is a curious anecdote suggesting that the death of the King might have been due to poisoning by arsenic, supplied by the fashionable London wizard Dr Lamb, a close associate of the Duke of Buckingham and known as the Duke's Devil. Lamb met his end at the hands of a ferocious London street mob who pursued him down Cheapside, howling, 'The poisoner, the poisoner', and stoned him to death as a wizard. Lamb's assistant, Anne Bodenham, was later charged with witchcraft and supplying of arsenical poisons, and suffered death on the scaffold.

In considering the role of toxic medicines in the pre-scientific era, one must take into account a point made by Christina Hole in her *Witchcraft in England*, that a poisonous thought can have as lethal an effect upon the mind as a poisonous substance; and that it is possible that the mere fear of poisoning might sometimes have been sufficient to bring about the death of a guilt-ridden husband.

In discussing instances of modern African witchcraft, the missionary Mary Kingsley referred to the importance of the state of mind of the victim: 'That all witches act by means of poison alone would be too hasty a thing to say. I think we need hardly doubt that the African is almost as likely to die from a poisonous idea put into his mind as a poisonous herb into his food.'

Village wise-men and women continued to supply herbal abortifacients as late as the middle of the 19th century. Cunning Murrell, the famous white wizard of Hadleigh, Essex, lay under strong suspicion locally of this crime, although there was no suggestion that he ever became a poisoner (see MURRELL). Works of medical jurisprudence published at this time indicate a continuing resort to mercury, cantharides, emetics and herbal potions in attempted abortions, measures which often resulted in the death of the mother. During the early years of the present century there were herbalists still to be found who were prepared to administer dubious abortifacients at a price.

Although the herbalist witch was traditionally blamed for supplying the means to wives who wished to make away with their husbands, even after she disappeared from the social scene, women continued to solve their marriage problems without the help of witchcraft. In 1851 Charles Mackay asserted in his *Extraordinary Popular Delusions* that 'women of the lowest classes' were once again resorting to poisons, for the double purpose of ridding themselves of their husbands and obtaining the burial money.

Pollution

Defilement, impurity, uncleanness, the spiritual parallel to physical dirtiness; frequently the result of some sin or breach of taboo or ritual; contact with a corpse is often regarded as dangerously polluting, as is contact with a pregnant woman; ceremonial washing, as in baptism, cleans away pollution. See BAPTISM; BIRTH; TABOO; WATER.

One of the oddest features about poltergeist outbreaks is not so much why they start as why, apparently inexplicably, they stop; in considering the possible psychological origin, the author suggests that these freakish occurrences should be regarded less as a disease than as an unconscious attempt on the part of the 'victim' at a cure

POLTERGEISTS

THE WORD POLTERGEIST was originally a German folklore term compounded from *polter* (a noise or racket) and *geist* (a spirit or sprite), indicating a Nature spirit of like status to elf or goblin or 'things that go bump in the night'. Subsequently the term acquired a wider sense. Phenomena ascribed to poltergeists included a remarkable variety of alleged happenings: movements of domestic objects, flinging of mud and stones, teleportation (the mysterious conveyance of articles into closed rooms), as well as the production of noises such as raps, bangs or scratchings, and sounds imitating the human voice whistling, singing or talking.

Despite the fantastic nature of the alleged phenomena serious investigators in psychical research during the late 19th century such as Frederick Myers, Frank Podmore, Andrew Lang and the criminologist Cesare Lombroso thought them worthy of unbiased study. But in order not to prejudge the issue they tended to use the term poltergeist in an adjectival sense as descriptive merely of the type of happenings reported, which were said to constitute a 'poltergeist disturbance' or outbreak. This purely descriptive approach leaves open the question as to whether poltergeists exist as 'spirits' or discarnate entities, so that to begin with we are concerned only with poltergeist phenomena or 'poltergeistery', real or alleged.

Natural Causes

Early writers on poltergeist outbreaks naturally offered many theories as to why they happened. The poltergeist was usually described vaguely as an evil spirit without necessarily implying that it was one of Satan's own imps. Gerald of Wales (1147–1223) refers to cases where mud was flung, holes cut in garments and a 'spirit' conversed with men in a somewhat aggressive and derisory fashion. Gerald's curiosity was aroused by the fact that rites of exorcism were ineffective, the priests themselves being subjected to insult. He concluded that sacraments are effective against true demons but not with merely mischievous ones, such as Nature spirits. During the Reformation period, for theological reasons writers tended to prefer either the demonic interpretation or explanation in terms of natural causes, ranging from death-watch beetles to the pranks of children or the trickery of adults.

Modern Spiritualism gained its first impetus in 1848 from an outbreak of rapping noises in the home of John Fox at Hydesville, a village in New York State. Subsequently there has been a tendency among Spiritualists to interpret poltergeist outbreaks as attempts at communication by the spirits of the dead. Some Spiritualists, however, regard poltergeistery as caused by elementals.

In view of the fantastic happenings alleged in poltergeist cases and their speculative interpretations, there is naturally also a strong tendency to regard them as merely tall stories, or due to badly observed natural causes. Mr G. W. Lambert, the distinguished psychical investigator, has demonstrated that a large proportion of 'haunted houses' and certain types of poltergeist case should be attributed to causes such as the shrinking of timbers, underground water, and so on. Frank Podmore, who inclined to the view that poltergeistery was the result of tricks by mischievous or maladjusted persons, laid down important criteria for assessing the evidential value of testimony in alleged poltergeist cases. Written statements from literate and intelligent observers providing circumstantial and mutually corroborative detail should be obtained as soon as possible after the occurrences. Nowadays the investigator likes also, if possible, to have films and tape-recordings, bearing in mind that such things can be faked and remembering that the reliability of a mechanical record is not, in the final analysis, greatly superior to that of the person who offers it in evidence. While mechanical records can be very informative (for example, in disposing of the possibility that the events are hallucinatory), in the end the

The Offensive Perriwig

An account of the Daemon of Spraiton in the County of Devon, Anno. 1682.

One time the young mans head was thrust into a very strait place, betwixt a Beds head, and a Wall, and forced by the strength of divers men to be removed thence, and that not without being much hurt, and bruised, so that much blood appeared about it: upon this, it was advised he should be bleeded, to prevent any ill accident that might come of the bruise; after bleeding, the ligature, or binder of his Arm was removed from thence, and conveyed about his middle, where it was strained with such violence, that the girding had almost stopp'd his breath, and kill'd him, and being cut asunder, it made a *strange and dismal noise*, so that the standers by were affrighted at it. At divers other times he hath been in danger to be strangled with Cravats, and Handkerchiefs, that he hath worn about his Neck, which have been drawn so close, that with the sudden violence he hath near been choaked, and hardly escaped death.

The Spectre hath shewed great offence at the Perriwigs which the young man used to wear, for they are often torn from his head after a very strange manner, one, that he esteemed above the rest, he put in a small box, and that box he placed in another, which he set against the wall of his Chamber, placing a Joint-stool, with other weight, a top of it; but in short time the boxes were broken in sunder, and the Perriwig rended into many small parts and tatters: Another time, lying in his Masters Chamber, with his Perriwig on his Head, to secure it from danger, within a little time it was torn from him, and reduced into very small fragments. At another time one of his Shoe-strings was observed (without the assistance of any hand) to come of its own accord out of his shoe, and fling itself to the other side of the Room; the other was crawling after it, but a Maid espying that, with her hand drew it out, and it strangely *clasp'd*, and *curl'd* about her hand like a living *Eel* . . .

Richard Bovet *Pandaemonium*

investigator has to depend on the integrity of the witnesses.

It is a typical and very puzzling feature of poltergeist outbreaks that they do not continue indefinitely. They last only a few days or weeks. It is difficult therefore to get conclusive evidence; by the time an outbreak becomes known outside the immediate vicinity, it is likely to be over or on the decline. When the investigator arrives on the scene things may be quiet again and he has to depend on the testimony of others. Very often the witnesses are persons of intelligence and integrity but the investigator may hesitate to accept what they say at its face value if they are members of the disturbed household, because he may feel that they are inclined to 'back one another up' or are trying to shield a member of the family whom they suspect of trickery.

The Drummer of Tidworth

However, the investigator does not always arrive too late. Since the 17th century there have been eye-witness accounts by men of education independent of the family affected by the disturbance. In 1666 the Rev Joseph Glanvill, a scholar and philosopher of some distinction, published an account of the famous 'Drummer of Tidworth' (or Tedworth) case and included his own first-hand experiences in the house which then stood on the site of the present Zouche Manor at Tidworth in Wiltshire. Mr Glanvill went upstairs and found 'two modest little girls in bed between seven and eleven years old'. A strange scratching sound seemed to come from behind the bolster. Glanvill exonerated the girls, whose hands were outside the bedclothes and, he says, 'made all the search that possible I could to find if there was any trick, contrivance or common cause of it, like did my friend but we could discover nothing . . .' Later, says Glanvill, 'I chanced to see as it had been something (what I thought was a rat or mouse) moving in a linen bag, that hung up against another bed . . . I stepped and caught it by the upper end with one hand, with which I held it, and drew it through the other, but found nothing at all in it. There was nobody near to shake the bag, or if there had, no-one could make such a motion which seemed to be from within, as if a living creature had moved in it.'

Glanvill's narrative seems eminently sensible, objective and matter of fact. It was written in an era when superstition was still rife although it was giving place to scepticism. Interestingly enough, reports of poltergeist cases were no more numerous than they are today. Out of 470 witchcraft trials in England only about five involved poltergeist phenomena; and since Glanvill's time one or two poltergeist cases have been reported annually in Britain. This suggests strongly that assertions of poltergeist activity are independent of the current climate of opinion. Outbreaks sufficiently dramatic or prolonged to become widely known are clearly rather rare, and both the rarity and the short duration of poltergeist disturbances are hindrances to scientific investigation. Nonetheless there is an appreciable number of cases where it is very difficult to find a good reason for setting aside eye-witness testimony, or to refuse to accept that the observers correctly described what they thought they saw and in fact did see what they thought they saw.

If there are genuine poltergeist cases in which these strange movements of objects occur, it raises challenging problems. At the least we have proof that there are physical forces at present unknown to science. Even if these forces should prove to be operated by 'spirits' or 'elementals', nonetheless they are physical forces as defined by the engineer, because to lift even a weight of only an ounce requires a force of one ounce weight. The 'poltergeist force', if not generated 'supernaturally', may have a purely physiological origin. On the other hand psychological factors may play a part in the genesis of this mysterious force which may be to some extent under unconscious mental control.

Furniture Moving By Itself

Any modern case with good witnesses is very exciting as it can cast some light on the mode by which the poltergeist force comes into play. It was the writer's privilege in 1961 to visit the scene of a poltergeist happening and obtain from no less than five first-class eye-witnesses written testimony based on their diary notes made only a few days before. In addition the possibility of 'mass-hallucination' was ruled out, one of the witnesses having made a tape-recording of some of the poltergeist noises. As in so many poltergeist cases the phenomena were invariably associated with a particular person.

The centre of the disturbance was a pretty little girl of 11 years of age, named Virginia. In the autumn of 1960 she was staying with her elder brother and his wife in Sauchie, a suburb of the town of Alloa on the river Forth in central Scotland. Virginia was an entirely normal child, loved and cared for by her relatives, endowed with physical and mental health, and is now a normal healthy and sensible adult. At the time school tests showed her intelligence to be above average.

When Virginia went to bed on Tuesday 22 November 1960, a sound described as a 'thunking' noise, like a ball bouncing, sounded in her bedroom. When she came downstairs to complain, the sound followed her, sounding in the wall of the stairway, and then in the wall of the living room. As with all the subsequent manifestations it ceased entirely when Virginia eventually fell asleep. At tea time next day she was sitting in an armchair next to a sideboard. Her relatives saw the sideboard move out five inches from the wall and then return to its place. No one had touched it throughout.

Witnesses who had been brought into the case in their professional capacities, and on whom special reliance may be placed, include the Rev Lund (Minister of Sauchie), Dr W. H. Nisbet and Dr William Logan (medical practitioners), Mrs Sheila Logan (Dr Logan's wife, also a qualified physician), and Miss Margaret Stewart, Virginia's class teacher at Sauchie school. Their statements are detailed and where they overlap are mutually corroborative. None of these witnesses were at all connected with the family or knew them other than very slightly.

On Wednesday 23 November, when Virginia was in bed but still awake, the Rev Lund (called in about midnight) found that violent knocking sounds were coming from the bed-head in circumstances which proved that it was not being struck by Virginia or by anyone else. He gripped the bed-head and felt it vibrating as it sounded. He also noticed a linen chest raise itself slightly from the floor with an uneasy rocking motion, travel with a jerky kind of movement through a distance of about 18 inches along the floor and then go back to its starting point. Putting his hand on top of it, Mr Lund found the chest to be slightly vibrating.

Attending Virginia's bedside on the following evening, Dr Nisbet heard knocking and a 'sawing noise'. He saw a peculiar rippling or puckering motion pass in a wave over the surface of the pillow. Later that night Mr Lund saw the pillow swing horizontally to a large angle from its proper position. Virginia's head was on one end of it but he saw no way by which she herself could cause this movement, by twisting her head or otherwise.

Virginia was kept at home until the Friday afternoon, when she returned to school. During a period of silent reading, her class teacher Miss Stewart saw Virginia trying to hold down the lid of her desk which was forcing itself upward by turning on its hinge. It rose three times. Miss Stewart was able to see that Virginia was not pushing it up with her knees. A little later on, the boy sitting behind Virginia left his desk to fetch a book. Miss Stewart saw this empty desk rise bodily into the air. The motion was quite slow and the desk rose only an inch or so off the floor, and finally settled down gently a little out of its original position. Miss Stewart who had not yet heard of the doings at Virginia's home, could not believe her eyes, but went straight over to the spot and verified that no strings or mechanism had been in operation.

The Rippling Bedspread

Phenomena continued in Virginia's bedroom that night. Dr Nisbet heard spells of knocking even when Virginia was lying motionless with the bed-clothes off. He saw the linen chest (standing in isolation) move distances of about a foot. There were swingings of the pillow and ripples along the bedcover.

On Saturday night Dr Logan saw the puckerings of the coverlet and a rotary pillow movement. Sunday was peaceful but poltergeist activity recommenced at school on Monday morning. While the class was busily writing Virginia came out to Miss Stewart for help with a question, and was standing a little aside from Miss Stewart's desk with her hands clasped behind her back. A blackboard pointer lying on the desk started to vibrate, worked itself to the edge and fell off. Meanwhile the desk, a substantial object, vibrated and slewed itself round a foot or two.

That evening, in the hope that a change of air might be beneficial, Virginia was sent to stay with an aunt at the neighbouring town of Dollar. When Dr Nisbet visited he heard knockings audible from outside the front door. On the following Tuesday Dr and Mrs Logan searched diligently for the source of noises ranging from gentle tappings to violent agitated raps. Unsuccessful in finding any normal cause for the sounds, they found that at one stage the noises seemed to be emanating from a point in mid-air near Virginia's bed.

Virginia came back to Sauchie on the Wednesday, when all stayed quiet. But the next evening, 1 December, was an active one. Rigging up lights and cine-camera, Dr Nisbet and Dr Logan tried to record on film some of the ripplings of the bedspread. But this proved difficult as the movements were of short duration. However a tape-recorder was kept running and collected sounds ranging from barely perceptible taps to agitated knocks emanating from a variety of apparent points of origin in the walls, floor and at times in mid-air. A persistent harsh, rasping noise often occurred simultaneously with the knockings. Meanwhile a service of intercession (not an exorcism) consisting of prayers and reading was being held in the house, in the hope that it might do some good. As it happened, things did quieten down thereafter and the poltergeist phenomena became muted and infrequent, dying out altogether in a few weeks.

Phenomena attributed to poltergeists include movements of objects, flinging of mud and stones, and the production of mysterious noises. Experience of objects moving 'of their own accord' may have contributed to folktales about magic sticks or clubs which jump up and beat people: an illustration to 'The Three Tailors' one of the tales collected by the Brothers Grimm

To those unfamiliar with poltergeist cases the account given may seem fantastic and unbelievable. But there is no real ground for setting aside any of the testimony, which has been recorded in much greater detail elsewhere. Poltergeist phenomena are therefore a fact and a very interesting one, although one that is not easy to assimilate to existing scientific knowledge. The Sauchie case illustrates the sporadic, unpredictable yet repetitive occurrence of the poltergeist

phenomena. The repetition is very typical of many other published cases. As the testimony is both detailed and reliable the case happens to be a wonderfully 'diagnostic' one. It was clear that the happenings were connected only with Virginia and had nothing to do with the place where she might be. In brief, the Sauchie case is a particularly clear-cut example of a type of outbreak in which there is a complete correlation between the occurrence of poltergeist phenomena and a particular person whom we can describe as the 'poltergeist focus' or as a 'poltergeist individual'. This correlation has far-reaching logical implications. For instance, it rules out the possibility that the events are random breakdowns in the laws of Nature, or the result of random fluctuations of atoms, and so on (see MIRACLES).

When we ask if the phenomena are supernatural, we encounter the usual difficulties attaching to the terms supernatural and natural. Few nowadays believe that poltergeists are imps called up by witches to harass their enemies. But what of the supreme Adversary himself? Many Roman Catholic devout, including the Curé of Ars (see CURÉ OF ARS), seem to have suffered persecutions similar to poltergeist doings, and some Catholic writers have regarded these assaults as diabolical miracles. The people who, in secular poltergeist cases, function temporarily as 'poltergeist foci' tend to be amiable, decent and respectable but they can as a rule hardly be said to be so religious or devout as to invite the attention of his infernal Majesty.

In problems of natural as opposed to supernatural causation, assistance may be gained from a helpful principle first enunciated by Hippocrates (c 460–380 BC), which may be called the principle of correlation. Writing of epilepsy, a supposedly miraculous disease induced entirely at the will of the gods, he noted that it did not strike at random but was correlated with a certain type of person.

What kind of people are more likely to be the centre of a poltergeist upheaval? Only statistics can answer this question. The present writer listed 27 cases in which the testimony seemed reasonably reliable and the events appeared to be associated with a particular individual. The poltergeist focus was female in 17 cases and male in the remaining ten. It is commonly said that poltergeist outbreaks are usually associated with adolescent girls. And from our sample there would seem to be some truth in this, taken in a rather broad sense. But statistically speaking, the figures so far as they go are not inconsistent with the sexes being equally prone to poltergeistery, though they are equally consistent with the possibility that the poltergeist focus is twice as likely to be a girl as a boy. In 25 cases out of the 27 we have information as to the age of the poltergeist individual, and it shows that the presumed association with adolescence is again true in only a wide sense. Most of the 25 individuals were between ten and 20 years of age, with a few notable exceptions.

As the sample shows there is a strong age factor involved. Indeed adult cases are rather hard to come by. With some effort I found records of about 11 such cases, in eight of which a female figured and males in three only; which suggests that the ratio of female to male incidence is in fact about in the ratio of two to one. Considering a group of 79 cases (including some of the 27 already mentioned and others less critically chosen) we find in aggregate 53 females to 26 males which (doubtless by chance) is almost exactly two to one. Thus there is a sex-effect in 'poltergeist-proneness', but males are far from enjoying immunity. However, poltergeist outbreaks clearly do not occur at random but are correlated with juvenility and femininity. On the principle of correlation (non-random incidence), this suggests that obscure natural causes play some part in bringing poltergeistery into being.

The Naturalistic Theory

Even if we acknowledge the presence of obscure natural causes as factors in 'poltergeistery', we are still left with a serious logical choice to make, because the Spiritualistic type of explanation cannot be set aside without scientific reasons for so doing. The Spiritualistic explanation assumed that the poltergeist focus is really a 'medium', a link or intermediary enabling a disembodied spirit to manifest its presence. On this view two elements are required for poltergeist phenomena; a spirit and a living medium. The Spiritualistic explanation leaves many questions open. For instance, does the spirit itself move the objects, or merely endow the medium with the capacity to act at a distance (the faculty sometimes called psychokinesis)? An alternative explanation assumes that the poltergeist focus is herself, at least temporarily, capable of psychokinesis usually without conscious intent or awareness of the fact. On this view there is no 'poltergeist' or 'spirit' involved other than that of the living poltergeist girl.

It would, of course, be improper to prefer the naturalistic explanation if, in the type of poltergeist case under discussion, there were definite indications of attempted communication from another world or from beyond the grave. However, in only a small proportion of cases it is alleged that the noises appear to take the form of coded raps. And even in these cases such communications as are inferred do not seem to be readily identifiable with such as we might expect from spirits of the dead or even with coherent personalities.

Apparitions are rare in poltergeist cases. There are some moderately well-evidenced cases, though only a few, in which the poltergeist (it is said) has carried on long conversations in human speech. Since speech is merely a form of sound these allegations are not necessarily preposterous, even though we cannot as yet place much reliance on them being true. However, such talking poltergeists as have been reported bring no important messages from other worlds. They are usually cheeky, flippant, fanciful and scatter-brained, and appear to have no stock of notions in any way different from those of the historical period in which they are manifested. This, for what it is worth, supports the concept of the poltergeist as a functioning of an unconscious part of a living human mind rather than as a messenger from the dead.

Harry Price Library

Poltergeist phenomena are frequently associated with one particular person, and often with a child or adolescent, as in the case at Sauchie in Scotland in 1960 (*top*), which involved peculiar noises and movements of objects: a linen chest raised itself a little off the floor and travelled across the floor with an uneasy rocking motion *Above* Douglas Drew, a boy who was the centre of poltergeist activities which were investigated by Harry Price, who also played an important role in the inquiries into phenomena at Borley Rectory *Right* Cartoon by 'Poy' in the London *Evening News*, based on the phenomena of Eleonore Zugrun

It needs to be stressed that the evidence against the Spiritualistic hypothesis is of a purely negative kind. Nor do I wish to insist that deceased persons never communicate; a question which remains open. However, I think that the naturalistic explanation is to be preferred for poltergeist cases of the type under consideration, where the happenings centre on a poltergeist focus. On this theory the poltergeist individual himself activates physical forces of obscure origin. Because of their selective mode of application these forces are not simply equivalent to electricity, magnetism or gravitation, but are of a new kind. Also the forces show no especial affinity with those supposed to be productive of physical phenomena at mediumistic seances. Ectoplasm is conspicuously absent in poltergeist cases. Poltergeist phenomena rarely require darkness and are almost

Harry Price Library

invariably observed in full light. In the few poltergeist cases where anything resembling a trance is reported, the phenomena, oddly enough, do not seem to happen during the trance but at other times.

On the naturalistic theory, should poltergeist studies be regarded as falling in the field of psychical research – as opposed to physics and physiology? Is there anything psychic about them? The answer is, yes. Poltergeist phenomena never centre on animals: poltergeist cats and dogs are unknown. In addition, no poltergeistery occurs when the poltergeist individual is in normal sleep. Thus the higher brain centres are in some way involved, and the problem is psycho-biological as well as physico-physiological. This suggests that it is profitable to look for psychological factors in causation.

Pubertal Changes

Sometimes emphasis has been placed on purely biological factors. Thus the juvenility of poltergeist individuals encouraged Hereward Carrington (a distinguished parapsychologist), writing in 1930, to associate poltergeistery with puberty: 'An energy seems to be radiated from the body . . . when the sexual energies are blossoming into maturity . . . It would almost seem as if these energies instead of taking the normal course . . . find this curious means of externalization.' Now I perceive in this remark the germ of a correct theory but it will not do as it stands. Admittedly it is a curious fact that many poltergeist foci do enjoy good physical health and their intelligence is at least average. However, the amount of energy used in poltergeist manifestations is quite trivial in relation to the normal physical activities of youth. Also Carrington's theory can hardly apply to cases of adult poltergeist individuals. Despite the fact that many poltergeist foci are in the age range ten to 20, it is by no means clear that the poltergeist disturbances coincide at all precisely with pubertal changes. However, there may be something to be said for a modified form of Carrington's theory in which we think not of physiological energy but of emotional tension which can occur both before and after puberty.

It is an interesting fact that though poltergeist individuals are in the main healthy, a few of them have suffered from curious fits or turns. A careful examination of the case histories shows that these fits are not epileptic but something quite different – hysterical attacks. One of the most interesting examples was that of 'Karin N.' who lived in a house in the middle of a forest in southern Sweden, for the good reason that in 1897 she had married Mr N., an Inspector of Forests. In 1905 Karin, then aged 27, was investigated by Dr Hjalmar Wijk of Gothenburg and Dr Paul Bjerre. Karin was basically healthy and of strong physical constitution. The marriage was childless and from 1898 Karin exhibited various neurotic symptoms. These took the form of fainting fits, which sometimes occurred several times a day. A fit would be preceded by a violent and unconquerable feeling of anxiety which ceased when the fit commenced. In the fit Karin's arms would tremble and sometimes her whole body also. She would then lie in a paroxysm of tears and laughter with partially veiled consciousness and incapable of voluntary speech or motion. From May 1904 the villa which Karin and her husband had occupied in April was agitated by mysterious knockings, occurring (as is typical of many poltergeist cases) in the evenings when Karin was in bed but not asleep. Karin's illness was correctly diagnosed as hysteria, a condition in which the patient is truly ill but totally ignorant of the real cause of his illness, which is psychological and locked away in the unconscious part of his mind.

Hysterical 'Absences'

Karin is not the sole instance of a poltergeist person with a hysterical illness. Hysterical fits, faints and comas were characteristic of Floralina, a poltergeist girl in India in 1897, of Mary Langdon at Youghal near Cork in 1661, and of Germaine Maire at Nancy, France, in 1910, who suffered from transitory losses of full consciousness which could well have been hysterical 'absences'. Esther Cox, the heroine of the sensational poltergeist haunting at Amherst, Nova Scotia, in 1878, was said to swell visibly, signifying hysterical meteorism or aerophagy, in which air is sucked involuntarily into the stomach. About 1898 Mary Carrick, an Irish servant-girl in Boston, was pursued by raps on the walls of any room where she was working and quite heavy objects would move in her presence. Knockings occurred by her bedside during her sleep in apparent exception to the rule that a waking state is necessary for poltergeistery. But she would cry out and stir agitatedly in her sleep which was not normal on these occasions. In fact Mary was a somnambulist. She would get up in the night and do housework while sleep-walking. About 1840 Mary Jobson of Sunderland had pains in the head, abdominal swelling, convulsive fits and insensitivity in regions of the skin. Then she became blind, deaf and dumb. Poltergeistery ensued: throwings of water and violent knockings. The illness was not mortal. She had a sudden recovery which amply confirms a retrospective diagnosis of hysteria. Angélique Cottin, investigated by the French Academy of Science in 1846, had some symptoms also reconcilable with hysteria. Her left arm was at a raised temperature; it trembled and was easily put into a muscular spasm.

It would be wrong to suggest that all poltergeist people are or have been hysterical. Indeed the majority show no sign of this or any other psychological ailment. But the proportion of markedly hysterical persons is certainly high among poltergeist people as compared with a random sample of the general population. This suggests rather forcibly that poltergeist happenings like hysteria are psychologically triggered off. We must suppose also that the psychological mechanism which precipitates a poltergeist outbreak involves some of the same factors as are encountered in the production of a hysterical illness.

Hysteria and dissociative reactions constitute only one group of a class of ailments known as neuroses. Neuroses have no organic cause; they are psychological illnesses. A neurotic has no derangement of his mind or reason. It is basically a disturbance of the emotions in a person who is essentially normal and of good character, *not* a psychopath. One kind of neurosis is the anxiety attack, spells of 'free-floating' dread such as Karin had before her fits. Betsy Bell of Tennessee, the centre of elaborate poltergeistery in 1817, seems not to have been hysterical but to have suffered from the 'hyper-ventilation syndrome', in which an anxiety attack engenders 'over-breathing' so that the victim faints, from temporary oxygen-poisoning. It was *after* these fainting fits that the Bell poltergeistery would commence each evening. It is tempting to suppose that *in* some way the poltergeist phenomena relieved Betsy's anxiety. In Karin's case her anxiety was relieved by her hysterical fits. As we say: the anxiety was 'converted' into the hysterical symptoms. We can therefore hazard the guess that for Karin there were two forms of relief of anxiety, conversion into hysterical symptoms on the one hand and poltergeistery on the other. In each case the process would be an unconscious one.

Is poltergeistery therefore a conversion neurosis? Is anxiety converted into noises and flinging of objects? This temptingly simple theory is not quite adequate. Unless relieved suddenly by one of the 'miracle' cures so typical of this field, hysterical conversion symptoms tend to be durable. Looked at from this point of view the mystery of poltergeistery is not so much why it starts as why it usually stops. We could liken it to a mild infection such as chickenpox from which the victims invariably recover in a week or two. It runs its course like a fever. And fever is not so much the disease itself as the body's effort at cure. Pursuing this analogy, we might guess that poltergeistery starts but eventually terminates because it is not a disease but the cure.

'Blowing Off Steam'

In 1895 Sigmund Freud and Josef Breuer published a series of papers entitled *Studies on Hysteria* in which they sought for a scientific theory of how hysteria comes about. Much of what they said is directly applicable to the poltergeist problem. In all human beings there is a natural tendency to keep emotional tension (or 'excitation' as Freud called it) down to a moderate level. A surplus of excitement is disturbing and the individual therefore has a variety of means for dissipating it. Sometimes this can be achieved in a direct way. Love or anger can be subdued by erotic activity or by taking revenge. Life is not always so simple but fortunately there is another mechanism which is usually effective. This is the 'wearing away' or erosion of the excitation, which takes place by a process of intellectual activity, 'cooling off' by thinking around the situation or 'talking it over', even if only with oneself.

In addition, Freud and Breuer drew attention to a third normal mechanism, 'working-off', for disposing of the charge of emotional tension. This mode of reducing tension employs physical activity and tends to occur in an automatic and instinctive fashion. When fearful or enraged or in mental or physical pain, we are apt to tense our muscles, pace the floor, utter lamentations or curses, or indulge in sobs and tears. These activities are often quite pointless as regards improving the objective situation but popular wisdom acknowledges their role in reducing tension by such proverbial phrases as 'blowing off steam' or 'crying oneself out'. These colloquialisms point the contrast between the method of 'working-off' and that of dissipating tension by 'wearing away', which is popularly described as 'talking it over' or 'thinking it out'.

The physical activity of 'working-off' is itself a substitute for direct fulfilment. According to Freud and Breuer, when Bismarck the German Chancellor had to suppress angry feelings in the King's presence he would subsequently resolve the tension created by smashing an expensive vase upon the floor. A similar delayed or surrogate reaction is sometimes observed in small but generally well-behaved children who occasionally astonish their elders by sudden and isolated acts of vandalism accompanied by no outward sign of temper or irritation.

This brings us close to the psychological meaning of poltergeistery. I believe that poltergeistery is a 'working-off' *à la* Bismarck of emotional tension. There is some reason to believe that it happens by an unconscious process, because the poltergeist person usually seems to have no conscious control over the happenings and only the dimmest awareness that she or he is responsible for the happenings. This suggests that poltergeistery occurs in those most liable to psychological repression; which squares with the fact that many actual hysterics are represented among poltergeist people. Of course, more elaborate features may be superimposed on the process and the form of the manifestation (like the symptoms of hysteria and other neuroses) may be capable of having a symbolic content reflecting the specific emotional issues involved. This theory, while explaining several of the curious features of poltergeistery, of course sheds no light on the physical nature of the poltergeist force and little light on the mysterious age factor.

The religious ideas of the Polynesians were sophisticated, complex and poetical; both they and the Micronesians believed that the islands on which they lived had been drawn up from the sea by semi-divine fishermen

POLYNESIA AND MICRONESIA

THE ORIGIN of the Polynesians and Micronesians, who people almost every speck of inhabitable land in the Pacific north and east of Melanesia, (see MELANESIA), has been argued since Captain Cook's voyage of discovery in the 18th century. The evidence shows that their ultimate links are with Asia, but recent research suggests that they became a distinct group in the area of eastern Melanesia and western Polynesia, and then spread eastwards to the central groups and north to Hawaii, south-east to Easter Island and south-west to New Zealand (see MAORI). The Micronesians, especially in the west, have been influenced by later immigrations from Asia.

The history of these peoples is very relevant in a religious context. When it was believed that they left Asia as a distinct ethnic group, it was natural to look for origins of their religion and mythology among the ancient Asiatic civilizations: their metaphysical ideas were compared with those of the Vedic Aryans, for instance. Now interest centres as much on the relationship of their ideas with those of the Melanesians, with whom they seem to share a common origin.

Like the Melanesians, the Polynesians when whites discovered them were at a 'Neolithic' cultural level, using ground stone or shell for their cutting tools. In most of the islands they subsisted mainly by gardening but, especially on the small atolls, they also depended heavily on the sea.

Their religious and metaphysical ideas

Head of one of the colossal stone images on Easter Island; these figures, weighing up to 50 tons, were cut from compressed ash quarried from the crater of an extinct volcano. They represent ancestors, and stood in burying-places P. Beighton

were, by comparison with their simple material culture, sophisticated, complex and poetical. All Polynesians had myths about the beginning of the world. Some feature a deity who is the Creator, others emphasize an evolutionary sequence. In Tonga and Samoa the Creator was Tangaloa (Tangaroa, Ta'aroa), who existed alone above a vast expanse of water. He threw down a stone, which became land, and gave his bird-messenger a vine to plant. The vine withered and rotted, and in the decomposing matter grew a swarm of maggots which became men and women.

Ta'aroa also seems to have been the Creator in the Society Islands. According to Tueira Henry, author of *Ancient Tahiti*, '. . . Ta'aroa sat in his shell in darkness from eternity. The shell was like an egg revolving in endless space, with no sky, no land, no sea, no moon, no sun, no stars. All was darkness, it was continuous thick darkness . . .' The notion of an original void, or chaos, in which there was nothing material or tangible, is common.

Whatever its origin, once created the world evolved. At first the sky father and the earth mother lay embraced, and their offspring, the gods, were born into the darkness between them. Finally one (often Tane) decided to separate them, and thrust the sky up into its present position, allowing light into the world. Evolution often proceeds by a series of procreative acts, pairs of personified abstractions producing offspring unlike themselves, but there is also an idea of continuous growth and development.

Most of the great gods are found throughout Polynesia, but their names and attributes differ in the various groups, and some islands had deities unknown elsewhere. The New Zealand Maori seem to have had a supreme Creator called Io. The name occurs again (as Ihoiho) in Tahiti. One has to distinguish between Io as a true Creator of all things, and the gods who bring order out of chaos. Tangaroa was especially the god of the sea, but in the outlying groups became of minor importance, sometimes as a forest god.

Tane was primarily a sky god, of special importance in the Society and Cook Islands and in Hawaii. He was also lord of the forest and, as a result, the patron of woodworkers. In Mangaia, one of the islands in the Cook archipelago, his symbol was a stone-bladed adze, into which he was believed to enter on ceremonial occasions. In some mythologies he created woman and was regarded as the life-giving force.

Tu (Ku in Hawaii) was a war god. In the Society Islands he was associated with Ta'aroa in the creation myths, but his function as war god was usurped by Oro, a son of Ta'aroa, who became the supreme deity. But in Hawaii Ku, in various forms, was supreme.

Rongo was widely known in central and eastern Polynesia, alternative forms of his name being Lono in Hawaii, and Ono in the Marquesas Islands. He was an agricultural god, in whose honour harvest festivals were celebrated; he was also patron of singing and music. In a Hawaiian legend he sailed away, overcome with grief at the death of his wife, but promised to return one day in a canoe laden with food. The Hawaiians took Captain Cook for the returning Lono, and their disillusion led to his death.

Goddesses were of less importance. Hina or Hine appears in many forms. According to the Maori tale, Tane created Hine from the sand of the sea-shore as a mate for himself, and took their daughter Hine-Titama, the dawn maiden, as his wife. When she discovered their dual relationship she fled to Po, the underworld, and so originated death. Hine in her different aspects was the goddess of death and the underworld and, as the first woman, a source of fertility. She was also associated with the moon and with women's crafts.

Keeping the Blood Pure

The great gods were too remote to take much interest in the daily affairs of ordinary people, which were the concern of numerous lesser deities: local or family gods, or those who watched over certain crafts or activities. Some were sons or descendants of the great gods, others were deified ancestors. The two classes merged, for chiefs were themselves descended from gods.

The Polynesians felt that all creation – gods, mortals and Nature – was one. Natural and supernatural were equally real, and equally significant, aspects of experience. The whole of creation was pervaded by a force, *mana* (see MANA), which showed itself in power, efficacy, success, skill, fruitfulness, prowess. It was beneficial if rightly directed, but always dangerous. Religion was concerned with controlling and directing mana, with increasing it where it was needed, with shielding man from its dangers. The moral content in Polynesian religion was slight. What mattered was not probity or standards of conduct but the correct performance of ritual. Breaches of custom might offend the gods and be punished, but punishment could be averted by offerings. There is no clear distinction between religion and magic, since both aim to control and make use of mana, though in general religion works for social ends whereas the aims of magic would often be considered antisocial.

Chiefs were directly descended from the gods, and were therefore charged with mana. A chief who was descended from a god through an unbroken line of oldest sons was not only the senior in a political or social sense; he also possessed the most potent mana. The mana of a chief was the mana of his people, as he was the main link between his tribe and the gods and the non-physical world. Because any diminution of this force was a matter of general concern, it was essential that the blood be kept pure. A Hawaiian chief of the senior line therefore married his sister.

The chief had obligations to his people as well as autocratic power over them. He had to ensure that his mana was not diminished and that commoners did not come to harm by accidental contact with it. The consequent restrictions could be extremely onerous.

One of the means by which mana was manipulated, and danger from it avoided,

C. M. Dixon

Figures representing gods or spirits are common in Polynesia: this wooden image from the Austral Islands shows Tangaroa, a Creator and sea god, in the act of creating gods and men

was the institution called taboo (see TABOO). The word covers a number of related concepts. A chief and anything connected with him were taboo, because contact was dangerous (often fatal) to his inferiors and because at the same time it diminished his mana and therefore that of his people. This kind of taboo was automatic and unavoidable; but a chief could use his mana positively to impose a taboo, on a place, an activity, the consumption of a certain food.

These taboos derived from sacredness. Another type derived from pollution. Women, especially, were charged with this kind of power; their reproductive organs and functions were the greatest danger to sacredness. Death, sickness and women (especially at childbirth and menstruation), were contaminating; all who came into contact with them were in peril. At childbirth and periodically, therefore, women retired to special huts in the bush.

A mao contaminated in this way, or by contact with excessive mana, could be restored to a state of *noa*, or normality, by ritual and by means of the cleansing agents, fire and water. In the same way a crop which had been under taboo, or a new canoe or house which acquired mana during the making, had to be made noa before they became free for general use.

The Polynesian sense of the unity of all creation probably explains the licence which characterized certain harvest festivals, and the performances of societies of entertainers such as the Arioi of Tahiti.

Two-headed figure from Tahiti; images representing ancestral spirits or minor deities were frequently the familiars of sorcerers, who derived their powers from the spirits

C. M. Dixon

Dances celebrating the unity of all creation were a feature of certain Polynesian harvest festivals; wooden figure, from Hawaii, depicting a dancer passing into a trance

These were religious in nature and consisted of recounting creation myths, singing, drumming, miming and dancing. As they proceeded they became more and more erotic, the tempo accelerated, and finally all present (or in some accounts, only the lower grades) succumbed to a frenzy of sexual abandon. The gods were believed to be present enjoying these performances, and as the people copulated so did the gods, and all Nature was fructified.

Unlike the Melanesians, the Polynesians had specialist priests who varied in grade and function, though on great occasions the chief himself often officiated. The temple priests, often of noble rank, were in charge of ritual. They presented sacrifices to the gods, conducted ceremonies, released from taboo those who had come into contact with divinity. They were the repositories of sacred learning, and some groups ran schools in which chiefs' sons were instructed in the sacred lore. The second kind were the inspirational priests, subject to possession by their god who spoke through them. They were consulted before all important enterprises. Others, considered inferior, were mediums who were able to contact spirits, and who were consulted in case of sickness, to detect thieves and on similar occasions.

The presence in most of Polynesia of temples or sacred enclosures is another point of difference from Melanesia. In Tonga and Samoa the graves of chiefs served the purpose, but in the eastern groups temples were more elaborate. The Society Islands had family, district and royal temples, and temples associated with occupations such as canoe-building and fishing. They often had stone platforms, superimposed and stepped back at each level, and a walled forecourt. A stepped platform in Tahiti was 44 feet in height. Some temples in Hawaii and Tahiti provided sanctuary for criminals, or refugees in time of war.

Fickle Gods

Figures representing gods or spirits, many of them important deities, are found widely in Polynesia. In the Marquesas and on Easter Island they represent ancestors, and the figures in human form from Tahiti also seem to be of ancestral spirits or perhaps minor deities, in many cases the familiars of sorcerers. In this island the great gods were represented by blocks of wood covered with closely-plaited coconut-fibre cord set with red feathers, red being the sacred colour. These figures were not in themselves sacred, but became so when the god or spirit descended into them. Nor did they necessarily represent the deity's actual appearance. In some islands gods were symbolized by paddles, clubs or intricately-carved batons.

In ritual, forms of words were all-important. Exactness was essential; any error not only made the ceremony ineffective but could endanger the life of the priest. This was especially so when, as sometimes happened, the ritual consisted of repeating the precise words of the god.

Ritual was almost always accompanied by sacrifice. First-fruits – from the gardens, or of fish when a new season began – were offered to the god whose creatures they were, as an act of conciliation. Pigs were commonly sacrificed on important occasions, but at a family meal the offering would be merely a few morsels of food.

In Tahiti and the Marquesas human sacrifices were made before a war, and in Hawaii when an image of Ku or a new war canoe was made. The Hawaiians also placed a victim at the foundation of a sacred building. It seems that the soul, tied to the site by ritual and by the presence of the body, became a guardian spirit.

The fickleness of Polynesian gods is illustrated by the Tahitian practice of making offerings near a besieged enemy to lure his gods away. A deity's followers were equally fickle: a god who failed his people would be abused, insulted and abandoned. This perhaps explains the changes in function and status of deities, and the willingness with which most Polynesians adopted Christianity.

The Sorcerer and the Soul

The Polynesians believed that the soul could leave the body without causing immediate death, and that dreams were the experiences of the wandering soul. In sickness it could be caught and restored by experts, but it might also be trapped by enemies. In Pukapuka, an atoll of the Cook group, a priest whose god had been offended would make a trap consisting of a series of coconut-fibre rings and suspend it from a tree over the offender's house. If a bird or insect flew through one of the rings the offender's soul was captured.

Sorcerers had other means of destroying people by attacking their souls. Hair, nail-parings, or fragments of food left by the victim could be burnt or buried with magical objects, and his soul would then be extinguished. The sorcerer could also send an evil spirit to attack his soul.

Sickness could be sent by a god to punish a transgression, or by discontented spirits of the dead who had not been accorded the usual ceremonies. In either case a propitiatory rite and an offering might bring about a cure. Since the progress of the soul to the next world, and its status and survival there, depended on rites performed by the living, it was justifiably annoyed by neglect.

Sorcerers derived their power from spirits or used them as their agents. In Hawaii a sorcerer could create his own powerful familiar. The body of a dead person was obtained, the bones and hair preserved, and regular offerings made to the spirit to build up its power. Such a familiar might destroy its creator if it was not regularly sustained by offerings.

After death the ghost soon began its journey to the land of the dead. Usually this was to the west, and most islands had a place at the western end from which souls were thought to leave. In western Polynesia the afterworld was called Pulotu, but in the eastern groups it was often Hawaiki, the homeland. The souls of commoners, or those for whom the rites had been omitted, often failed to overcome the dangers of the journey or to survive for long in the afterworld, but chiefs and eminent people could expect immortality.

Axel Poignant

Carved figures in the courtyard of the temple of Honaunau in Hawaii; the deified bones of the chiefs were at one time buried there, and it was a sanctuary for criminals and for refugees at times of war

The less fortunate souls might go to Po, which sometimes meant extinction and sometimes an underworld, ruled by Miru. In the Cook Islands Miru was an ogress who cooked and ate the souls of ordinary men. The Marquesas had three underworlds, ranging from pleasant to wretched, and the soul's destination depended on the rites and offerings made on its behalf, and also, no doubt, on rank and prowess.

Apart from cosmogonic myths, and legends concerning the wanderings and origin of the peoples of the different islands – many of which undoubtedly have historical foundation – there are numerous tales about the adventures of heroes and heroines, about the pranks of tricksters, about ogres and demons. A favourite hero, often regarded as a demigod, is Tahaki. He is the epitome of the great chief: brave, resourceful, handsome, full of mana, gracious and at ease, proud but patient. His adventures do not show him as perfect. That would be dull. He has his faults, he is occasionally foolish, his numerous love affairs do not always go easily.

Tahaki's grandson Rata is a hero of a different kind, a great seaman and adventurer, headstrong, quick-tempered, determined. His mother, Tahiti Tokerau, was abducted by one Puna, who plucked out her eyes to serve as lights and buried her head downwards in the sand so that her feet could be supports for the baskets of Puna's wife. When Rata grew up he determined to rescue his mother. He built a great canoe with the aid of wood spirits, who had at first been angered by his action in cutting down a tree but relented when they heard of his project. Finally, after numerous adventures, overcoming monstrous guardians and other dangers, he slew Puna and released Tahiti Tokerau. Several chiefly lines claimed descent from Rata.

Probably the most popular hero was Maui. Born prematurely and discarded by his mother, he was rescued and reared by the gods. After learning everything they could teach him he rejoined his mortal family. The stories of his adventures are innumerable. He feared no one and respected no one. No institution or taboo was sacred to him. In a society as rigidly hierarchical and strictly governed by etiquette as the Polynesian, the Maui stories must have provided a welcome safety-valve.

Many of his escapades are simply tricks or jokes, in which he makes the pompous or the great appear ridiculous, or outwits the clever. But some of his greatest feats were of benefit to man. He lassoed the sun, which used to race across the sky, and so gave people the day as we know it, with time to work and cook meals. He stole fire, which man had lacked. He fished up islands from the depths of the ocean, according to some accounts with a hook made from his grandmother's jaw-bone (and therefore possessing great mana).

His last adventure, though it led to his death, was his greatest: he tried to save humanity from having to die. Accompanied by his friends the birds he sought out Hina, the goddess of death. He found her asleep. Warning his companions to keep silent so as not to wake her, he attempted to kill her by crawling between her thighs into her body and emerging from her mouth. When only his legs were still visible the ridiculous sight was too much for the wagtail, which let out an uncontrollable chuckle. Hina awoke, closed her legs together, and Maui was crushed.

Micronesian Religion

The mythology and the religious and magical ideas of Micronesia form a less cohesive and clear-cut pattern than those of Polynesia. Cosmogonic myths are relatively unimportant. Certain groups had a Creator being, and the concept of an original chaos or void is present, but many Micronesians seem to have regarded the world as always existing: the task of the Creators was to make it habitable. Stories of the separation of earth and sky are fairly common. As in Polynesia, islands were drawn up from the sea by semi-divine fishermen, whose names are sometimes variants of Maui. There are stories about the snaring of the sun, the obtaining of fire, and other themes popular in Polynesia and other regions.

Many tales concern man-eating monsters or ogres, ferocious but stupid, who are often overcome by children: a theme common in Melanesia. Another group explains the

origins of food taboos: for example, there is the story of the porpoise girl who came ashore at night to watch men dancing, removing and hiding her tail. A man found it, thereby preventing her return to the sea, and married her. After a while she found its hiding place and went back to the sea, warning her children that they must never eat porpoise meat.

Ancestor worship seems to have been a more conspicuous element in religion than it was in Polynesia. Supernatural beings who were not of human origin were less prominent in cult, and their spheres were less clearly defined. Among the most important families of gods were those concerned with canoe-building and seafaring.

Everywhere sacrifices and offerings were made, but human sacrifice was apparently absent. Ritual, and the priesthood, were less highly developed; and possession by a god was unusual, though there were mediums who communicated with the spirits of the dead or with lesser deities. Representations of gods or spirits were rather rare.

In general chiefs were not considered sacred and though they were treated with great respect their powers were more limited than in Polynesia. As a result the belief that danger could be caused by contact with a chief's mana was not strongly held, though a chief could impose taboos. Mana seems to derive more from a personal relationship with a spirit than from the universal power of gods and Nature, as in Polynesia.

Williamson, *Religion and Social Organization in Central Polynesia* (AMS Press reprint); the most useful work on the Polynesian view of the supernatural is E. S. C. Handy, *Polynesian Religion* (Kraus reprint).

Scala

Polytheism

From Greek words for 'many' and 'god', belief in many gods, who preside over different departments of Nature and aspects of life; distinguished from monotheism, belief that there is only one God, and from henotheism, devotion to a single god without asserting that he is the only one.

C. M. Dixon

Pomegranate

A symbol of fertility, because of its many seeds; in a Turkish custom, a bride throws one on the ground and the number of seeds scattered when it breaks shows how many children she will have; the mother of the god Attis conceived him by putting a pomegranate in her bosom; it was a pomegranate seed which Persephone ate in the underworld, committing her to spending a third of each year there: in Christian art, a symbol of hope.

PONTIUS PILATE

IF PONTIUS PILATE had not sentenced to crucifixion a Galilean Jew who became the Saviour God of Christianity, he would be known today only to a few students of ancient history. But that fateful sentence has caused his name to be remembered down the centuries.

To understand Pilate's curious fortune in legend, it is necessary first to know what history tells about him. Except for one broken inscription and a few coins, our knowledge of Pilate comes from three sources: Philo, a Jew of Alexandria who was a contemporary of Pilate's; Josephus, a Palestinian Jew who was born a year after Pilate left Judaea in 36 AD; and the four Christian gospels, which date respectively from about 71 to 100 AD.

But these sources, although they are close in time to the events they relate, are all strongly motivated by interests other than historical accuracy in their accounts of Pilate. Both Philo and Josephus were Jewish apologists, concerned to show the Roman government of their day that the Jews were

Sonia Halliday

According to St Matthew's gospel, Pontius Pilate washed his hands before the crowd at Jesus's trial, saying 'I am innocent of this man's blood . . .'; in fact, Pilate probably ordered his death because he was convinced that Jesus was politically dangerous: 15th century wall painting, Cyprus

a loyal and peaceable people, whom bad Roman governors had provoked. The authors of the gospels were moved by a very different interest. They sought to explain Pilate's condemnation of Jesus by making the Jewish leaders responsible for the charge of sedition on which he was executed (see JESUS).

From the tendentious evidence of Josephus, whose writings are our chief source of information, it can be ascertained that Pontius Pilate was appointed governor of Judaea in 26 AD and continued in office until 36. His title, as an inscription found in 1961 shows, was 'praefectus of Judaea'. As praefectus he was responsible for maintaining Roman rule in the region.

Both Philo and Josephus represent Pilate as inherently hostile to the Jews, and as deliberately seeking to violate Jewish religious law and institutions. But on critical analysis, these accounts reveal inconsistencies and improbabilities that render their testimony gravely suspect.

Assessment of the gospel presentation of Pilate is a very complicated task, and involves the consideration of many problematic factors. Briefly, the Christian writers, in seeking to explain the Roman execution of Jesus for sedition, represent Pilate as a witness to the innocence of Jesus, forced by the Jewish leaders and people to crucify him. However, critical investigation of the gospel accounts of the trial of Jesus reveals a more intelligible situation – that Pilate ordered his death because he was convinced by the evidence laid before him that Jesus was politically dangerous.

According to Josephus, in *Jewish Antiquities*, Pilate was relieved of his command in 36 and sent to Rome by Vitellius, the legate of Syria, because of his harsh suppression of an incipient revolt of the Samaritans. We are not informed of Pilate's eventual fate.

The impetus given by the gospels to presenting Pilate as a witness to the innocence of Jesus, was soon exploited by other Christian writers, who obviously drew upon their imagination. The apologist Tertullian (c 160–220), declared that Pilate, 'himself in his secret heart already a Christian', sent such a report about Christ to Tiberius that the latter was convinced of his divinity, and sought to persuade the Senate of it.

Persecuted by the Roman government as a subversive sect, it was natural that Christians should seek to rebut such an accusation by claiming that the Roman governor of Judaea had not only acknowledged the innocence of Jesus, but had recognized him as divine. However, the importance of Pilate to the Christian case was also appreciated by its enemies, and it resulted in a mysterious episode. In 311 the Emperor Maximin, a fierce persecutor of Christians, issued 'Memoirs of Pilate'. That they were harmful to Christianity is certain, but no copy has survived. Christians claimed that these 'memoirs' were forgeries and eventually had the offending documents rounded up and destroyed.

The consternation caused by Maximin's publication of the 'Memoirs of Pilate' seems to have led to the production of a Christian version. It takes a narrative form, and contains long tortuous dialogues between Pilate and the Jewish leaders, and Pilate and Jesus. The writing develops the gospel thesis that the Jews were responsible for the Crucifixion, exonerating Pilate. This theme was elaborated in other writings to such a degree that it was eventually claimed that Pilate died as a martyr for Christ.

This transformation of Pilate from the Roman governor who executed Jesus into a Christian saint who died for him, was arrested in the Catholic Church by its triumph under Constantine I. With its legal status now assured, it had no further need of the witness of Pontius Pilate. A change of attitude towards him soon set in. It is marked by the statement of Eusebius, Bishop of Caesarea (260–340), that Pilate, overwhelmed by misfortune, committed suicide. A later Latin legend tells how Pilate anticipated execution by killing himself and how Tiberius had his corpse thrown into the Tiber; but its presence there attracted such swarms of demons that it was transported to Vienne, on the Rhône. After burial near Lausanne and consequent demonic disturbance, the unholy thing was finally deposited in a lake by Mount Pilatus, Switzerland, where its awful presence continued to provoke diabolical activity.

Pope Joan

Mythical female pope of the 9th century; supposedly of English birth, she went to Rome disguised as a man, after a love affair with a Benedictine monk; she became a cardinal and was elected pope as John VIII on the death of Leo IV in 855; she died in childbirth during a papal procession; the legend was current by at least the 13th century; one of the Tarot trumps is named for her.

Poppy

Symbol of sleep, death and the soothing of pain, because it yields opium; it was connected with Ceres, the Roman corn goddess, because it grows in wheatfields, and wheat and poppies growing together stand for life and death; widely believed to spring from the blood of slaughtered warriors; since the First World War, the symbol of remembrance of those killed in battle.

POSEIDON

POSEIDON starts as the second greatest of the Greek gods. No other male deity ranks as the brother of Zeus, except for Hades, the ruler of the dead: the other important ones are sons of Zeus, and so more certainly subordinated to him. In the *Iliad*, Poseidon is the god whom Zeus has the greatest difficulty in bending to his will. Threatened with physical violence, he protests that his status is equivalent to Zeus': the universe has been shared out equally among the three sons of Cronus, and Poseidon has the sea, Hades the underworld, and Zeus the sky, the earth being common property.

For Homer, then, Poseidon is the god of the sea. He has a golden palace in the depths of the waters, the sea creatures dance at his passing by, and when he leads the Greeks to battle the waves surge up to their encampment. He causes storms at sea and sailors pray to him for a safe voyage. But he is also the god of the earthquake, and this appears to have been his primary role at the time when the formulaic epic language was taking shape, for his standard epithets all refer to it: *enosichthon* or *ennosigaios*, 'earth-shaker', *gaie(w)ochos*, 'earth-carrier', *eriktypos*, 'loud-booming'. Homer never calls him 'marine'.

To delve further into his past, we assess his importance in the cults and legends of different parts of Greece, and we discover a significant fact. We know that the Hellenes entered Greece in two main waves. The first came about 2000 BC, and during the following centuries was much affected by cultural influences from the subject people and the civilization of Minoan Crete. The second wave came about 1200 BC, flooding large areas with a dourer folk known to us as the Dorians. Now in these areas, Poseidon has his cults, but is noticeably less prominent in myths. In Sparta the dialect form in which his name appears shows that he was taken over from the pre-Dorian population. We infer, firstly, that his worship spread itself in Greece before the Dorian invasion, and was diminished by it; secondly, that it

Michael Holford

As god of the sea, Poseidon has a golden palace in the depths of the ocean, according to Homer, and the sea creatures dance when he passes by; but he was earlier the god of the earthquake and his standard epithets were 'earth-shaker', 'earth-carrier' or 'loud-booming': the head of Poseidon from a mosaic in North Africa

was not shared by the invaders, in other words, it was not brought by the Hellenes from an earlier home but was native to Greece. That is what we should expect. Greece was always a land shaken by earthquakes, and if the pre-Hellenic population feared any god, they must have feared the earth-shaker. Poseidon's name does not lend itself to explanation from Greek, and is probably indigenous. (An interpretation as 'Husband of the Earth', still maintained in some quarters, is better theology than philology.)

In Homer his only peer is Zeus, who certainly came with the Hellenes, and afterwards we see Zeus steadily growing in power and universality while Poseidon declines. Perhaps Poseidon had once been the greatest god in Greece. It is worth considering which of his aspects can be related to his management of earthquakes, and which are extraneous functions such as a supreme god might acquire. It is natural enough that the god who makes the earth heave and toss should be identified as the one who makes the sea heave and toss. It is also possible that the belief that the earth rested on the sea – the starting point of scientific speculation in the 6th century BC – goes back to much earlier times: the god of the sea might then indeed be the 'earth-carrier'. We can understand too why Poseidon should be a builder of walls. (He helped Apollo build the walls of Troy, and he made a prison for the Titans in Tartarus.) The mason would pray to him to uphold his wall; and a god prayed to by masons must soon become a master mason. It is no less natural that he should sometimes be associated with springs and rivers, which are frequently seen to change their courses in earthquakes. On the other hand, the simplest explanation of his special connection with horses is that he was the chief god of a people who depended on horses. And when he appears in genealogies as the first ancestor of a royal line, or in cult as 'Father', 'God of the clan' and so on, he is clearly exceeding the prerogatives of a seismic force. At Athens, 'Poseidon!' was a colloquial expostulation, like 'for heaven's sake!' These do look like survivals from a time when he was really great.

But he has passed his prime by the time literature comes into view. If he is primarily the god of the sea in Homer's eyes, he is no longer mighty in the land. He maintains his place in the ceremonial calendar, and one of the great national sports meetings, held every two years at the Isthmus of Corinth, was consecrated to him. But he is honoured like a great man in retirement. He is made to fit in with other arrangements. At Athens and elsewhere there were legends of how he competed for possession, unsuccessfully, with the city goddess, and was left with a subordinate position in cult. Other gods develop and take on new aspects in response to changing needs; Poseidon remains static. He is more and more confined to the sea. In Euripides' *Erechtheus* (423 BC) Athene commands *marine* Poseidon not to shake the earth. His title Asphalios 'god of security', originally of geophysical significance, came to be understood as 'saviour of ships'. By the 6th century BC, earthquakes were being explained from natural causes by the sophisticated. In another Euripidean play, air is called 'earth's carriage', virtually taking over Poseidon's old title. When the gods came to be allegorized, he was put down as the sea without further ado. In 373 BC an earthquake and tidal wave destroyed the town of Helice (along the coast from Patras), together with a notable shrine of Poseidon. Such an occurrence was not calculated to increase respect for the ancient gods, any more than when Zeus struck his own temples with lightning.

M. L. WEST

FURTHER READING: H. J. Rose, *A Handbook of Greek Mythology* (Dutton, 1959) gives an excellent brief survey of gods and myths. For the early period, M. P. Nilsson, *The Minoan-Mycenaean Religion* (Lund, Sweden, 1950) is the standard work. For the classical period there is much material in volume 1 of L. R. Farnell, *The Cults of the Greek States* (Caratzas Brothers, 1977), though the discussion of the gods' natures is outdated.

POSSESSION

'MY NAME is Legion; for we are many.' This was the reply of the madman who lived among the tombs, when Jesus asked him his name before driving the demons out of him and into a herd of swine (Mark, chapter 5). The number of gods, spirits or devils which have been believed to enter into and seize control of human personalities, all through history and all over the world, has indeed been legion. What is particularly interesting about so many accounts of possession and exorcism is their marked similarity to modern psychiatric case-histories and methods of treatment.

One of the techniques used successfully during the Second World War in treating men suffering from battle neuroses was to induce the patient, under drugs, to recreate in his mind the situation of terror and stress which had caused his breakdown, so that he could relive the situation and better deal with it. (Hypnosis had been used for the same purpose during the First World War.) Late in the war we began to discover that it was not so much this reliving of a particular situation of stress that helped recovery but the release of intense emotional excitement, and this remained true when the excitement was focused on some comparatively trivial occurrence or even on an incident which was entirely imaginary.

The emotions which seemed to be the essential ones to arouse were either those of fierce anger and aggressiveness or those of intense anxiety and fear. What happened, very briefly, was that the patient's state of excitement would rise to a crescendo, which might be followed by a temporary collapse, after which the patient felt that the abnormal fears and worries by which, in the age-old terminology, he had been 'possessed' had now left him. Various types of shock treatment, including electrical shock therapy, have been extensively used in the same way (though, of course, it should not be supposed that all patients or all varieties of mental illness will respond to treatment of this sort).

It was towards the end of the war that I came across a volume of John Wesley's *Journal* and was struck by the resemblance between his accounts of what happened at his revival meetings and the reactions which my colleagues and I were deliberately inducing in patients. Wesley was a preacher of formidable power who impressed on the minds of his hearers the horrors of hell which awaited them if they did not repent. Some of them reacted as the possessed of all times and places have done, groaning and shrieking, shaking and pouring with sweat, writhing on the ground and feeling 'pierced in the heart', and finally collapsing. When they recovered, they often felt soothed and 'changed', converted to a new outlook, and at peace with themselves, as our patients who had been through a similar ordeal felt that old terrors had lost their hold.

Wesley's entry for 23 October 1739 gives a vivid picture of the experience of possession. He went to see two women who were 'tormented'. One of them, aged 19 or 20, was being forcibly held down on a bed. 'It was a terrible sight. Anguish, horror and despair, above all description, appeared in her pale face. The thousand distortions of her whole body showed how the dogs of hell were gnawing her heart. The shrieks intermixed were scarce to be endured. But her stony eyes could not weep. She screamed out, as soon as words could find their way, "I am damned, damned; lost for ever. Six days ago you might have helped me . . . I have (now) given myself to him. His I am. Him I must serve. With him I must go to hell. I will be his. I will serve him. I will go with him to hell. I cannot be saved. I will not be saved. I must, I will, I will be damned." She then began praying to the devil. . . . We continued in prayer till past eleven; when God in a moment spoke peace into the soul, first of the first tormented, and then of the other. And they both joined in singing praise to Him who had "stilled the enemy and the avenger".'

Satanic Laughter

Wesley had at first put the curious effects of his preaching down to the action of the Holy Spirit but he soon came to wonder whether the Devil had a hand in them. Very similar behaviour was reported of some of Mesmer's patients in the later 18th century (see MAGNETISM; MESMER). One of the Commissioners who investigated on behalf of the French Royal Society of Medicine reported that: 'Some patients remain calm, and experience nothing; others cough, spit, feel slight pain, a local or general heat, and fall into sweats; others are agitated and tormented by convulsions . . . characterized by involuntary, jerking movements in all the limbs, and in the whole body, by contraction of the throat, by twitchings . . . by dimness and rolling of the eyes, by piercing cries, hiccoughs, and immoderate laughter. They are preceded or followed by a state of languor or dreaminess, by a species of depression, and even by stupor.'

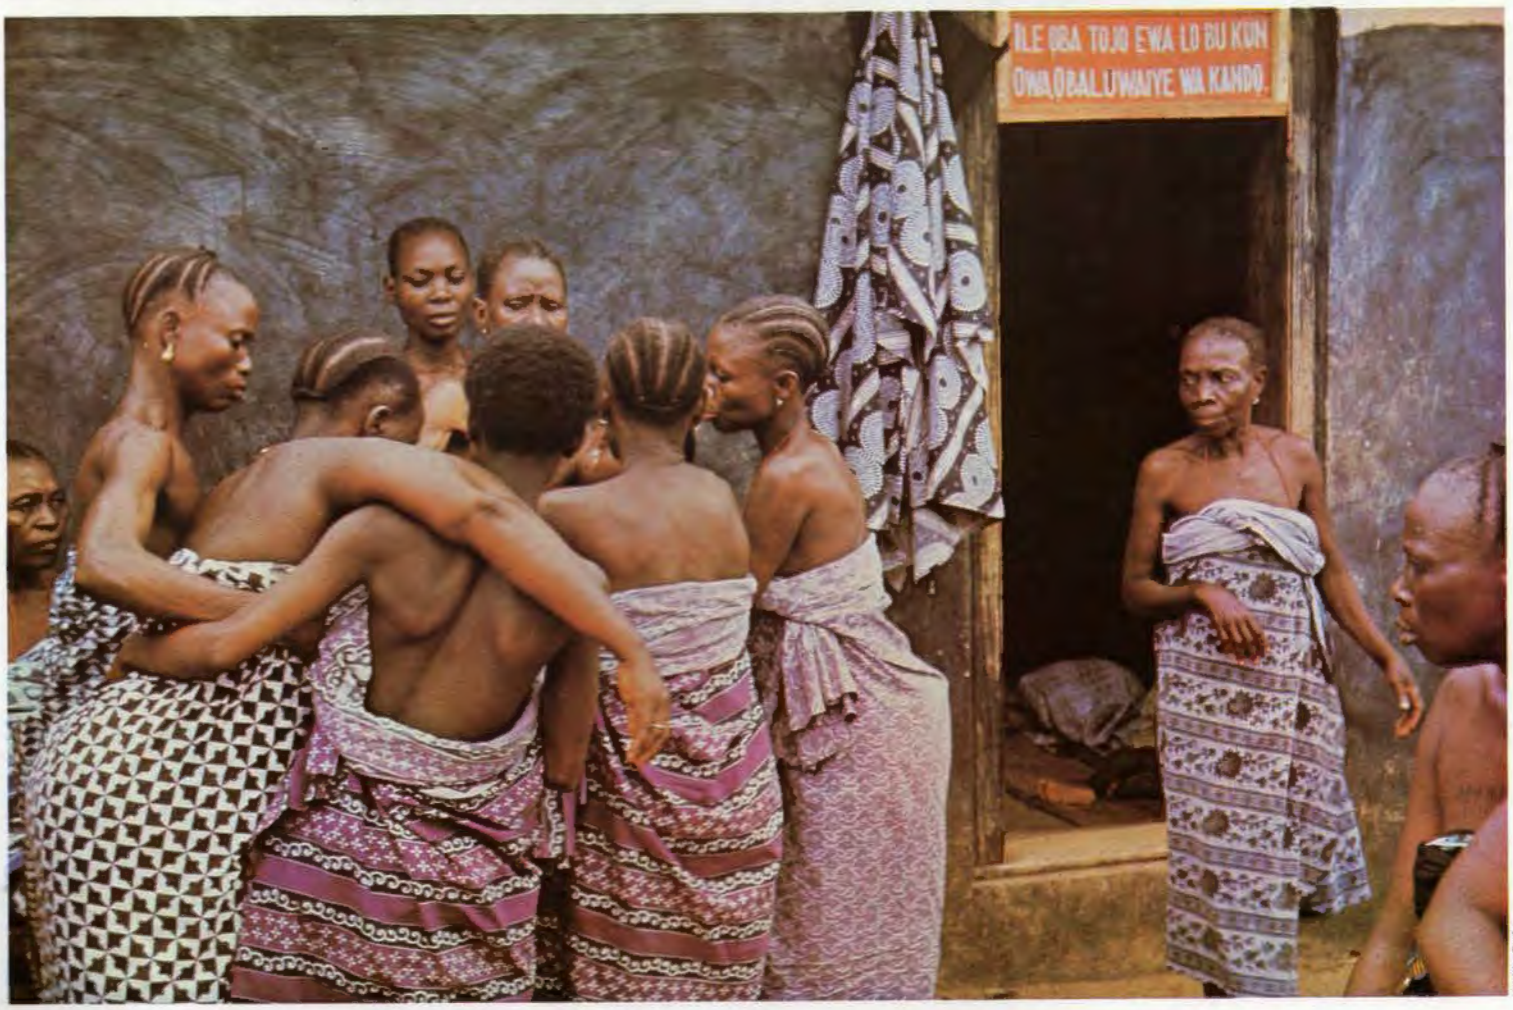
It was noticed that women were more likely to experience this 'crisis' than men, that the hysterical excitement was contagious and spread rapidly from one person in a group to others, that the patients became extremely suggestible and that this suggestibility played a vital role in both the crisis and the cure, and that in many cases the behaviour of women patients closely resembled what happens in female orgasm. All these points are highly relevant to the famous cases of so-called demonic possession in French convents in the 16th and 17th centuries. The possessed were mostly women, the contagion spread from one nun to another, the behaviour of the victims was orgasmic and they were also highly suggestible, pouring out torrents of horrific, detailed and imaginative filth in response to suggestions by their exorcists that they were witches, that they worshipped the Devil at sabbaths, that they had practised cannibalism, and so on (see AIX-EN-PROVENCE NUNS; AUXONNE NUNS; GRANDIER; RENATA). The parallel was observed by the Commissioners themselves, who commented in a private report to King Louis XV that Mesmeric treatment might

John Moss

Jurgen Schadeberg/Susan Griggs

In many parts of the world drumming and dancing help to induce a state of possession; during a Ghanaian festival held annually in a medicine-man's camp, a woman dances frenziedly *(above right)* until she finally falls into his arms *(above)*. Yoruba worshippers of Sopono, the god who inflicts smallpox, dance themselves into a possessed state *(below right)*, and *(below)* a Bushman in trance

John Moss



Philip Daly

cause epidemics of the behaviour which had occurred in the convents.

Not that women are the only victims of possession, far from it. One of the most famous modern cases is that of a French peasant named Achille. He was 33 when 'he fell into a complete lethargy, and remained motionless for two days. At the end of that period he awoke and burst into a fit of Satanic laughter, which presently changed into frightful shrieks and complaints that he was tortured by demons. This state lasted for many weeks. He would pour forth blasphemies and obscenities . . . He would describe the evil spirits which tormented him, their diabolic grimaces and the horns which adorned their heads.' He was treated by the celebrated psychologist Pierre Janet, who found that the root cause of the attack was Achille's intense guilt at having been unfaithful to his wife, which in his own mind had condemned him to damnation and to be the sport of devils. He showed all the signs of what in earlier centuries was considered diabolic possession.

Divine Combat

An account of the method of exorcizing 'the impure spirits of both sexes' which infest the bodies of living men, given by Zeno of Verona in the 4th century AD, emphasizes the frightening emotional excitement of the possessed state. 'But as soon as we enter into the field of divine combat and begin to drive them forth with the arrow of the holy name of Jesus, then thou mayest take pity on the other . . . His face is suddenly deprived of colour, his body rises up of itself, the eyes in madness roll in their sockets and squint horribly, the teeth, covered with a horrible foam, grind between blue-white lips; the limbs twisted in all directions are given over to trembling; he sighs, he weeps . . .' This is very reminiscent of the sort of symptoms observed in the drug abreactive treatment of cases of battle neurosis from the Normandy beachhead in 1944.

A case reported by a clergyman in Germany in 1714 describes an emotional 'crisis', with subsequent collapse and recovery. He first visited the possessed woman in a workhouse where, he says. 'Satan abruptly hurled this invective at me by her mouth: "Silly fool, what are you doing in this workhouse? You'll get lice here," etc.' He took the woman to church, read to her two of the accounts of demonic possession in the New Testament, and commanded Satan to come out of her. 'Satan tortured the poor creature horribly, howled through her mouth in a frightful manner and threw her to the ground so rigid, so insensible that she became as cold as ice and lay as dead, at which time we could not perceive the slightest breath until at last with God's help she came to herself . . .'

For thousands of years, all forms of madness, of grossly abnormal behaviour and, sometimes, of physical disease have been explained in terms of spirit possession. The spirit might be an evil one, a morally neutral one, a good spirit or a god. Various Christian groups have felt, as Wesley did at first, that 'enthusiastic' behaviour was a sign of

Roger Wood Studio

possession by the Holy Ghost. In other societies there has been the belief in 'holy madness' or the belief that a magician or shaman can become possessed by a god or a spirit, can convey the god's words to his worshippers and can heal the sick. Many of these cures work, probably because of the patients' heightened suggestibility.

In Ethiopia, for example, people are sometimes believed to be possessed by spirits called 'zars'. Patients are treated by a 'doctor' who is himself zar-possessed but who has 'come to terms' with his zar. He, or she, sometimes goes into a state of trance, in which his own zar takes control of him, and then tries to discover the identity of the patient's zar so as to negotiate with it. He speaks in the special language of zars, a jumbled tongue based on Amharic and recalling the phenomenon of 'speaking in tongues'. He persuades the zar, by promising it the gifts which it demands through the mouth of the patient, to turn itself into a kindly and helpful guardian spirit.

Madness, abnormal behaviour of various kinds, and the ability to fall into an ecstatic state have been attributed to spirit possession all over the world *Left* In West Pakistan a youth drinks the blood of a goat after becoming 'possessed of fairies', and eventually falls into a trance *Below* The symptoms of possession and exorcism, as described by Christian writers, strikingly resemble the reactions of some patients to modern psychiatric treatment: 13th century painting of St Dominic exorcizing a man possessed by demons

In Haiti the main purpose of Voodoo ceremonies is for one or more of the worshippers to become possessed by a *loa*, a god or spirit which 'rides' him as if he was a horse but which is also inside his head. As in many other parts of the world, drumming and dancing help to induce the experience. When the loa enters a man, he behaves in its characteristic manner and speaks with its voice, sometimes in the loa language, which is a jumble of muddled words (see also VOODOO).

Possession by a god or by the ghost of someone who has died is common in India. Two anthropologists who investigated a case at a village near Delhi commented that 'spirit possession, like hysteria, has two conditions: a basic condition due to the individual's intra-psychic tension and a precipitating condition due to an event or situation involving unusual stress or emotion.' The young woman who was possessed, shivered and complained of feeling cold. Presently she sat up and started to jerk violently. The ghost, which had now entered her, spoke through her mouth and her assembled relatives had a long conversation with it. They were mainly concerned to establish its identity, and the emphasis on discovering the name of the possessing spirit, so as to gain power over it, is a common feature of exorcism procedures all over the world.

Mircea Eliade has described how a Siberian shaman restores the soul of a sick patient, which has escaped from his body. After drumming for a long time, the shaman calls on various spirits to come and stand near him. After more drumming, he goes to the door and breathes deeply, to swallow the spirits he has summoned, who now speak through his mouth. Then he lies on the ground, face down and motionless, for he has left his body and is travelling in the spirit world. Eventually he returns, bringing with him the fugitive soul which he has rescued from the 'kingdom of shadows' and which he restores to the patient's body. (See also PRIESTS; SHAMAN.)

G. Tomsich Spectrum

Streaming in Like Light

Drugs and sex have both been used to induce the experience of possession and to gain personal contact with the divine. Here is John Addington Symonds, the 19th century art critic, describing his sensations under chloroform: 'I thought I was near death; when suddenly my soul became aware of God, who was manifestly dealing with me, handling me, so to speak in an intensely personal present reality. I felt him streaming in like light upon me . . . I cannot describe the ecstasy I felt.'

The magician Aleister Crowley (see CROWLEY) experimented liberally with both drugs and sex as gateways to communication with spirits. To take only one example from many, here is his account of the results of an operation of sex-magic with a woman named Mary d'Este Sturges in 1911. 'At about midnight she was in a state of excitement, exhaustion and hysteria . . . one little removed from an amorously infuriated lioness . . . suddenly and without warning (this) gave place to a profound calm hardly distinguishable from prophetic trance and she began to describe what she was seeing . . . (she) had seen in a dream the head of five White Brothers . . . The person now appeared again to her. He was an old man with a long white beard.'

The evidence increasingly suggests that cases like this have nothing to do with spirits of any kind but have their causes in the human brain, and particularly in greatly increased brain suggestibility in states of emotional excitement and upheaval. If this is true, the implications go far beyond the field of possession, and may throw much light on the phenomena of conversion and faith, the mystical experience of being 'one' with God, ecstatic and 'enthusiastic' behaviour, 'speaking in tongues', mediumistic communications with the dead, trance and semi-trance states, 'astral travel', spiritual healing and other supposedly supernatural manifestations. (See also CONVERSION; DRUGS; ECSTASY; ENTHUSIASM; EXORCISM; HYSTERICAL POSSESSION AND WITCHCRAFT; MADNESS; TRANCE.)

Prayer

Communication addressed to a god or supernatural power, asking for help or guidance or the granting of a wish, or expressing devotion, giving thanks or confessing faults and asking forgiveness, or sometimes conveying orders and threats; often expressed in a set formula and accompanied by prescribed postures and gestures, for example, kneeling and bowing the head; the prayer formula is sometimes magically expected to be effective by itself.
See INCANTATION; ROSARY.

Albertina, Vienna

Precognition

Knowledge of what is going to happen in the future; ways of gaining such knowledge, really or allegedly, have been legion and include astrology, palmistry and many other methods of fortune telling, prophecies, oracles and omens, summoning up spirits or ghosts, trance states, dreams, premonitions and 'intuitions'; much work has been done on precognition as a type of psi ability.

'At the beginning of the world God knew all men that would be born, and decreed in advance which ones would be saved': since the early days of Christianity theologians have attempted to reconcile doctrines of predestination with the belief in man's free will

PREDESTINATION

VARIOUS DOCTRINES have been elaborated within the Christian Church which seek to explain the manner in which God, it is supposed, calls some individuals to eternal life and condemns others to everlasting punishment. Theories of predestination encounter acute difficulties in reconciling man's freedom of will with the complete knowledge of the future which theologians ascribe to God, and which imperils our notion of time. Few laymen now have much interest in the minutiae of theology but the problem of free will is still a tantalizing one.

Problems of destiny, determinism and free will came under discussion in the ancient Greek and Roman world long before the Christian era (see FATE). The ideas of both determinism and providence derive from the orderliness of natural phenomena, such as the succession of the seasons, which suggest that physical and biological events progress according to invariable laws. Implicit in the notion of determinism is the idea of causality which is firmly rooted in the human mind as a result of very elementary experiences. A child pushes an object and it moves. The operator of any machine, however humble, is completely familiar with the concept of causality. But it can only be recognized if the nature of things does not change capriciously. The laws of Nature must be invariable. It was by recognition of natural law that the philosophers were led to a monotheistic form of theism. The uniformity and lawfulness of Nature must, they thought, result from a single Mind. This intelligence was often identified with Zeus, traditionally the chief of the gods, but just as often considered as a mere abstract kind of Being.

Views differed as to the relations between the deity and the world. Aristotle (384–322 BC) thought of the universe after its creation as running more or less under its own steam according to natural causality. A minority of thinkers such as Epicurus (341–270 BC) postulated an entirely self-sufficient uncreated universe lasting for all eternity and running on purely mechanical lines, a remarkable anticipation of modern scientific materialism. Such a scheme (except that it included an element of randomness or chance) represented a determinism of a mechanical kind without any additional determinism imposed by an overriding providence.

Mansell Collection

The tension between destiny and free will is an old philosophical problem *Above* Fortune wears a blindfold, indicating the random way she grants favours: painting by Giovanni Bellini *Right* The position of the planets was said to influence a man's life: illustration from a 16th century book on midwifery shows astrologers at work during a confinement

The teaching of the Stoics started with Zeno (336–264 BC). Their doctrines developed into a kind of materialistic pantheism. (Pantheistic theologies are those which regard the deity as permeating the world to a degree that makes it hard to distinguish between God and the world.) According to the Stoics the soul consists of a fine material. So also does the Soul of the World (God) who, or which, suffuses all other matter. Everything therefore happens in a purely mechanical way but also in accordance with the will of the World Soul which is the ultimate cause of all motion and change. The Stoics taught acceptance of the Will's decrees, and this is why the adjective stoical is used nowadays to describe fortitude and resignation. In Stoicism the ideas of mechanical determinism and overriding providence were curiously fused together. According to the Stoics everything was predetermined by the immanent or indwelling World Soul, and they gave credence to the arts of augury, divination and astrology.

In fact the ancient thinkers, while recognizing a considerable degree of determinism (either mechanical or providential) in the world, were uncertain as to whether all physical happenings are strictly determined and they puzzled over the meaning of free will. Epicurus claimed that atoms have a random motion which is completely uncaused. Similarly, operations of the will in man are uncaused, so that human choice is totally free. Carneades (c 214–c 129 BC), one of the Sceptics (philosophers who tended to probe into all assumptions and question all statements), argued that the wayward course of both the atom and the human soul was not uncaused, but resulted from their own inner natures. He admitted that the inner cause of action might well be unknowable, so that human actions were unpredictable. Carneades was perhaps the first thinker to make a clear distinction between determinism and predictability.

In Judaic tradition God created the angels, giving them freedom to obey or disobey him. Satan, Prince of the Angels, disobeyed, together with a considerable following of other ranks. Adam, though created in a state of sinless virtue, yielded to Satan's persuasion and also disobeyed, and having fallen into sin forfeited his immortality. According to St Paul and all the early Christians the sinfulness of Adam was 'inherited' by all his descendants (see EVIL: FIRST MAN; MAN).

According to this concept, all men owed a debt or penalty to God and were therefore

subject either to eternal death (a mere forfeiting of immortality) or, in the more traditional view, to everlasting punishment. However Christ's sacrifice of himself upon the cross was, so Paul believed, a complete and adequate discharge of the debt.

Some of the Pauline epistles can be read as if implying that it was God's will that everyone should be saved: '. . . God our Saviour, who desires all men to be saved . . .' (1 Timothy 2.3). However other passages imply that, as was almost universally believed in the Church, the salvation of individuals was conditional on factors additional to the Incarnation and Crucifixion. For example, '. . . for those who are factious and do not obey the truth . . . there will be wrath and fury' (Romans 2.8). In fact Paul tells his readers they will be saved if they have in their hearts the faith that God raised Jesus from the dead.

Christians have always averred that the individual's faith in Christ is essential for salvation. Naturally there has been controversy as to what is meant by 'faith'. Clearly it ought to go deeper than superficial intellectual assent. According to Paul, in order to have saving faith the grace of God, that is, the power to have real faith which is bestowed on the believer as God's free gift, is necessary. The word 'grace' derives from Latin *gratia*, a gift. All the work of salvation is therefore God's and not man's. God paid the penalty of sacrifice, and also bestows the grace necessary for the faith that saves. In the epistles Paul was not writing a theological treatise and so does not set out a fully elaborated doctrine of predestination. But there are several texts which can be, and were, interpreted as meaning that God chooses those whom he will save. For instance, Paul says that 'For those whom he foreknew he also predestined to be conformed to the image of his Son . . . and those whom he predestined he also called . . .' (Romans 8.29–30). Clearly, whether or not Paul intended it, a fully predestinarian doctrine can be extracted from this: at the beginning of the world God knew all men that would be born, and decreed in advance who would be saved.

The doctrine of predestination remained in the somewhat nebulous Pauline form until the Pelagian controversy of the 5th century. Pelagius (360–420), whose name means 'man of the sea', came from Britain. Like many provincial visitors to Rome before and since, he was scandalized by the decadent life of the city. The licentious Romans blandly pleaded human frailty as an extenuating circumstance. Pelagius was therefore prompted to stress the positive qualities in human nature, and maintained that, if need be, a man's salvation could be achieved by his own efforts unassisted by grace. He did not, of course, deny that if grace were given it would aid the process of salvation. Pelagianism, as the resulting doctrines were called, affirmed the freedom of the will, maintaining that it is at any time free to choose good or evil. This is also true at the moment of birth. Having no innate bias to evil, we lack original sin. According to Pelagianism, no individual was predestined to be saved or lost.

St Augustine (354–430) of Hippo, near Carthage in North Africa, one of the greatest of the Fathers of the Church, was provoked by Pelagianism into formulating a theory of predestination that was to have lasting influence. He maintained that man was free to do good or ill, to seek for God or reject him. Therefore men might differ in their natural merit. But a man was not saved by his natural merit, which was ineffective for salvation unless assisted by grace dispensed by the Holy Spirit. Merit assisted, or instilled, by grace was supernatural merit and only supernatural merits were able to save. The giving or withholding of grace, resulting in salvation or damnation, was God's free choice. Lest it seem that God might be unfair to the damned, Augustine was concerned to stress the totally undeserving condition of fallen man. Because of original sin we deserved eternal punishment; but God in his mercy raised some to blessedness by grace gratuitously given. The graceless therefore should not complain of injustice.

The Ineffable Vision

So far so good; God chooses those whom he will make his own. But why is it *pre*-destination? According to Augustine, because of God's perfect foreknowledge of all events. Christians traditionally set no limits to God's powers. His omniscience means that he has a complete knowledge of the future. God's foresight moreover differs from man's. He does not predict events as a super-computer might if fed with all possible information about the present and the past. God, according to Augustine and later theologians, knows everything *directly*, whether past, present or future, because his existence is outside of time. His knowledge consists of 'one eternal, immutable and ineffable vision'. According to Augustine, God foresees even the free acts of men and knows in advance how their free choices will turn out. He also foresees at the Creation all that he will himself bring to pass, including the dispensation of grace. Augustine was therefore able to say, 'Predestination is nothing else than the foreknowledge and fore-ordaining of those gratuitous gifts by which God makes certain the salvation of those who are saved.'

The status of free will remains somewhat ambiguous in St Augustine's system. The Roman statesman and philosopher Boethius (480–525) wrote that if from eternity God foreknows the wills of men, there can be no free will. Augustine clearly implied that God pre-destines the blessed to salvation, but left in obscurity the question whether God can be said to fore-ordain the graceless sinner to perdition. The question was particularly acute in respect of infants dying unbaptized. Baptism was generally considered adequate to confer saving grace and blessedness on children who died shortly after receiving the sacrament; but the unbaptized were in an unmitigated state of original sin. According to one solution, their fate was settled by God through his foreknowledge of whether, if they had lived, they would have received (from him) supernatural merit through grace. According to a milder solution unbaptized infants go to limbo, a region adjacent to hell and inhabited by virtuous pagans who had died before Christ's coming.

It was easy to move from Augustine's teaching to the doctrine of Predestinarianism. In the 5th century Lucidus, a Gallic priest, taught that Christ did not die for the non-elect who had been created expressly to go to hell. Similarly, in the 9th century in France, the monk Gottschalk of Orbais was condemned for saying the same, and maintaining that original sin had cancelled free will. The resulting controversy had to be settled by a synod of bishops in 860, which decided that God desires the salvation of all men. Despite original sin, the will is free and is aided by grace. The damnation of the lost results from their abuse of free will. St Bonaventure (1221–74) supported this formulation and held that while God offers saving grace to all, men are wholly free to reject it.

St Thomas Aquinas (1226–74) revived a formula originally developed by the Greek theologian St John of Damascus (676–754). A man is free to accept or reject the gratuitous gift of grace which God offers to all. God *antecedently* wills to save him, but in the very instant of the Creation foresees how he will respond and, in the light of this prevision, God *consequently* wills his salvation or reprobation. Of course the antecedent and consequent wills of God are not separated in time, and this solution will seem to many to be mere sophistry and logic-chopping. The Roman Catholic Church has never spoken authoritatively on the doctrine of predestination as a whole. At present Catholic theologians tend to favour a theory similar to that of St Thomas Aquinas, involving God's antecedent and consequent will.

Predestinarianism really came into its own among the Protestant reformers. Martin Luther, himself an Augustinian friar, was concerned to stress faith and grace as being superior to good works, and maintained that God absolutely predestines his elect to glory without regard to their human merits. Free will went out when original sin came in, and all human acts are subject to the overriding providence of God. It was Ulrich Zwingli (1484–1531), the Swiss reformer, who went to the extent of declaring that God fore-ordained some men to perdition in order that his justice be made manifest, though it is John Calvin (1509–64) who is usually associated with this doctrine.

Few modern Christian sects put much stress on predestination or related doctrines. Salvation is primarily the gift of God through grace. The ways to making oneself receptive of grace are the sacraments, prayer, moral effort and striving to love God and one's neighbour. None can be sure of salvation but all may hope.

PREHISTORIC RELIGION

WHAT PREHISTORIC MEN thought can never be known with certainty, because they did not write it down. The bits and pieces they left behind them – bones, tools, weapons, works of art and the rest – can be interpreted in many ways and are the fragmentary records of different groups of men in different circumstances over a period far longer than recorded history.

However, some deductions can perhaps be drawn from the burial practices and tools of the man-like creatures who preceded true man on the earth. Neanderthal men buried their dead with care, with food and equipment and often, it seems, with affection. This suggests belief in an afterworld of some kind, in which the dead were not entirely cut off from the living. It also implies the presence of one factor which distinguishes man from other animals, the knowledge of his own inevitable death, which in turn implies a sense of time.

The deliberate manufacture of tools also implies a sense of time, because it means planning for the future. A sense of time implies a feeling for order, for events following one another in succession, which may have carried with it the concept of a rough general pattern behind human existence. We are born, we live for a while and we die. The same is obviously true of the animals. The realization of order and the observation that 'all flesh is grass' may have pointed to the conclusion that whoever or whatever is responsible for the order of Nature is not human or animal but something superhuman and superanimal, though it (or they) may be given many human and animal characteristics.

Evidence of some sort of religio-magical cult, dating from c 100,000 BC, has been found in caves in the Alps where the skulls of bears had been placed on stone slabs in what looks like a ceremonious arrangement. It may be that a creature's head was already thought to contain the essence of its being, and the rituals of later bear-hunting peoples suggest that the intention was to appease some supernatural power for the killing of a bear, to make sure that there would be no decline in the supply of bears for hunting. Whether or not this is the right explanation, the finds indicate that certain places were being treated as special, set apart, holy. Later, there is plenty of evidence for the use of caves as sacred places (see CAVES).

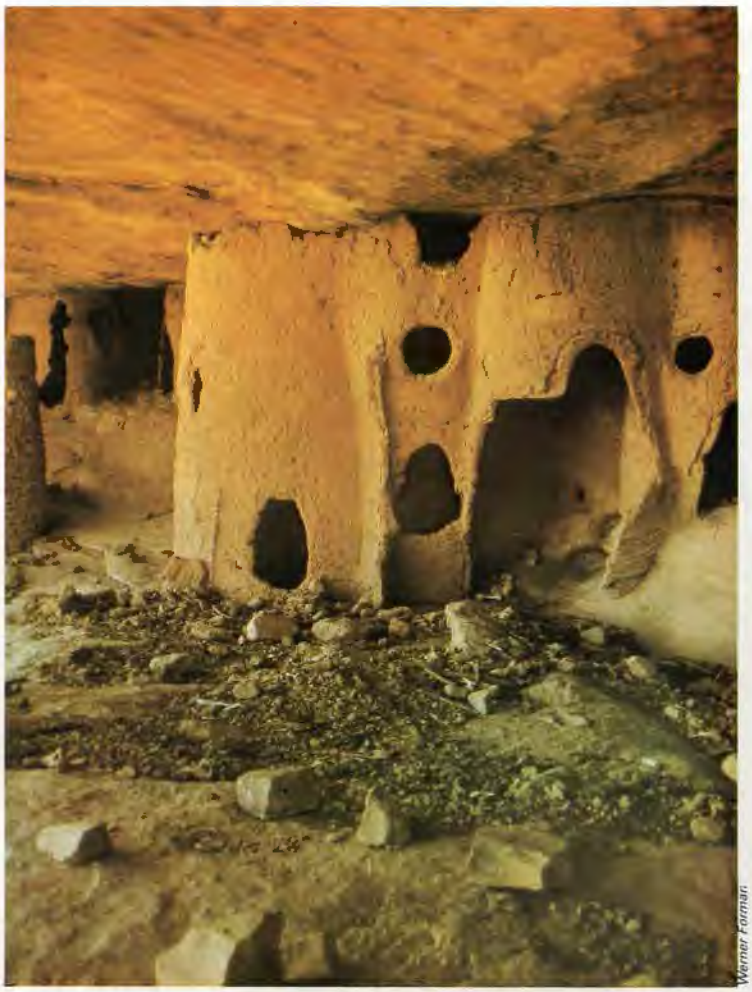
People whose control over their environment is limited are naturally likely to try to establish good relations with their own ancestors, from whom they have inherited such techniques as they possess, and with whatever powers control the order of Nature which provides food and children, or which sometimes disastrously fails to provide them. In the Upper Paleolithic period (c 30,000 to 10,000 BC), after the arrival on the scene of *homo sapiens* himself, burials became more elaborate and ceremonious, and there is strong evidence of concern for fertility in the 'Venuses', small figures of women, some highly stylized and others comparatively realistic, with the breasts, thighs and buttocks grotesquely emphasized. The swollen pregnant bellies of many of these figures and their blank, featureless heads suggest that they were not meant to portray women but 'woman' in general, and woman in her role of mother. They may have been worn by women as amulets to ensure fruitfulness and they may have represented a Great Mother, the source of all life.

The Upper Paleolithic is also the period of the magnificent cave art which may have been meant to promote fertility in human beings and animals, as well as to assist hunting (see CAVE ART). The art indicates belief in a supernatural order of reality which man must try to influence if he and his quarry are to eat, live and beget. It also implies a magical attitude to symbolism and mimicry, that the real can be influenced through the simulated.

Scenes in some of the caves show human figures dressed in animal skins and masks, and dancing. There is an example in the cave of the Trois Frères in France, where a man disguised as a bison is dancing and apparently playing a musical instrument. Ahead of him are two peculiar animals, a reindeer with what look like human arms, and a creature part-bison and part-reindeer which is looking back at him. Professor

Michael Holford/British Museum

That spirits inhabit all aspects of Nature, that every tree or hill or stream has a soul, is one of the oldest human beliefs: Indian tree spirit, c 2nd century BC



Werner Forman

C. M. Dixon

Maringer asks, 'What else can this odd scene be but a magic performance, wherein sorcerer and "animals" alike are human hunters in disguise? And what was the disguise for if not to compel animals to bow to the hunters' will?'

An alternative possibility is that the dancing figure in a bison's skin is a deity, a Lord of Beasts, and that the other two creatures mingle parts of different animals because they stand for 'beasts' in general, the whole world of animal life which the god controls. The Trois Frères cave is also the home of the famous Dancing Sorcerer (see ICONOGRAPHY), who again can be interpreted as perhaps a magician, perhaps a god, or perhaps both – a man acting the part of a god.

Neanderthal man did not wear ornaments, so far as is known, but the later Paleolithic peoples did. They made necklaces of animals' teeth or cowrie shells, for instance, and carved bracelets from mammoths' tusks. It seems likely that ornaments contained an ingredient of magic, as they have tended to do ever since. The teeth may have carried with them the qualities of the animals from which they came, and the cowrie shell has long been an emblem of woman and fertility because of its shape. The same principle may have applied to weapons. For example, the figure of a jumping horse was carved on the end of a spear-thrower found at Bruniquel in France, presumably to give it the propelling energy of the horse's leap.

The 'Neolithic revolution', as it is called, the gradual development of cultivating crops and breeding animals, instead of gathering and hunting, originated in Asia in the ninth millennium BC, or earlier, and had spread to most of Europe by c 3500 BC. The picture now becomes, if anything, even more obscure than before and the course of the transition from what is known of the Paleolithic to the religions of societies with written records is not at all clear.

It seems evident that as agriculture and stockbreeding are gradually established, the plants on which men and herds depend for food become crucially important. The annual cycle of Nature becomes a dominating factor in men's lives and a focus of religious and magical attention. Seedtime and harvest are the two great occasions of the year, and are likely to be celebrated with festivals and rites intended to ensure a good crop.

The sky also becomes important, because sun, rain and wind affect the growth of crops and because the calendar, which successful agriculture demands, is worked out by reference to events occurring in the sky. (Reverence for the sky and its forces may easily have existed long before, though there is no evidence of sky worship in the Paleolithic). Later on, we know that there were ideas of Sky Father copulating with Earth Mother, and of rain penetrating her, so that she would bring forth harvests for men and pasturage for beasts. These ideas must have begun to develop earlier, but how, where and when is uncertain.

Paradoxically, the Neolithic advance in control of the environment may have created a greater sense of dependence on supernatural powers than before, because the farmer's attitude is likely to be more passive than the hunter's. He relies more on the slow workings of forces which are still largely beyond his control, and less on his own resources of courage, quickness and skill, as in the chase. Hunting's perspectives are relatively short-term and farming's are relatively long. The sense of an order behind Nature, of man's dependence on it, and of the perils of disorder in the shape of drought, famine, destructive storms, pestilence, may have been strengthened by the longer perspective of farming communities.

Most Neolithic societies buried their dead with greater pomp and circumstance than before, especially those who had been powerful in life, and sometimes with extravagant toil, as in megalithic burials in Europe, implying a deep respect for the powers of the dead and probably the belief that they influenced the growth of crops from the earth in which they lay buried. Representations of the mother goddess are often found in burying places and she seems clearly connected with the earth.

As Earth Mother, the goddess would need to be impregnated, so that she would conceive and bear her annual yield. In some societies the masculine principle in fertility is represented by carved phalluses, and in some, apparently, by animals, especially the bull. At Catal Hüyük in Turkey, for instance, the shrine of a mother goddess, dating from c 6000 BC, was adorned with representations of bulls' heads, human heads and the

C. M. Dixon

breasts of women, and with human skulls. Farming communities in the Danube area made female figurines and effigies of bulls and other male animals. Later, the ancient world knew many great bull gods, responsible for the fertility of fields as well as herds and frequently connected with sky, storm or sun (see BULL).

Another pattern, presumably already developing in the Neolithic, was the tendency to personify the life of vegetation as a god who was both the son and the lover of the Great Mother and who died and rose again each year, as the plants did. This concept sprouted a rich harvest of mythology and ritual in the ancient world (see DYING GOD; VEGETATION SPIRITS).

As men began to master new techniques, inventions and discoveries were fitted into a religio-magical context. The discovery of yeast, for example, made it possible to bake bread and brew beer, both commodities which had a long history of symbolic connections with the gods and the otherworld. The rise of metallurgy with the development of working in copper, bronze and iron gave the smith the uncanny powers of one who was as much magician as craftsman (see SMITH). Writing was an invention of the gods and the preserve of priests. Improved control of the environment was still disrupted by what we call accidents, which less sophisticated people put down to supernatural interference. Greek potters in historical times, for instance, still fixed hideous masks on their kilns in order to frighten away the demon who liked to crack the pots while they were being fired.

In the East the development of towns, states and armies, of male dynasties and priesthoods, tended to diminish the Great Mother's status in favour of the great male gods of the sky who loom large in the civilizations of the ancient world, the gods who created the universe, who made man, who established order and put down disorder. In Europe the invasions and conquests of warrior peoples, whose deities were gods of the sky, had the same effect.

All these developments occurred over long stretches of time and their details are concealed from us, but there was evidently considerable continuity. The prehistoric Earth Mother, in her various local incarnations, was the ancestress of goddesses of historical societies. A striking example of continuity from prehistoric to historic was found at Eridu in Mesopotamia, which in the ancient world was the home of the great god Enki, lord of waters, to whom fish were sacred. When the prehistoric sanctuary there was excavated, an altar was found, covered six inches deep with the bones of fish.

Premonition

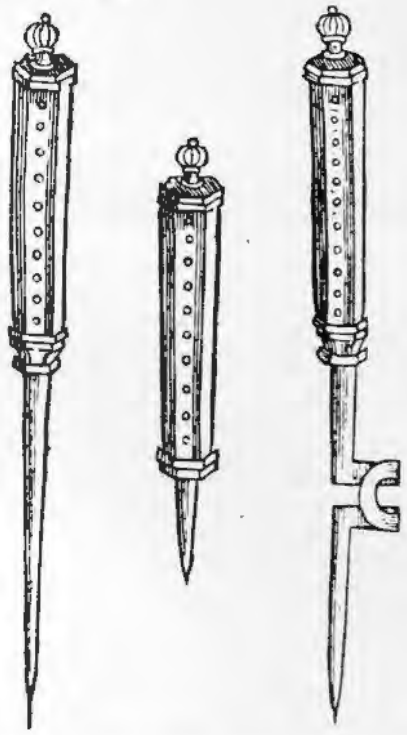
Awareness of a future event, usually of something unpleasant – death, disaster, danger, ill luck; it may be a clear precognition of a specific event in the future or a vague foreboding, a presentiment of some impending but unspecified evil; premonitions are common and can occur in dreams or when awake or when in the borderland between the two. See DREAMS; EXTRA-SENSORY PERCEPTION.

Prester John

Literally 'Priest John', a mythical Christian priest-king believed in the Middle Ages to rule in a land of marvels in the mysterious East where there was no poverty or vice; in c 1165 a letter from him was fabricated, describing the fountain of youth, the sea of sand, the river of stones, the magic mirror and other wonders of his kingdom; European travellers in Asia looked for him in vain, and he was later placed in Ethiopia.

The search for the Devil's mark involved piercing the suspect's body with long needles; if any spot was insensitive to pain, or if it did not bleed, this was regarded as proof that he or she was a witch

PRICKING



In order to obtain 'proof' that a suspect had sealed a pact with Satan, false instruments with retractable blades that disappeared when they were pressed against the body of a suspected witch were sometimes used in the search for the Devil's mark; because the victim showed no sign of pain, he or she could then be presumed guilty: two false bodkins *(left)* and a genuine instrument

THE THEORY that a witch could be identified by a special mark, a bodily blemish representing the seal which Satan had set upon his followers, led to the practice of pricking the suspect's body in order to find this proof of her pact with the Devil. The 'Satanic compact' was held to be one of the vilest forms of heresy, since it committed the witch to a denial of God and the frustration of his angels and servants. The search for the Devil's mark became standard witch-hunting procedure, the suspects being subjected to ruthless inspection, often accompanied by torture.

The mark was supposed to be made by Satan's teeth, tongue or claw, and in some cases it was actually called the 'Devil's claw'. It might be in the shape of a spider, a dormouse, or 'the likeness of a hare', and according to some early medieval authorities it could be compared with the imprint of a cloven hoof.

Opinions varied as to where on the human body it was most likely to be found; on the Continent the left shoulder was regarded as the most usual spot, while in Britain it was the finger. One medieval wizard who was said to have sold his soul to the Devil was proved afterwards to have a black stain on his hand, which was thought to be the unmistakable mark of Satan's thumb.

The great majority of witch-hunters, however, looked for the mark near the pubic area of a female suspect, or the anus of a male. Michael Dalton, in his *Country Justice*, a guide to witch-hunting published in 1618, makes it clear that the 'marks be often in their secretest parts and therefore require diligent and careful search'.

Satan's Invisible Mark

The hunt for the Devil's marks was conducted by skilled witch-hunters who had acquired, as the result of long and careful study, an ability to distinguish between ordinary bodily blemishes like moles, warts, old scars and piles, and genuine Devil's marks which had the peculiar characteristic of being insensitive to pain and incapable of bleeding. It is difficult to determine how this theory could have arisen in the first place, but such an assumption might have been based upon cases of stigmatization which sometimes occur among hysterics. Bleeding can also be halted on occasion by shock or suggestion.

A suspect's naked body had to be completely shaved to ensure that no protective charm lay concealed among the hairs. With a woman this work was occasionally delegated to a committee of honest matrons, but in the vast majority of cases a highly skilled searcher, usually a man, was responsible for the whole operation because of the possibility that a demon might be lurking in the pubic regions. The entire body was then exhaustively inspected for possible Devil's marks, every wart, pile or mole being thoroughly prodded with a long bodkin which pierced the flesh right down to the bone. The effusion of blood and the screams of the prisoner generally bore testimony to a clean record so far as witchcraft was concerned, but the witch-hunter usually prodded on until some old scar that was insensitive to pain provided him with the evidence he needed.

There were occasions, of course, when even a comprehensive searching and pricking failed to produce proof of witchcraft, and the theory that the Devil's marks could be invisible began to find favour among witch-hunters. It seemed reasonable to suppose that the Devil would protect his slaves by imprinting upon their bodies a mark that could not be seen, and it therefore became necessary for the witch-hunter to prod every inch of the victim's body, even if it was completely free from blemishes. Even then the Devil's mark might still elude the searching bodkin, and the suspect would be handed over to the torturers.

In Switzerland in the 17th century Michelle Chaudron strenuously protested her innocence although she was searched for Devil's marks until her whole body gushed blood from the wounds she received; but when she was tortured she readily confessed her guilt. This kind of treatment was justified by a declaration made by the Jesuit Martin Del Rio, that a Devil's mark was not invariably insensitive to pain; it was recognized that even a true witch might occasionally experience agonies when pricked.

Paid By Results

In countries where torture was not commonly practised, or was forbidden by law as in England and Wales, the witch-finder sometimes had to cheat in order to ensure a conviction. A false bodkin, consisting of a hollow shaft with a retractable needle, would be pressed against the body of the prisoner who, since he or she betrayed no symptom of pain, could then be presumed guilty.

Throughout the 17th century, the witch-hunters continued their search for the Devil's marks. In the case of Father Louis Gaufridi, of the notorious Aix-en-Provence affair, no less than three such marks were discovered

National Film Archive

The Devil's mark was at first thought to be visible, and witch-hunters were credited with the ability to distinguish between ordinary bodily blemishes like moles, and genuine Devil's marks which were insensitive to pain and incapable of bleeding. Later the belief that marks could be invisible found favour with witch-hunters, and it became necessary to prod every inch of a suspect's body: a suspected witch is searched for signs of the mark in a scene from the film *Witchcraft Through the Ages*

upon his body (see AIX-EN-PROVENCE NUNS). Scotland at one time had a number of witch-prickers who were paid by results, one of whom was hired by the magistrates of Newcastle-on-Tyne at a fee of 20 shillings for every witch he brought to book, plus his travelling expenses. As a result of his activities 15 victims, all but one of them women, were sent to the gallows.

During a witch-hunt in 1649, one of the magistrates, a Lieutenant Colonel Hobson, challenged the authenticity of the tests. A woman, her clothes pulled over her head, was being examined by a witch-finder. He 'ran a pin into her thigh, and then suddenly let her coats fall, and then demanded whether she had nothing of his in her body, but did not bleed.' Because she had felt nothing, the woman would have been sent for trial had not the magistrate ordered the witch-finder to run his pin into the same place again. This time the wound gushed out blood, and the 'pricker' had no alternative but to release her.

'Like a Little Spot'

Closely allied in the popular mind with the Devil's mark were the 'biggs' or teats known as witches' marks, with which witches were supposed to feed their familiars with blood (see FAMILIARS). These naturally became objects of great interest to the witch-prickers. In a typical case which came to light during the time of Matthew Hopkins, the Witch-Finder General, Margaret Bayts, a housewife of Framlingham, Suffolk, was found guilty of feeding a familiar by means of two teats concealed in her 'secret parts'. Another English victim was Elizabeth Sawyer, a one-eyed and blasphemous witch of Edmonton. When searched by 'three grave matrons', she was discovered to have a 'thing like a teat', the size of her little finger, in the region of her buttocks.

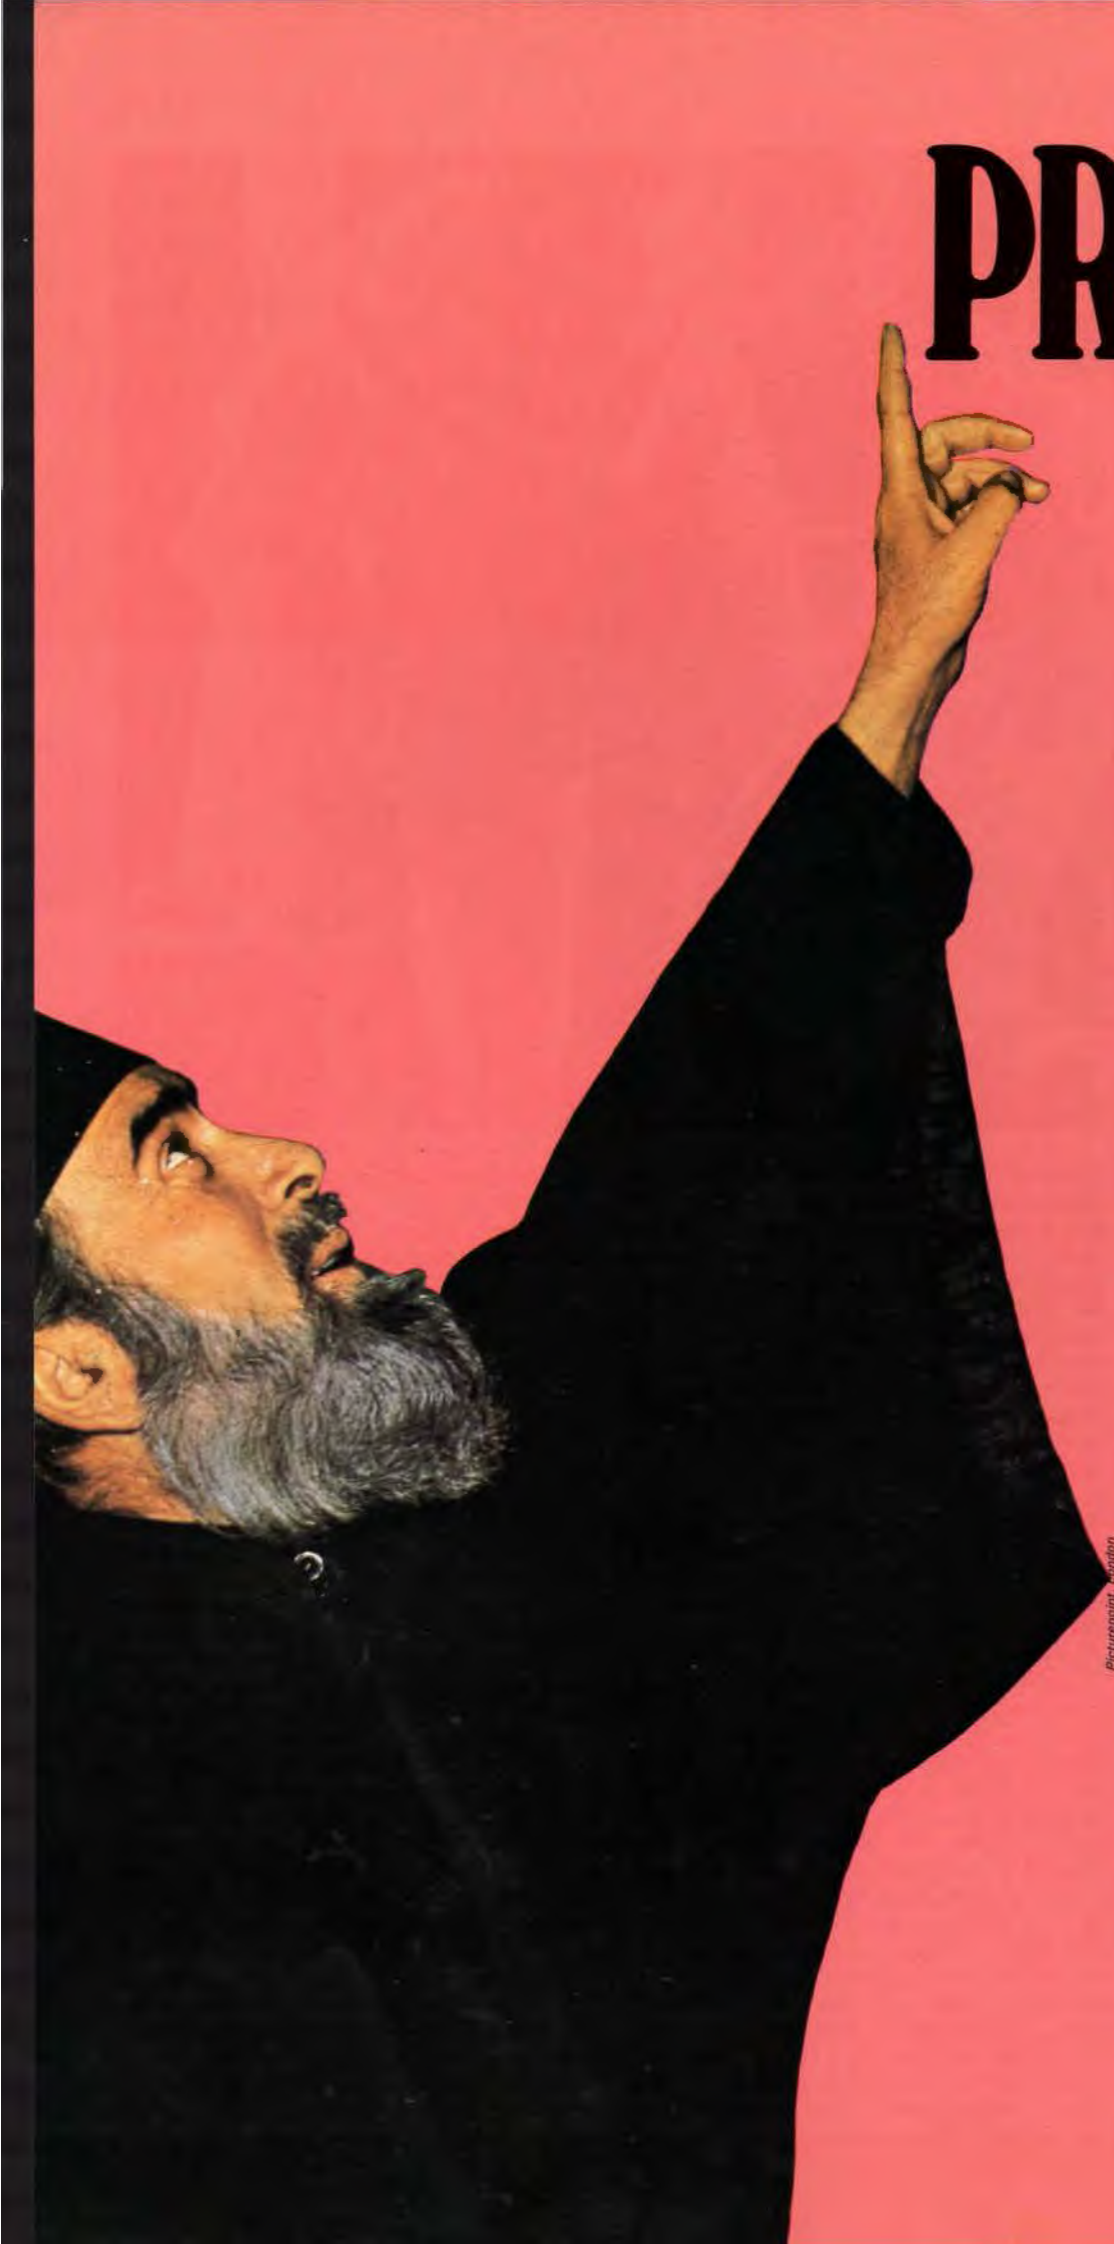
Matthew Hopkins was heavily criticized for regarding natural blemishes such as piles, warts and old scars as witch marks. But he defended himself by arguing that he found such marks to be insensitive to pain when pierced with a pin. It is apparent that witches' marks and the Devil's marks were one and the same so far as he was concerned.

It is obvious from the writings of John Bell, an 18th century Scottish clergyman, that this confusion was fairly general as he describes witches' marks as being 'sometimes like a little spot, or a little teat, or red spots like flea-biting, sometimes also the flesh is sunk into a hollow'. The problem of the witch's mark is doubtless connected with the fact that many people have supernumerary nipples which are frequently hereditary, as the powers of a witch were also frequently believed to be.

The examination of women for witches' marks seems to have continued into the 18th century, although the old belief in the Devil's marks disappeared. Jane Wenham, the last person to be brought to trial for witchcraft in England, was thoroughly searched for marks without success in 1712, and it was finally found necessary to indict her for 'conversing familiarly with the Devil in the shape of a cat'. She was found guilty of this offence, but later pardoned. During her interrogation Jane Wenham was subjected to the ordeal of witch-pricking, a pin being plunged into her arm six or seven times to start with, and then, when no blood came, 'a great many times more'.

The ill-treatment of suspects was eventually confined largely to 'scoring above the breath'. This involved tearing the forehead of the suspect with the fingernails, or pricking it with a pin, in the belief that once a witch's blood was seen to flow her familiar would leave the body of the person she had bewitched in order to feed upon it. Although the underlying reason for the practice has been largely forgotten, examples of pricking have occurred in the 20th century. In 1924 it was reported in *The Times* that a smallholder had tried to shoot an old woman after attempting to draw blood from her with a pin because he believed she had bewitched his pigs; and as recently as 1947 an army pensioner of East Dereham in Norfolk attacked his neighbour in an attempt to draw her blood, believing that she had placed him under a spell.

PRIESTS



Picturepoint, London

The priests, medicine-men or shamans of primitive societies are 'specialists in the supernatural', who provide a channel of communication between human beings and the divine: more sophisticated societies also have specialist priesthoods

AT MOST LEVELS of civilization priests act as the socially recognized mediators between men and supernatural beings. They are the experts in the performance of rituals, and in pre-literate societies it is they who preserve, by oral tradition, the myths and the body of religious concepts and ideas which constitute a people's intellectual heritage. The functions, selection, training and social position of priests differ widely even within simpler societies, and the designation 'priest' has been applied to a large variety of religious practitioners, who may have little in common except for their alleged ability to establish contact with gods and spirits, or to manipulate supernatural forces.

In some societies there is a distinction between priests, who are the official religious leaders and representatives of the community, and magicians, shamans and prophets whose power derives from individual supernatural experiences or what is presumed to be direct inspiration by deities or spirits. In practice, the functions of these two types of religious practitioners often overlap, and the distinction is not universal.

At the lowest level of economic development, there is little scope for the emergence of ritual experts or any other form of occupational specialization. Most societies of nomadic food gatherers and hunters lack religious specialists comparable to the priests of more advanced peoples. All adults

According to Christian doctrine, Christ gave priestly authority to the apostles, who passed their authority to the bishops who came after them. They in turn consecrated other bishops, and it is this authority, which stems from Christ himself, that is transmitted to priests of the Orthodox, Roman Catholic and Anglican Churches during the ceremony of ordination, the central rite of which is the laying on of hands by a bishop *Left* An Orthodox priest, in Cyprus *Facing page* Priests and monks have sometimes claimed to be more directly inspired by Christ: 13th century miniature showing an abbot receiving a manuscript from a monk who is shown with two faces, indicating that his work was divinely inspired

Members of different priesthoods may have little in common except for their alleged ability to establish contact with gods and spirits

are considered capable of invoking gods or spirits and of soliciting their favour by way of prayers and offerings. Cult acts involving all the members of a group may be conducted by old men experienced in the performance of ritual, but no training or hereditary qualification is required for such activity, nor do those engaging in the organization of religious rites enjoy any special privileges.

G. Tomsich/Spectrum

Priest and Magician

Where larger and more stable social groups have developed, increased economic efficiency enables man to divert some energies to the elaboration of religious practices. In most societies of some complexity the task of establishing contact with transcendental powers tends to be vested in individuals who act as the representatives of their clan or village. Such individuals need not possess outstanding intellectual gifts, but the ability and the right to perform priestly functions may be hereditary in certain families, lineages or clans. Another claim to priesthood is derived from psychological states interpreted as possession or selection by a divinity or spirit, who is supposed to invest the priest with powers and knowledge not accessible to other men. Priests who base their position on hereditary rights and priests called to their vocation by the gods may co-exist in the same society.

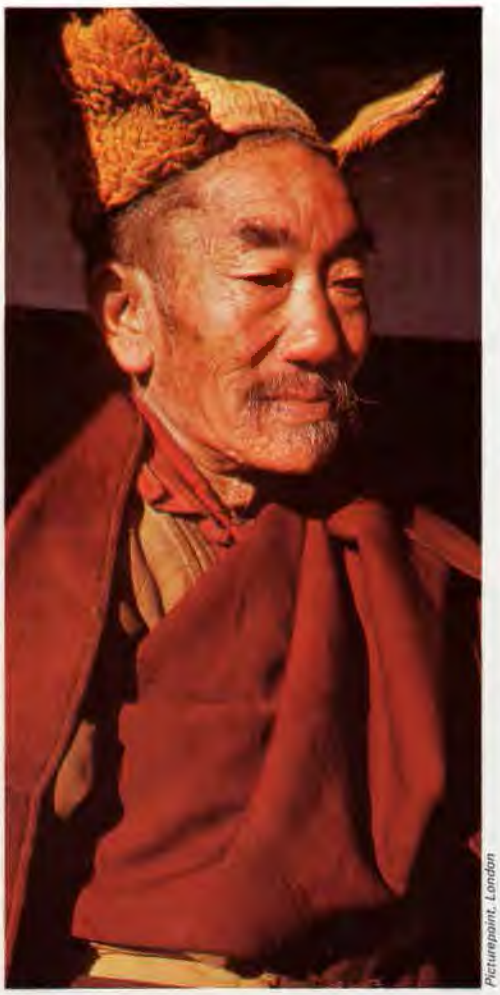
The Hill Reddis, an aboriginal tribe of southern India, for instance, depend on two classes of intermediaries in their relations with the supernatural world: the hereditary priest of the local group or village, and the magician who derives his powers from an intimate connection with a specific god or spirit. The hereditary priest is normally a descendant of the village-founder, and membership of the lineage of the man who first settled in the locality is sufficient qualification for his office. He is regarded as the head of the village, and as the appropriate mediator between man and the deities and spirits who dwell in the area.

As representative of the village he performs those rites and ceremonies that are believed to secure the prosperity of the community as a whole. And since this prosperity is intimately linked with the thriving of the crops, it is above all the agricultural rites that call for the intercession of the priest. He must inaugurate the sowing of the grain, propitiate the earth deity with sacrifices, and perform the rites at the great seasonal feasts. No special intuition or skill is required for these tasks.

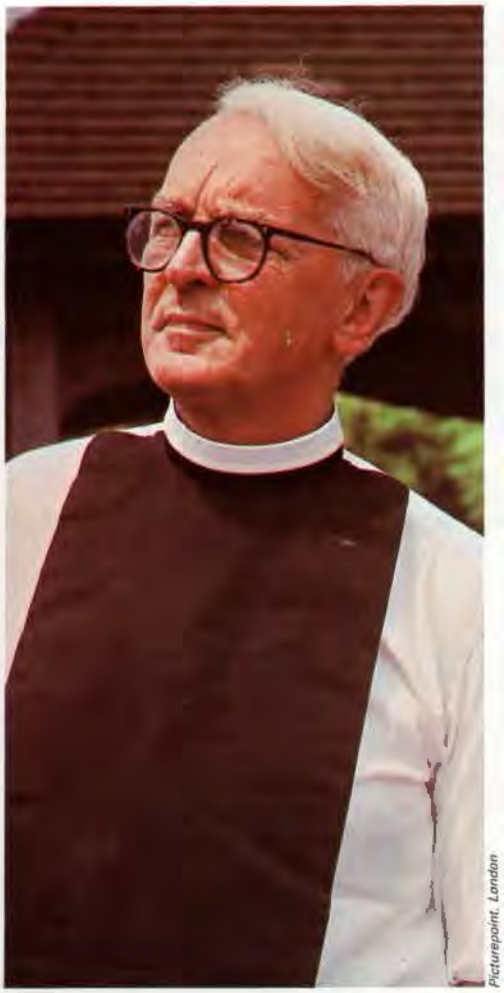
Less simple are those that fall to the magician. While the hereditary spiritual head of the community follows the broad and well-trodden path of long established ritual, the magician must battle through the wilderness of the supernatural world to discover the cause of disease and threatening disaster, and must devise the means of placating the wrath of malignant spirits. The priest acts, so to speak, while all is well; his offerings are tendered to gods while their mood is benevolent, and his prayers are designed to solicit their favour for the welfare of the community, and their protection against dangers not yet arisen. It is only when misfortune is rife that the magician is called in to restore the disturbed relations with supernatural powers, to draw the sick from the jaws of death or to counteract the black magic of an enemy. This power, which he could not wield unless he himself possessed a thorough knowledge of magical practices, justifies his being called a 'magician'.

Every Reddi village must have a priest, but there may or may not be a magician in the community. Being a magician is an art, acquired by learning or bestowed by supernatural beings on an eager apprentice. It is an art and a power within reach only of those men and women who are predisposed towards it by particular mental qualities. Naturally these may occur in a priest as well

G. Cubitt



Picturepoint, London



Picturepoint, London

as in any other man, and his frequent performance of ritual acts is bound to favour their development. Nothing debars a priest from learning the practices of a magician, and the combination of both functions is fairly common.

No Reddi is born a magician and aptitude for the work does not manifest itself in childhood. A magician frequently owes his knowledge to the instruction of his father or an older kinsman, but not every son of a famous magician has the talent or the desire to assimilate his parent's teaching. The co-operation of a deity is indispensable to the process of becoming a magician, and it is not only men who seek the gods; on occasion the gods themselves take the initiative. Reddi magicians agree that they receive their inspiration and knowledge from the gods, either while in a state of trance or through the medium of dreams. When a magician is called on to treat a sick person, it is usually his guardian deity who tells him what medicines to apply and what animals to sacrifice.

Married to a Spirit

While the roles of priest and magician are clearly distinguished in some of the simpler societies, they overlap in others and a distinction between the functions of priests and magicians is hardly perceptible. Both deal with the control of supernatural forces and priests are generally expected to influence the gods through prayer and ritual performances, while magicians exert their power through spells and the manipulation of certain material objects possessed of mysterious efficacy. But as the principal duty of priests is to mediate between mankind and the higher powers, the faculty of communicating with gods and spirits is a primary qualification for the priesthood in many societies. This ability may be proved in different ways. When a person falls into a state of trance or ecstasy, people think that he or she is under the influence of a supernatural power, and therefore suitable for the role of mediator between men and gods. Or the supposed connection between priests and the spirit world may be that they have one or more tutelary deities of their own who assist them when required.

A striking example of this type of link between priests and supernatural beings occurs among the Saora tribe of Orissa in India. Among these primitive hill-farmers, placating the vast otherworld of invisible and often hostile beings occupies the energy of a small band of dedicated men and women. Armed with a few fragile implements, and devoting themselves to supplication of spirits and the sacrifice of animals, these people strive bravely to protect mankind.

There are two types of religious practitioner among the Saoras, the village priest and the shaman or magician. The priest's special function is to maintain the cult of the local shrines and to guard the village lands from the interference of hostile spirits and sorcerers. When a new priest is to be appointed a shaman is called and, falling into a trance, he asks the gods and ancestors whether the proposed candidate is acceptable to them. If they agree that he is, the shaman summons the ghost of the last priest to hold office in the village. If he too approves, the shaman – possessed by, and representing, the dead man – puts his hands on the head of the new priest and tells him to do his work well. This selection and installation of a Saora village priest demonstrates the co-existence and friendly co-operation of two quite different types of ritual expert.

For practical purposes, however, the shaman, who may be male or female, is the most important religious figure in a Saora village. He has the power not only to diagnose the source of trouble or disease, but to cure it. He is doctor as well as priest, psychologist as well as magician, the repository of tradition, the source of sacred knowledge. His primary duty is that of divination; in case of sickness he seeks the cause in trance or dream. Every male shaman has a spirit-wife in the underworld and every female shaman has a spirit-husband, whom she visits in her dreams. These tutelary spouses are the strength and inspiration of Saora shamans. The marriages are absolutely real in their own minds, and they believe themselves to be chosen by the direct intervention of the guardian spirit, through whom they subsequently have immediate access to the world of spirits and deities. A female shaman may have to be wooed by a spirit for a long time before she consents to accept him as husband. Usually such calls from the spirit world

Although the basic function of the priest, to communicate between man and the divine, is the same at most levels of civilization, their selection and training differ widely in different societies; in the Christian Church, for instance, the priest's authority is bestowed on him at his ordination, while in more primitive cultures a shaman will be selected because of his ability to fall into a trance or ecstatic state which is thought to invest him with knowledge and powers inaccessible to ordinary men. The Brahmins of India inherited their ability to perform priestly functions, and have been worshipped as though they were gods themselves ***Left to right*** **A Coptic priest in Ethiopia; a lama in Nepal; a clergyman of the Church of England** ***Right*** **Medicine-man of the Turkana tribe in northern Kenya**

Picturepoint, London

come as hallucinations or dream-experiences, and a girl may appear to be deranged and ill until the 'marriage' to her suitor from the underworld has been performed.

After the marriage, the shaman's spirit-husband visits her regularly and lies with her till dawn. He may even take her away into the jungle for days at a time. In due course a spirit-child is born, and the ghostly father brings it every night to be nursed by the human wife. This imaginary marriage is no bar to marrying a human husband, but the dream-spouse seems as real to a Saora shaman as her husband of flesh and blood, and it is believed that she will become a spirit herself after death.

The Master of Ecstasy

The term 'shaman', now widely current in anthropological literature, was first applied to the religious practitioners of central and northern Asia, where the magico-religious life of most of the indigenous population traditionally centres on the shaman. He is the dominating figure, though in many tribes there are also priests concerned with the performance of animal sacrifices, and every head of a family is also the head of the domestic cult. The ecstatic state is considered to be the supreme religious experience, and the shaman is the great master of ecstasy. Unlike persons possessed by spirits and temporarily in their power, the shaman controls spirits. He is able to communicate with the dead, or with demons and Nature spirits, without becoming their instrument (see SHAMAN).

Medicine-men often receive their knowledge and inspiration from the gods, and exert their powers through spells and by manipulating objects that are believed to possess mysterious efficacy: dried monkeys' heads, an important ingredient in curing disease, for sale in a Nigerian market

Shamans are separated from the rest of society by the intensity of their religious experience, and in this sense they resemble the mystics of historic religions. The mental disposition which qualifies a person for the functions of a shaman points to an important feature of early priesthood. Among many peoples, priests must display a certain excitability of temperament, which in modern Western society might be considered as bordering on a psychopathic condition. The ability to fall into trance may be an essential prerequisite for the performance of certain rites, in which case only those capable of such psychological states are suitable as priests.

The importance attached to ecstasy as a visible means of divine inspiration is shown in the numerous instances of priests obtaining their initiation by inducing a state of delirium or trance through the use of narcotics or fasting. The convulsive movements and seemingly irrational utterances of the inspired person suggest that his own controlling will is in abeyance, and that an external force or being has taken possession of his body. In many cases a god or spirit is supposed to speak through his mouth and determine his actions.

Not all priests need to undergo a formal course of training, or be initiated into the mystery of relations with supernatural powers by a specific ritual. Those who succeed to the priesthood through inheritance, for example, are usually believed to have powers acquired by birth into a family or clan. On the other hand, there are many preliterate societies which require potential religious practitioners to be subjected to a rigorous training in self-control and in the sacred lore of the tribe. Among the Eskimo, for instance, the priests are trained in their profession from childhood.

Where priests receive formal instruction, their education often consists of two different phases. During the first period the

Most priests in primitive societies act simply as agents of their fellow-men, and are intent only on obtaining material benefits for them

novice is under the care of an experienced practitioner, who initiates him into the body of religious beliefs and teaches him how to perform various rites. A later phase is devoted mainly to self-training, in the course of which the novice seeks mystic experiences, and through them a direct relationship with supernatural powers. During this preparation for the priesthood he may have to live in seclusion or submit himself to austerities such as prolonged fasting or exposure to the elements.

In some primitive societies the period of instruction and training culminates in an elaborate initiation ceremony which confirms upon the candidate the full status of an ordained priest.

In many societies, however, priests are trained in a much more casual way. Among the Ifugao tribe of the Philippines, for instance, there is no institutionalized method of initiating priests into the labyrinth of an immensely rich and complicated mythology. There is no organized priesthood recruited from a special social class. Any Ifugao possessing intellectual ability and a good memory may attach himself to an experienced priest of his kin-group or locality as an apprentice; but in many cases sons follow in the footsteps of fathers enjoying a reputation as knowledgeable and successful priests. Ifugao priests also act as chroniclers and genealogists, for the frequently repeated incantations of ancestors give them an unrivalled knowledge of genealogies. The ministrations of priests form an essential part of all the innumerable rituals by which Ifugaos mark social as well as religious occasions.

Some of these rituals may extend over a whole day or even over several days, and the demands they make on the memory can be prodigious. The priests are of supreme importance to the Ifugao, for only they are thought to be capable of manipulating the gods and coaxing them to aid human endeavour. The relation between man and deities is looked upon as one of bargaining and of give and take, and the priests must exert all their skill to get favourable terms for their clients. Ifugao gods are regarded as morally neutral and unconcerned with the ethical conduct of men, and the priests do not take any stand on moral questions. They do not feel any need to behave in an exemplary way in their private lives, nor do they attempt to influence the moral conduct of their clients and fellow-villagers.

Unlike Christian priests or other holy men who regard themselves as representatives of a moral order that derives its sanction from a supreme deity, most priests in primitive societies act simply as the agents of their fellow-men, and are intent only on obtaining material benefits for them. They have no interest in giving them any guidance in moral matters. Priests of this kind do not preach to men, but address themselves solely to the deities they seek to influence.

In addition, whatever the circumstances in which a priest acts as an intermediary between men and gods, the quality which makes his mediation effective often resides in his office rather than in himself as an individual. Consequently it may not greatly matter what sort of person he is, socially, psychologically, or morally.

Government by the Supreme Power of Chinese religion was carried out through a bureaucracy, and the high gods were generally approached through honourable men, priests or monks: figure of a monk, Sung Dynasty (980–1279 AD)

G. Tomsich/Spectrum

A Sense of Awe

Because of his usefulness and power a priest may enjoy considerable prestige and authority, but his position is so precarious and easily damaged that he tends to be surrounded with taboos to protect him against harmful contacts with forces that might render him ineffective. The social position of priests varies greatly from one society to another. The ability to experience states of trance and spirit-possession is usually not combined with great economic efficiency or political acumen, and priests who on ritual occasions will act as the mouthpieces of gods may be withdrawn and comparatively ineffective personalities in ordinary life. On the other hand, someone who holds the position of clan-priest by hereditary right, and functions as the sole mediator between a powerful clan and its protective deities, may derive considerable prestige and material advantages from his office.

In some societies, as among certain West African tribes for instance, priests tend to increase the respect in which they are held by enveloping their proceedings in mystery. They often create a sense of awe and fear among the laity, in order to enhance their power. The special and sometimes fantastic attire donned by some priests is intended partly to distinguish them from the rest of the population, and partly to impress deities and spirits or avert malignant forces. Masks worn by priests have similar purposes, and occasionally signify a mystical connection between the priest and an ancestor spirit or deity whom he embodies.

In primitive societies priesthood is not exclusively a male occupation, and there are many instances of women functioning as priestesses and magicians. It is rare for them to be debarred from marriage, just as male priests are usually expected to marry and lead a life not basically different from that of other members of their society. Though their priestly status may provide them with certain privileges and material benefits, occupational specialization among primitive populations normally does not go far enough to free religious

There is frequently a close relationship between kingship and the priesthood, and in the ancient Near East the gods were served by official state priesthoods, with the implication that priestly authority was one aspect of the royal government. The king was himself the chief priest, though in practice he delegated most of his priestly functions to others *Left* Statue of an Egyptian priest: there was often rivalry between the priests of different gods *Right* In the Maya civilization of Central America, the high priest of a city ranked equally with the 'ruler of men', who was himself educated in religious magic: this relief shows a masked figure carrying a ceremonial sword

G. Tomsich/Spectrum

practitioners from the need to till the soil or herd cattle. At that level of material development priesthood is seldom an exclusive profession, and a priest does not diminish his spiritual status or prestige by engaging in normal secular occupations.

Restrictions on the sexual life of priests and priestesses are usually found in the more advanced civilizations. Primitive peoples rarely place any value on celibacy and chastity, and priests are expected to have normal family lives. They may be obliged to abstain from sexual activities during periods of training or at the time of major rituals, in the same way as fasting is regarded as a preparation for spiritual experiences; but in general primitive priests are not expected to lead a life basically different from that of laymen.

C. VON FÜRER-HAIMENDORF

Clergy and Laity

Specialist priesthoods also play an important role in more complex societies where, although priestly functions may be performed by people who are not priests – the head of the family may say grace at meals, for example – the community's dealings with God or the gods are mainly conducted by the 'clergy' who are distinguished from the 'laity', the non-specialists who are by implication incapable of, or at least less efficient at, communication with the divine. This implication has been resented on occasion, and some Protestant Christian groups insist that all believers are priests. Some refer to their functionaries as 'ministers' or 'elders' rather than 'priests' (the English word is derived from Greek *presbyteros*, 'elder') and deny them any unduly exalted status. At the other extreme, the members of some priesthoods have claimed to be gods themselves. This is true of the Brahmins in India, who belong to a hereditary caste, and some of the lamas of Tibet are regarded as divine (see BRAHMAN; CASTE; LAMAS).

In the ancient world the principal duty of priests was to offer sacrifices and conduct the major rituals of the gods. They also discerned the will of the gods: in Rome the augurs were priests, for example, and the classical oracles were staffed by priests (see AUGURY; ORACLES). Appealing to the gods for help, for individuals or for the community as a whole, curing the sick and battling

G. Tomsich/Spectrum

Lamas, the priests of Tibet, at one time made up about 20 per cent of the population; many lamas, and nuns, were regarded by Tibetans as being reincarnations of saintly predecessors: 17th century painting

against evil spirits were also priestly functions. A priest was usually attached to a particular holy place, the shrine or temple of his god (unlike Christian clergy, who are not tied to sacred sites in this way).

In the Near East the gods were served by official state priesthoods, with the implication that priestly authority was one aspect of the royal government. The king himself was a priest, the chief priest in fact, though in practice he delegated most of his sacerdotal duties to others (see KING). In Mesopotamia, for instance, there were various classes of priests, who performed the temple ceremonies, who took omens and interpreted dreams, who were called in to cure diseases and expel demons, and there were also priestesses, who acted as sacred prostitutes (see MESOPOTAMIA; PROSTITUTION). A priest usually inherited his office and he lived on the offerings made to the god, including the food which in theory the god himself ate. The god owned the land and an important task of the priests was to administer his estates for him.

In Greece and Rome where, in historical times at least, there were no kings, the political importance of priesthoods was minimal. Many priests served only for short periods and were not expected to put aside their ordinary secular activities. The most revered priest in Attica was the chief priest of Eleusis (see ELEUSIS), who was chosen from the priestly clan of the Eumolpidae. He served for life and because he revealed the secrets of the Mysteries to the initiates, it was important for him to have an impressive voice. On appointment he took the name of Hierophantes, and formally threw his old name into the sea.

In Rome the formal worship of the gods by the community as a whole and the rituals which it entailed, as distinct from the devotions of pious individuals, were conducted by various priests, presided over by the pontiffs (*pontifices*) who had originally been concerned with the rituals which accompanied bridge-building. Their chief was the Pontifex Maximus. Among other priests were the *flamines*, of whom the most important were the flamen Dialis, the flamen Martialis and the flamen Quirinalis. The flamen Dialis, the priest of Jupiter, and his wife were bound by all sorts of taboos and restrictions to protect them from pollution (see JUPITER; MARS).

In the Old Testament, patriarchs including Noah, Abraham and Jacob are recorded offering sacrifices to Yahweh but later legislation prohibited all sacrificial offerings except those made in the Temple by qualified priests. The priesthood has almost entirely disappeared from Judaism, and Islam 'allows no priest between man and God' (see ISLAM; JUDAISM).

In the New Testament, St Paul mentions various Christian officials – apostles, prophets, teachers, workers of miracles, healers, helpers, administrators, speakers in tongues (I Corinthians 12.28). An organized Christian hierarchy gradually developed, founded on the doctrine that Christ had given priestly authority to the apostles, who in turn passed their authority to the bishops who succeeded them, who in their turn consecrated other bishops, so that through this 'apostolic succession' a properly ordained bishop has inherited, as it were, an authority originally stemming from Christ himself. In the Orthodox, Roman and Anglican Churches priests are ordained by a bishop in a ceremony whose central outward ritual is the laying on of hands, a sign of the transmission of apostolic authority and grace (see SACRAMENTS). The laying on of hands in the appointment of officials by the original apostles is mentioned in Acts (chapter 6).

PRINCE - Abode of Love

With money from his wealthy admirers, the Rev. H. J. Prince, self-styled messiah, founded his Agapemone or Abode of Love, a place of luxury and pleasure where he lived surrounded by numerous 'soul brides'

H. J. PRINCE

THE REVEREND Henry James Prince has the distinction of having founded his own religious sect for his personal benefit and gratification; and seldom has it been done so brazenly or successfully. His successor, the Rev. J. H. Smyth-Pigott, was equally unscrupulous, and between the two of these rogues there was little difference, although there is no record that they ever met.

H. J. Prince was born in April 1811. He took holy orders in the Church of England, being ordained in 1840 to the curacy of the small parish of Charlinch, near Bridgwater, Somerset. The Rector was named Starkey and like Prince he was an excellent speaker. He soon recognized in his curate the voice of God, and within a year a great revival of religion had started at Charlinch, bringing squires, farmers, gentlemen and their ladies, farm workers and their wives, flocking to the church.

Prince possessed considerable fascination for women, and he did not withhold his powers. There were scandalous rumours about his behaviour and when these reached the Bishop of Bath and Wells, Prince was forbidden to preach.

There seems little doubt that from 1843 onwards, Brother Prince became subject to delusions. In May of that year he wrote a long letter to his brother-in-law, explaining how the Holy Ghost had come to be settled and fixed in the personality of H. J. Prince. Having been inhibited by his own Bishop, Prince fell foul of the Bishop of Salisbury, and when he tried to officiate as curate of Stoke by Clare, Suffolk, he was dismissed by the Bishop of Ely. Then, to use his own words, 'prevented from preaching *within* the pale of the established Church, Bro. Prince, after six months' waiting on God for guidance in faith and prayer, proceeded to preach without it'.

Prince now boldly denounced the Church, and he and Starkey started preaching in the open and in barns around Charlinch. One day, when addressing a meeting in a field, Prince suddenly announced that he was the prophet Elijah, yet few of his listeners appeared to find this revelation extraordinary. Prince then went to Brighton, where he took over the running of a chapel in Windsor Street. The town was a popular resort of wealthy people, and to attract their attention to his chapel he wrote and published several religious books. His masterpiece was *The Great Declaration*, in which he revealed that God had selected him to be the perfect man, incapable of sin. Brother Prince claimed to be immortal, and also said that those who had faith in him would never die: anyone who followed him was assured of immortality. Furthermore, if they were strong in the faith, the love act between the sexes would be entirely innocent. Fleshly pleasures could be enjoyed in a completely spiritual way, especially with Brother Prince.

Prince's first marriage, to a woman old enough to be his mother, had been – according to him – God's will. God was certainly on his side because the lady's income was enough to provide him at Charlinch with the luxuries usually denied a humble curate. When she died he was still at Charlinch, and within a few weeks of the funeral was courting the Rev. Starkey's daughter, whom he quickly married.

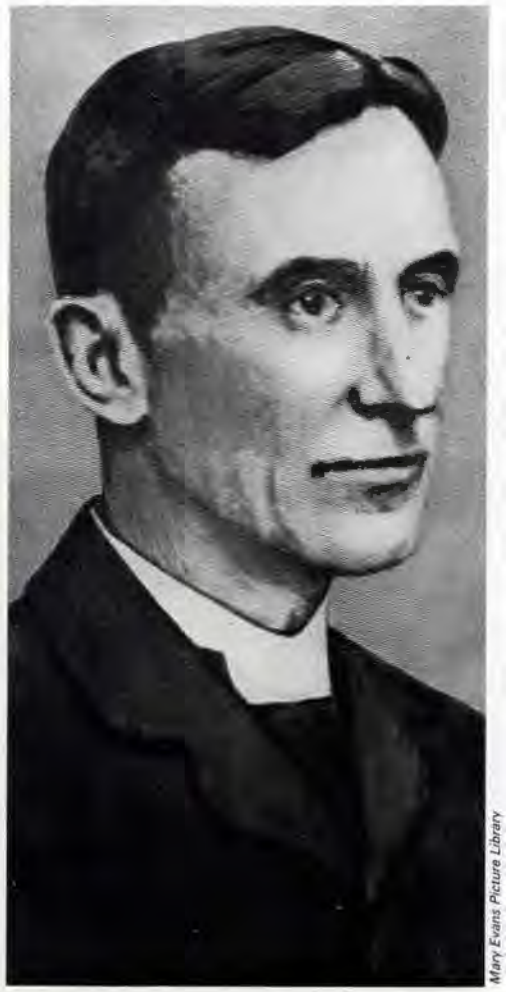
Billiards in Chapel

From Brighton, Prince returned to Somerset with £30,000 in his pockets, most of it contributed by his society admirers. He and his followers travelled in a long procession of carriages with liveried coachmen and postilions, and at Weymouth the entourage stayed at the Royal Hotel, where Prince held a reception and announced his plans for the setting up of an *Agapemone* or Abode of Love. Those who wished to be saved, he said, need only make gifts to help the new community. Some 200 local people of influence, invited especially for this purpose, crowded into the ballroom and agreed to give up all or part of their worldly possessions in order to be saved. With this money, a considerable sum, Prince in 1849 bought a plot of land on the outskirts of Spaxton. He began to style himself 'the Beloved', while Starkey and a brother of Prince's were 'the Two Anointed Ones'. There were also an 'Angel of the Last Trumpet', 'Seven Witnesses' and other divine officials.

The house at Spaxton was large, with an unfinished chapel, stables, outhouses and several cottages. Accommodation was allotted to the disciples according to the money they had subscribed. An even larger mansion was built on the adjoining land, and the chapel was converted into a kind of drawing-room with a high altar, easy chairs, sofas and a billiard table.

It took two years to complete the building of the Agapemone, large numbers of workmen being employed; when it was finished it was extremely luxurious. The estate was self-sufficient and consisted of about 200 acres. There were at first about 60 disciples in residence, with their servants. The Queen-Dowager's carriage was bought, and in this Brother Prince was driven in style along the country lanes behind four white horses. Visiting the Great Exhibition in London, he was preceded by outriders.

In 1927 an old villager in Spaxton stated that he remembered Brother Prince driving through Bridgwater in his carriage and pair with a footman sounding a horn and crying: 'All hail! All hail! The Messiah!' To his followers, Prince was God. Letters addressed to 'Our Lord God, Spaxton, Somerset' reached him safely. And because he claimed to be divine, Prince took to his bed those of his sister disciples whom he desired. Their children were born in comfort and secrecy at Bristol, and were later given quarters in the house, but were kept out of sight when visitors called. The women regarded it as an honour to be taken by the Beloved, who explained in his work



Mary Evans Picture Library

The Little Open Book (1856) that Christ had appointed him for these special tasks.

A wave of religious fanaticism swept across the Bridgwater district. Many otherwise intelligent people were convinced when Brother Prince rose and announced that he was the final revelation of the will of God.

The Disgrace of Death

With time, Prince took less interest in the theological aspects of religion, and there was considerable open debauchery in the Abode, without pretence of prayer or devotion. One of his followers, Miss Paterson, became Prince's 'soul bride', and when she became pregnant Brother Prince announced that there would be no birth, just as there was no death for his followers. But when Miss Paterson's newborn child could hardly be so lightly dismissed, Prince explained that it was Satan's final despairing act against God.

Several of the followers were upset by the open immorality and left the community, bringing lawsuits against Prince. One of these cases resulted in a complete exposure of the way the Beloved and his colleagues 'crept into houses, leading silly captive women' and 'turning the Grace of Lord Jesus Christ into licentiousness'. The suit was heard in the Court of Chancery in the summer of 1860. The Vice-Chancellor referred in the strongest terms to the disgraceful revelations, and a bill was filed to recover £5,728 from Prince, the property of three sisters.

After this, Prince led a retired life and

Previous page **At Spaxton in Somerset a complex of luxuriously appointed buildings provided accommodation for the members of the Agapemone *Far left* John Hugh Smyth-Pigott, a curate in the Church of England, declared that he was God in 1902, three years after Prince's death; shortly afterwards he moved down to Spaxton as the new messiah *Left* Ruth Preece, a wealthy young woman, became Smyth-Pigott's 'chief soul bride'; it was for fathering her illegitimate child that Smyth-Pigott was eventually inhibited by his bishop**

a cloak of silence fell over the Agapemone. The funds of the brotherhood fell low, for no work had ever been done in the Abode: every day and night had been spent in pleasure. But the Beloved's good fortune did not fail him. In the late 1880s a wealthy London merchant presented Prince with all his property, worth some £10,000, and moved into the Abode to serve the community as butler.

Finally, in January 1899, when he was almost 88, Brother Prince relinquished his claim to immortality. He was buried under the lawn, near the bodies of those of his followers who had also failed to prove that they possessed the secret of everlasting life. No headstones marked the graves of the departed, who were buried standing up. The remaining brothers and sisters concluded that by dying their companions had let them down. Death was a disgrace, an admission of sin.

This should be the end of the story of the Abode of Love, but it is not. In 1890 and for several years afterwards there had been a remarkable revival of interest in the Agapemone. Several prominent members of the Salvation Army had joined. At Clapton, London, the Children of the Resurrection, as they now called themselves, built in 1892 a magnificent church, the Ark of the Covenant, seating about 400 people, at a cost of some £16,000. The preacher at the opening ceremony in 1896 was the Rev. J. H. Smyth-Pigott, who was to be Brother Prince's successor at Spaxton.

The Beloved's Successor

After a varied career as a university man, sailor before the mast, curate in the Church of England, and evangelist in the Salvation Army, Smyth-Pigott was converted to the views of Brother Prince. In his opening sermon at Clapton he declared that he expected Christ to return that very day and descend upon the congregation.

It was on Sunday, 7 September 1902 that Smyth-Pigott stood before a crowded congregation in the Ark and publicly announced his divinity. According to one report, he revealed that he was going to walk across the water. Some of the believers fell on their knees and shouted for joy. On the next Sunday some 6000 people waited from dawn until the evening to see the new messiah arrive in his carriage. When he appeared he was greeted with loud hisses and catcalls; hundreds of people stormed over the railings to enter the church, but the doors were closed. The messiah at once drove back to his home, Cedar Lodge, followed by a shower of stones, bricks and umbrellas. Smyth-Pigott's declaration of divinity was greeted with scorn by General Booth of the Salvation Army, and the Plymouth Brethren regarded the claim as 'wicked and dishonourable'.

Smyth-Pigott moved down to Spaxton, where after some time an attractive girl named Ruth Preece went to live with him as his wife. Smyth-Pigott had been married since August 1886 but his wife accepted the newcomer, who was one of three wealthy sisters. In 1906 a male child was born to Miss Preece, the records at Somerset House showing that the father was John Hugh Smyth-Pigott, Clerk in Holy Orders. This led to his being inhibited by the Bishop of Bath and Wells, the court finding him guilty of 'immorality, uncleanness, and wickedness of life'. But Smyth-Pigott was unconcerned. 'I am God,' he said. 'It does not matter what they do. There is no such thing as marriage at the Agapemone. We are all brothers and sisters in God.' Less than a year later a daughter was born to 'Sister Ruth'.

At this time there were nearly 100 women in the Abode, but few men. Sister Ruth was 'bride-in-chief', and Mrs Smyth-Pigott lived in her own apartments.

Smyth-Pigott died in March 1927, a tired old man of 75. It was reported that the servants were unpaid, working for love and receiving only a little pocket money. In 1955 60-year-old Miss Ruth Ranken of Barnet revealed that she had been brought up as a member of the sect, and was still one in spirit. Brother Prince had founded it, and had been known as 'the Messenger'. On his deathbed in 1899 he had handed to Smyth-Pigott a 'horn of power'. Thereafter, said Miss Ranken, the true personality of Smyth-Pigott became clear – he was the same person as Jesus Christ. Miss Ranken said she had stayed at Spaxton many times, and was present at the Ark in 1902 when Smyth-Pigott proclaimed himself not as the Messiah but as the Son of Man.

In 1962 the house at Spaxton was sold and the story of the Abode of Love came to an end.

JOHN MONTGOMERY

The goddess Athene, it was said, came to live with Proclus, for this 5th century Neoplatonist combined his prolific output of philosophical treatises with a devout life of prayer and dutiful observance of pagan rites

PROCLUS

THE BEST KNOWN of the later Neoplatonists, Proclus (410–485 AD) was also the most influential of them in the Middle Ages. There are two sources for his life, a pious little biography written by Marinus, his disciple and successor in the headship of Plato's school at Athens, and the fragments of the *Life of Isidore* by Damascius, a rather rambling work which contained a great deal of information about a large number of later Platonic philosophers, written a little before 500 AD.

Proclus belonged to a legal family from Xanthus in Lycia, where he lived as a child. His father intended him to be a lawyer, but after beginning to study for this profession at Alexandria he decided to devote himself to philosophy and eventually went to join the Platonic school, the Academy, at Athens, at about the end of the year 430 AD. The *Diodochus*, or successor of Plato, who was head of the school at that time was Plutarch of Athens (not to be confused with the biographer and essayist Plutarch of Chaeronea, who lived about 300 years earlier). The 5th century Plutarch was a convinced late Neoplatonist (see NEOPLATONISM). At the time of the arrival of Proclus he was very old, and most of the teaching in the Academy was done by Syrianus, the successor of Plutarch in the headship who became Proclus's loved and venerated master.

These late Neoplatonists were a small closed group of devout pagans in an officially Christian world, often closely interrelated and living together on terms of considerable intimacy. Proclus lived in the house of Syrianus, and was initiated into the secret rites of theurgy (see THEURGY) by Plutarch's daughter, Asclepigeneia. Under Syrianus he went through the first two parts of the normal course of Neoplatonic philosophical studies, the study of Aristotle (conceived as

an indispensable preliminary intellectual exercise) and the study of Plato (regarded as a 'mystagogy' or initiation into divine wisdom). The third and final part of the course was the study of the 'theologians', that is to say the Orphic and Chaldean writings supposed to contain revelations from the gods themselves, to the understanding of which the study of Plato according to Neoplatonic principles of interpretation was thought to provide the key. But Syrianus died before embarking on this part of the course, and Proclus was left to complete the study of the 'theologians' by himself, with the help of the voluminous commentaries of his predecessors; this he did all too thoroughly, as his works show. He became himself the Platonic successor, probably inheriting the position from Syrianus in about 437, and was referred to by later generations as Proclus Diadochus.

Philosopher and Rain-Maker

Proclus never married, and lived an intensely austere and hard-working life, combining the activities of an exceptionally industrious professor with a monastic life of prayer and ritual observance. He lectured and wrote a great deal and held discussions with other philosophers, while he also spent much of the night in contemplative prayer and ceremoniously venerated the sun with triple prostrations at dawn, noon and sunset. He conscientiously evoked the gods according to the rites which he had learnt from Asclepigeneia, and practised rain magic for the good of the community. Eventually the goddess Athene herself, so it was said, came to live in his house when her statue was taken from the Parthenon to Constantinople. But none the less he lived for the most part on good terms with his Christian fellow citizens and with the officials of the Imperial government, which had already several times forbidden all forms of pagan cult, under heavy penalties, but rather ineffectively. (There was still a minority of high Imperial officials who had sympathies with Neoplatonic paganism, and their influence may have helped the Academy: it continued in possession of its large endowments until its closure by Justinian in 529, and perhaps even managed to retain some of them afterwards.) There was only one short period when Proclus had to leave Athens and spend a year in Asia Minor, apparently because of Christian hostility. He died peacefully of old age in 485.

In his long and industrious life Proclus wrote a very great deal, and a fair proportion of his works survives. He produced commentaries on Aristotle's logical works and on a number of dialogues of Plato; of these some of the most important survive, notably those on the *Timaeus* and the *Parmenides*. Of a number of short works on particular questions, three survive, mostly in medieval Latin translations. However, an elementary introduction to Plato, and possibly another to Aristotle, have not survived. He wrote a group of systematic expositions of Platonism, of which the *Elements of Theology*, a series of propositions modelled on the *Elements* of Euclid, is the best introduction to his thought. The greatest work of Proclus is the *Platonic Theology* and he also wrote works on mathematics and astronomy, of which three or four survive; works on theurgy, which have perished except for small fragments, no doubt owing to Christian hostility to their subject matter; and a number of hymns, of which seven survive.

Proclus is not easy or attractive to read. Except in the *Elements of Theology* he is excessively long-winded, and his style is pompous and heavily laden with the technical terms of late Greek philosophy. But his concern for clear and complete exposition and logical coherence makes him (when one has mastered the technicalities) often easier to understand than Plotinus (see PLOTINUS).

It is difficult to separate the thought of Proclus clearly from that of his predecessors, and especially from that of his master Syrianus. He is best considered as the representative of the distinctive kind of Neoplatonism which began with Iamblichus (c 250–326 AD) and reached its fullest philosophical development in the school of Athens in the 5th and 6th centuries AD. This did not claim to be in any way original. It purported to be the one true wisdom of the ancient masters, Pythagoras and Plato, correctly interpreted, with such modest help as Aristotle could give, according to the tradition of the Platonic school, and providing the only key to the understanding of the revelations which the gods had given to men through the 'theologians'. The Neoplatonic masters Plotinus and Porphyry, and above all Iamblichus and Syrianus, were not regarded, and would not have wished to be regarded, as original philosophers but as men who had, more or less, understood the true meaning of the Platonic writings and other sacred ancient texts. But this was no mere subordination of reason to authority. It was a matter of faith with the later Neoplatonists that the writings of Plato and the other ancient masters and the divine oracles contained a single, perfectly coherent and consistent system of thought, and that there could not really be anything in them which might seem to the late Neoplatonic mind to be illogical, irreligious or immoral. So the texts were very firmly interpreted, often by very odd methods, to produce a meaning which seemed to the philosophers rationally and religiously satisfactory.

Michael Holford/British Museum

Return to the Divine

Philosophy, for the later as for the earlier Neoplatonists, was primarily concerned with the truth about the Divine and the way by which man could return to it. Proclus presents the universe as an eternally existing, great and complex ordered structure. In it the ineffably transcendent First Principle, the ultimate One, expresses itself on all the levels of being: in the intelligible world and the realm of soul, and in the material world, whose matter is now no longer thought of as the principle of evil (as it was for Plotinus), but as wholly good and proceeding immediately from the One, so that material things have powers which can help to bring men back to the Divine. The return to God in later Neoplatonism is not brought about, as it was for Plotinus, through the discovery of the true, higher self which 'does not come down' but remains eternally in the divine realm. Man descends wholly to this world, and for his return to God needs the help of the divine powers. The One manifests itself on every level of being through the 'henads', unities and unifying principles which are identified with the gods of paganism; and men can return to it through unification each with his appropriate henad.

Theurgy is generally said to be superior to philosophy, and to be alone capable of bringing about the final stages of the return. But it is not entirely clear what theurgy meant to Proclus and other late Neoplatonists. It is the supreme expression of *pistis*, 'faith', one of the three great powers which unite and bring back all things to their divine source, the others being truth and love. It certainly included ritual magic which makes use of the occult powers implanted in material things by the gods, but it may sometimes have extended to include something like mystical prayer as well. In any case, preoccupation with theurgy was not for Proclus and his school any excuse for being vague, casual and incoherent in philosophy. They aimed at, and, granted their initial assumptions, very often achieved, the highest possible degree of logical rigour, consistency and completeness.

A. H. ARMSTRONG

FURTHER READING: E. R. Dodds ed, *Proclus: The Elements of Theology* (Clarendon Press, Oxford, 1923).

A Greek god notable for his efforts to improve man's lot, Prometheus first appears as a crafty trickster, but is more familiar in his later role of wise teacher of the arts of civilization and heroic opponent of tyranny

PROMETHEUS

THE OLDEST and fullest account of Prometheus comes from the poems of Hesiod (700 BC). Prometheus was a son of the Titan Iapetus. His brothers Atlas and Menoetius were both punished by Zeus for unruliness, and he too crossed the tyrannical ruler of heaven.

Gods and men were settling their affairs at Sicyon (not far from Corinth) prior to living apart. A bull was sacrificed, and Prometheus carved it up for eating. He served Zeus with a good meaty portion, but covered it in skin and paunch to make it look unattractive; while for mankind he set bones dressed up in juicy fat. Zeus complained at the unfair division, whereupon Prometheus, with a cunning smile, invited him to choose his own portion. Zeus promptly seized the better-looking one (the pious poet assures us that he was not really taken in), and ever since then men sacrificing animals have given the bones and other inedible parts to the gods, and divided the meat among themselves.

The Theft of Fire

As Karl Meuli has explained, the procedures of blood sacrifice go back to the hunting societies of Paleolithic times. The basic reason for killing the animal was to eat it. The remains were treated with care and arranged in a particular way, perhaps in the hope of restoring the animal alive to the herds. The Greeks, however, had come to think of it as a feast which men shared with the gods, and they consequently felt the need to justify the inequality of the division. The Prometheus story does so: it is an example of pure myth, a story designed to account for a feature of the world we live in, its details governed by present facts. The wrapping of the bones in fat corresponds to actual Greek sacrificial practice; the wrapping of the meat in the paunch may reflect a method of roasting.

Angered at the deception, Hesiod continues, Zeus withheld fire from men (perhaps with the idea of preventing them from cooking their meat); he 'would not give it to the ash-trees', the source from which men derive it. But Prometheus stole it in a fennel-stalk and delivered it to us.

The story belongs to a widespread type (see FIRE). Fire is a magical element that does not seem to belong on earth, and the myths commonly tell how it was stolen from heaven – often by a bird – and hidden in the trees. In Greece there was more than one local story. At Argos the bringer of fire was the hero Phoroneus, son of a tree nymph. Prometheus appears at Athens as one of the gods specially worshipped by potters and smiths. There was an annual torch-race from the altar he shared with Hephaestus, perhaps originally a ceremony for renewing the purity of another altar's fire. Prometheus's fennel-stalk was not a torch, it was an established means of transporting fire, which will live safely and inconspicuously on the white inner pith. But the external similarity of the torch-race in Prometheus's honour might have been responsible for his being identified as the

Mansell Collection

For thwarting the will of Zeus, Prometheus was bound to a rock; each day an eagle was sent to feast on his liver, which grew again during the night. In Aeschylus's play *Prometheus Bound* the hero is supported in his agony by a chorus of nymphs, a scene depicted by Fritz Zuber-Bühler in his painting *Prometheus and the Sea Nymphs*

The Defiance of Prometheus

Monarch of Gods and Daemons, and all Spirits
But One, who throng those bright and rolling worlds
Which Thou and I alone of living things
Behold with sleepless eyes! regard this Earth
Made multitudinous with thy slaves, whom thou
Requitest for knee-worship, prayer, and praise,
And toil, and hecatombs of broken hearts,
With fear and self-contempt and barren hope.
Whilst me, who am thy foe, eyeless in hate,
Hast thou made reign and triumph, to thy scorn,
O'er mine own misery and thy vain revenge.
Three thousand years of sleep-unsheltered hours,
And moments aye divided by keen pangs
Till they seemed years, torture and solitude,
Scorn and despair, – these are mine empire:–
More glorious far than that which thou surveyest
From thine unenvied throne, O Mighty God!
Almighty, had I deigned to share the shame
Of thine ill tyranny, and hung not here
Nailed to this wall of eagle-baffling mountain,
Black, wintry, dead, unmeasured; without herb,
Insect, or beast, or shape or sound of life.
Ah me! alas, pain, pain ever, for ever!

. . .

The crawling glaciers pierce me with the spears
Of their moon-freezing crystals, the bright chains
Eat with their burning cold into my bones.
Heaven's winged hound, polluting from thy lips
His beak in poison not his own, tears up
My heart; and shapeless sights come wandering by,
The ghastly people of the realm of dream,
Mocking me: and the Earthquake-fiends are charged
To wrench the rivets from my quivering wounds
When the rocks split and close again behind:
While from their loud abysses howling throng
The genii of the storm, urging the rage
Of whirlwind, and afflict me with keen hail.
And yet to me welcome is day and night,
Whether one breaks the hoar frost of the morn,
Or starry, dim, and slow, the other climbs
The leaden-coloured east; for then they lead
The wingless, crawling hours, one among whom
– As some dark Priest hales the reluctant victim –
Shall drag thee, cruel King, to kiss the blood
From these pale feet, which then might trample thee
If they disdained not such a prostrate slave.

Shelley *Prometheus Unbound*

thief who loped off with the stalk of fennel.

Zeus's next move was to send mankind a pernicious commodity to counterbalance the desirable one that they had got. On his instructions the divine craftsman Hephaestus made a beautiful girl, various goddesses adorned her, and Hermes gave her a deceitful disposition. She was named Pandora, and sent to Prometheus's foolish brother Epimetheus. Although Prometheus had warned him not to accept a present from Zeus, he married her, and all mortal women are her descendants. It was she who took the lid off the great jar in which all evils had been confined, letting them loose among us: only Hope remains in storage.

Many peoples have myths of the origin of women, as a separate event secondary to the creation of man. Eve was made from Adam's rib. Epimetheus was probably invented by someone who wanted to link the origin of women with the Prometheus story, but considered Prometheus himself to be too clever to be taken in by Zeus's trick. Prometheus's name suggested something like 'Forethought', so he was given a brother 'Afterthought' (as a *pro*logue has for its opposite an *epi*logue); a pair of brothers, one clever and one stupid, or one good and one bad, is a common theme in folktales. Genealogists later brought Prometheus, Epimetheus and Pandora into connection with Deucalion and Pyrrha. These were the ancestors of mankind in the mythical tradition of north and central Greece. After a flood of which they were the sole survivors, they had to throw stones behind them, and those thrown by Deucalion turned into men, those thrown by Pyrrha into women. This legend was reconciled with the story that women were descended from Pandora by making Pyrrha the daughter of Epimetheus and Pandora.

The jar of ills was an independent motif. Homer speaks of two such jars, in Zeus's keeping, one of ills and one of good things. Zeus dips in and dispenses to men as he thinks fit. Hesiod rather confusingly uses a single jar, primarily as a container of ills, but then also as a retainer of Hope. In daily life jars are used to store good things, but in myth they are useful for keeping evil spirits in bondage. It was much later, under the influence of the allegory of Cupid and Psyche, that Pandora's jar became a box.

Prometheus Bound

To prevent any further roguery, Zeus bound Prometheus in invincible bonds, and secured them by driving them through the thickness of a column. He then sent an eagle to feast on Prometheus's liver. Each night it grew again, and each day the eagle returned to its work, for constant repetition is proper to the torments of sinners. Later, however, Zeus's wrath abated, and he allowed his son Hercules to win glory by shooting the dutiful bird; yet Prometheus remains in bondage, for there is no thwarting the will of Zeus.

A late tradition identified Prometheus, the master craftsman, as the creator of mankind. He fashioned human shapes from clay, which were then animated by the goddess Athene: detail from a 3rd century sarcophagus

G. Tomsich/Spectrum Colour Library

Hesiod probably thought of Prometheus as being bound somewhere at the world's end, where his brother Atlas stands supporting the sky's weight. The column to which he is fastened may have a connection with the idea of pillars of heaven. This conception alternates in Eurasian folklore with that of a world tree or a world mountain which reaches up to the sky. In later versions of the Prometheus myth, the miscreant is shackled to a mountain – Caucasus, from the Greek viewpoint a remote eastern outpost of the earth. The story that the Argonauts saw Prometheus on their legendary Black Sea voyage might go back to a source of Hesiod's time.

There is some evidence that the Caucasus is in fact the original home of the myth. Throughout that region it is related that earthquakes are caused by the struggles of a fierce giant who tried to steal the water of life from the mountain heights, or was otherwise impious, and as a punishment was bound by God to a pillar or in a cavern in the mountain. In many versions a vulture pecks at his heart. He will have to stay there till the end of the world, but when he does break free his rage will destroy everything. Some accounts add that he once found a helper who nearly freed him; we think of Hercules.

Local variants are more reminiscent of the punishments of other Greek sinners. The water of life flows just out of the prisoner's reach: in the same way Tantalus was tormented ('tantalized', as we still say) by food and drink that kept eluding his grasp. Or beside the giant a great wheel turns, day and night; he never takes his eyes off it, for when it stops, he will become free. Ixion was bound on a revolving wheel. Tityus, like Prometheus, was fed on by birds of prey – two vultures.

In the Caucasus, then, we have a straight Nature myth with logical connections (the pecking bird accounts for the prisoner's intermittent wrath); in Greece, a loose group of curious stories. The myth can be traced back to about 400 AD in the Caucasus (a similar one was current in the Hindu Kush when Alexander the Great got there, 700 years earlier), and there is no reason why it should not be thousands of years older. It would not be the only myth to reach Greece from the heart of Asia.

Prometheus Unbound

Prometheus's punishment forms the subject of Aeschylus's play *Prometheus Bound* (second quarter of the 5th century BC). He is now represented as having given men a great deal more than fire; he is a dignified culture hero instead of a trickster. Formerly men lived in caves, ignorant of everything. Prometheus taught them to measure seasons by the stars, to reckon and write, to harness animals to their service, to sail the sea, to make medicines, to interpret dreams and omens, to mine metals. By Aeschylus's time the Greeks were speculating about the origins of civilization (see TIME), and while some saw it as a self-activated evolutionary process, others thought in terms of a divine or human instructor: Prometheus, or Palamedes, or

Indomitable under torture, the Titan continues his heroic defiance of the despotic ruler of heaven: *The Torture of Prometheus* by G. Moreau treats a subject which held great appeal for the Romantic imagination

the centaur Chiron, or Hephaestus and Athene, each nomination being based on some hint in traditional legend.

Aeschylus shows Prometheus as defiantly proud of his achievements in spite of the punishment they have brought him. Man's advancement is for the good, and Zeus must come to terms with it. In mythical language, he must come to terms with Prometheus, for if the craftsmen of Athens flourish, their god must flourish too: they will not have him a helpless prisoner at the world's edge. The story that Hercules relieved him of the eagle is accordingly developed into a full release. *Prometheus Bound* was followed in stage performance by *Prometheus Unbound*. The play is lost, but we know that after the lapse of 30,000 years Hercules freed Prometheus. Zeus only relented under pressure, however. It had been prophesied that a certain goddess would bear a son mightier than his father. As an insatiable wooer of goddesses, Zeus badly needed to know who it was, and only Prometheus could tell him. (It was Thetis. She was accordingly married off to a mortal, and bore Achilles.)

In the 5th century BC Greece's true classicism was already in decline. Certain analogies might be drawn with the Romanticism of the 19th century; and Aeschylus's treatment of Prometheus could be taken as an expression of one trend of thought which exalted man's indomitable nature and capacity for self-improvement. But events discredited this kind of enthusiasm, and dialectic discredited myths about the gods. The dramatists dropped Prometheus. A historian of the end of the century rationalized him: he was a Scythian king whose subjects incarcerated him because he could not stop the incursions of the Eagle river, until Hercules diverted it. Sophists and philosophers composed variations on the myth to suit their purposes, in particular developing the idea of Prometheus as a craftsman who fashioned mankind from clay, which presently became a cliché. From at least the late 4th century, allegorical interpretations were put forward. The fire that Prometheus brought represented philosophy, and he was accordingly the first philosopher. For the Stoics he was that divine Forethought which shaped man in the beginning, and then, lodging in him, apprehended the utility of fire. His punishment is heart-eating worry.

PROPHECY

A prophet was the human spokesman of a god and this special relationship to the divine led to the association of miracles and supernormal abilities with prophecy, including the ability to see into the future *Above* Daniel's vision of the destruction of the Temple: detail from a 16th century Flemish tapestry *Right* Elijah is miraculously fed by ravens: illustration from a 15th century manuscript

The Hebrew prophets claimed inspiration by the divine will: but while their main object was to teach, warn and encourage, they might also foreshadow future events

A WORD of Greek derivation, prophecy means 'speaking before'. In modern English it usually implies foretelling the future. Originally, however, this was not a prophet's essential function. He was the human spokesman of a god (pre-eminently of Yahweh, the God of Israel) and therefore a transmitter of divine messages, which might concern the future or might not.

Even in English the idea of prediction has not always been present. When St Luke's gospel describes the beating and taunting of the blindfolded Christ, his assailants say, 'Prophesy! Who is it that struck you?' (Luke 22.64). What is demanded here is proof of such supernormal knowledge as a true messiah ought to possess.

The Old Testament sometimes employs the term 'prophet' very loosely. For instance, Abraham is a 'prophet' because he is the friend of God. Moses and his brother Aaron are called prophets, and their sister Miriam a prophetess, each for a different reason: Moses as the appointed mouthpiece of divine laws, Aaron as their translator into practice, Miriam as a leader of song and dance in God's praise. The common factor in these four instances is a special relationship with Yahweh.

Miriam's song of triumph over the Egyptians (Exodus 15.20–21) may be the oldest thing in the Bible, a kind of 'spiritual' made up on the spot. It proves the antiquity of 'prophecy' in some sense. However, the Hebrew prophesying that led up to the poetry of Isaiah and Jeremiah had a more specific character. It took place in a state of ecstasy. The prophet was a *nabhi*, a 'called' person. The Holy Spirit of Yahweh breathed upon him, and he leaped and sang and saw visions, and burst out into oracular sayings. Nabhi enthusiasm could be contagious, like the dancing mania of the Middle Ages (see DANCING MANIA), attacking people not normally subject to it. It appears first in chapter 11 of the book of Numbers, where 70 Israelite elders undergo a temporary collective seizure in the presence

From the 8th century BC, the words of the Hebrew prophets began to be written down, and have come down to us in the Old Testament. Hosea *(left)* attacked religious corruption. Jeremiah *(centre)*, who was priest as well as prophet, envisaged a future when the religion of Israel would develop into something greater and nobler. Ezekiel *(right)* is 'the least spontaneous of the prophets'. Illustrations from a Byzantine manuscript, 13th or 14th century

of Moses. In 1 Samuel (chapter 19) the rapture engulfs its victims against their will.

Men or women could prophesy. But when prophets began to combine in guilds, membership was apparently confined to men. The full-time nabhi who had the gift was often a strolling player with a flute, harp or tambourine. He wore a skin mantle with a leather belt. In the early period when Samuel and Saul flourished (c 1050–1015 BC) the nabhi might appear to be hardly more than a fortune teller, offering 'inspired' messages in return for presents and hospitality. But a graver theme always underlay his vocation, even at its most debased. Ostensibly at least, he received the word of Yahweh.

A Vessel of the Spirit

When we search for parallels outside Israel, we should recognize a distinction. The nabhi might look like a soothsayer or medium, but in fact he was not. Saul knew the difference, and banished persons of the latter type while respecting prophets (1 Samuel 28.3). Soothsaying and mediumship in the ancient world were based on techniques. Diviners had their pseudo-sciences of dream interpretation and omen-reading. Even the priestesses of Delphi, who succumbed to possession by Apollo, put themselves into a drugged state which induced the prophetic process and brought the oracle (see ORACLES).

The Hebrew nabhi, if true to his calling, did not seek answers to questions by any similar art. He might make himself receptive by prayer or fasting, but he could not compel the Lord. It was the Holy Spirit that came, or did not come, with an imperiousness beyond the prophet's control. The prophet might deceive others, and himself, into thinking the Spirit was upon him when it was not – as in the remarkable story of Ahab and the battle of Ramoth-Gilead (1 Kings, chapter 22) – but he never pretended that his message was extracted from God by some technique of his own.

The sounder parallels with the Israelite tradition are to be found in the realm of ecstatic religion. There is an account of a Canaanite fanatic becoming possessed by a god, about 1100 BC, chronologically between Moses and Saul. Closer still to the nabhi excitement, and better documented, is the frenzy accompanying the cult of Dionysus (see DIONYSUS). But while the outward symptoms may have been much the same everywhere, Hebrew prophecy had a unique capacity for growth and enrichment. Yahweh was more than Dionysus. To faithful Israelites he was not merely a god but supreme, the only higher power that mattered, at least to them; and his cult had an ethical content, both for the community and for the individual. The nabhi experience could and did mature, over the centuries, into a solemn disclosure of the divine will through inspired speakers.

Its Greek counterpart passed from the fiery Dionysiac phase into Orphic mysticism (see ORPHEUS). Hebrew prophecy went on growing as a phenomenon in its own right, even after it transcended its nabhi origins. In the end it transformed Israel's religion without losing its identity.

So profound were its effects that some scholars have claimed what is certainly too much. They have contended that the later, literary prophets – Isaiah and the rest – actually invented Israel's religion, and that Old Testament history is largely fiction, concocted to give a pedigree to their teachings. This theory is now out of favour for several reasons, but chiefly because of what the history says, and the tone which the prophets take.

We get a picture, first, of a priestly cult of Yahweh as the God who rescued his people from Egyptian bondage and settled them in the Promised Land. The nabhi prophets have only a subsidiary role. Then, after many years, come the literary prophets. They do not speak like innovators founding a new religion; they appeal to a pure ancestral faith, which they say has been corrupted by monarchy, material wealth, a court priesthood and flirtation with paganism. The priestly-political tradition and the prophetic tradition are two aspects of the same religion. It is incredible that either party would have invented the other in just this way. But having recognized the fact, we should also recognize that it was the prophets, rather than the priests, who gave Israel's faith its eventual grandeur and permanency.

The Prophetic Succession

Between the nabhi and the authors of the later Old Testament books stands the transitional figure of Elijah. He denounced paganism and tyranny in the northern Israelite kingdom under Ahab (875–853 BC). A memorable event in this prophet's career is a visit to Mount Horeb in Sinai, where Moses had received Yahweh's commandments. Elijah witnesses much the same portents – wind, earthquake, fire – but 'the Lord was not in' them. The Lord speaks to him in a 'still small voice'. Here Israel's religion is moving toward a new spiritual level.

Elijah left no writings, apart from a doubtful fragment preserved in 2 Chronicles 21.12–15. About 760 BC, however, literary prophets began to be active, in a succession that went on for centuries and has had no parallel in any other religion. Even these were speakers rather than authors: they harangued crowds, recited verses and told stories in public, underlining them with symbolic gestures, such as smashing a pot in token of a city's ruin. But some of their doings and utterances were set down on sheets of papyrus, either by themselves or by their disciples. The sheets were glued side by side to form a continuous roll; these rolls are the books of the prophets, as we have them in the Bible after many transcriptions.

The literary prophets were still men on whom the Spirit breathed as it had on the nabhi. Habakkuk seems to have regarded himself as a nabhi still, and to have made himself receptive with conscious purpose (Habakkuk 2.1). But in both respects he was unusual. Generally, ideas and images surged unbidden into the prophet's mind; visions forced themselves on him, in sleep or waking; and now, instead of pouring them out in a raw state, he reflected on them and gave them poetic form.

The most important literary prophets fall into two groups. The first quartet comprises Amos, Hosea, Isaiah and Micah. Amos was a shepherd and labourer. His

Ideas and images surged unbidden into the prophet's mind; visions forced themselves on him, in sleep or waking

book of divine messages is notable as the earliest known left-wing manifesto. It denounces the complacent nobles of Israel, and foretells a 'day of the Lord' which will bring retribution on an unjust society. Hosea attacks religious corruption. Isaiah and Micah scan a broader horizon, seeing the Lord as ruler over other nations besides Israel, and foreshadowing a world-wide peace when he will be worshipped by all mankind, if his chosen will only be faithful.

A second quartet of prophets arose in the late 7th century, after the northern Israelite kingdom had been destroyed by Assyria. These were Zephaniah, Nahum, Habakkuk and Jeremiah. Jeremiah, the most important, was a priest; there was no inevitable clash between the two callings. He speaks darkly of the sins of Jerusalem and its impending fall. However, he looks farther ahead to a restoration and a 'new covenant', which the Lord will write upon the hearts of his people.

Jeremiah, in fact, envisaged a future when the purified religion of Israel would develop into something greater and nobler. So did the unknown author of the mistakenly attached portion of the book of Isaiah which begins at the 40th chapter. This 'Second Isaiah' prophesied in Babylon during the Jews' captivity. He hails their deliverer in the person of Cyrus the Great, who will conquer Babylon and let the captives go home. He calls Cyrus the Lord's Anointed, or Messiah. By launching that momentous theme, and predicting a universal reign of righteousness under the One God of all mankind, the Second Isaiah takes a further step toward the expansion of Israel's faith into a world religion. So, in another way, does the book of Jonah, which depicts that prophet bearing God's word to the Gentiles of Nineveh (see JONAH).

Ezekiel, like the Second Isaiah, belongs to the Babylonian exile. He is the least spontaneous of the prophets, the nearest to being a composer of planned essays. His book closes with a description of a Utopia (see EZEKIEL). Afterwards come a few post-exilic prophets who add little. Judaism regards prophecy as ending with the Old Testament canon.

Hints of the Future

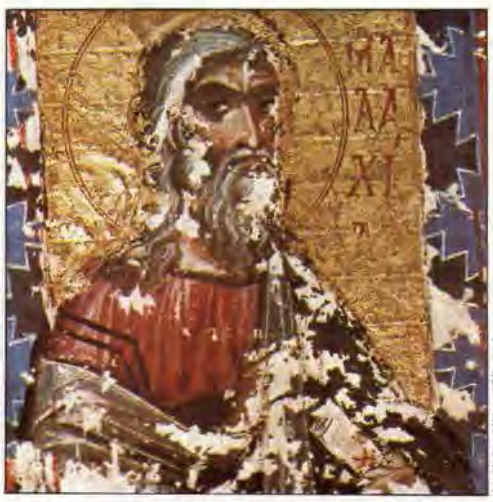
It will be noticed that while the prophets' main objects were to teach, warn and encourage, they did foreshadow future events: hence the notion of prophecy as prediction. But the divinely revealed hints at the future are never the whole message. Some, moreover, are conditional and not absolute: 'If you do this, such and such will happen,' not simply 'Such and such will happen.'

Yet with every allowance made, the predictions raise difficulties for their religious interpreters. If inspired, they must be right. But how should they be construed? On a literal reading, some have been fulfilled (the repeated promise of Israel's return to Palestine, very impressively indeed); but several of the more grandiose have not. There is, for instance, no sight of the prophets' Golden Age.

Here Christians and Jews part company. The orthodox Jewish view is that the Golden Age and similar consummations still lie ahead. They will come with the Messiah. Christians have sought to gather the prophetic loose ends together by applying them to Christ and the Church. Often the application is figurative, but not always. The gospel of Matthew insists on Jesus's literal fulfilment of various cryptic texts in the prophets, from his birth at Bethlehem onward.

Many of the Christian interpretations involve a species of hindsight. In the light of Christ the prophetic text may seem to make sense, and sometimes it manifestly does. Yet a person reading the text beforehand would seldom have been able to predict the fulfilment. The strongest argument for the Christian view is probably Isaiah, chapter 53, which describes a suffering 'servant of the Lord' in terms that fit no historical person but Jesus. An episode in the Acts of the Apostles (8.27–35) shows how strangely readers were driven to speculate about this passage in Jesus's time, and how quick the Christians were to apply it.

Christianity counts John the Baptist as



The book of Jonah reflects concern with the expansion of the Jewish faith, and depicts the prophet *(left)* carrying God's word to the Gentiles of Nineveh. Joel *(centre)*, one of the 'minor' prophets, wrote after the return from the Exile, as did Malachi *(right)*, the last of the Old Testament prophets

Habakkuk receives the word of the Lord: from a 14th century manuscript. The Old Testament prophet was a man whom God inspired: he would keep himself in readiness to receive God's message, but did not attempt to obtain it by any art of divination

the last prophet of the old dispensation. Christ himself assumes the prophetic role when he foretells the fall of Jerusalem and the Temple. His words raise the same problem as the other unfulfilled prophecies, because they suggest that the world will end when the Temple falls, or soon after, and that some of his contemporaries will live to witness both events. The Temple fell in 70 AD, but the world did not end. One explanation is that Jesus was simply wrong. Another is that he spoke of the nearer event as a type or symbol of the more distant, and his sayings on the two topics have not been clearly enough distinguished. Another is that the prophecy was conditional like Jonah's, and the condition, whatever it was, has been left out of the gospels.

Christianity pursues the prophetic theme in the story of Pentecost (Acts, chapter 2), when the Holy Spirit descended on the disciples. Official Christian prophecy ends with the Apocalypse, the last New Testament book.

Has valid prophecy occurred since? Jews deny this. Roman Catholicism asserts, as a matter of faith, that the Holy Spirit abides in the Church, preserving it from error but never adding to the content of revelation. The main Protestant bodies have taken the same stand, often more firmly.

Nevertheless, several extremists of the Reformation period claimed to be, in effect, prophets; and the term has since been applied occasionally to leaders of sects. The Mormon Church refers to its founder as 'the Prophet Joseph Smith', on the ground that he was a vessel of special revelations. Roman Catholic theologians have argued that such events as visions of the Blessed Virgin are Christian equivalents of the pre-Christian prophetic experience. Mary's appearances at Fatima in Portugal in 1917 are said to have been accompanied by predictions of future happenings.

The Prophet of Islam

Islam, the third great religion with Old Testament antecedents, places prophecy at the heart of its scheme. Mohammed (see MOHAMMED) was and is *the* Prophet. Rejecting both Jewish legalism and the divinity of Christ, he declared that prophets were the only true teachers. His mission was to restate and perfect the teachings transmitted from Allah by five predecessors – Adam, Noah, Abraham, Moses and Jesus – all of whom had been misconstrued. The Koran, supposedly dictated to him by the angel Gabriel, is frequently spoken of as the Islamic Bible; in fact it is more like a single prophetic book of the Old Testament. While no Moslem can ever supersede Mohammed, Islam has allowed a kind of prophecy to continue, in such cults as Sufism (see SUFIS). The predictive element has always been less conspicuous than in Judaism and Christianity.

In other religious contexts it is doubtful whether the word 'prophecy' should ever be used. There are no close parallels to the Jewish literary genre. As for the more primitive excitements that are reminiscent of the nabhi, these are better discussed in terms of 'ecstasy' or 'possession'.

Can any safe conclusion be drawn about the prophetic experience? Visions, voices and so on can doubtless be explained away, but does the explanation dispose of the message? Bertrand Russell once alleged that we can draw no objective distinction between a man who eats too little and sees heaven, and a man who drinks too much and sees snakes. However, such dismissals cannot be final, because prophecy never took place in isolation. It was a factor in the life of Israel, or the Church, or the Moslem community. The depth and durability of the prophets' insights, the effects on history, are a matter of record. The alcoholic does nothing comparable with his delusions.

Nor does Russell refute the one modern genius who professed to be a prophet himself and, in some sense, demonstrably was: William Blake (see BLAKE). It is thought that Blake's visions and revelations may have come to him in a hypnagogic state, between sleeping and waking. But the prophetic books which he based on them are not mere 'automatic writing'. They are highly-wrought works of unique literary stature, profound and far ahead of their time. As with Blake, so with Isaiah or Ezekiel. Wherever the experience came from, the resulting work cannot be exorcised by pseudo-scientific incantations about mental unbalance or physical disorder. The prophet may have been subject to either or both. Even so, he still has a secret that escapes his critic.

Colloquial use of the word 'prophecy' to mean 'prediction' raises the question whether people who profess to foretell the future should ever be called prophets because of that alone. As in antiquity, so today, the practitioners of such arts as astrology and dream interpreting cannot normally qualify. Seeking knowledge through a technique is a different thing from being invaded by divine inspiration. Still less should the term 'prophet' be attached to racing tipsters, pollsters or forecasters of economic trends.

One query does persist. There are cases where a person who seems to be simply a fortune teller like other fortune tellers is strikingly more successful than most. The classic historical instance is the astrologer Nostradamus (see NOSTRADAMUS). When

Sonia Halliday

The angel Gabriel is said to have brought the text of the Koran, which is frequently spoken of as the Islamic Bible. In fact it is much more like a single, prophetic book of the Old Testament

all wild claims have been discounted, it remains true that a handful of his bizarre quatrains scored astonishing hits. The American crystal-gazer Jeane Dixon, whose forecasts are a regular feature in the United States press, is a modern counterpart. In such cases we may be tempted to feel that the technique is merely superficial, and the soothsayer has been touched by more mysterious influences.

The final judgement should turn, perhaps, on the nature of the messages. Where they carry a spiritual or moral charge, it should seriously be considered whether something like Hebrew prophecy is occurring again. With Nostradamus that element is slight. Jeane Dixon, on the other hand, has made predictions about the future of religion, including the rise of a new messianic figure born in February 1962. It is noteworthy that although she is a devout Catholic, she concurs with two other Catholic seers in expecting an early end to the papacy as we know it. Such a forecast, against the forecaster's presumed beliefs, certainly suggests an idea forcing its way in from outside the conscious self.

Multiple Time

Few attempts have been made to explain prophecy scientifically, except in the sense of explaining it away. The Holy Spirit's visitations are explained in psychological terms; the predictions are swept aside as guesswork, wishful thinking or, when correct, as forged after the event. Among rationalists who have admitted that knowledge, including knowledge of the future, may indeed come from 'beyond', the best known is J. W. Dunne, author of *An Experiment with Time* (1927).

Dunne had noticed that stray images entering his mind – either in dreams or in passive receptivity – fitted into experiences which he underwent later, yet could not have foreseen. He persuaded 22 experimental subjects to write down their dreams immediately on waking, and watch for fulfilments within a limited time. Several produced images and motifs, some highly unlikely, which figured later in their waking experience. None was associated with any important message or meaning. Still it might fairly be urged that some features of biblical prophecy were being reproduced.

Dunne proposed a theory of multiple time. The human mind stretches away back from ordinary consciousness into an inner self that can observe other temporal dimensions. This sometimes pushes through into the conscious ego with glimpses of what that ego may eventually see for itself, but has not seen yet, because it has not reached that point on its own time-track. The deeper self is immortal and might, one gathers, look indefinitely far ahead.

Possibly the main interest of Dunne is that while he sets up a kind of unconscious in place of God, he concedes that this unconscious must be more than psychoanalysts recognize. If it is to fill its ambitious role, it must have its own methods of cognition. Much the same view has been advanced, as the logical conclusion of Jung's system, by the Catholic psychologist Victor White. In any impartial study of prophecy, the most fruitful approach may well be to say: 'Yes, I agree with any Freudian or Jungian that these things come from the unconscious. But how did they get there in the first place?'

PROSTITUTION

THE GREEK author Herodotus, writing in the 5th century BC, says that there was in Babylon a great temple with a sumptuous couch, on which no one spent the night except one woman; she had been chosen by the god himself, who visited her there. Remarking on a similar practice in Egypt, he goes on to state that these women were forbidden intercourse with men. Even allowing for Herodotus's often uncritical reporting of local tradition, there is clear reference to such a practice in ancient Mesopotamia in documents dating from the second millennium BC. The passage in Herodotus refers to the voluntary self-dedication of women, who surrendered themselves in the sexual act to a representative of the god, either the king in his sacral function or a priest. This represented a dedication of the procreative powers in the community and its flocks and fields, in which its efforts were promoted by the engagement of the god in the same enterprise. To state it from another angle, the king, as the executive of the Divine King, was the channel of material blessings, of which his procreative powers were a guarantee; and opportunity was provided on a solemn occasion at the most important seasonal crisis of the agricultural year, when he ritually joined with a specially dedicated woman. This woman represented the mother goddess, and on that account held priestly office.

Such a woman was known among the Sumerians and Semites in Mesopotamia as *entu*, and she is known to have held office at Ur at least for the whole of her sexual life, conventionally 40 years. (This suggests an analogy with the 30 years during which the Vestal Virgins at Rome were not allowed to marry.) Texts from Mesopotamia imply that intercourse with any other man than the representative of the god was prohibited. This probably refers to the period of the entu's dedication, since legal texts from Hammurabi's time (c 1700 BC) show that marriage with an entu was possible. This might be desirable despite the age of the entu when she was free for marriage, since these women were of the highest class, including even kings' daughters. What happened to children of the 'sacred marriage' is uncertain. They may have been adopted. The great king Sargon of Akkad was the son of an entu and was exposed in the river like Moses, which may suggest that his mother had broken her vow by intercourse outside her strict temple duty.

A lower class of votaress in Mesopotamia was the *naditu*. She might be married, but since the texts do not mention children of such women, they either became celibate after marriage or married after completing their temple service, which may have lasted the length of their mature sexual life.

Herodotus also states that every woman in ancient Babylon had once in her life to

The goddess of love is shown at a window as a sacred prostitute, in this Phoenician ivory of the 8th century BC

British Museum/C. M. Dixon

offer herself to whatever male chose her in the temple of Ishtar, the goddess of love (see ISHTAR). The man who chose her threw into her lap a silver coin with an invocation to the goddess by her title 'Mylitta' (Herodotus's rendering of the Akkadian *mu'allitu*, 'she who brings to birth'). The piece of silver was made over to the temple as a consecrated offering, which recalls the prohibition in Deuteronomy 23.18 against bringing the hire of a prostitute into the sanctuary of God.

Goddess and Harlot

This passage is one of a number of protests in the Old Testament against prostitution, either secular or ritual, to which apparently women in Canaan subjected themselves by special vow. They would make themselves available for longer or shorter periods for sexual intercourse, not with the dedicated representatives of the gods, but with the worshippers. They are known from Mesopotamia and Canaan, and from the Old Testament where they are called *qedeshoth* (Deuteronomy 23.17).

This is ritual prostitution proper; and though the underlying principle was imitative magic, intended to promote fertility, it was capable of social abuse, as its condemnation by the Hebrew prophets and reformers clearly indicates. The practice is implied in a passage in a hymn to the goddess Ishtar, which describes her as a glorified temple prostitute whom 120 men could not exhaust. The fact that sacral prostitution was open to abuse, passing into secular prostitution, is indicated in the Gilgamesh legend of ancient Mesopotamia, where a *harimtu*, or sacred prostitute, is employed to decoy and subdue Enkidu, the wild man of the steppe. In condemning the Canaanite fertility cult as 'whoredom' the Hebrew prophets, notably Hosea and Ezekiel, inveigh against this aspect of the cult and its gross abuse.

It is uncertain whether prostitution in the cult was only practised as a rite of imitative magic, or whether the prostitutes were also considered to represent the Canaanite goddesses of fertility – Asherah, the mother goddess, Anat the sister and wife of Baal, and the goddess Astarte (see ASTARTE). The former significance of the rite might be suggested by the fact that male prostitutes (*qedeshim*) are mentioned in the Bible. On the other hand, pendants and plaques moulded in clay and metal of one or other of these goddesses in the nude, with breasts and pudenda emphasized, may indicate that the prostitutes were considered as representatives of the goddesses.

In view of the invective of the Hebrew prophets against this aspect of the Canaanite fertility cult, it is remarkable that there is no explicit evidence of the rite in the Ras Shamra texts (cuneiform texts from ancient Ugarit, which provide much of our information about Canaanite religion). However, the word *inst*, mentioned in the texts, may denote temple prostitutes as 'sociable ladies'.

Ritual prostitution on a wide scale, with its abuse, which made it practically licensed promiscuity, was practised in all Nature

British Museum/C. M. Dixon

Canaanite fertility goddess depicted as a sacred prostitute on an Egyptian stele: she holds a lotus and phallic serpents

cults throughout the Mediterranean, especially in the cult of Aphrodite in Cyprus and in that of Cybele, the Magna Mater of Asia Minor, which was introduced into Rome during the Punic Wars (see APHRODITE; CYBELE). In Cybele's cult and in the related cult of her consort Attis, male perverts and eunuchs played a conspicuous role, the former in rites of ritual prostitution and the latter as those who had in an ecstasy of devotion emasculated themselves in the service of the deity. Ritual prostitution was a feature also of the cult of the Egyptian goddess Isis, in its development as a Mystery religion in Ptolemaic Egypt and in Rome, where it was introduced at the end of the 3rd century BC (see ISIS).

J. GRAY

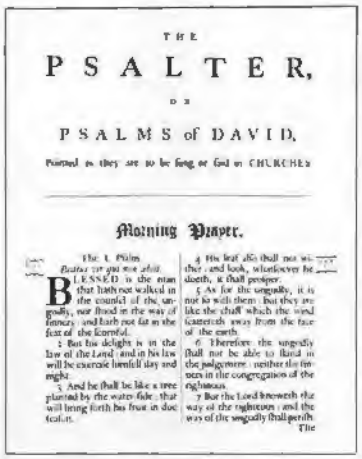
God's Slaves

Sacred prostitutes were common in India till the end of the 19th century, and Benjamin Walker comments, in *Hindu World*, that: 'The ancient temples were for centuries establishments of venery, and the early writers speak of the difficulty of honest pilgrims trying to perform their religious duties because of the shameless blandishments and solicitations of the temple girls. . . . The practice of temple prostitution is said, though on no reliable authority, to be current still. If it exists it is entirely clandestine. The persuasion of Christian missionaries, criticism from European observers, and agitation by Hindu reformers, have put a stop to it.'

The *devadasi*, or 'god's slave', usually began her career as a little girl of seven or eight. She was formally married to the god whose temple she was to serve, and was ritually deflowered by a priest, or by a favoured customer, or by the carved phallus of a god's image. Trained in the sensuous arts and in dancing, the girls were available to worshippers at the temple, their earnings going to the priests, and they and the children who were born to them also helped to clean the temple and assisted at ceremonies. They enjoyed high prestige and were in demand at weddings, where a devadasi's presence was a fortunate omen.

Providence

Power which determines the course of all events, distinguished from Fate because it is regarded as generally benevolent: in Christian theology, God's foreknowledge and beneficent ordering of events; the extent to which the concept of providence denies human free will is an old philosophical and theological problem; connected with Christian theories of predestination, concerned with God's willing the salvation or damnation of men. See PREDESTINATION.



THE

PSALTER,

OR

PSALMS of DAVID,

Pointed as they are to be Sung or Said in CHURCHES

Morning Prayer.

The I. Psalm.

Beatus vir qui non abiit.

BLESSED is the man that hath not walked in the counsel of the ungodly, nor stood in the way of sinners, and hath not sat in the seat of the scornful.

2 But his delight is in the law of the Lord, and in his law will he exercise himself day and night.

3 And he shall be like a tree planted by the water-side, that will bring forth his fruit in due season.

4 His leaf also shall not wither, and look, whatsoever he doeth, it shall prosper.

5 As for the ungodly, it is not so with them: but they are like the chaff which the wind scattereth away from the face of the earth.

6 Therefore the ungodly shall not be able to stand in the judgement, neither the sinners in the congregation of the righteous.

7 But the Lord knoweth the way of the righteous: and the way of the ungodly shall perish.

The

Psalms

Religious songs, specifically those in the Book of Psalms in the Old Testament; its Hebrew title, *Tehillim*, 'praises', was translated into Greek as *psalmoi*, literally 'songs sung to a stringed instrument'; traditionally ascribed to King David, a celebrated minstrel, the psalms in fact come from many different authors and periods.

Psi

Greek letter, used in parapsychology for 'psychic' abilities or phenomena; clairvoyance, precognition, telepathy and psychokinesis are generally regarded as effects of a single, unified ability, called 'psi'. See EXTRA-SENSORY PERCEPTION; PSYCHOKINESIS; SPONTANEOUS PSI EXPERIENCES.

Mansell Collection

Psyche

Greek word for 'breath', used to mean life, soul, spirit or mind, as distinct from body; in classical mythology, a beautiful girl with whom Cupid, the love god, fell in love; she eventually became immortal herself and the lovers were united; the story, told in *The Golden Ass* of Apuleius, was taken as a parable of the union between the human soul and divine love. See EROS.

The modern history of psychical research is a story of the application of great resources of talent and energy to peculiarly puzzling phenomena, and of a gradual shift in educated opinion towards a more open-minded attitude to the 'paranormal'

PSYCHICAL RESEARCH

PSYCHICAL RESEARCH is not easy to define. The stated purpose of the Society for Psychical Research (the S.P.R.) is 'to examine without prejudice or prepossession and in a scientific spirit those faculties of man, real or supposed, which appear to be inexplicable on any generally recognised hypothesis.' That psychical research is a 'science' in the sense that most psychical researchers attempt to investigate certain classes of phenomena, real or imaginary, 'without prejudice or prepossession' may indeed be granted; though it must be borne in mind that some of the groups which have called themselves societies for psychical research are in effect Spiritualist organizations.

Problems arise when one attempts to demarcate the alleged 'faculties of man' which constitute the special subject matter of psychical research. They cannot be just those faculties which are 'inexplicable on any generally recognised hypothesis', because most human faculties are far from properly understood, and psychologists diverge as to how they should be explained.

Are they then faculties whose existence rather than whose explanation is in doubt? Hardly. There are many alleged human faculties whose existence might very well be doubted, but which have hardly ever been considered to form part of the subject matter of psychical research. Obvious examples are the abilities to assume animal form, to work sympathetic magic, to control the weather, and to maintain a kind of existence after death by drinking the blood of the living. It might be replied that although in a sense such 'faculties' fall within the scope of psychical research, they are largely neglected by researchers because they are quite certainly fictitious. The fact is that although the literature of travel, folklore and anthropology is full of stories of these kinds of faculties, very few psychical researchers have so much as contemplated investigating them.

Mesmerists and Mediums

Could it be simply a historical accident that certain alleged 'faculties of man' are commonly held to constitute the subject matter of psychical research, whilst others are excluded? A case could be made out on these lines. The immediate ancestry of modern psychical research is to be found in certain aspects of the mesmeric and Spiritualist movements which spread across Europe and America during the early and middle 19th century (see MESMER; SPIRITUALISM). Some of the early mesmerists believed that mesmeric subjects might exhibit not merely heightened faculties and heightened responsiveness to the commands of the operator, but faculties which appeared to be almost unknown in unmesmerized persons. Accounts of thought transference, of clairvoyance and 'eyeless vision', of clairvoyant diagnosis and mesmeric cure of ailments, and of hypnosis at a distance, were in circulation quite early in the history of French and German mesmerism – in fact before the end of the 18th century. In the first part of the 19th century accounts of some of these kinds of phenomena became commoner on the Continent; and in the 1830s and 1840s the mesmeric movement, and with it alleged instances of such phenomena, spread to the United States and Great Britain.

The mesmeric movement paved the way for the Spiritualist movement of the second half of the 19th century. It accustomed the public to the idea that certain especially gifted persons might, when in a state of trance, exercise clairvoyant and other paranormal faculties, and even to the idea that some mesmeric subjects might become aware of, and perhaps communicate with, the spirits of departed persons. The mesmeric trance developed, by an easy and natural transition, into the mediumistic trance, in which the medium's 'interior vision' might have imposed upon it scenes and personalities from the next world; and the rapport which was thought to exist between mesmerist and subject provided an analogy for the process by which departed spirits were thought to control the hand or vocal apparatus of a medium. A public which had digested the leading ideas of mesmerism

had little difficulty in assimilating the beliefs of Spiritualists.

There can be little doubt that the central body of material commonly studied by psychical researchers comprises those seemingly novel faculties which were apparently revealed by the experiments of mesmerists, plus the developments of, and superadditions to, those alleged faculties which took place in the context of the modern Spiritualist movement. The first 'psychical researchers' were in effect those persons who first attempted a dispassionate examination of these supposed faculties. One might mention, in Germany, Arnold Wienholt (1749–1804) whose *Heilkraft des Thierischen Magnetismus* contains accounts of a number of experiments on hypnosis at a distance; in France, J. H. Petetin (1774–1808), author of *Électricité Animale*, who conducted experiments on mesmeric clairvoyance; and in England John Elliotson (1791–1868), editor of *The Zoist*, a periodical which contained many accounts of the 'higher' phenomena of mesmerism, and Sir William Crookes (1832–1919), whose *Researches in the Phenomena of Spiritualism* (1874) described his own experiments with D. D. Home and other noted physical mediums (see CROOKES; HOME).

Although it seems quite possible that the supposed paranormal faculties and phenomena which constitute the subject matter of psychical research have been grouped together largely for historical reasons, it could none the less be argued that whatever the historical reasons for associating the phenomena, many of them do in fact together form a unitary class – a class to which similar laws and similar kinds of explanation will ultimately be found to apply. Whether psychical research can be marked out as a distinct branch of inquiry, or as a distinct branch of psychology, on grounds such as these, only time and sustained investigation will show; and the time required is not likely to be short, or the investigation simple.

Founders of the S.P.R.

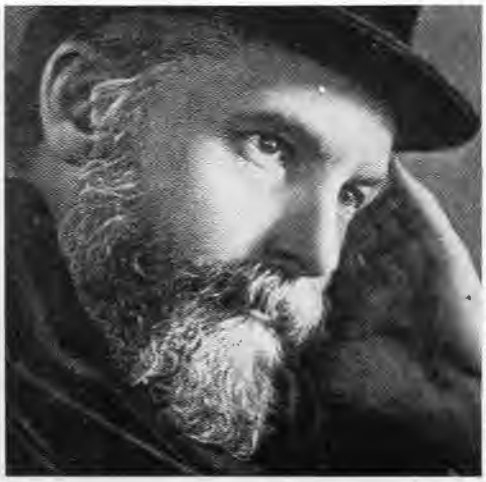
The history of modern psychical research can be roughly divided into three periods: from 1882 to 1914; from 1914 to 1945; and from 1945 to the present day. A great impetus was given to psychical research by the foundation, in 1882, of the Society for Psychical Research. Prominent amongst the founders and early members were Sir William Barrett (1844–1925), professor of physics at the University College of Dublin; Henry Sidgwick (1838–1900), professor of moral philosophy at Cambridge; his wife Eleanor (1845–1936), later principal of Newnham College, Cambridge; F. W. H. Myers (1843–1901), a noted poet, essayist and classical scholar (see MYERS); Edmund Gurney (1847–1888), a keen student of psychology and philosophy (see GURNEY); Richard Hodgson (1855–1905), an Australian by birth and one of Sidgwick's pupils; Walter Leaf (1852–1927), eminent both as a banker and a classical scholar; Frank Podmore (1856–1910), the historian of the Spiritualist movement, and a man of keenly sceptical mind; and Sir Oliver Lodge (1851–1940), a well-known physicist, professor of physics at Liverpool University.

A number of these people, and of their associates, most of them religious by upbringing, were of the opinion that recent scientific developments had not merely undermined orthodox religion, but were in danger of rendering any form of religious belief impossible. They felt there was just a chance that they could meet science with science, and by conducting strictly scientific inquiries into the more puzzling phenomena of mesmerism and Spiritualism, achieve not, perhaps, new religious insights, but at any rate the overthrow of the 'materialist synthesis' which had seemed imminent during the 1870s. To that end they gave unsparingly of their time and money and of their very considerable abilities; and within 20 years a great many data had been collected and the main outlines and the main problems of modern psychical research had become clear.

A comparable society was founded in the United States following a tour of that country in 1884 by Sir William Barrett. Its first president was Professor Simon Newcomb, the astronomer, and its leading early light was Professor William James, the philosopher and psychologist.

For the spectacular physical phenomena associated with Spiritualist mediumship (see MEDIUMS), the S.P.R. found at first little evidence; indeed, certain investigations whose results the S.P.R. published seemed,

J. Cutten



Radio Times Hulton Picture Library

J. Cutten

by revealing the extent to which even honest and intelligent persons could be misled by deliberate conjuring, to cast doubt on the reality of any of the alleged physical phenomena. In 1886 S. J. Davey, a member of the S.P.R. who was a skilled amateur conjuror, was introduced as a medium by Richard Hodgson, and succeeded in reproducing many of the feats of William Eglinton, one of the better-known physical mediums of the time. It was not until the year 1908 that the S.P.R. was able to obtain evidence for 'physical phenomena' under anything like satisfactory conditions. Three of its most experienced members, Hon Everard Feilding, Hereward Carrington and W. W. Baggally, had a series of sittings at Naples with a well-known Neapolitan medium, Eusapia Palladino (see PALLADINO). Eusapia had been detected in fraud by the three investigators; none the less, she many times produced for them seemingly inexplicable movements of objects, and materializations of hands, in fair light and under apparently satisfactory conditions of control.

Reports were also received, and investigations conducted, of a number of poltergeist cases (see POLTERGEISTS). The principal investigators of these cases were Sir William Barrett, who came to believe in the genuineness of some of the phenomena, and Frank Podmore, who concluded that fraud was probably always responsible.

The most striking experimental results published by the S.P.R. in its early years were probably those obtained in certain experiments on telepathy. The design of many of these experiments would not nowadays be considered satisfactory; none the less some of the results remain puzzling. Particularly curious were various experiments on the telepathic transmission of drawings conducted during the 1880s by Mr Malcolm Guthrie and Sir Oliver Lodge. In these experiments the transmission took place only over a short distance; but in the Miles-Ramsden experiments of 1906–8, the percipients were sometimes separated by many miles. Also curious were certain experiments on telepathy under hypnosis conducted in the 1880s and 1890s by Edmund Gurney, Mrs Sidgwick and Miss Alice Johnson. It will be remembered that in the early days of the mesmeric movement clairvoyance and thought-transference had often been regarded as phenomena peculiar to the mesmeric trance; this view has not really been borne out by later work. Indeed it has several times been suggested that the subjects in Gurney's and Mrs Sidgwick's experiments must have been in collusion with the person who acted as hypnotist in almost all of them, Mr G. A. Smith.

Case Histories on Ghosts

Soon after the foundation of the S.P.R. various of its members initiated a systematic and successful attempt to collect first-hand testimonies from persons who had seen apparitions. A considerable amount of testimony was obtained, and examples were found of 'haunting' apparitions, of collectively perceived apparitions and of apparitions of the dead. By far the largest body of testimony, however, concerned 'crisis' cases, that is, apparitions which coincided in time with some crisis in the affairs of the persons they resembled; and in 1886 a two-volume survey of crisis cases and related material was published by Gurney, Myers and Podmore under the title of *Phantasms of the Living*.

Gurney was the principal author, and he took the view that crisis apparitions are telepathically initiated hallucinations. In many instances the figures seen contained details which, Gurney felt, must have come from the mind of the percipient, strongly suggesting that the figures were in some sense 'constructed' by the percipients, that is, were hallucinations. The coincidences between the hallucinations and the deaths of the persons whom they represent may be accounted for by supposing that at some level of their personalities the percipients become aware of the crisis telepathically, and 'externalize' this knowledge in the form of a hallucination. Gurney held that this possibility was supported by the evidence for telepathy which had already been obtained both from actual experiments and from accounts of its spontaneous occurrence in everyday life (see SPONTANEOUS PSI EXPERIENCES).

Edmund Gurney died in 1888, but his work on crisis apparitions was contained in the so-called 'Census of Hallucinations', the Report on which was published in the *Proceedings* of the S.P.R. for 1894. One of the principal aims of the census was to determine whether or not the coincidences between apparitions and deaths which marked the numerous recorded crisis cases could be set down to chance; whether, in other words, it might be that people who had hallucinations tended to forget or remain silent about their experiences except in those very rare cases where the hallucination chanced to coincide with the death of the person it resembled. Answers to a questionnaire on hallucinations put to 17,000 persons revealed that hallucinations are commoner among sane persons than might have been supposed (about one person in ten is likely to have had one), but also strongly suggested that the number of reported death coincidences could not be ascribed to chance.

The most interesting single case which was investigated in the early days of psychical research was undoubtedly that of the American trance medium, Mrs Leonora Piper (see PIPER). Mrs Piper came to the notice of psychical researchers in the year 1885 through the agency of William James, and she was intensively investigated for a good part of the next 30 years. Most of those who seriously investigated her mediumship became convinced that she possessed paranormal powers, and some (including Richard Hodgson, who had studied the case in great detail) that the 'communicators' who purported to speak or write through her organism were indeed the spirits of deceased human beings.

Messages from Dead Leaders

The most curious development in this, or perhaps any, period of the history of psychical research, however, was not the Piper case (though Mrs Piper played a part in it) but the series of automatic writings known as the 'cross-correspondences'. The early leaders of the S.P.R. all died relatively early – Gurney, aged 41 in 1888, Sidgwick, aged 61 in 1900, and Myers, aged 57 in 1901. Shortly after the death of Myers there began to emerge through various automatists a series of interlinked communications purportedly coming from Myers and various of his deceased friends. The cross-correspondences had ostensibly been constructed by these deceased persons as a means of proving their own survival (see CROSS-CORRESPONDENCES).

Before he died, F. W. H. Myers had

almost completed a large-scale survey of the whole field of psychical research. It was published in 1903, under the title *Human Personality and its Survival of Bodily Death*. In addition to presenting a mass of factual evidence, Myers developed a unifying theoretical framework which has had a good deal of influence. He suggested that a man's everyday stream of consciousness is only one of perhaps several streams of consciousness which may be connected with his organism. Many of the phenomena of ordinary life and of psychopathology – for instance, dreams, hypnosis, and hysterical tics and anaesthesias – are to be understood as manifestations of these submerged or 'subliminal' streams of consciousness. Telepathy and other supernormal faculties are commonly to be found exhibited in dreams and hypnosis and even in certain hysterical states; and in Myers's view this suggests that the subliminal consciousness possesses powers which the ordinary waking consciousness does not. Such phenomena as crisis apparitions or automatic writing embodying supernormal knowledge may then be understood as the means by which the subliminal consciousness may pass information in its possession to the ordinary, waking consciousness when the latter would otherwise remain ignorant of it.

Myers's studies in psychopathology brought him into contact with many leading psychologists, English, American and European; and by the first decade of the 20th century a number of them were seriously interested in psychical research. In the United States there was William James; in Austria, Freud; in France, Janet and Bernheim; in Switzerland, Jung and Flournoy; in England, G. F. Stout and William McDougall. The contemptuous hostility with which a large part of the academic and scientific worlds had greeted the inception of psychical research had to some extent been blunted by the persistence and the care and candour with which the early psychical researchers had set about their task. It seemed not altogether impossible that before long psychical research would become a generally accepted branch of scientific endeavour.

Between the Wars

The First World War did not bring about any sudden break or change of direction in psychical research. The most influential figure on the English scene remained Mrs E. M. Sidgwick, widow of Professor Henry Sidgwick. Together with her brother, G. W. Balfour, and her S.P.R. colleagues J. G. Piddington and Miss Alice Johnson, she devoted much time to supervising the collection and analysis of a growing mass of cross-correspondence scripts. She also studied certain aspects of the mediumship of Mrs Gladys Osborne Leonard (see LEONARD), perhaps the most remarkable mental medium of all time.

Mrs Leonard's mediumship possessed a number of unusual features, in addition to the sheer quantity of impressive material which it provided. There were the celebrated 'book tests', in which her 'control' Feda showed an apparent ability to read

designated pages and lines in books not ordinarily accessible to the medium; there were also her successful 'proxy' sittings, in which the sitter obtained messages on behalf of an absent third party of whose concerns he was himself largely ignorant; and there was her 'direct voice' – a voice apparently not emanating from her own vocal apparatus, which sometimes joined briefly in the conversation under circumstances which made imposture unlikely.

In the United States the central figure of the 1920s was Margery Crandon, wife of a Boston surgeon. Around the physical phenomena of her mediumship there grew up controversies which deeply divided the American S.P.R., and led to the establishment of a separate organization, the Boston S.P.R., under the leadership of Dr Walter Franklin Prince. Prince's own studies of the Doris Fischer case of multiple personality and of the automatic writings of Mrs J. H. Curran (*The Case of Patience Worth*, 1923) remain among the classics of psychical research.

A Telepathic Rationalist

Indeed, many of the investigations and controversies of the 1920s and the 1930s centred round alleged cases of physical mediumship. Serious investigations of these phenomena were more numerous then than at any other period before or since. Besides Margery Crandon, there was 'Eva C.', who had been investigated before the war by Charles Richet, the French physiologist, and was studied again by Dr Gustave Geley, by members of the S.P.R., and by a committee of the Sorbonne. Franek Kluski, a Polish professional man, was studied by Geley, who claimed startling results. Geley also studied another Pole, Jan Guzyk, who was many times detected in fraud. None of these mediums won anything like universal confidence from those who investigated them. Perhaps the most interesting physical mediums of the period were two Austrians, Willi and Rudi Schneider, and especially the latter (see SCHNEIDER BROTHERS). Rudi was studied in England by Harry Price, a controversial figure who ran the National Laboratory for Psychical Research in London, and by various members of the S.P.R., including Lord Rayleigh, the famous physicist. He was able to produce a variety of minor physical effects under seemingly stringent conditions of control – manual, electrical and infra-red.

In the study of apparitions, little progress was made, the two outstanding studies being Mrs Sidgwick's *Phantasms of the Living*, published in the *Proceedings* of the S.P.R. for 1923, and G. N. M. Tyrrell's *Apparitions* (1943), a theoretical discussion. Experiments on telepathy and clairvoyance were at first not numerous. The most interesting were perhaps those in which Professor Gilbert Murray, the noted Hellenist, acted as percipient; reports of them were published in the *Proceedings* of the S.P.R. for 1918 and 1924, and in the *Journal* for 1941. Although a lifelong rationalist Professor Murray showed a very curious ability to pick up impressions of scenes drawn either from fiction or from real life which

groups of his friends concentrated on; it was these experiments which finally convinced Freud of the reality of telepathy. Of note in a somewhat different way are the observations made by E. Osty on a number of 'sensitives' or clairvoyants and published in his *Supernormal Faculties in Man* (1923). Osty's clairvoyants were able to give their sitters correct information not merely about matters known to those sitters, but about matters which, although relevant, were quite unknown to them. Some writers have suggested that the existence of powers of extra-sensory perception so extraordinary as these would, if further confirmed, make it plausible to ascribe even the most 'evidential' mediumistic communications to telepathy and clairvoyance on the part of the medium, rather than to the influence of the spirits of deceased human beings.

Experiments at Duke

Later in the period work on the problem of extra-sensory perception increased greatly and assumed a form which has remained largely characteristic of it ever since (see EXTRA-SENSORY PERCEPTION). In 1927 William McDougall, a British psychologist, went from Harvard to Duke University at Durham, North Carolina, to establish a department of psychology there. McDougall had been interested in psychical research for many years (he was a member of the S.P.R. Council), and to his laboratory there came a young Harvard biologist, J. B. Rhine, and his wife, Louisa. Rhine set out to apply the ordinary methods of statistical analysis and experimental design to the problems of extra-sensory perception (ESP). He and his collaborators devised the pack of cards, commonly called Zener cards, consisting of five of each of five different symbols – star, circle, cross, square and wavy lines. The order of these cards would be randomized, and an 'agent' would then turn them over one by one while a 'percipient' recorded guesses. Most of Rhine's subjects were university students or members of the university staff, and a number of them succeeded in scoring well above the level of chance even under strictly controlled conditions. Occasionally – as in the famous Pearce-Pratt experiments of 1933 in which agent and percipient were in separate buildings 100 yards apart – the odds against chance reached an astronomical level. Rhine's early results were summarized in his *Extra-sensory Perception* (1934).

As a result of these findings, the Parapsychology Laboratory of Duke University was formally constituted, and a few years later, in 1937, the *Journal of Parapsychology* began publication. Rhine and his associates weathered some heavy criticism from statisticians and academic psychologists, and continued to obtain striking results. They also attempted the first statistical investigations of 'physical phenomena'. Here again they made no use of professed mediums; yet above chance results were obtained. Ordinary persons were required to attempt to influence the fall of dice thrown at first by hand and later by mechanical means. To this effect the name of psychokinesis (PK) was given (see PSYCHOKINESIS).

In England Dr S. G. Soal, a mathematician from London University, began in 1934 an attempt to repeat Rhine's work. By 1939 he had tested 160 subjects under stringent conditions, and had obtained no success whatsoever. It was then suggested to him by an S.P.R. colleague, Whately Carington, who had been conducting experiments of his own, that he should re-examine his results for a 'displacement' effect; that is, for correct guesses of the cards before or after the target cards. Soal found that two subjects (Basil Shackleton and Mrs Gloria Stewart) had scored significantly above chance on the cards immediately following the target cards. In collaboration with Mrs K. M. Goldney, Soal re-tested these two subjects at considerable length, and in his report (1943) he announced results of outstanding significance. In 1978, however, a study by Betty Hardwick indicated that Soal had altered his figures to get results.

The insistence on laboratory techniques in psychical research between the wars may be seen as a reaction to the fact that academic psychology had become steadily more behaviouristic and more 'scientific', and therefore more hostile to the kind of psychical research which had been predominant during the first quarter of the century. Orthodox psychologists showed themselves if anything less tolerant of psychical researchers than scientists from other fields; no doubt they found it hard enough to win recognition of the scientific status of their own subject, without its being joined to so dubious a yoke-fellow.

A flashlight photograph taken during a seance reveals a dark mass of ectoplasm behind the test tubes. After analysis by Massachusetts Institute of Technology and a medical school, its composition was reported as being 'sodium, potassium, water, chlorine, albumen, epithelial cells and fresh red blood corpuscles'

Harry Price Library London University

Shortage of Good Subjects

The promise which the statistical approach to the problems of extra-sensory perception seemed to hold out has not been altogether fulfilled. A great stumbling block has been the shortage of outstanding ESP subjects, without whom extended research projects cannot progress. Exceptions are the U.K. born Matthew Manning (see MATTHEW MANNING), Uri Geller from Israel (see URI GELLER), also Pavel Stepanek of Prague.

In the last two decades the centre of activity in psychical research has shifted away from Great Britain and Europe to the United States of America. By far the greatest percentage of practical work now being done is carried out in America, and two new and important parapsychological organizations have been established there, the Parapsychology Foundation of New York (1951) and the Foundation for Research on the Nature of Man (1964), successor to the Duke University laboratories. Recently a Division of Parapsychology has been set up at the University of Virginia, and other institutions in the United States have provided facilities for research.

A somewhat surprising development has been an upsurge of interest in the Soviet Union in the study of extra-sensory perception. A landmark in Russian parapsychology was the publication of L. Vasiliev's *Experiments in Mental Suggestion*, which described experiments extending back over 40 years. Russian ESP experiments have often utilized hypnotic techniques; and in a number of ways they represent almost a throw-back to the experiments of 19th century hypnotists. Western psychical researchers have been somewhat suspicious of Russian claims and experimental designs, especially since they have often been linked with rather doubtful speculation about possible electromagnetic radiations.

In the absence of spectacularly gifted individual subjects, many attempts have been made to devise methods of obtaining results which, though not necessarily outstanding, are at any rate repeatable. A good deal of speculation and experimental endeavour has revolved around such problems as the possible physiological correlates of ESP, and the possible influence of psychedelic and other drugs upon ESP ability. So far the lines of work that have shown most promise are perhaps Gertrude Schmeidler's experiments on the relationship between positive or negative scoring in ESP tests and belief or disbelief in the possibility of ESP, and the experiments of Dr Montague Ullman and his collaborators on the occurrence of ESP during dreams.

Recently Dr Helmut Schmidt has reported some experiments in which subjects were required to guess which of four lamps would

light next. Which lamp in fact lit was determined by a purely random process. Dr Schmidt selected his subjects carefully, and took especial care that they should be in a cheerful frame of mind at the time of testing. The results were highly significant.

The hope that they may reveal some short cut to repeatable significant scoring in ESP and PK tests has helped to produce a renewed interest in spontaneous cases – apparitions, poltergeists and 'out-of-the-body' experiences (see OUT-OF-THE-BODY EXPERIENCES) – and in mediumistic and related phenomena. Of particular note here have been Dr Louisa Rhine's analyses of spontaneous cases in the files at Duke University, Miss Celia Green's studies of out-of-the-body experiences, and Professor I. Stevenson's unique *Twenty Cases Suggestive of Reincarnation* (*Proceedings* of the American S.P.R. 1966).

Although it would not be true to say that the occurrence of ESP and of other paranormal phenomena is now widely accepted by scientists and by the general public, there is no doubt that general attitudes to the subject are much more tolerant than they once were. Should the elusive 'repeatable experiment' be hit upon within the next decade or so, psychical research might well win rapid and widespread recognition by scientists and others, and take a place as a legitimate part of orthodox psychology. If, on the other hand, experimental findings continue indefinitely in their present somewhat unsatisfactory state, psychical research will not disappear, but it may well pass more and more into the hands of cranks as its present relatively respectable supporters drop away.

Evil spirits, in a still from the film *Witchcraft Through the Ages*: witches were feared for their ability to enlist evil to bring harm upon their victims

Methods of bewitching, enchanting or magically harming an enemy range from the distortion of Christian services to the withering stare of the Evil Eye: many old beliefs about psychic attack have their parallels in modern occult theories

PSYCHIC ATTACK

IN THE YEAR 1455 the nuns of a convent at Wennigsen, near Hanover, who were determined to resist all attempts to reform their order, were visited by a group of officials bent on enforcing reform. After some inconclusive argument, 'the nuns lay down forthwith with one accord flat upon the choir pavement, with arms and legs outstretched in the form of a cross, and chanted at the top of their voices, from beginning to end, the antiphon, *In the midst of life we are in death*.' This demonstration was a good deal more sinister than appears at first sight, for the purpose of the solemnly chanted words was to kill the objectionable visitors.

This method of cursing an enemy had been forbidden long before, by the Synod of Cologne in 1310, but without effect. Words sanctified by use in a Christian context were believed to have acquired an inherent magical force of their own, and an even more drastic way of harnessing pious ritual to the murder of a victim was the saying of Mass for the dead against a living man. Petrus Cantor, Rector of the Cathedral School at Paris in the 12th century, said in his *Verbum Abbreviatum* that the sacrament 'is turned by some to magic arts, men celebrating masses over images of wax as a curse upon others; nay even, for such a curse, they sing the Mass of the faithful (departed) ten times or more, that their enemy may die by the third day or at least within a brief while afterwards, and may be laid with the dead in the grave.'

Besides their activities of Devil-worship, storm-raising and the rest, witches were particularly feared for their power to kill or to inflict serious mental and physical

damage on human victims. Fear of a 'psychic attack' of this sort was well-grounded, at least in the sense that people who believe that hostile magic is being directed against them, and who believe that magic works, are likely to suffer mentally and physically as a result (see CURSE). A famous 17th century work on witchcraft, Guazzo's *Compendium Maleficarum*, gives a list of the typical symptoms of bewitchment. They include loss of appetite, vomiting, pricking pains in the region of the heart, sexual impotence, breaking out in a light sweat at night even in cold weather, pains in the neck, kidneys or belly, and sensations which would nowadays be put down to indigestion. 'The sicknesses with which those who are bewitched suffer,' Guazzo says, 'are generally a wasting or emaciation of the whole body and a loss of strength, together with a deep languor, dullness of mind, various melancholy ravings, different kinds of fever . . . certain convulsive movements of an epileptic appearance; a sort of rigidity of the limbs giving the appearance of a fit; sometimes . . . such a weakness pervades the whole body that they can hardly move on any account at all.'

Also listed are unnatural pallor or yellowness of the skin, and an inability to look a priest in the eye (there was in fact a superstition, resented by Christian writers, that priests were uncanny and unlucky). 'If by chance the witch should come to see the sick man, the patient is at once affected with great uneasiness and seized with terror and trembling. If it is a child, it cries.'

Feathers and Blood

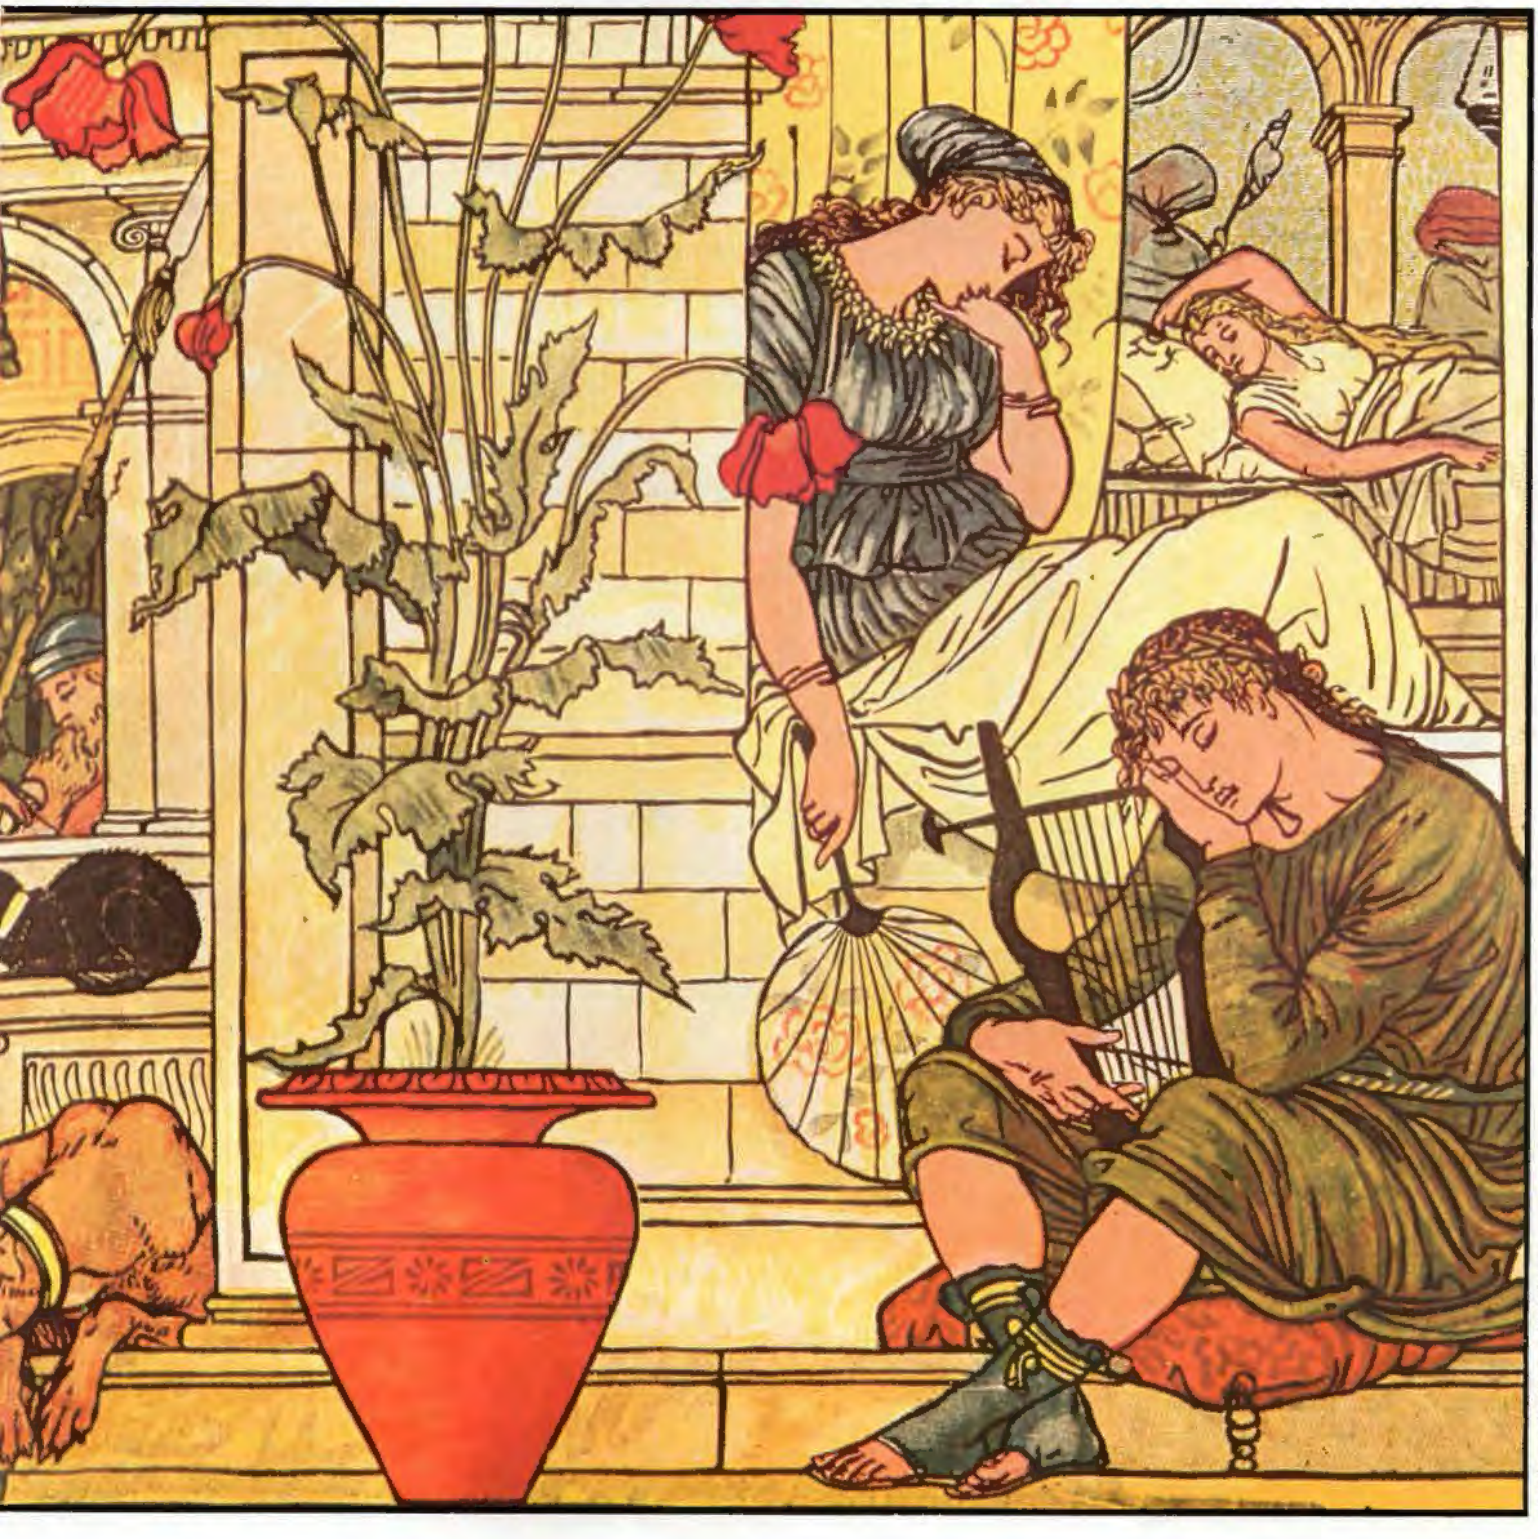
Some of the symptoms listed are those of depression and the emphasis on psychosomatic complaints is significant, for it is likely that hysterical reactions had much to do with the belief that one was bewitched (see HYSTERICAL POSSESSION). Reviewing the English evidence on the effects of spells cast by witches with the aid of demons, C. L'Estrange Ewen concluded that 'it appears that the infirmities and disorders supposed to be induced by the Devil and his angels, although sometimes described as of weird and unknown character, in general,

conformed to the bodily and mental manifestations exhibited in recognized derangements, such as insanity, seizures, sterility, paralysis, wasting diseases, or sensorial disorders.'

That diseases, physical and mental, are caused by demons or actually *are* demons is a very old and rooted belief. When witches were believed to be in league with the Devil, fear of them was heightened by the conviction that God allowed Satan and his minions considerable latitude to warp the minds and torment the bodies of men. The *Malleus Maleficarum* explains that the Devil can inflict diseases on the body and can take possession of it. He can chain up the reason and disorder the senses. He can create a frantic infatuation of love in the mind and equally a fierce obsession of hatred. He can create all manner of delusions which, though hallucinatory, are fully convincing to the unfortunate victim. A witch can even delude a man into thinking that his penis has been removed (see INVISIBILITY) and, discussing the well-known ability of witches to make people impotent, the *Malleus* characteristically observes that God permits bewitchment 'more in the case of the generative powers, because of their greater corruption, than in the case of other human actions'.

The methods of psychic attack credited to witches generally combine an element of mimicry with the use of an object or process as a focus for concentrating malice. The obvious example is image magic, in which a doll represented the enemy so that what was done to it was done to him (see IMITATIVE MAGIC). Something which had been in contact with the victim could be used in the same way, and would create the necessary link between the spell and its target.

A celebrated English witch named Joan Flower, tried at Lincoln in 1619, was accused of revenging herself on the Earl of Rutland for the dismissal of her daughter, a



The Sleeping Beauty was cast into a deep slumber for 100 years, together with all her court, until a king's son came to release her from her enchantment: illustration by Walter Crane of Perrault's fairytale, which is based on a widespread folk motif

Victoria and Albert Museum/Chris Barker

servant in his household at Belvoir Castle. She obtained the right hand glove of one of the Earl's sons, Lord Henry Roos, rubbed it on the back of her familiar, a cat named Rutterkin, and then plunged it in boiling water, pricked it with a pin and buried it, meanwhile wishing that the glove's owner might never thrive. Within a week Lord Henry sickened, 'being much tormented', and eventually died. The witch also cursed the Earl and his wife, and 'boiled feathers and blood together, using devilish speeches and strange gestures'.

In Norfolk in 1583 Mother Gabley of King's Lynn was accused of 'boiling or rather labouring of certain eggs in a pail full of cold water', by which she caused the deaths of 13 men in a shipwreck. In 1682 Temperance Lloyd, a notorious witch of Bideford in Devon, was charged with sticking nine pins into a piece of leather, so causing Mrs Grace Thomas to suffer from pricking pains from head to foot, as if pins had been stuck into her body. Another method of attack, usually employed against a thief, was the Black Fast. This involved abstaining from meat, milk and all food prepared with milk, while mentally projecting a current of venom against the thief until he either returned what he had stolen or died. A woman named Mabel Brigge was executed at York in 1538 for 'fasting upon' King Henry VIII to cause his death. She admitted that she had previously used the Black Fast against a thief, who had broken his neck before the fast ended.

Fascination and Glamour

The simplest techniques of psychic attack are 'ill-wishing' and, in the case of someone unfortunate enough to possess the Evil Eye, 'overlooking' or 'fascinating' the victim with a glance (see EYE). It was long believed in Europe that when you look at something, a ray or beam or force of some kind flows out from your eyes to the thing seen, and that the ray or force which emanates from some people's eyes, voluntarily or involuntarily, is noxious and destructive. The belief is by no means dead and in 1952 in a village in West Germany a woman whose hens failed to lay blamed an elderly neighbour, who she said was a witch and possessed the Evil Eye. The owner of the hens attempted to break

Far left **Exploits of Medea, the great enchantress of Greek legend, from a 4th century vase: when her lover, Jason, chose another bride, the witch sent her rival a poisoned robe which killed the girl and her aged father; then, after slaying her two sons by Jason, Medea escaped in a chariot drawn by dragons. Two 14th century woodcuts show *(above left)* a witch with her master the Devil in amorous mood and *(above right)* attacking a peasant, using a hazel wand to work her spell**

the power of the spell by burning two of them alive in an oven.

The word 'fascinating' originally meant controlling someone by looking at him and came, by extension, to mean charming or enchanting. The Scots word 'glamour', which came into English literature by way of Sir Walter Scott, meant the same thing the other way round, the effect of an enchantment cast on the eyes and causing hallucinations. Stories in which a hero becomes the helpless captive of a beautiful enchantress, who snares him by deluding his senses, are common in legend and folktale. The powerful sexual attraction of the great enchantress is reflected in the connotations of the words fascinating, glamorous, charmer, enchanting, entrancing, bewitching. The close connection between sex and the magic of sight also comes out in the belief that the Evil Eye was particularly likely to cause impotence.

An Evil Elemental

A witch could also injure an enemy by sending her familiar against him (see FAMILIARS). The idea has not entirely died out, and I was recently told by a witch that she had taught a gossiping neighbour a lesson by 'sending her cat to him', which made him impotent for a month. But in modern occultism generally, the equivalent of the familiar is an artificial elemental which frequently takes some grotesque and frightening animal shape (see MAGIC).

There is an occult theory that every human thought coalesces with one of the creatures of the astral plane, which temporarily embodies it. A mere passing impulse of annoyance with somebody will not last long in the astral world, any more than in this one, but a steady flow of malevolence will have more potentially dangerous results. C. W. Leadbeater, a friend and ally of Annie Besant in the early days of the Theosophical Society (see BESANT), explained in his book *The Astral Plane* that: 'A feeling of envious or jealous hatred towards another person sends an evil elemental to hover over him and seek for a weak point through which it can operate: and if the feeling be persistent, such a creature may be continually nourished by it and thereby be enabled to protract its undesirable activity for a long period. It can, however, produce no effect upon the person towards whom it is directed unless he has himself some tendency which it can foster – some fulcrum for its lever, as it were. From the aura of a man of pure thought and good life all such influences at once rebound, finding nothing upon which they can fasten, and in that case, by a curious law, they react in all their force upon their original creator. In him by the hypothesis they find a congenial sphere of action . . .'

When a magician, with deliberate intent, performs a ceremony of hatred and destruction sinister creatures of the astral plane may be attracted to, or created by, the operation and will join in the attack. But the essential ingredient of the ritual is the vivid concentration of violent rage which the magician conjures up in his own mind and

Psychic Recovery

There is a great deal that can be done upon the physical plane to help the person who is suffering from an occult attack . . . Sunlight is exceedingly valuable because it strengthens the aura and makes it much more resistant. People are often advised to go away into the country on this account, but for the victim of an occult attack to go into the depths of the country may not be the wisest thing, because elemental forces are much more potent away from towns, and if he is threatened by an uprush of atavistic forces, he had better cling to the haunts of men. The sea, too, is an elemental force that is best avoided, for water is an element intimately associated with psychism. Large bodies of water and high mountains should be avoided in choosing a health resort for a person suffering from psychic trouble. The best place is an inland spa. Games, physical training, massage, anything that improves the bodily condition, are invaluable, but long solitary walks should be avoided . . .

Dion Fortune *Psychic Self Defence*

which he projects at his victim, wrapping him in an atmosphere of poisoned malevolence like a man trapped in a thick and evil mist. According to Eliphas Levi (see LEVI), in *The Key of the Mysteries*, 'through a series of almost impossible exercises . . . our nervous system, having been habituated to all tensions and fatigues, has become a kind of living galvanic pile, capable of condensing and projecting powerfully that light which intoxicates or destroys', and in this way 'it is possible to destroy life by the sudden congestion or withdrawal of the Astral Light'.

Hysteria and Nightmares

Although a magician powerful enough to kill by ill-wishing in this way is, fortunately for the rest of us, a rarity, the effects of a psychic attack on someone of sensitive and nervous disposition can be drastic. The characteristic symptoms are said to be extreme fear, anxiety and distress of mind, and also bruises on the body – sometimes in the shape of a goat's hoof or an ace of clubs – disgusting smells, especially of rotting flesh (the belief that demons, as agents of corruption, stink of decomposition is an old one), smears of slime, perhaps with footprints in them, inexplicable outbreaks of fire, and the phenomena associated with poltergeists, which until comparatively recently were assumed to be evil spirits (see POLTERGEISTS).

In her book *Psychic Self-Defence* Dion Fortune (see FORTUNE) said that from the forces of positive evil in the world there have sprung evil intelligences that 'probably originated through the workings of Black Magic, which took the essential evil essence and organised it for purposes of its own'. When these creatures prey on human beings, they cause nightmares and terrifying hallucinations, and they also manifest themselves in sinister noises, slime and blood, balls of light and pungent stenches.

Beings of this sort may seize on the careless or unwary magician. Dion Fortune quotes the case of a man who tried to use a magic square but failed to perform the ritual correctly. He began to suffer from feelings of terror at night, and eventually saw the creature which was obsessing him. 'Its eyes were closed and it was bearded, with long flowing hair. It seemed a blind force slowly waking to activity.' One night he saw a red snake uncoiling itself from under his bed and was so frightened that he jumped out of the window to escape it. The next time he saw the bearded creature, its long locks of hair had turned into the beads of snakes.

One of the dangers of travelling on the astral plane is said to be that the experimenter may fail to bring his astral self back into his physical body (see ASTRAL BODY). The astral body may wander helplessly about and may be attacked by evil forces. The probable short-term results will be hysteria, nightmares, fainting fits, splitting headaches and possibly, in extreme cases, even insanity. The experience may leave permanent damage behind it in the form of lassitude, lack of persistence and inability to concentrate, which recalls some of the symptoms of bewitchment mentioned by Guazzo – weakness, a deep languor, dullness of mind. This helpless wandering of the astral self is the modern occult parallel to the widespread primitive belief that the soul can leave the body and travel about, especially during sleep. Dreams are frequently explained as the experiences of the wandering soul, while the body is asleep. This wandering is dangerous because the soul runs the risk of being ensnared by a sorcerer or by an evil spirit, the result of which will be illness and insanity, and death if the soul is not rescued and restored (see SOUL).

Psyc – Shin

PSYCHOKINESIS

In 1936 E. M. Sturgess claimed that he had made a pendulum move without touching it. The claim was challenged, but since then experiments have produced evidence to suggest that the mind can influence matter

Harry Price Library

PSYCHOKINESIS or PK is what the layman calls 'mind over matter'. It is the ability to influence the objective environment without the use of the motor system of the body (the muscles and glands). PK is the counterpart of extra-sensory perception or ESP, which is the acquisition of knowledge without sensory aid (see EXTRA-SENSORY PERCEPTION). These two abilities together make up the communication or exchange a person may have with his surroundings in the form of experiences that are familiarly called 'psychic'. Such communication is better known as parapsychical or psi behaviour, and its study is called parapsychology (or psychical research). PK ability is closely interrelated with ESP but it can well be handled as a separate topic – one that is today only beginning to command as much human and scientific interest as the ESP phase of psi behaviour.

Reports of PK happenings appear in the records of the past as far back as records go. Today of course it is impossible to check on the reliability of such older reports as are available, but at least men believed they were witnessing miraculous physical events that seemed to have their origin in superhuman agency.

Whether the production of these mysterious physical effects was associated with the prevailing religious doctrine or attributed to one of the many systems of magic, the individual who was believed to exercise control over them was likely to become an influential member of the community, whether priest or magician. He might be the tribal rain-maker or healer or the practitioner of some strange power to save or destroy. Belief in this ability to control the physical environment may still be found even today, and not only in less sophisticated cultures. There are actually many unorthodox practices of healing that suggest PK still going on within sight of some of the modern medical centres. For example, warts are reported to be removed from men and animals, at least without known physical intermediation.

Leif Geiges

Other 'magical' therapies are practised as well, such as the control of bleeding or the counteraction of injury from burns. Most of these healings are not expressly in the name of religion, although the practitioner may personally believe that it is God's work he is doing.

How valid these claims are no one can safely say. Certainly no practically dependable application of the alleged powers has emerged and persisted over the centuries as evidence of a reliable principle. Belief in supernatural physical effects has steadily declined with the advancement of the natural sciences, but this does not in itself prove that no PK function ever operated to produce the effects men believed were unexplainable by physics. At most it indicates that the evidence for the PK interpretation has not been good enough for the educated modern intellect.

Heritage from the Casino

The one magical practice that has persisted and even flourished right on down to the present day is gambling. In games of chance the belief in luck, good and bad, is an intuitive acceptance of the traditional magical interpretation. Consistent winning (or for that matter consistent losing) in an honest game of pure chance would seem to require an element of psi ability. While in some of the games the most likely type of ability that could bring luck would be ESP, in others such as the dice and roulette systems, PK would be the type needed.

The point is that the fair game of chance is basically a contest of psi abilities, whether it depends on the successful guessing of an opponent's card or the effective influencing of his dice. But the conditions of play do not permit a clear-cut measure of the psi element, and to a large extent they work against the consistent use of it. What was needed was the seclusion and protection of the laboratory and a proper test design instead of a complicated game.

Early in the 1880s Professor Charles Richet adapted a game-like card-guessing technique to the testing of his hypnotized subject Leonie for clairvoyant ability. He also applied the new probability mathematics to the results. Leonie was 'lucky' enough to guess many more cards correctly than mean chance expectation, and when the extra-chance odds of these results were calculated they were (in today's terms) highly significant. It was an important step, but it was little noticed at the time.

The Duke PK Experiments

A half century later and in quite a parallel way I introduced the technique of dice throwing at a climactic point in the ESP experiments that were going on in the department of psychology at Duke University. Following a tip from a young gambler, I undertook to test the belief that some men have had, that in certain states of mind, which they call 'hot', they can will dice to fall with desired faces turned up. The many volunteer student subjects who took part in these tests were stimulated to high motivation by the game-like contest with the challenge to beat chance, and a large body of results accumulated that for the most part favoured the PK hypothesis.

It was easy to apply the mathematics of probability which furnished us with the chance expectation for each test. The overall number of hits (as the dice were thrown for a designated face or combination of faces) was found in most of the series conducted to be statistically *significant* (that is, to exceed the chance rate of scoring by so large a deviation as could not reasonably be ascribed to chance alone). This success continued from experiment to experiment and from one research worker to another.

On the sober reflection possible after 35 years, it should not have been so surprising as it was to find these scores of people able to influence those dice. There had already been a strong case made for the clairvoyant ESP hypothesis, and it seemed logical to think that if the subject could communicate with a deck of cards completely cut off from sensory contact, the principle might be reversible – for every action in Nature there is a reaction. In other words, something might be happening to the deck of cards under the influence of the mind of the subject. If so, then it should be effective on the rolling dice where a subtle influence could be more delicately registered.

There was also the background of strange physical effects reported in the past, not only miracles and magical practices but spontaneous psychic experiences. Many of these last were purely physical effects, like the unaccountable stopping of a clock at the time

Picturepoint, London

Facing page **Psychokinesis (PK) became an important competing hypothesis to ESP, for it was suggested that significant scoring of hits in card-guessing tests might be due, not to precognition, but to the ability to influence the shuffle, so as to make the fall of cards match the 'predictions' made by the subject. It is now considered that ESP and PK are not separated or competing abilities but effects of a single ability, which parapsychologists call 'psi'. PK required ESP for any intelligent hypothesis of its operation and in most experiments the subject could not give intelligent guidance to PK without using ESP at the same time, for example to know where, how and when to apply the effort**

Above **Much of the evidence for PK has come from experiments with dice throwing, testing a subject's ability to will the dice to fall with specified faces showing. PK may account for what the gambler calls a winning, or losing, streak of luck, which may in fact be the product of psi ability**

Right **Sherpas playing dice in a village in Nepal: the belief that in certain states of mind one can psychologically control the fall of the dice is familiar to gamblers the world over**

of a death or the falling of a picture at the time of a crisis happening to the person represented. While these were not as numerous as the ESP type of spontaneous experiences, a substantial collection of cases of unusual physical phenomena had accumulated, especially at the psychical research societies (see SPONTANEOUS PSI EXPERIENCES). Then too there had been a vast amount of reporting of the phenomena of physical mediumship, describing strange happenings that if correctly reported and honestly produced (large questions) would suggest that they had been produced by some kind of unknown mental agency (see MEDIUMS). Even though little credence was given to any of the claims of non-experimental physical happenings that suggested PK, they were puzzling enough to justify attention to the possibility.

Precautions and Reactions

It takes more than an open mind, of course, to set off on such a new project. There was the argument that since the ESP experiments had confirmed one type of spontaneous experiences, why should we not look at the others? Only a few months before the start of work on PK, in fact, a beginning had been made on precognition. Then too, coming as it did on top of the first major discoveries about the ESP types, the PK work seemed almost to follow those successes in logical relation. Clairvoyance was apparently a subject-object interaction in one direction. Why not expect a reaction in the other, as the spontaneous cases had suggested? Besides, the sensorimotor parallel suggested ESP and PK as an extra-sensorimotor analogue. So PK fitted into a niche in the developing rational picture.

Yet the work with the dice did not immediately receive full attention from the group at the Duke Laboratory, and for a time was a little overwhelmed. At that stage, with the first report on the ESP work about to appear, the new discovery was just too much to handle with sufficient reflection and comprehension for immediate publication. Even the reporting of the precognition results was delayed for nearly five years and, as it turned out, the findings on PK were held back for almost ten.

An important new consideration arose which nevertheless required that PK be taken quite seriously, even before publication, in connection with some of the ESP experiments. There came a point in the research in precognition at which PK became an important competing hypothesis. Some workers in parapsychology found precognition so hard to take seriously as a hypothesis that even PK was preferable if it could possibly explain the results of the precognition tests. One of these enthusiastic critics in the laboratory challenged the adequacy of the mechanical card shuffler used for a time in randomizing the order of target cards for precognition tests. He thought PK was a possible factor in favourably influencing the shuffling process so as to make the cards match the predictions made by the subject. This and other methods for preparing targets for precognition (for example, the rolling of dice) had therefore to be discontinued. (Later on, as will be seen, the tables were turned, and precognition gave PK experimenters a difficult time as a counter-hypothesis in their own research.)

The PK studies continued throughout the period of delayed publication, so that by 1943, when it was decided to release the first report, there were 24 completed projects, most of which would normally have been published over the waiting interval. But even so, the long lead given the ESP side of the field represents a comparative disadvantage to the PK branch and accounts for the appearance of retarded progress in this equally important section of the field since the first PK report appeared. There are signs today, however, that this imbalance is likely soon to be corrected.

The problems that needed handling in adapting dice throwing to PK testing were recognized from the start; they are much the same as those which have to be watched if an honest game is to be played in games with dice. Precautions have to be taken against skills in handling the cubes that might influence their fall, as well as in correcting for possible inequalities in the faces. In the laboratory it was possible to take the necessary steps, which the game situation would not always permit. The 'game' could be modified to suit the experimenter's needs. For instance, correction for imperfections in the dice was best achieved by equalizing the number of throws for all the faces as targets. If the faces are equally well represented in numbers of trials, any imperfections in one

Psi research has entered upon a new period, marked especially by the greater sophistication of testing devices

Belief in 'mind over matter' is very old, and there are many reports of the human mind influencing its physical environment in ways which were thought supernatural and miraculous. They include accounts of magical healing, rain-making and other types of weather control, and such peculiar powers as the ability to levitate *Above* Indian Brahmin practising levitation *Right* The disciples saw Jesus walking on the water, and St Peter tried to emulate him but began to sink. Interestingly, Jesus reproved him for lack of confidence

will be balanced off by the others. Similarly, the ways of throwing the dice progressed from hand and cup throwing to stages of completely mechanized gravity release or rotation in baffled cages, in which no human factor entered.

The Diagonal Decline

The most clinching evidence of PK was a psychological by-product of the research itself, the diagonal decline effect resulting from the quarter distribution (QD) analysis of the records. First of all, it is an independent valuation, and it is one that at a single stroke effectively answers all the major questions that the researcher attempts to cope with in a well-designed and well-controlled PK experiment.

The QD analysis developed as a result of examining in 1942 the earlier PK records to see whether declines in scoring rates, such as had occurred frequently in ESP experiments, were also to be found in the PK data. It was immediately evident that there was not only a decline from the top to the bottom of the record page but also from the left to the right half, so that on dividing the page into quarters the upper left showed the greatest number of hits and the lower right the fewest. This is the typical diagonal decline. The difference between those two quarters was statistically significant and it made a formidable and independent case in itself, whatever else the experiment showed or failed to show.

All that was necessary to meet the conditions for the analysis was that the page be made up of records of trials made under uniform conditions – as most of them were. All the considerations that normally had to be watched, such as dice bias, non-random throwing or recording errors, could not be supposed to decline as the QD analyses had shown the actual results did. One major point was that neither subjects nor experimenter could have had any anticipation that years later these analyses would be made. They were thus as objective as fingerprints.

It turned out that 18 out of the 24 series were recorded in such a way that the QD analysis could be applied. Of these, 16 showed the diagonal decline from upper left to lower right, and when the entire 18 were combined the significance of the difference between the upper left and lower right quarters gave astronomically high odds against a chance theory for the results.

This was not all of the QD evidence; there were still smaller blocks of data in the records which could be quartered and treated in the same way to see how general these position effects were. The same effect was found to be widely distributed in a similarly highly significant way. One virtue of these position effects is that they can be examined over and over again and thus have much the same firmness as rock strata to the geologist. It has been especially advantageous to have had this strong foundation laid under the PK work which has not been so well represented in the amount of research done as have the various types of ESP.

The conclusive QD evidence for PK came to a head in 1945. A quarter-century later psi research has entered upon a new period, marked especially by the greater sophistication of testing devices that is possible today. It might be called an electronic era, since much of the apparatus in use in facilitating psi testing is of that character. Dr Helmut Schmidt, Director of the Institute for Parapsychology, has designed a number of test devices adaptable to specific types of psi, all based upon the same essential mechanical principles.

The randomization of events on which the tests are based is dependent upon the emission of electrons in radioactive decay. This basic process can determine the order of targets for ESP tests or provide a random order of events for the subject to try to influence in PK tests. In these latter, the subject mentally concentrates on trying to make a designated one of two (or more) lamps light up, by influencing the selective action of the random generator. The subject has nothing to do but concentrate on the lamp assigned to him as target for a given run of trials. The experimenter is not necessary at all except to give the instructions to the subject. Mechanical recording and provision for mechanical analyses of the data are features of the system.

One wonders, of course, in this new stage and style of testing, just as in the ESP testing with the same types of machines, whether the central factor in the equipment, the electron, has any importance in itself. It is too early yet to say whether the size of particle has anything to do with the rate of success or whether other systems of generating random targets will do as well when they are developed. Such problems can now be handled and will surely not be kept waiting long for solution.

The Nature of PK

Enough is already known about PK, however, to allow some illuminating generalizations about its nature. Of these, first consideration should be given to the relation of PK to the physical world. Almost immediately in the early testing at Duke, it was noticed that none of the physical properties of the dice seemed to be important in relation to the scoring rate – that is unless they led to psychological preferences. For example, the subjects found that they could achieve a better scoring rate (a better rate per die) while throwing two dice at a time instead of one. Yet two dice certainly made the task more difficult from a purely physical viewpoint. Again, when two dice per throw were compared with six, the larger number gave the better rate of success per die. But the subjects recognized in all these comparisons that they *liked* to throw two dice better than one and preferred six to two. The larger number made a faster moving and more efficient procedure than the smaller.

Essentially the same type of effect was observed with respect to two different sizes of dice used in the test. Very small dice did not do well and exceptionally large ones were not as high in yield as medium sizes (from $\frac{5}{8}$ to $\frac{3}{4}$ of an inch). Again the rate of success seemed to be largely a matter of the size that could most easily he picked up, observed

British Museum

quickly and handled nicely. The actual size as a factor appeared to have nothing to do with the amount of success. The actual mass of the material from which dice were constructed seemed to make no difference either, so far as comparisons could be accurately determined. Dice of medium weight were the best liked by most subjects, for example, those made of plastic or lighter metals such as aluminium were popular and gave good results. Dice made of lead and those made of balsa wood were respectively too heavy or too light to be favoured by the subjects, and under the conditions of the early tests neither yielded scores comparable to the better-liked materials. A number of other comparative tests involving physical features further supported the point that the physical characteristics of the target objects in PK were not the determinative ones. The mental factor of preference was usually clearly the dominant one.

What was most needed was a type of test that would allow the physical differences to be tested without the subject's preference being allowed to influence him, at least consciously. Such an experiment has recently been carried out at the Institute for Parapsychology by William E. Cox. Lead and celluloid dice were painted alike and compared in PK tests without the subjects being aware that two different weights of dice were being used. They were also handled mechanically in the same apparatus and were made to roll at the same speed so as not to show differences indicating weight. Not even the observer who did the recording knew there were two different weights of dice; yet the amount of evidence of PK effect was almost identically the same for the light and the heavy ones. The ratio of mass was about one to seven and such a difference would of course be expected to have an effect upon the energy required to alter the fall of the cubes. Almost certainly this experiment, if conducted in the manner of the earlier ones mentioned, would have introduced a preferential difference in the amount of PK effect registered. As it is, the effect of density on psi capacity seems to be ruled out again.

In the Schmidt experiment with PK on the electron level of target magnitude, the selection of the lamp to be lighted depended on a single quantum of energy, yet the result did not show a different order of magnitude of scoring success over that of the various dice throwing tests, some of which involved incomparably larger target objects. This would appear to be strong evidence that physical differences in the targets as such do not affect the magnitude of PK scores. In the tests on extra-sensory perception results on that side of the psi field have not shown any physical relation either. Space-time conditions which are so limiting in sensorimotor exchange have not been found to show any well confirmed relation to the results of comparative ESP tests. Thus no physical theory of psi gets a leg to stand on from the evidence of either ESP or PK.

But while this draws a major distinction around psi it does not necessarily imply any discontinuity in Nature. To say that psi is superphysical is not to call it supernatural. Rather it is to indicate that some other natural basis of exchange will have to be inferred, and eventually found and confirmed if it is there. Since effective communication is involved (even though not often highly reliable) there should by definition have to be an energetic interaction, and this again raises interesting new questions not for speculation but for exploration.

At this point, of course, the concept of a psi energy is not much more than a working hypothesis. It is true that mental energy has from time to time been suggested by psychologists, but until the work in experimental parapsychology began they had no way of testing the hypothesis of an energy that is different from the recognized physical systems. PK research experiments with dice, conducted by Haakon Forwald, were found to produce effects that were measurable in terms of standard units of energy; yet under the test conditions no known physical energy could conceivably have been responsible for these effects. It is true that the only measurement possible was the physical differences in the results produced. These were the mean distances between dice released from the same point and allowed to roll by gravity, with one side of the table the designated target in one set of trials and the opposite side in another. Thus the cubes of known weight were caused by PK to roll to the side intended to a measurable average distance.

Forwald, of course, was not directly

'As they were looking on, he was lifted up, and a cloud took him out of their sight' (Acts, chapter 1): the Ascension of Christ, a 15th century wall painting from Cyprus. One of the spurs to parapsychological research was 'the background of strange physical effects reported in the past'

Sonia Halliday

measuring the energy which influenced the dice but rather the resultant lateral displacement. However, at this point it is a question as to whether concepts such as quantity (associated primarily with the physical order) are indeed applicable to this psi function or for that matter to any process that is distinctly mental.

Targets in PK Tests

What kinds and states of matter can PK influence? First approaches have usually to be made at the easiest point of attack. Clairvoyance was the simplest starting point for assault on the ESP side. In PK it had to be something with moving targets (PK-MT) since matter in motion offers advantages; almost all the PK work done since the beginning of 1934 has been with targets in motion, mostly dice.

A certain amount of testing of PK with moving targets has involved the use of electrical equipment, such as electric clocks and pendulum devices adapted to the tests. The attempt has been made also to use the flow of liquids or sand as target matter. Tests have likewise been made on micro-physical targets, as in the emanation of electrons from radioactive substances.

On the whole, nothing in the PK testing has thus far consistently exceeded the rate of success with the dice throwing methods. It still remains to be seen how the new work with electronic targets will compare with dice tests. So far there is no indication of a new level of magnitude of PK performance to correspond to the microscopic size of the targets.

As stated, all these materials have been inanimate objects in motion. What about PK on living targets, or PK-LT? The idea has long prevailed in popular folklore that some individuals have the power to influence plant growth and others to affect animals, including man, physically in various ways. The plant specialists are said to possess what is known as a 'green thumb', and others are believed to be able to induce healing of the sick by unknown powers that suggest PK. In recent years efforts have been made to test these healing and growth-promoting powers in the laboratory. The PK tests most often tried were based on the attempt to influence the growth rate of seedlings and the best known of these efforts is the work of Dr Bernard Grad of McGill University Medical School. But there have been a few efforts to influence animal healing and other effects on the animal organism. It would be fair to say that altogether a good beginning has been made on PK tests with living targets; but a hard and fast valuation need not be forced at this stage. The research continues, but it should not be confused with fantastic and prematurely popularized claims of emotional reactions of plants and so-called plant perception.

The stiffest challenge facing the PK researcher today is the question, now being investigated, of whether static inanimate objects can demonstrably be influenced psychokinetically. This is a point at which to reflect on the fact that, one by one, the types of psi effect suggested by the spontaneous cases of psychic experience have been verified by experiment or, as in the sector of the PK of living targets, there is at least a fairly satisfactory case. One cannot of course argue that we may now therefore conclude that PK on static targets (PK-ST) will have to follow, but it does appear much more plausible as one thinks back over the progress in the past on the other target areas of psi.

The more favourable climate of today has led to increased attention being given to some of the claims for the PK-ST type of effect. There has been some attention to the claims for the darkroom seance, for example the reports of tables levitated by PK. Increased attention is also being given to reports of the so-called poltergeist and haunting cases in the attempt to verify claims of unexplainable movements of objects that support PK.

On the American scene the best known effort to achieve PK-ST has been in the attempts to project thought impressions onto a photographic film. While some psi workers such as Dr Jule Eisenbud are led to the conclusion that a genuine psi effect has been involved in these productions, such firm acceptance at this stage would abandon the criteria followed in the other sectors of psi investigation. If the results reported are indeed due to genuine PK, the capacity involved should be expected to respond, as efforts continue to devise better conditions, making conclusive demonstrations possible in due course.

The relation of PK to the ESP types of psi phenomena has become clearer as the different types have been studied. During the early investigations it seemed necessary to treat each phenomenon as though it was the result of a separate function. Difficulties result from these distinctions, especially in attempting to distinguish clairvoyance and telepathy from each other in the experimental situation. Another problem arose in trying to do a PK experiment that completely ruled out the possibility of precognition and conversely (as mentioned above) in trying to investigate precognition with the hypothesis of PK experimentally eliminated. Eventually, however, these conflicts were resolved and each type of psi was satisfactorily established as phenomenologically distinct.

But even though much time was expended

The exercise of psi abilities is still too slight and uncertain for them to be of serious practical use. When they become reliable the consequences will obviously be fantastic

in separating PK and ESP by independent demonstration there was frank recognition of the fact that PK required ESP for any intelligent hypothesis of its operation. In fact in most of the experiments it was impossible for the subject to give intelligent guidance to PK without using ESP at the same time (for example, to know where, how and when to apply the effort). Accordingly, even while the separation experiments were going on it was recognized that the distinction between types was a superficial one and that PK and ESP were aspects of the same function. Moreover, the similarity of conditions that affected both of them further confirmed the hypothesis of the unity of psi. Gradually workers in the field came to regard psi as fundamentally a single process of which the different types of phenomena were surface manifestations.

Some of the experimental studies came in due course to take this unitary character of psi for granted, especially those in which PK tests were carried out with the targets unknown to the subject at the time. In some of these the targets were enclosed in opaque envelopes until the end of the series for which they were intended. In others, as in the distance experiments by the English workers G. W. Fisk and D. J. West, the target was set up at a distance of 170 miles from the subject while she, a medical woman, threw the dice with significant success, depending upon ESP guidance as to the target face. Distance has been found to be no impediment to ESP.

Whether distance between the subject and target would have any effect upon success in an adequately controlled PK test would be difficult to say at present on the basis of the limited evidence. The distances in tests have been relatively short (30 feet) and subjective factors could easily enter in the way of preferences; but the results, such as they are, harmonize well with the other findings regarding the absence of any physical influence. But it is just at this point that the view of PK as being an aspect of the psi function is very important. Since psi is a unitary ability and the ESP tests have shown no limitation thus far due to space-time, it seems to follow logically that PK would not be limited either; it is the same ability with another form of expression. So there should not be any need to do PK experiments at longer distances.

One of the most important findings about PK, and one that was already known about the ESP types, is that it seems to be reversible in its effect. The easiest way to describe this is to go back to the example of luck in games of chance; this form of psi (as it seems likely to be) can be both good and bad, and thus, as everyone knows, lead to winning or losing. The discovery in parapsychology of this tendency to psi-missing as the opposite of psi-hitting has been probably the greatest single contribution thus far made to the understanding of the psi process. For some unknown reason psi-missing is much more prevalent in the ESP researches than in those of PK.

It happens, however, that the Cox experiment involving the comparison of lead and celluloid dice offers an instructive example of psi-missing. It will be recalled that the dice were indistinguishable to the subjects and that they gave equally significant results in spite of their large difference in weight. However, there was an important difference; while the celluloid gave the normally expected psi-hitting, the lead dice gave psi-missing results – that is, negative deviations. Both kinds of dice were activated together, and for the same target face, yet the heavy ones deviated as far below the chance mean as the light ones did above. The results were fairly uniform too among the different subjects and sessions, indicating that the participants were in some way cognizing the kinds of dice and reacted to both with equal measure but in opposite directions, even while they were unconscious of any difference. Some sort of discrimination was evidently involved in this 'psi differential effect' as it has been called, which shows up almost regularly when an experiment is conducted with two different kinds of methods or targets, or other circumstances. (Such a subtle unconscious differential in the operation of the mind could be an important principle of wider scope.)

Frontiers of PK Research

The years ahead may be expected to see the expansion of PK investigations into much territory still unexplored. Interest is growing in meeting the challenge of applying PK to static targets, but it is even more active at present in the use of living targets, with a wide range of plant and animal species and their functions being put to the test. New work with animals has independently confirmed and amplified the discovery of precognition in mice. With the promise this gives of providing parapsychology with a 'guinea pig' there should be accelerated interest in the animal branch of the field.

In 1972, Uri Geller (see URI GELLER) came into public awareness with his astonishing feats of metal bending. Geller had only to appear on television for reports of forks and spoons being bent out of shape in many thousands of homes to flood in. His powers led to psychokinetic metal bending (PKMB) becoming a field of study in itself.

In 1974, Matthew Manning (see MATTHEW MANNING) gave a display of PKMB to a group of 21 scientists; however the first scientist to study PKMB rigorously was Professor J. B. Hasted of Birkbeck College, London. He published his findings in a co-authored article in *Nature*, in April 1975. He took the view that PKMB was the product of the unconscious mind, and recommended that the person being tested should be relaxed. Other research programmes in PKMB are ongoing all over the world.

Is there a foreseeable limit to this PK power of the mind and its other aspect ESP? Nothing has yet been found that is beyond the range of the extra-sensory ability to apprehend knowledge, and the progress of PK research is approaching a similar generalization on its side. This is to say that man's range of communication has (or promises to have) in principle, no limitation. On the side of modesty, however, let it be recalled that the exercise of these psi abilities is still too slight and uncertain for them to be of serious practical use. When they become reliable the consequences will obviously be fantastic; but the work to be done is enormous too. Fortunately it is now possible to do it, and it will get done in time.

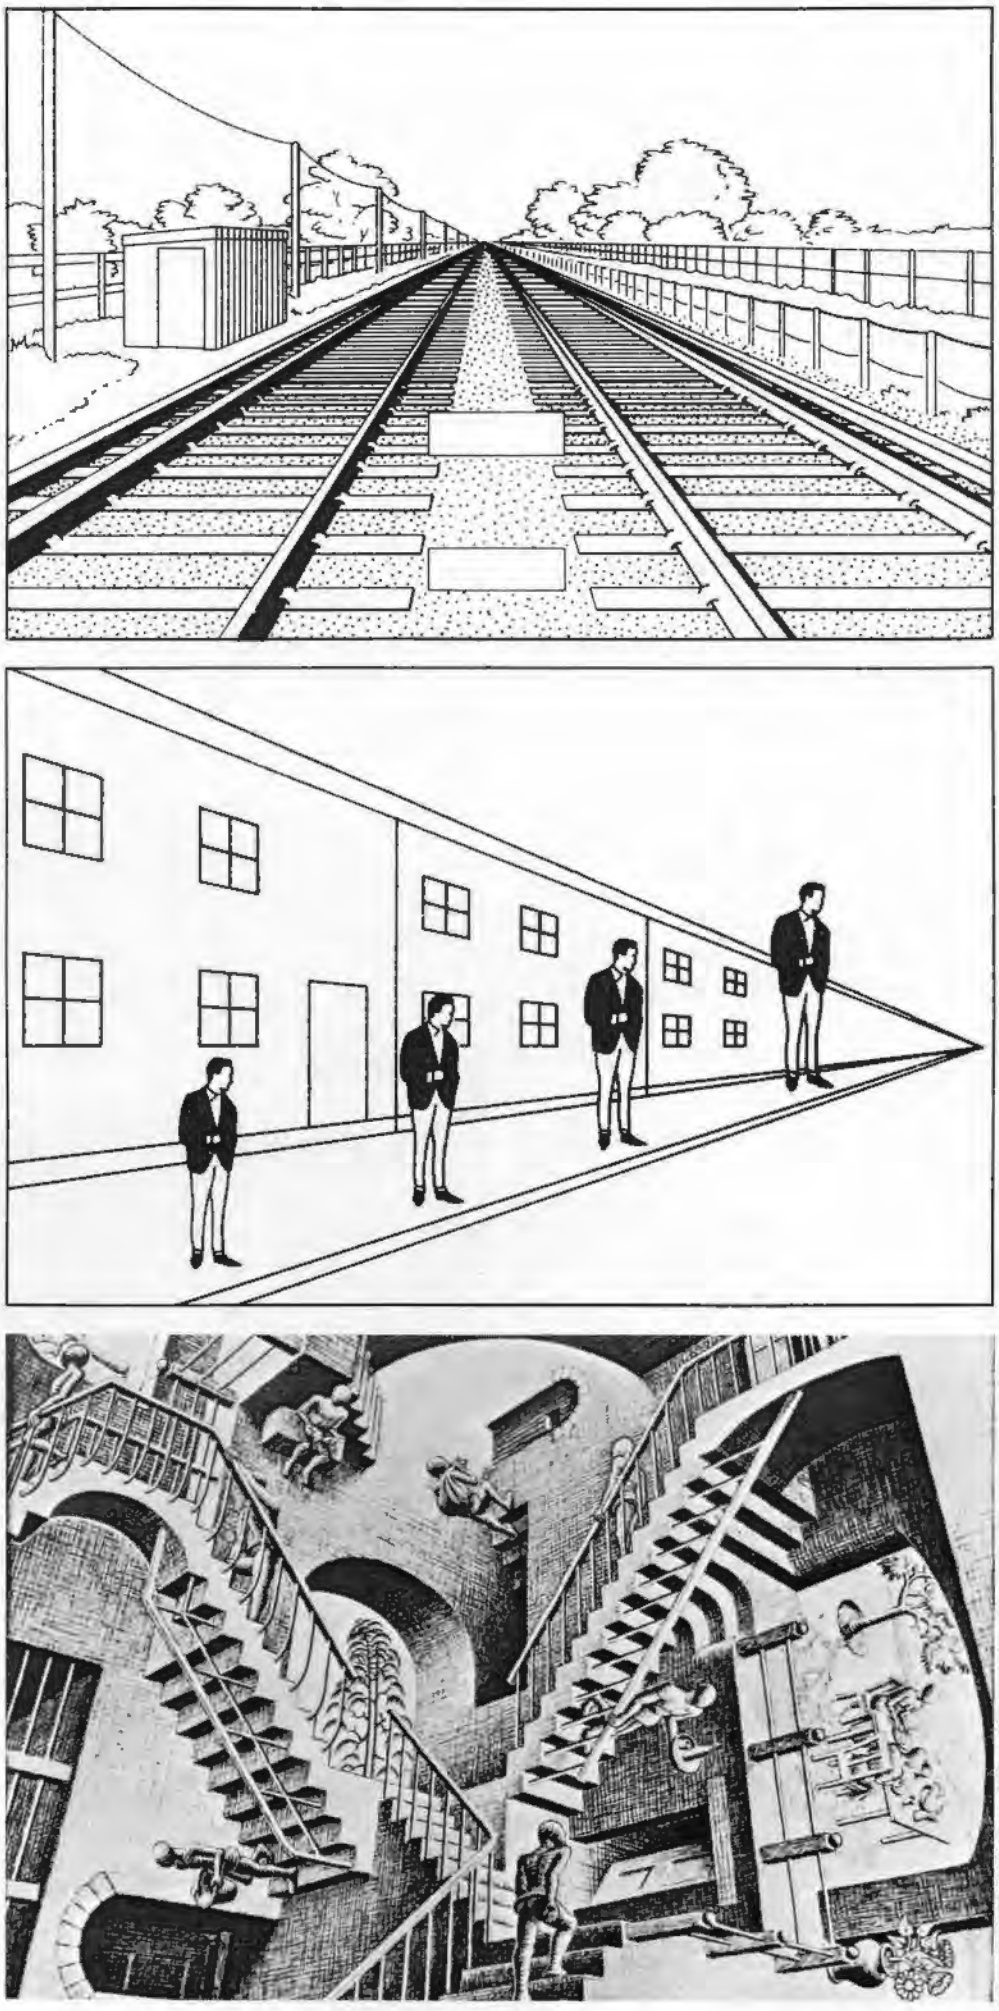
PSYCHOLOGY

THE WORD 'PSYCHOLOGY', literally translated, means 'the study of the mind'; and by 'mind' we must understand the basis of consciousness, whether that basis turns out to be merely the material brain, or whether we prefer to identify it with some kind of immaterial entity interacting with the brain – what the sceptics derisively term 'a ghost in the machine'. As a scientist, the modern psychologist scrupulously refrains from postulating any novel entity, such as an immaterial mind or soul, which is not already recognized in other branches of science, unless the factual evidence practically forces him to do so. But this critical approach in no way entitles him to deny its existence outright if, on non-scientific grounds (those, for example, of philosophy or religious experience), any other thinker prefers to adopt this widespread belief.

The systematic study of the mind began with the ancient Greek philosophers, Plato and Aristotle. The idea of an immaterial soul, capable of surviving the death of the body, was elaborately defended by Plato in the famous speech he puts into the mouth of Socrates just before drinking the hemlock (see IMMORTALITY). In its origin it was not a Christian doctrine. As the oldest of the creeds distinctly states, the early Christians believed in 'the resurrection of the body'. St Paul, however, seems to have held that the resurrected 'body' would be a 'spiritual' rather than a 'physical' body.

From the time of Plato and Aristotle until about 100 years ago, psychology remained essentially a philosophical study. But during the second half of the 19th century it gradually came to be regarded as a branch of natural science. On the Continent the tendency was to treat it as a subdivision of physiology – part of the general study of the brain and sense organs. In Britain, owing to the influence of the philosopher Herbert Spencer and the scientist Charles Darwin, it was regarded rather as a branch of biology. Biology is the science of life; and psychology was consequently defined as the study of mental life. Mental capacities were treated as the product of evolution; and special emphasis was laid on the influence of heredity. In America, following the teaching of Pavlov, the Russian neurologist, an influential group of writers insisted that the analysis of consciousness should be left to the philosophers, and preferred to redefine psychology as the objective study of behaviour.



Visual illusions pose a problem to an understanding of how we perceive the outside world, and suggest that what seem to be, according to the realist theory, direct perceptions of concrete objects are in fact 'interpretations automatically imposed on our own sensations by the mind itself' *Top* In perspective drawings, parallel lines converge with distance *Centre* This drawing wrongly suggests that the men are of varying height *Bottom* The complex arrangement of perspective makes this visually possible, although it could not exist objectively: lithograph by M. C. Escher, *Relativity*

Mickelson Gallery, Washington DC/Cornelius Van S. Roosevelt

The methods adopted by contemporary psychologists are essentially those of all other sciences – systematic observation, controlled experiment, measurement wherever possible, and up-to-date statistical techniques for checking the results so obtained. Every department of psychology now has a laboratory, with a dark-room for the study of vision, a sound-proof room for the study of hearing, clocks measuring to a thousandth of a second, electrical apparatus for recording brain-waves, and mechanical or electrical computers. Most British psychologists also adopt a mode of observation that is used in no other science, namely, self-observation or introspection. When a psychologist is trying out a new test – of reasoning, for example – he asks his human guinea-pigs how precisely they actually proceeded in their attempts to solve the various problems: many of them, so it often appears, rely not on reasoning, but on memory or even on sheer guess-work; some work out the answers in silent speech; others use imaginary diagrams or mental pictures. Unlike American behaviourists the British psychologist sees the analysis of consciousness as one of his most important tasks.

The Act of Sensing

In ordinary parlance the word 'consciousness', and most of the terms used to describe its various forms, are highly ambiguous: they are used sometimes with an active meaning, sometimes with a passive. The term 'sensation', for example, is now commonly used to denote what is sensed, for example, the touch of pain that I feel; strictly speaking, it means the *act* of sensing: it implies that I (or whoever is the subject at the moment) am actually feeling this particular pain. It is therefore important to distinguish between what are technically called the 'contents' of consciousness and the 'processes' of consciousness. Earlier psychologists were interested chiefly in classifying the different contents of consciousness and analysing them into their basic elements; and all too often forgot that consciousness itself is a unique activity.

Of the various contents of consciousness the most conspicuous are the colours we see, the sounds we hear, the odours, flavours, touches, warmths, pains and so on, that we smell, taste, or feel. These, as I have just observed, are popularly described as sensations; but to avoid ambiguity the psychologist prefers to describe them as 'sense-data' or 'sensa'. This classification, be it noted, has a physiological basis, and corresponds to the various sense organs involved – the 'gateways to the mind'. There are, however, several other senses besides the traditional five. The ear contains, not only an organ for hearing, but also an organ for perceiving changes in the position of the body: if you pivot on your toes with your head bent on your chest or a shoulder, the sensation of giddiness – the 'world going round' – will vary with the way you held your head. There are also tiny sense organs in our muscles and joints which inform us as to the position of our limbs: when you wake up in the night, you do not need to switch on the light and look in the wardrobe mirror to see how your arms and legs are placed. And in the background of our consciousness there is always a mass of vague organic sensations coming from sense organs in the heart, lungs, stomach and intestines – sometimes highly intense, particularly when we are emotionally excited or out of sorts.

Every evening you lie down in a dark and silent bedroom and close your eyes; the more obvious of your sensations are thus cut off. Yet you do not immediately drop into an unconscious sleep. In your 'mind's eye' you see mental pictures – memories of the day's events, or imaginary visions of what will happen tomorrow; you may recall the actual voice of someone you have talked to, or start rehearsing what you will say next time. These ghost-like copies of actual sights and sounds are called 'mental images'. In dreams and in hallucinatory states they may become so vivid that you mistake them for genuine sensations.

Sensations and images were the sole elements which the older psychologists commonly recoguized. Like the atoms of the chemist, these 'psychical atoms' were supposed to combine and form 'psychical compounds', and so give rise to the more complex intellectual experiences, such as observing and thinking. As I came into the room just now, I noticed an orange on a side-table. What occurred, the earlier writers world have said, was that I happened to see a circular yellow patch, shaded on one side: this sensation of colour called up in my mind a memory image of certain tastes and smells, and they in turn suggested the word 'orange', which I heard echoing in my mind's ear. These various memories, it was held, are due to an acquired 'association of ideas', that is, to more or less habitual connections linking sensations with images and images with one another – the effects of past experience on my brain. Thus, the whole process, it was argued, could be explained in purely physiological terms. A globular object on the table reflects light rays of certain wavelengths. Impinging on the retina at the back of my eye, these rays cause nerve-currents to pass up the optic nerve, and stimulate certain cells at the back of the brain; and I see something yellow. From the visual centre nerve fibres lead to other nerve cells in the centres for taste, smell, and hearing. Eventually perhaps the nerve currents reach to the motor centres; and I reach for the orange and start to peel it.

This is the traditional account of sensory perception. It contains an important modicum of truth; but it is greatly oversimplified, as we shall see in a moment. In any case, it is quite wrong to suppose that sensations and images are the only

Further examples of visual illusions ***Figure 1*** **A famous distortion-illusion in which one vertical line appears longer than the other, but is in fact the same length** ***Figure 2*** **There is no information as to which face is nearer and which is farther; the oval shape looks like an ellipse but it could be a circle** ***Figure 3*** **An impossible object which even visually is contradictory** ***Figures 4 & 5*** **Neither figure can be represented as a single object lying in space**

contents of consciousness. Looking again at the orange, I see to the right of it a large jug of water; above both, in the wall behind, there is a window between two pictures, with a view of a rose garden further away. Prepositions like 'above' or 'between', and phrases like 'to the right of' or 'further away', describe spatial *relations*; and relations are things we can directly perceive. There are other relations, still more elusive, which are usually described by conjunctions, notably logical or inferential relations, indicated by such words as 'because', 'since', 'therefore', or 'it follows that'. These too we directly perceive or apprehend. When you read the proofs of Euclid's theorems, your attention is almost wholly fixed on the relations – spatial or logical – which make up the argument.

If you glance at the diagrams that illustrate this article, what you notice are not the sensations of black and white, but the shapes or patterns – the right-angled triangle, the isosceles triangle, the square, the circle, and the still more complex little patterns that make up the letters; it is impossible to regard these as *mere* associations of sensations. When you recognize a familiar face, what you notice are not the sensations of colour, but the distinctive impression which the shapes and arrangement of the features make upon you at first glance: Alice in Wonderland even saw a grin when the cat had disappeared. It is the same with hearing: when the band strikes up with *Land of Hope and Glory*, what you listen to is the tune, not the separate sounds: with a change of key, every note could be altered, and yet, so long as the melodic pattern remains unchanged, you would probably detect no difference. What we call hunches, intuitions, impressions, are of much the same nature. They are conscious experiences, but are not themselves sensory. Thus, even in ordinary life, there are 'extrasensory perceptions'. Nor is there any sense organ for pleasure or its opposite; nevertheless these too are distinctive types of feeling.

Transitory though they usually are, all these experiences are unquestionably real. Yet they do not form part of the real world as the physicist understands it. His world consists of hypothetical entities, like atoms, or the protons, electrons, neutrons which make up the material atoms, and certain forces or forms of energy, existing in a three-dimensional space, and constantly changing with the passage of time or, as some would prefer to say, arranged in a four-dimensional relational scheme termed 'space-time'. In themselves these physical entities have neither colour, sound, taste, nor smell, though they are usually supposed to be capable of causing these experiences by their effects on a specific type of material structure, namely, the living body of a human being or another animal. An exclusively materialistic view of the universe would have to omit these conscious phenomena altogether, for, whatever else they may be, they are neither material entities nor material qualities.

So far we have considered consciousness purely in the passive sense. We have asked what precisely are we aware of. But the study of the mind must also include an investigation of consciousness in the active sense, that is, as a set of conscious processes. These are generally classified under three broad headings – knowing, feeling, and willing. In almost every concrete experience we can distinguish three main aspects – technically called the cognitive, the affective, and the conative.

Knowing, Feeling, Willing

The processes of seeing and recognizing an orange, and recollecting its taste and its name, are all cognitive processes: they are forms of knowing. But the knowledge of its existence may make me want to eat it; so I decide to put down my pen, and look for a knife to peel it; or, on second thoughts, I may decide to resist the temptation. In such a case I feel perfectly free to choose. These processes – desiring, striving, choosing, and willing – are called conative or purposive processes. If the orange tastes sweet and juicy, I shall approve of it; if it is sour and dry, I shall disapprove. Ordinarily we say we 'feel' pleased or displeased, satisfied or dissatisfied. But 'feeling' is also an ambiguous word, for we talk of feeling cold or warm, and cold and warmth are sensations. So the psychologist prefers to speak of the other modes of 'feeling' as affective or valuative processes. Purposive processes and valuative processes are of special importance because they provide the mainsprings of all motivation and of all our values. Each of these three main types of process may be further sub-classified; cognition, for example, includes not only perceiving things, but also learning things, remembering things, imagining things, inferring things, and so forth. These form distinct cognitive capacities, which in the laboratory can be tested and measured. And once again it is important to note that they are not in themselves material or physical capacities. They are capacities possessed only by those peculiar beings which possess what we call a mind.

Of all these conscious processes the one that is commonly regarded as most typical and most important is observation, that is, sense perception. Through observations carried out by the aid of our sense organs, it is maintained, all our knowledge, practical and scientific alike, is acquired. Consequently, sense perception was the earliest type of mental process to be studied experimentally; and it is the one about which we know most. The majority of the experiments have been concerned with the accuracy and limitations of the human senses. Many of them have given rise to tests in frequent practical use, as when your sight or your hearing is tested by specialists, or when engine-drivers and navigating officers are tested for colour-blindness. In the laboratory the psychologist now uses instruments of remarkable delicacy for his more precise measurements. He asks what exactly is the smallest object the average 'subject' can perceive by touch or sight, what is the faintest sound, or the smallest difference between two musical notes that he can hear, in short, what is the minimum amount of physical energy required to produce some discernible change of consciousness? One of the most striking limitations is the absence of any sense organ for perceiving electricity or magnetism. As a result few people appreciate the immense importance of the electrical and magnetic fields that surround us and are spread throughout the universe; and until quite recently the physicists themselves had not the faintest inkling of the still more powerful forces that bind elementary particles together to form an atom, and are released by the explosion of an atomic bomb. On the other hand, we are extremely sensitive to the influence of gravity and of various mechanical forces; and, from Galileo and Newton down to the middle of the 19th century, most scientists thought of the universe as simply one gigantic mechanical system.

To the evolutionary psychologist the reason for these strange limitations seems obvious. We inhabit a very unusual type of planet; most of the things which a mammal of our size, living on dry land encounters, including both food and foes, are more or less solid objects which obey the laws of gravitation and mechanics, but are almost devoid of any manifest electrical and magnetic properties. Accordingly, our senses have been evolved by natural selection to assist us in coping with this limited type of object and situation; they were not evolved to enable us to comprehend the universe as a whole. For many of the smaller mammals smell has proved to be the most useful sense; for the primates, including man, it is vision. Light, as we now know, is a form of electromagnetic radiation; but the human eye is sensitive only to an exceedingly narrow band of radiations somewhere between 10^{11} and 10^{12} kilocycles per second. Slightly slower radiations, the infra-red, may be perceived as warmth; but we have no direct knowledge whatever of the faster radiations which form 'X-rays' and 'cosmic rays', nor of the slower wireless waves now exploited by radio and television.

Is a Red Rose Really Red?

In ordinary everyday life, however, we seldom think about our actual sensations; our attention focuses on concrete things. From the construction of the eye we might imagine that what we saw was a mosaic of colours forming a complex pattern which was entirely flat, like a coloured photograph or print. But what in fact I see, or seem to see, are solid objects, existing 'out there' in three-dimensional space – a writing-desk, a table and dish with oranges, and through the window rose-trees in full bloom. Indeed, a certain school of psychologists – the so-called 'realists' – insist that the orange is really a coloured ball, that the roses are really red, and that in normal circumstances I directly perceive them as they actually are by a kind of clairvoyant insight. The physicist's account, which reduces everything to systems of atoms or elementary particles, is (so the 'realists' maintain) no more than an abstract model of the real world; and, if taken as a complete description, utterly misleading. This clairvoyance they assume to be a distinctive property of

the immaterial mind, and our physical sense organs and brain have the function, not of producing the colours we see, but of limiting our clairvoyant processes to those particular items or situations which at the moment are most likely to affect the body's welfare and survival. It would follow that the brain of the genius, who possesses rare gifts of intuition, or of the medium who claims an extra-sensory clairvoyance, is neither abnormal or paranormal, but simply a rather exceptional brain in a rather exceptional state.

The obvious difficulty which any realistic theory has to face arises from the frequency of perceptual errors and illusions. Such anomalies suggest that what seem to be direct perceptions of concrete objects are really no more than interpretations automatically imposed on our own sensations by the mind itself. Look at Figure 2 on page 2293. It is a flat hexagonal figure made up of a dozen straight lines. But you do not see it as a flat pattern; you see it as a three-dimensional cube; and oddly enough, while you watch it, it will, so to speak, abruptly turn inside out, and the point that looked nearest now seems furthest away. Here plainly the interpretation is furnished by the perceiver's mind. Or consider the four men in the centre diagram on page 2292. The one on the right looks taller than the one on the left. Yet, if you measure them, you will find they are of exactly the same height. Here the interpretation is due to the converging lines that represent the house-tops and the pavement: the illusion thus seems to result from an unconscious inference from the laws of perspective. Other illusions are due, not to unconscious logical processes, but to unconscious emotional tendencies: when over-eager or over-excited, we are apt to see or hear what we desire, expect, hope for, or dread. The effects of these unconscious influences have been noted by almost every psychologist in the past; but no one realized how frequent and how powerful they are, until Freud undertook a detailed and systematic study of their nature.

Capabilities of the Brain

For the contemporary psychologist one of the most baffling problems is to decide how far these various conscious and unconscious processes can be explained in terms of brain action. Is the brain itself capable of generating these strange phenomena, or must we after all postulate some elusive spiritual agency to account for the contents and activities of consciousness, so that the brain (in the phrase of one of the greatest brain physiologists of the 20th century) acts merely as 'an organ of liaison', linking the conscious self or mind with the physical world around us, much as a 'walkie-talkie' apparatus serves both to receive messages and to transmit replies.

Toward the end of the last century nearly every physiologist would have agreed with Huxley that consciousness is just an incidental by-product of the working of the brain, as powerless to affect his actions as the shadow of a steam-roller to guide its course or the ticking of a clock to quicken its speed. Man is no more than a complex automaton, and free will a complete illusion – a doctrine elaborated by Pavlov in his theory of 'conditioned reflexes', and later accepted by the influential school of American behaviourists: the notion of a 'ghost in the machine' they scornfully dismissed as an out-of-date superstition. It is a simple, attractive, yet highly paradoxical theory, difficult to carry over into practical life with complete consistency. In his unofficial moments no behaviourist ever treats his wife and children as mere automatic mechanisms, devoid of all responsibility for their actions.

In those early days very little was known of the detailed structure of the brain and its peculiar chemistry. It therefore seemed quite plausible to argue that the nerve cells of the brain might contain some unique chemical substance, capable of generating some equally unique type of energy, flowing up and down the nerve fibres and so producing the phenomena of consciousness. During the past 15 years or so, however, amazingly delicate techniques have become available for the investigation of the brain

G. Tomsich/Spectrum

Painting by a patient suffering from epilepsy; scientists can now excise the part of the brain responsible for producing an epileptic fit. Yet there is apparently no difference between the areas that yield consciousness and those that remain silent; it has been suggested that the brain is an apparatus 'for detecting and responding to the conscious activity of some immaterial agent', a ghost in the machine

and for the study of its chemical and electrical activities. The electron-microscope, the application of micro-electrodes and micro-pipettes, new methods of chemical analysis, and the practical skill of the anatomist and brain surgeon, have vastly increased our knowledge of the minute structure of the nervous system and of the nature of the electro-chemical processes involved. Contrary to all expectation, it now appears that the chemistry of the brain cell involves nothing that is really unique. It is just an ordinary gland-like cell with a rather high rate of synthesizing certain familiar chemical substances. Like the cells of other tissues, it is specialized for a particular purpose. Just as the function of a muscle is to contract, and thus move the jointed levers we call our bones, so the function of the nerve cell is to conduct energy: hence its peculiar elongated shape, drawn out into fibres which may be several feet long. In all living cells the electrical activity that accompanies every chemical change is intensified by any stimulus, excitation, or injury, and tends to spread throughout the cell. Thus the so-called 'nerve impulse' or 'nerve current' involves no new form of energy: it is an electrical change which travels rapidly down the membrane covering the nerve thread, and can readily be imitated by an artificial model constructed in the laboratory. The transmission of the impulse from one cell to another is effected by tiny squirts of chemical substance, similar to those secreted by certain glands. It therefore seems quite impossible to suppose that these very ordinary electrical and chemical processes could be directly responsible for producing anything so remarkable and so richly diversified as conscious experience.

Some unfortunate patients suffer from epileptic fits caused by obscure disturbances in a particular part of the brain. It is now possible to raise a portion of the skull and explore the surface of the patient's brain with an electrode until a mild fit is actually started: the part, thus found to be responsible, is then excised. The preliminary exploration can be carried out with only a local anaesthetic while the patient remains fully conscious. When certain areas of the brain are stimulated, he often reports some highly complex experience – hearing a snatch of a concert or seeing a vivid landscape; other areas never yield any conscious experience. Yet a microscopic post mortem study of human brains discloses no essential difference between those parts which do yield such experiences, the so-called 'sensory area', and those 'silent areas' which are never accompanied by consciousness. Sir John Eccles, our most eminent living brain physiologist, after years of research on the activity of the brain, considers that from its general structure it would seem to be an apparatus, not so much for generating conscious activity, but for detecting and responding to the conscious activity of some immaterial agent, which might reasonably be called a mind. It is, as he puts it, 'just such a machine as a ghost might operate'. And, taking up this cue, some biologists have argued that consciousness itself has been evolved to deal with situations too complex for a mere physiological mechanism.

What then would be the essential characteristics of such a mind? We can say little more than that it appears to be the basis of the permanent self or 'I', which serves as the subject of the verbs of knowing, feeling, and willing. Possibly during its terrestrial lifetime each individual ego or 'I' also acquires distinctive characteristics peculiar to itself – personal memories, ideals and purposes, specific types of skill, a certain temperament or character, and its own set of values. Only if that were so could we regard the abstract ego or mind as forming an individual personality. Whether or not such an individual mind or personality survives the death of its body remains a matter on which there is no decisive evidence one way or the other. The 'mind' might of course vanish completely with the dissolution of the brain, or it might be re-absorbed into some kind of universal mind. This is one of the main problems studied in psychical research. The evidence obtained seems just enough to keep the issue an open question. Certainly, no one can absolutely deny the possibility; and, in the present state of knowledge, each person's tentative opinion must depend chiefly on his philosophical or religious preconceptions. As with so many of our practical assumptions, the choice, whichever way it goes, will be a matter of faith, hope, or temperamental outlook.

PUCK

SHAKESPEARE'S PUCK in *A Midsummer Night's Dream* is the best-known literary reference to this character from folklore. Shakespeare and his contemporaries were faithful to folk tradition in their treatment of Puck, and his double, Robin Goodfellow, but at the same time, the name has certainly a wider range and more various connotations. Shakespeare's Puck was a jester and personal attendant to King Oberon, in just the same way as the poet Drayton's Puck was in his fairy tale *Nymphidia*. This aspect of Puck may perhaps be a sideline to true folk tradition, but he had retained his tricksy character; he was a shape-shifter and misleader like any other hobgoblin. He could turn into a three-legged stool or a roasted crab-apple just as easily as into a filly foal or a Will-o'-the-Wisp. He laughed at mortals and teased them, but he was not incapable of compassion or kindness, and he had his own moral standards. If he delighted in mischief, he was not malevolent.

We hear of one brownie-like task performed by Shakespeare's Puck; he sometimes 'laboured in the quern', that is helped to grind malt and meal. On the other hand he played tricks with the churning. 'Puck' and 'Robin Goodfellow' seem to be names indifferently used for the same spirit, and it is difficult to differentiate between them, though on the whole rather more domestic tasks are ascribed to Robin Goodfellow.

Both are commonly used as personal names, though occasionally we have 'pucks' spoken of in the plural. The generic term is usually hobgoblin for a spirit more friendly than the sinister goblins.

Puck and Robin Goodfellow, like all of their kind, played Will-o'-the-Wisp tricks to mislead travellers. 'Pouk-ledden' is the Midland dialect term for going inexplicably astray, and we still occasionally hear personal anecdotes of puck-leading.

In a 17th century pamphlet, *The Life of Robin Goodfellow* (1628), Robin Goodfellow is described as half-human, the child of a mortal maidservant and a fairy king. His father acknowledged him, granted his wishes and gave him the power of shape-shifting. This power is characteristic of all hobgoblins, the Hedley Kow, the Picktree Brag, the Dunny, Shagfoal and so on (see FAIRIES).

The name Puck, however, has a broader base than a single person among the fairies. There are many variants of it: the Welsh pwca, the Irish Phouka, the West Country pixies, Pug, used for small devils, and closely related to it are the Scottish buckie, the Highland bucans, bug-a-boos, boggarts, bogies and bugs, many of them more frightening creatures than Puck. Robin Goodfellow has also a fair number of variants: Robin Roundcap, possibly Robin Hood, hobs, lobs, hobgoblins, Hobthrush.

The Puritans generally held Puck, Robin Goodfellow and all other hobgoblins to be plain devils, but the ordinary countryman, though he thought them mischievous and occasionally formidable, believed that they were kindly disposed to humans, and they were on the whole beloved. There seems evidence from scattered references in the drama that Robin Goodfellow was a popular character in the Mummers' Play. His costume was a calfskin, and he carried a broom, as Shakespeare's Puck did, to sweep the dust behind the door. The clearest evidence of this is in Ben Jonson's masque *Love Restored*, when Robin Goodfellow comes in with his broom and his candles and announces himself as part of the device. There are indications also in less well-known plays, such as *Fortunatus*, *Grim the Collier of Croydon* and *Wily Beguilde*. In the crude illustrations to the pamphlets both Puck and Robin Goodfellow are generally horned, with goats' feet and legs.

His part in these ceremonial plays, the widespread linguistic resemblances and the association he was held to have with the Devil, all suggest that he was a minor god or fertility spirit, who continued to hold his place in men's hearts when his origin had been forgotten.

PUEBLO INDIANS

Pueblo life is rich in ceremonial that intrudes into almost every action of life. If the rites are performed correctly, no ill-fortune can penetrate their field of force, for ritual 'automatically sets the gods to work, automatically taps the animistic power of things'

PUEBLO INDIANS

OF ALL American Indians north of the Rio Grande, the Pueblo developed the most impressive civilization. Their culture had matured some time before the Spanish arrived to give them the name we now use (Pueblo means 'village'); and it remained at those heights in spite of later white incursions and ever-shrinking reservations. Indeed, much of the admirable culture of other south-western tribes – the Navaho especially – was borrowed from the Pueblo.

The conquistadors found the Pueblo to be agriculturally skilled, expert in crafts like pottery and weaving, and above all great builders in adobe mud and timber. They erected towering structures of many storeys – the first 'high-rise' apartment buildings in the New World. And so their houses, and the family units within them, came to be a main focal point for Pueblo life – if that sophisticated and highly intricate interweaving of activity can be said to have had a focal point.

All an outsider can do is sort out a few threads of that complex pattern, as it fans out from the centre of the individual home. For instance, Pueblo society is matrilineal, structured in terms of descent through the female line. Women hold an unusually important position in society: they own the houses, newlyweds move in with the bride's mother, and the men work in the fields – something unheard of among male-dominated Indian nations.

The unit of the village, a clutch of adobe houses, forms another pivot round which an individual's life revolves. Once there were hundreds of villages, now there are only 25 (in north-west New Mexico and north-east Arizona). The villages cluster together in accordance with tribal links – for there are five separate tribes of Pueblo Indians: Hopi, Zuni, Keres, Tiwa and Tewa.

Other social organizations cut across the family-village-tribe ties, and with these we approach the incredibly complex structure of Pueblo religion. As with many other comparatively simple societies, religious belief and practice infuses every detail of ordinary existence. When a tourist once asked a Pueblo man what his religion was, the Indian replied, 'Life'. He was not being grandiose: he merely saw no separation between religious activity and any other kind. So, while there are special religious groups cutting across the village or tribal boundaries, there are also groups with definite social functions which blend indivisibly with those of religion.

These social groups are the clans. Membership is supposedly determined by inheritance (that is, which clan one's parents belonged to) but, in fact, this common ancestry is largely symbolic: adoption is perfectly in order, even sometimes of non-Pueblo Indians. A clan will have a common name, special religious totems (animals or plants), special insignia and secret words, and specific tribal duties which mainly involve playing a traditional role in specific tribal ceremonies, separate from individual clan ceremonies.

Other rituals are looked after by several specialized religious cult groups, operating in connection with the village ceremonial centre, the *kiva* – a highly symbolic gathering place for ritual activity. Within the cults, again, there are often several 'medicine societies', smaller secret organizations even more highly specialized, with their own unique rituals, fetishes and kivas.

The cult of the *kachina* dancers comes in for much attention, probably because the gorgeous masks and symbolic kachina dolls have been more accessible to anthropologists and tourists than other more secret cult elements. The kachinas impersonate

Religious belief and practice infuses every aspect of Pueblo life; through ceremony and ritual the gods are summoned to exercise their powers on human behalf ***Above left*** **Ceremonial dress of a Pueblo at the Corn Dance Festival, at Taos, New Mexico** ***Above right*** **Children attending the Corn Dance Festival**

supernatural beings (and the impersonation can reach the level of full ritual possession); ritually disguised, they are important to many tribal ceremonies. Zuni cult members can 'dance kachina' to reinforce, say, the disease-curing cult; Hopi kachinas turn out to lead the worship at ceremonial times of year, such as at the solstices.

The Pueblo also have a delightful group of secret societies whose members are holy Fools. They perform clowning antics on ceremonial occasions, as a kind of parody of the kachinas, rich in blasphemy and violent farce. Their costumes are grotesque, their dances are involved ritual satires, they eat filth and bellow obscenities. And, it seems, they perform a much-needed function of providing comic relief from the emotional tensions that build up during a nerve-racking ceremony with all its meticulous attention to detail. They also help to purge the undeniable aggressions and tensions that must develop within the whole rigidly organized and tradition-bound Pueblo society (see FOOL).

Sun Father and Corn Mother

With all this concern for rich helpings of ceremonial, it would be expected that the ceremonies are performed almost for their own sake – not as empty rituals, certainly, yet not entirely as open-ended acts of devotion. That is, the gods and spirits do not rule, do not gaze down continually to ensure that religious and moral laws are observed. The supernatural beings seem to keep to themselves, until specifically summoned by a ceremony to exercise their power on human behalf. And if they are called properly, if the rites are performed correctly, the spirits cannot refuse to respond.

The spirits themselves occur in large quantities, often in vaguely defined and overlapping groups. The Cloud Beings are prominent, and have criss-crossing ties among various cults and societies, most obviously among the rain-makers. Other spirit groups include the Corn Maidens, the Star Spirits and Dawn Spirits, the rain-bringing Lightning (or Storm) gods who are related to the Cloud Beings.

Out of this welter of supernaturals crowded into the Pueblo environment, a few figures can be separated out as important single deities. Sun Father or Sun Old Man seems to be paramount among the Zuni; Moon and Morning Star are both High Gods (Moon is female to some Pueblo, but male to Hopi and Tewa); Corn Mother holds a dominant position among the Keres. The archetypal Twin Heroes appear among the Zuni as War Brothers, giving power to warrior societies and featuring in hero and trickster myths. Their grandmother, Spider Old Woman, is a powerful deity although she is identified with an actual creature; her power flows towards war, but in myth she is a benevolent healer and intercessor. The ubiquitous trickster Coyote also appears as an intercessor, aiding human development and, like Prometheus, bringing fire. Water Serpent, another individual animal god, is connected with flood and other watery disasters, and also in myth with fertility and sexuality.

The Indians have their share of animistic belief, attributing supernatural power to anything and everything. Stones, mountains, rivers and the like have power; they either have humanized spirits associated with them, or are 'containers' of magical power that can be tapped.

Ancestral worship, or something very like it, occurs as well: the deceased chiefs of cults and medicine societies join the Cloud People and take on supernatural aspects; enemy dead killed in war and scalped are transformed (by a scalp ceremony) into rain-making spirits; for the Hopi, just about all the tribe's dead become Cloud People. Sometimes it is said that wicked Indians will undergo punishment after death: dead witches become mere smoke, without substance, unable to join the Cloud People.

Both ghosts and witches are taken seriously by the Pueblo. Ghosts return if burial rituals are neglected, and their return (even in dreams) brings ill-fortune and omens of death. Sometimes a neglected ghost who has been sufficiently angered will attack the living; and witches too attack ordinary folk, bringing disease or death upon them. Then the curing societies

(or often the warrior societies, who police the Pueblo) go into action to counteract the malediction.

Many rituals are designed to prevent hauntings and witchery, or as curatives if the malefics get past the magical barriers. But again the intrinsic power of the ceremonial magic is apparent. If the rites are performed correctly, no kind of ill-fortune, natural or supernatural, can penetrate their force field. So we come back to the idea of ceremonial that automatically sets the gods to work, automatically taps the animistic power of things, automatically puts up the witch or ghost repellents.

Enormous numbers of ceremonies are attached to household affairs: building the house, acquiring new members of the family, receiving visitors. Whole villages turn out to perform rituals for collective activities – planting, harvesting, hunting, kiva building, road-making. Society chiefs are ceremonially installed and new members ceremonially initiated. Weather control of various kinds, and not only rain-making, demands ceremony; so do requests for better crops, more domestic animals, more babies, more prosperity. Kachina dances occur as parts of other ceremonies, or erupt on their own as special cult or clan rites.

Ritual magic is also projected into many everyday objects. Corn and corn meal, pollen, tobacco, stones and shells can be thus transformed, often as offerings to gods. Ashes protect against witchcraft, as do arrow-heads. Special beads and pigments have great power, and many of these things are used to enhance the power of the splendidly decorated prayer sticks that serve as offerings, or bearers of ritual addresses to the gods. Prayer feathers in particular may decorate the sticks, but can be used alone, perhaps worn in the hair. The sticks are carried by ritual dancers, by travellers, by cult chiefs, or are planted in sacred places.

The Shalako Festival

Pueblo ceremonial also employs powerful sticks of office, as rich in magic as a medieval monarch's sceptre. The dolls of the kachina dancers are images of someone's desire (like a figurine of a baby for a barren woman): the positive side of the black witch's wax image. Ears of corn with unusual shapes are highly-prized fetishes that accompany the dead, guard the newborn, protect cult initiates and more. Unusual stones or shells may be kept for generations as cult fetishes: petrified wood for a Keres warrior society, abalone shell for a Zuni kachina society. Complicated masks are vital in most grand ceremonials, especially for the kachina impersonation of spirits.

This is a small selection of the artefacts of Pueblo ceremonial. Still, all these objects and materials are merely, as it were, stage properties. Equally vital within a ceremony is the intricate stage management and

Kachina dancers impersonate supernatural beings in full ceremonial disguise; kachina dolls, which have been carved from cottonwood, are given to children in order to help them recognize their own tribal gods

C. M. Dixon

production of the various activities. One example is the fantastically complex and lengthy ceremonial festival of the Zuni, called 'Shalako'.

It is a hunt ceremony, relating to war, fertility and longevity as well. It also has something in common with the European All Souls ceremony for the dead. It begins soon after the winter solstice, when the paramount chiefs select the organizers and main participants (the impersonators). These people go immediately into rehearsal which, accompanied by regular ritual offerings and the like, goes on for months. The actors meet nightly, for arduous practice, throughout that period.

By early October the pace increases. Prayer sticks have been planted regularly during the intervening time, with accompanying song and ritual. Now the impersonators receive a string tied with 49 knots, one to be untied every morning. When the 40th knot is freed, the holy Fools (*koyemshi*) appear; masked, painted, joking; they pass through a ritual involving corn meal, then go into an eight-day purificatory retreat. More small-scale rituals, preparation of sacred objects and so on fill those days; fires are lit on the fourth day and lengthy prayer songs intoned. On the eighth day the masked Shalako impersonators and the local kachina dancers go into action, visiting specified houses (usually new ones, chosen for dedication) and 'blessing' them with ritual involving meal, seeds and prayer sticks.

The owners of the houses 'entertain' the kachina, and listen to a litany chant that lasts for about six hours; and the Shalako impersonators offer their own two-hour chant. A feast follows, and offerings to the dead, who are now believed to have returned, are made. The kachina then dance for the rest of the night (and sometimes the night's entertaining also includes heavy drinking and uninhibited sex). The koyemshi make the rounds of the houses, until at dawn the kachina are washed and fed and plied with gifts, and the last knot of the tally string is ceremonially untied – on a house roof, facing the sunrise.

Then the Shalako impersonators gather to race over the fields to a prepared place where they must gather up prayer sticks. They are pursued by other men: if a Shalako falls while running, ill-fortune accompanies the rite, and must later be driven out by an exorcizing flagellation. The pursuers try to strike the runners, symbolic of a hunter's kill, magically ensuring successful hunting all year. For the rest of that day, the Koyemshi move from roof to roof of the ceremonial houses, never touching the ground.

The four days that follow are filled with dancing: the kiva groups dance, the koyemshi cavort, the kachina exhaust themselves. On the last night of dancing, the koyemshi eat a ritual meal, then begin a sleepless fast (which, if broken, brings disaster to next year's crops). The next morning they play a central role in an involved ceremony where dancing interweaves with special sprinkling of meal and burial of sacred objects. At the end the Koyemshi, naked, are cleansed of their body paint by the women of the ceremonial houses, and are given gifts.

On the last day of the Shalako ceremony, all the dance groups perform exceedingly complex dances in strict accordance with tradition. Then many sacred objects including the ceremonial prayer sticks are taken (usually by the koyemshi) to the river, where they are consecrated for the dead.

In this brief space it has been possible only to give a generalized and simplified notion of the main constituents to be found in the social-ceremonial structure of the Pueblo Indians. Innumerable variations exist, from town to town and from tribe to tribe. This is not a full account, or anything like one, but more like an arch or two out of a Gothic cathedral, or a few patterned shapes from the Bayeux Tapestry. They can offer only an oblique glimmering of the richness, the density, the unimaginable intricacy, and the superbly harmonized unity of the whole. (See also TOTEM.)

Punch and Judy
Traditional puppet-show; Punch, with humped back, hooked nose and nightcap, is a mischievous bully who kills his baby, beats Judy, his wife, to death and tricks the policeman, the hangman, a dog, Death, the Devil and other characters; Punch is an abbreviation of Punchinello, a character in 17th century Italian comedy.

The ancient tombs of Westminster Abbey were originally placed there in the belief that the prayers of the living helped the dead to be purged of sin in purgatory

PURGATORY

THAT THE SANCTIONS for unjust and immoral conduct which can be imposed in this life are inadequate might occur to any thinking man. What form the penalties of another life might take would be a matter for guesswork, but that there should be some penalty seems reasonable to many who believe in the immortality of the soul (see IMMORTALITY) and who accept purgatory as a condition or place of spiritual cleansing for the dead. That there should be a restoration of the human soul to a lost integrity, where that is possible, also seems reasonable. In the *Aeneid* Virgil pictured a threefold purgation of souls that were too earthy, the elements of fire, water and air being called upon to do the work; some were seared with fire, others hung out as on a clothes-line to suffer the action of the air, and a third sort churned in a vast whirlpool. Virgil was governed by the Stoic idea that this process lasted for 1000 years and that then the life of the world began anew.

The Pythagoreans, with whose views Virgil was not unfamiliar, held that the soul at death passed upwards through the air, then through the waters above the air and finally through the atmosphere warmed by the sun, until it was deposited in the Isles of the Blest. This passage through air, water and solar radiation was looked upon as the purgation of the soul. Once in the Isles of the Blest it might be left for a time and then escorted to a still higher Elysium, or alternatively it might be sent down to join another body on earth (see REINCARNATION). The Isles of the Blest were located in the moon and disembarkation there was considered to be endangered by certain 'customs officers' who might rob the soul of its assets. Ritual acts

C. M. Dixon

There are traces in pre-Christian pagan belief of 'a condition or place of spiritual cleansing for the dead'; at the Roman Catholic Xaghra Shrine, Malta, a statue flanked by torches over the archway symbolizes purgatory

performed while on earth might be a guarantee that the soul would escape harm from these searchers.

Towards the end of Old Testament times, Jewish belief was centred on prayer and sacrifice for the dead in such cases where hope for the remission of their sins might be entertained. The famous incident of Judas Maccabeus set the pattern; after a victory he had found that some of his dead warriors had pagan amulets under their tunics. They had died nobly for the liberty of their Jewish faith, but they had also offended God by superstition or else by greed. Judas directed that sacrifice should be offered for them at Jerusalem that they might be set free from their sins (2 Maccabees, chapter 12). The book of Enoch (22.12) holds out a prospect that sinners who are themselves sinned against will not stay for ever in Gehenna with those sinners who have no such asset.

The coming of Christianity meant that the two books of Maccabees were taken over as part of the scriptures of the Church and the incident there reported was valued as precedent. Prayer for the dead (as distinct from prayer to those who had died by martyrdom) was a Christian practice from the beginning. The mention of 'the house of Onesiphorus' (2 Timothy, chapter 1) in a context where the past good works of its head are commemorated, implies that this Onesiphorus was already dead and is being commended to mercy. Inscriptions of the 2nd century ask the passer-by to intercede for the soul of the dead person who is named.

St Paul himself once indicated that he held the same belief. In 1 Corinthians (chapter 3) he speaks of the varying work of evangelists; some are good builders, others run up a shack with anything that is to hand. When a fire sweeps through the town, the good building of stone will stand, but the shack will burn, and its occupant may only just manage to get out, 'being saved as it were through the fire'. The careful evangelist is rewarded; the careless one is saved, but only just. This is an allegory of heaven and purgatory, though not a direct formal pronouncement of belief. The saying in the gospel of St Luke (12.59) about the officer of the law putting in ward the evil-doer and keeping him there till he pay the last farthing was likewise taken as an indirect way of describing the fate after death of the soul whose sin was not irremediable.

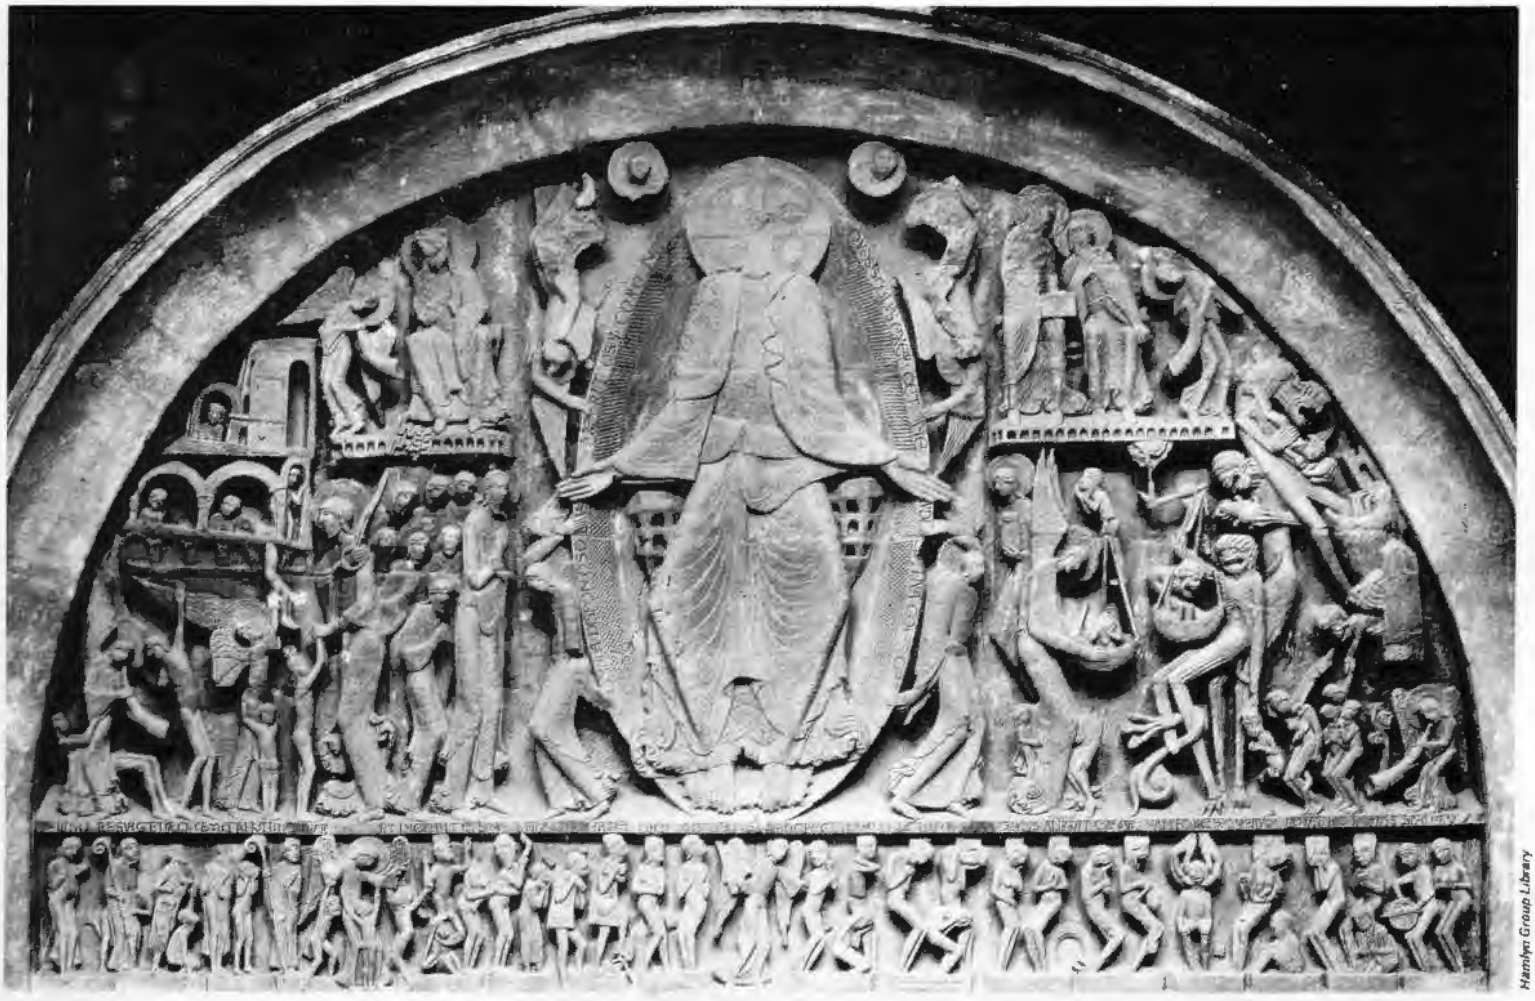
British Museum/Chris Barker

The Keys of Pardon

While urging prayer for the dead, the Church was also teaching that there were certain capital sins which, if they were not forgiven in this world, could never be pardoned. Thus the category of what came to be called venial sins (those which could be pardoned) was established, and the conclusion was reached that it was these which the living by their prayers could cause to be remitted for their dead friends. Not without a purpose did the Church at Rome substitute a feast of the *Cathedra* of St Peter for the pagan festival of the *cara cognatio* on 22 February. On that day pagan Roman families celebrated the memory of their departed relatives by setting out food for their spirits. Christians were reminded by the Petrine feast that the keys of pardon had been assumed by St Peter when he was set to guard the gates of heaven.

Infiltrations of pagan practice troubled the Christian Church from time to time, and a Gallican Church council at Tours in 567 had to forbid the practice of putting out food for the spirits of the dead on this feast. Origen included in his writings the figures of the evil 'customs officials' who wait on the boundary of the world to despoil the dead of their hard-won merits. Origen also pictured Christ as standing like another John the Baptist by the side of a river of fire, baptizing in fire those who came forward to cross the river. In a Christian poem by Commodian (c 250 AD) the myth is introduced of the lost tribes of Israel living in tranquillity across the river of Persia, with toil and death but with no disease and no sin, awaiting the end of the world.

One notable difference between Christian practice and other religions was that monarchs and other famous men sought to be buried within Christian churches, so that they might benefit after death from their being remembered by the priests praying at the altars. The Emperor Constantine set this fashion in 337, soon after the building of the first great basilicas; and the tombs in Westminster Abbey are originally due to the same motive. The



Hamlyn Group Library

prayers in the liturgy, as witnessed by the oldest of the Sacramentaries, correspond with this idea, asking for 'purgation after death' for the departed faithful. The nature of this purgation was much debated.

The institution of a system of public penance by the Church was more exactly carried out in the West, with its juridical background of Roman law, than in the East. The Western belief that a penitent who was admitted to Communion on his death-bed could work off the remainder of his public penance in purgatory was not so clearly understood in the East. At the Council of Florence (1439) the Greeks readily accepted the lawfulness of praying for the dead. After discussion they also agreed on a formulation of the expiatory character of purgatory for penitents who had not carried out their full penance. Soon after this the Western mystic St Catherine of Genoa (1447–1510) gave a new direction to theological thought by her account of her mystic experiences. She claimed that those in purgatory rejoiced at their growing awareness of the removal of all obstacles to their future union with God. Having passed beyond their period of free will they could no longer sin, and hence could not grudge the happiness of those who departed from purgatory before themselves; neither could they gloat over the thought of leaving before others, as in an earthly prison.

The *Purgatorio* of Dante (see DANTE) is a seven-storey mountain where the expiation goes on of what was due to the seven capital sins which a man may have repented

The souls of those who were not already damned beyond redemption went to purgatory; there expiation was made for past sins in the hope of acquittal at the Last Judgement *Above* 12th century relief of the Last Judgement from Autun Cathedral *Left* Illustration to Dante's *Purgatorio* by Gustave Doré: Dante bows before the angel who pilots dead souls to purgatory

Circle of Envy

My master said: 'This circle castigates
The sin of envy . . .'

I do not think that there exists on earth
Even at the present day, a man so hard
That he would not be moved by what I saw.
For when I had drawn near enough to them
So that their actions were made clear to me,
I grieved so, that the tears sprang from my eyes.
Their clothing seemed to be of coarsest
haircloth;
One leaned upon the shoulder of another,
And all of them were leaning on the bank.
Thus do the blind who beg their daily bread
Take station in the churches of indulgence . . .
And as the sun doth not avail the blind,
So to those spirits whom I have described,
The light of heaven hath here denied its
blessing:
For through their eyelids runs an iron wire,
Sewing them shut – as it is often done
To a wild falconet, to keep him quiet.
It seemed to me that I was doing wrong
To stare at others, while unseen myself . . .

Dante *Purgatorio* (trans. L. G. White)

of before death. Dante uses purgatory to read a lesson to those still alive who incline to the capital vices, very much as Chaucer's Wife of Bath said of her dead husband: 'On earth, I was his Purgatory'. St Patrick's Purgatory, the Irish penitential sanctuary on Lough Derg, became famous before Dante's time and indeed influenced him. The short and sharp penance done there was held to mitigate enormously what might await the sinner in the next life. The other great work of literature inspired by purgatory, Cardinal Newman's *Dream of Gerontius*, has through Elgar's music brought the idea of purgatory once more into the awareness of the English-speaking world from which it had so largely faded at the Reformation. The medieval painting of a weighing of souls, still to be seen in the church at Catherington in Hampshire, may owe its form to the classical picture of Hermes weighing Achilles against Memnon, but here the hand of the Virgin Mary has adjusted the arm of the balance to the advantage of the soul that is being weighed against his sins. There is a mildness about Christianity which paganism did not dare to envisage.

The pygmies have been described as 'the happiest people on earth'; untroubled by superstitious fears they live harmoniously, devoting their energies to the practical struggle for survival

PYGMIES

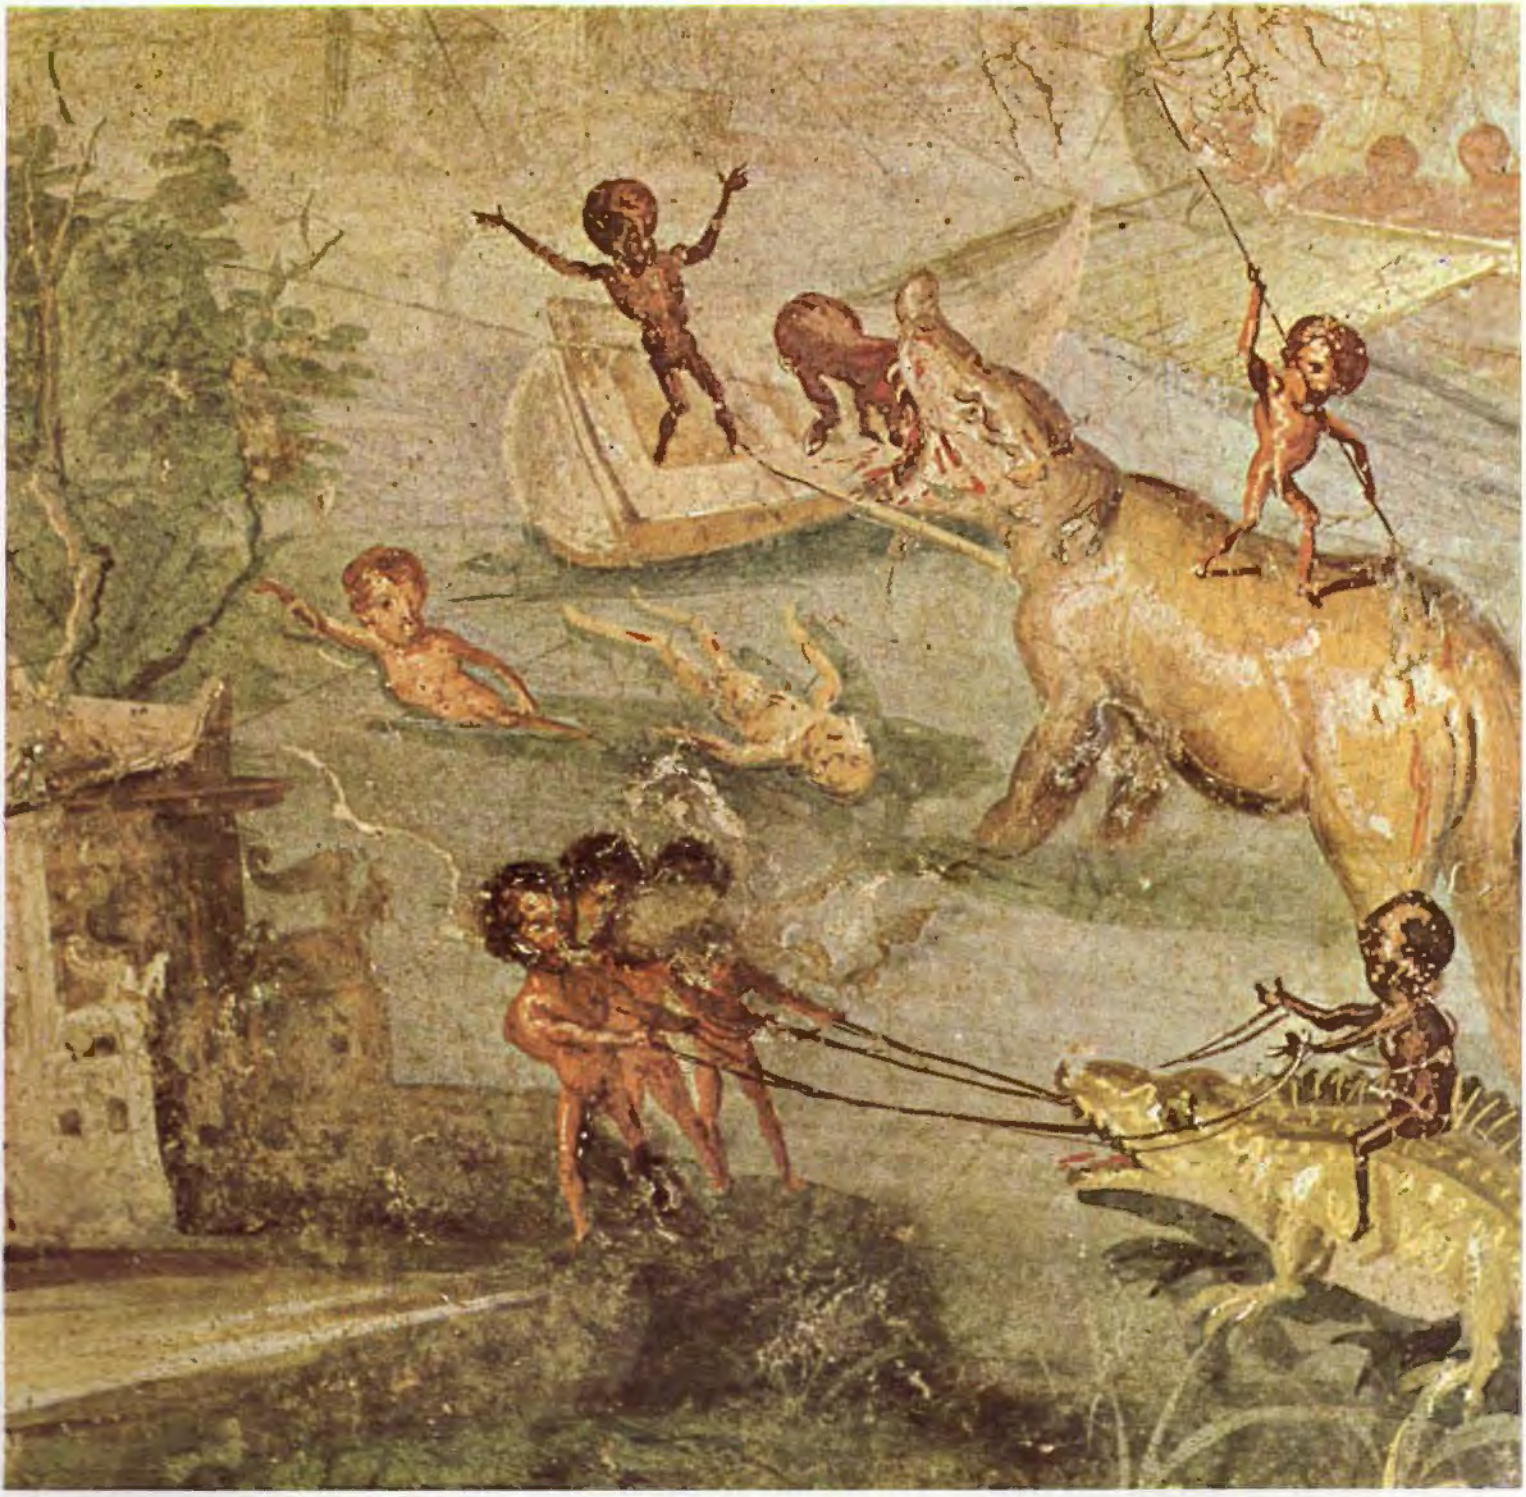
BELONGING to the smallest as well as one of the most primitive races of men, the pygmies are seldom taller than 4 feet 8 inches; they are primarily forest dwellers who survive by hunting and root-gathering. They have no settled communities, no agriculture, and cannot read or write.

The most typical of these little people are the Bambuti who inhabit the Ituri region of the eastern Congo. Here the trees grow to a height of 150 feet and are so densely packed together that they form a roof of leaves thick enough to prevent the tropical rains from reaching the forest floor. Such a forest knows only twilight by day and inky blackness by night. The silence is profound, for the animals that live in this primeval world move about stealthily, hunting and being hunted.

Deep within the Ituri forests live an estimated 35,000 pygmies in small family groups, setting up temporary shelters and always on the move in search of food. Survival, where there are none of the technical aids known to civilized men, depends on instinct. And because these African dwarfs have been so isolated from the outside world, they can truly be called 'dawn men'.

An integral part of their surroundings like other forest creatures, the pygmies have never 'invented' those gods who are supposed to control human destiny. They do not believe, for instance, in witches, evil spirits, or those taboos which are so characteristic of other African pagans.

They are not, however, devoid of some sense of the supernatural. They appear to recognize the existence of a supreme deity who is variously called Mungu and Nokunzi, although they can only describe him as another man, bigger and stronger than they are, but not particularly frightening since he is both good and bad, like any other man. He can, of course, make thunder



G. Tomsich/Spectrum

The pygmies are intrepid hunters and this early Italian mural showing pygmies hunting wild animals is not completely fanciful

and lightning, but pygmies are not alarmed by these phenomena any more than they are by the screaming of chimpanzees or the trumpeting of elephants.

The reason for these little men's absence of fear is their complete familiarity with their surroundings. They accept the dangers of the forest as they accept its protection. Living in the half-light of the almost silent world of giant trees, they have become accustomed to the mysterious, and rarely lose their nerve when something unexpected happens. To them, a sudden movement in the undergrowth does not mean the presence of a ghost, but perhaps a snake slithering across the forest floor, in which case a pygmy will dive into the leafy mould and try to catch the reptile for food.

His profound knowledge of even those creatures which civilized men regard as either dangerous or repulsive, leaves him with little time for fears or superstitions. If, while out hunting, a group of pygmies spot a python hanging from a tree, they do not beat a hasty retreat, but advance stealthily, drag the snake to the ground, drive one stake through its head, another through its body, and then beat it to death. The same evening the python will feed several families. And this snake, which is worshipped as sacred by certain West African tribes, is merely another source of food to the pygmies.

When left to themselves in the depths of the forests the pygmies are too busy staying alive to acquire anything resembling an organized religion. Even death for them is only another event in their day-to-day existence, and though they grieve for the loss of a loved one, they do not attach any spiritual significance to dying, and do not blame the gods or the malevolence of witches. They do not believe, that is, in an afterlife, but that death ends everything.

The pygmy's indifference to religious ideas undoubtedly arises from the simplicity as well as the rigours of a life which leaves him very little time for reflection. Everything about existence is, for him, a question of survival. And because women are his equals

The pygmy's hard struggle for survival leaves little time for religious activities *Above* A group of pygmies dence in a jungle clearing *Left* Pygmies armed with their principal weapon, the bow and arrow *Below* Pygmy hunter from the Central African Republic *Right* Attic vase in the form of a pygmy carrying e dead crane; classical legend tells of cranes making an annual attack on a dwarfish race of men

John Moss

in this endless struggle, men do not dominate women as in other primitive societies.

The pygmy is usually monogamous, not because there is a law against having several wives, but because in a balanced economy one wife is enough. In fact, the pygmy cannot get a wife at all unless he provides, in exchange, a woman from his own family to take the place of the girl he is taking away from her parents. Marriage is not a question of buying a wife, as in other Negro societies, but a bargain based on 'head for head'. The pygmy only gets a wife if he can offer a sister or near relative as compensation for depriving the parents of a food-gatherer and house-builder.

Nor are these little forest-dwellers troubled by complicated sexual taboos. Pygmy girls, when they come of age with their first menstruation, are not rigorously separated from the community, since blood is not regarded as an ill-omen. A girl's first period is merely thought to be the result of sexual intercourse, which is not considered reprehensible. On the contrary, this easy-going attitude gives unmarried girls the opportunity to name the boy they fancy as a prospective husband; and the coming of age is, therefore, a gay time for the girl herself, for her friends, and for the boys. The girls have considerable freedom in choosing their future husbands; and while they are permitted a certain promiscuity before marriage, they are expected to be faithful once they are wed. If a child is born out of wedlock, it belongs to the mother and her family group and will be accepted without complications. An anthropologist who admired a pygmy baby and asked who was the lucky father was told quite simply by a young man, 'We are all its father.'

One of the rare taboos pygmies tend to observe is for mothers-in-law and sons-in-law to avoid each other as much as possible. The same restriction applies to fathers-in-law and daughters-in-law. No doubt this custom is related to the universal abhorrence of incest among primitive people.

In Peace and Love

This absence of taboos, superstitions and complex tribal relationships adds up to one of the most simple and, at the same time, harmonious societies in the world. The pygmies do not have national, let alone racial, problems, since they live in small clans, or family groups, and live in peace and co-operation among each other. Serious quarrels and disorders are rare. The likeliest cause of dissension is between husband and wife if the former proves to be a poor provider. In such a case, the wife might refuse to cook for her spouse or sleep with him, and will even beat him.

Nobody, including the old and sick, needs go hungry, since all food is shared and, in general, all possessions, such as they are, are held in common. The clans exist as an integral unit, with each member of them equal to the other. There is not even a chief as in tribal societies.

Yet there are several serious crimes in the pygmy code. One is adultery, another theft, and a third violence on the part of children towards their parents. But there are no set punishments for misdemeanours, beyond the disapproval of the clan.

All these customs and practices, it should be noted, are characteristic of those pygmies who have managed to remain more or less isolated from the world beyond the frontiers of their forest homeland. But for hundreds of years now, groups of these little people have been in contact with the Negro tribes who inhabit the river valleys of the eastern Congo and Ruanda. Their contacts with white men, on the other hand, have been very infrequent, though missionaries have made some attempts to convert them to Christianity.

But where the pygmies have come into contact with Negroes, visiting the black men's villages for trading and sometimes staying long enough to become servants, they have adopted some of the Africans' traditional beliefs in magic, witchcraft and various forms of fetishism.

Typical is their acceptance of the ritual of circumcision, which is alien to the pygmy culture, but which these little people accept in order to prove that they are equal to their big black overlords. Circumcision among nearly all Negro tribes is a religious or magical cult practice, symbolic of a boy's coming of age, entitling him to be a warrior, to marry, set up house, and to have his say at tribal councils.

But, as we have seen, the pygmies are not really interested in any of these dominant male activities and only submit themselves to the operation out of pride. Their boys offer

British Museum/C. M. Dixon

C. M. Dixon

Nilotic mosaic showing pygmies on the Nile; classical writers believed that pygmies were a race of dwarfs somewhere in Ethiopia

themselves for the ceremony under the same rigorous conditions as the young Negroes. They suffer the same physical and mental tortures which always accompany this ritual. They are separated from their families, placed in special camps, deprived of food, forced to dance in crouched positions, and even beaten by their elders. After the period of initiation, they are taken to a sacred grove where they are cut. The operation is performed by a witch-doctor, and the boy is required to limp towards a log on which his companions sit. The mutilated penis is wrapped in a leaf packed with salt for hygenic as well as psychological reasons.

Sometimes the boys are danced to by witch-doctors daubed in white clay and covered with bundles of raffia, and they are sometimes made to dance themselves. In all this, a pygmy boy will make a special effort to suppress his emotions so as to prove that his people are the equal of Negroes, for while these little people are unconscious of race, they are aware of the deep difference between themselves and the rest of the world.

To the extent that they have left their forest sanctuaries to trade with and work for the more advanced Negroes, they have acquired some of the beliefs and taboos of their masters and have become conscious of the power of magic, both black and white. Yet there are still no genuine witch-doctors among them, nor do they blame sudden deaths on witches.

They remain, in fact, extremely vague in their concept of God and all those divinities, good and bad, which more sophisticated people worship or fear. Dr Paul Schebesta, who lived with them, described them as 'the happiest people on earth', even though they have no organized religion and know nothing of the blessings of modern civilization.

PYRAMIDOLOGY

PYRAMIDOLOGY means the attempt to prove a theory first proposed by John Taylor in 1859, and developed by the Astronomer Royal, Charles Piazzi Smyth, in 1864. This theory maintained that the Pyramid of Cheops (the 'Great Pyramid') was built to express a knowledge of the mathematical irrational Pi; secondly, that its measurements embodied a totality of geodesic and astronomic knowledge; and thirdly, that these measurements also embodied in cipher form prophesies relating to the events that would later form the body of the Old Testament, as well as the complete future history of Christendom up to and including the Second Coming of Christ. The fourth and final proposition was that the Great Pyramid was unique among the monuments of Egypt in that it was not constructed by the ancient Egyptians but, under divine inspiration, by a race of invaders, of whom the biblical Israelites and latter day Anglo-Saxons were the descendants.

Though the pyramids of Egypt had been a subject for speculation since the time of Herodotus in the 5th century BC, pyramidology proper was an essentially Victorian phenomenon and can only be understood in reference to its time. Buonaparte's expedition to Egypt had opened the eyes of the West to the magnitude of the civilization of ancient Egypt. The French archeologist Jean Champollion (1790–1832) succeeded in deciphering the Rosetta stone, giving access to the meanings of the hieroglyphs, and the new field of Egyptology was born.

The intellectual world at this time was split into two rough but distinct camps. On the one side the scientists and academicians; inheritors of the beliefs of the 'Enlightenment', violently anti-religious and atheistic, convinced that the secrets of the universe would shortly yield to a mechanistic Newtonian explanation, and firm in the belief that man had progressed

One of the arguments used to support the belief that the Great Pyramid was built with supernormal knowledge is that it stands on the line between the North Pole and the South which crosses the greatest amount of land

Peter Castle/Camera Press London

gradually but inexorably from savage or animal beginnings to a state of civilization.

The religious camp formed the opposition; equally violent in its belief, perhaps more numerous, but disorganized, and adhering to a form of fundamentalism, the belief in the literal truth of the Bible. A strong, specifically English and American subgroup of this movement were British Israelites (or Anglo-Israelites), believing that the Anglo-Saxon race was descended from the ten lost tribes of Israel (see LOST TRIBES), and that the specific Anglo-Saxon mission was to show the rest of the world the way into the New Kingdom upon the impending Second Coming of Christ.

In the face of accumulating geological, archeological and anthropological evidence, the fundamentalist belief in the divine creation of man in about the year 4000 BC was difficult to defend. On every front, the discoveries of science seemed to support a materialistic conception of the universe; and those that did not were ignored or, as with Darwin's theory of evolution, turned into apparent support by tacit, unanimous subterfuge.

The fundamentalists, in their way, were as materialistic as their opponents, and required some material 'scientific' proof in order to support their views. The Great Pyramid of Giza provided an admirable cornerstone upon which to build. The magnitude of this structure, its rigorous geometry, the fact that it was oriented precisely to the cardinal points of the compass, and sited to within minutes of the 30th degree of latitude; that double its height divided into the length of its perimeter gave a close approximation to the value of Pi, that amazing technical expertise had gone into the levelling of the plateau upon which it stood, and into the joining of its huge blocks of stone; all this seemed to the fundamentalists to be evidence that a mighty civilization had existed, possessed of advanced science and divine knowledge.

However, since they were reviled in the scriptures as representing all that was unholy, and shown by the new translations to have been worshippers of dog-headed gods and crocodiles, the builders of the Great Pyramid could not have been Egyptian. Charles Piazzi Smyth wrote, in *Our Inheritance in the Great Pyramid*: 'In speaking of anything in this book as simply *sacred*, I mean, to the best of my poor and limited ability, to distinguish such things as sacred to the God of Israel, i.e., to the one and only true God who liveth for ever and ever, and I have no respect of the same kind, nor similar comprehensive word, for anything attributed to the Gods of Egypt, Assyria or Babylon . . .'

It was in this climate that pyramidology was born. It was virtually complete at its inception in John Taylor's book, *The Great Pyramid; Why was it built? And Who Built it?* Among the many intrigued by this work was Charles Piazzi Smyth who, on Taylor's insistence, travelled to Egypt to take rigorously scientific measurements, no mean task at that time; and it was Smyth's book, *Life and Work at the Great Pyramid* which, with the apparent authority of science upon it, struck the public imagination.

The Pyramid Inch

Smyth's great contribution to pyramidology was the 'pyramid inch', corresponding to 1.001 English inches (the other .001 having been lost over the course of history), upon which all subsequent pyramidological prophecy was based. The subject of Egyptian weights and measures was in any event a complex one. The ancient Egyptians employed a variety of different cubits, spans, palms and digits which obeyed no discernible single standard. Thus it was in no way disturbing that no known Egyptian measure corresponded to Smyth's 'pyramid inch'; it was even used as necessary evidence to support the contention that the Great Pyramid, alone among the ruins of Egypt, had been constructed by a divinely-inspired non-Egyptian race. In 1865 another early pyramidologist, Robert Menzies, put forward the idea that prophecies and biblical history were inscribed into the Pyramid in the ratio of one pyramid inch per solar year, and pyramidology was complete.

By taking measurements of the perimeter, sides, outer courses of masonry, inner chambers, galleries and corridors, by dividing the result by certain numbers held to be significant in the construction of the pyramid, and by relating the results to biblical chronology and to the history of Christianity, exact correspondences were claimed to exist. By the same token, an understanding of the cipher was supposed to permit the making of prophecies up to the Second Coming which, following the pyramid-inch-per-year theory up the Grand Gallery, was clearly close at hand. Argument arose, however, over the method of dating; one faction maintained that the birth of Christ should stand at the starting point, so placing the Second Coming in 1911, while others decided that the starting point should correspond to the Resurrection, pushing the Second Coming back to 1936. Pyramidologists claimed that such events as the accession of the first Labour Government to power, and the Papal Bull inviting all Catholics to Rome to attend Holy Year (1924), were foretold by the divinely-inspired Pyramid builders and duly inscribed into the measurements of the Grand Gallery. Though a society of pyramidologists still exists, the movement appears to have lost most of its popular appeal.

Although orthodox authorities insist that there is nothing mysterious whatever about the pyramids, it remains possible to suggest that there is a mystery, and that it has not yet been solved. According to I. E. S. Edwards, Keeper of Egyptian Antiquities in the British Museum, 'The true pyramid was merely a representation in stone of the sun's rays shining to earth through a gap in the clouds, and by its possession the king could transport himself at will to the celestial kingdom of the sun god.' But set against the statement that 'Egypt lies in an almost rainless area, where the temperature is high by day and sinks quickly at night in consequence of rapid radiation under the cloudless sky' (*Encyclopaedia Britannica*), this conclusion seems open to question. Since the celestial kingdom of the sun god was visible most of the time, to the non-specialist it may seem odd that the Egyptians should expend such considerable time and effort emulating a phenomenon they seldom, if ever, saw.

Divine Plan of the Ages

Much and rapid travelling and unprecedented increase of knowledge are outstanding characteristics of our present day. We are therefore in 'the time of the end,' and since 1914 the Old Order is being broken up. Accordingly, the due time has come when God said He would reveal the future 'times and seasons' of His plan, hitherto concealed throughout all ages. Consequently, the major matters in the Book of Daniel and other prophetic Books of the Bible have been revealed right on time, and in addition, like any wise architect, God has disclosed where His drawings are. Moreover, these plans are portrayed on better material than paper, namely, in stone, within the largest and most substantial building in the World, the Great Pyramid of Giza – in what seems to be a most unlikely place, camouflaged and concealed, ostensibly in a pharaoh's pyramid so as to keep them a profound secret and unsuspected all down the ages till the present due time, divinely appointed . . .

It is not yet generally known that the Almighty arranged for His great and wonderful plan to be portrayed in symbols of stone long before the Bible was written. Modern discovery and research have revealed the fact that this, the World's most massive edifice, symbolically and by measurement, declares the great Divine Plan of the Ages from the beginning to the consummation.

As we can now demonstrate that the Great Pyramid was built under Divine inspiration, this fact in itself proves that God thought that it was necessary for us, therefore it does not matter what we think. It is not for puny man to begin debating with the Almighty as to whether the Pyramid is necessary or not if God Himself in His infinite wisdom sees that it is necessary. Had it not been necessary God would not have had it built. Therefore if we ignore or neglect the Pyramid in these perilous days at the close of this Age we will miss something valuable which God has specially provided for us in this day and generation. The Great Pyramid displays the Christian religion upon a scientific basis in response to the scientific appeal of our age.

Adam Rutherford *Pyramidology*

Camera Press London

Pyramids
Structures of stone or brick with a rectangular base and four triangular sides which slope inwards and meet at an apex: the most famous are those of ancient Egypt, which were royal tombs; the Great Pyramid at Giza has been described as 'perhaps the greatest single building ever erected by man' and has attracted the speculations of pyramidologists: there are also notable pyramids in Central America.
See PYRAMIDOLOGY; RELIGION.

Pyramid Texts
Texts containing myths, burial rituals, hymns, incantations, prayers and magic spells, inscribed on the interior walls of pyramids at Sakkara, near Memphis in Egypt; dating from c 2350 to 2175 BC, they are 'the earliest records we have of Egyptian thought' and 'the earliest body of religious writings we have of mankind as a whole'.
See BOOK OF THE DEAD.

The doctrine of Pythagoras placed a special emphasis upon the significance of numbers as symbols of cosmic principles, discerning a mathematical system in the apporently disorderly universe

PYTHAGORAS

G. Tomsich

THE DISCOVERIES attributed to Pythagoras, the Greek mystic, mathematician and philosopher, in the fields of geometry, music and astronomy have had a major influence in Western history, yet he left nothing of his own in writing. He was born c 580 BC and died c 500 BC. The details of his life and of his doctrine are known only through followers, detractors and commentators.

A native of Samos in Greece, son of Mnesarchus, an engraver or merchant, Pythagoras studied with various Greek masters. He won the heavy-weight boxing championship in the 48th Olympiad, and then set out upon long journeys, some of which are almost certainly fabrications of his followers. Although the Pythagorean doctrine of the transmigration of souls and reincarnation bears much resemblance to Indian doctrines, the accounts of Pythagoras having spent years studying with the Brahmins in India are probably false. It is also extremely unlikely that he travelled to Britain and studied with the Druids. But it is highly probable that much of his time was spent travelling throughout the Near East, learning from the priests of the temples of Egypt and Babylon.

The extent of the knowledge he brought back from these travels has always been a controversial subject. It is usual to discount those ancient sources which claim that Pythagoras was principally a transmitter of ideas rather than their discoverer, not because there are facts to support this view, but largely because Western scholars prefer to believe that all pre-Greek civilization was primitive — although technically and artistically accomplished – and devoid of mathematical, scientific, philosophical or astronomical knowledge. Recent work, however, has shown that certain discoveries invariably attributed to Pythagoras – such as the 3,4,5 triangle – were known in Egypt and Babylon, which again raises the question of sources. It is no longer improbable that, as the philosophers Porphyry (c 233–308 AD) and Iamblichus (c 250–325 AD) maintained, Pythagoras learned his geometry and astronomy in Egypt, and his astrology and science of numbers in Babylon and Phoenicia.

Returning from his travels, Pythagoras set up a school or 'brotherhood' in the Italian city of Croton, dedicated to musical experimentation (he taught that all phenomena were fundamentally harmonic by nature, a view corroborated by 20th century physicists), and to the study of geometry, mathematics and astronomy, combined with a religio-ascetic discipline.

His teaching having met with enormous initial success, Pythagoras made the fatal error of attempting to carry his ideals into the practical world of politics. He succeeded in establishing a philosophical and ethical aristocracy in a number of Greek city states, but the hold was tenuous and foredoomed: the desire for external liberty and the incapacity to submit to the discipline essential to internal liberty that so commends the Greeks to the modern West asserted itself. Cyron, rejected by the brotherhood because of his violent nature, became its implacable enemy and succeeded in fomenting rebellion. In successive coups, the brotherhood lost all temporal power and ultimately, in a massacre, most of its advanced members. Thereafter, though never a secular or organized force, the Pythagorean doctrine was carried forward into Western culture by his followers. It is expounded almost unadulterated in Plato's *Timaeus*, seems to vanish for several centuries, reappears in the 1st century AD in the Neo-Pythagorean writings of Apollonius of Tyana (see APOLLONIUS), again vanishes, reappears with Plotinus, Proclus and the Alexandrine Neoplatonists (see NEOPLATONISM), and is injected into Christendom by Boethius in the 6th century AD, where its influence was strongly felt in the Middle Ages. But whereas in philosophy and literature the Pythagoreans are known, in art and architecture they are somewhat shadowy presences; their influence and knowledge is obvious but the names of those responsible for keeping the tradition alive and pure are unknown. Meanwhile, as is invariably the case, innumerable followers distorted and misused his teaching in numerology, black magic, astrology and so on.

'Number is All'

The Pythagorean doctrine resembles other mystical and religious teachings in that it held that the universe is a divine creation and that in the divine plan man was placed to fulfil a unique purpose: carrying a spark or germ of divinity within him, his role was to conquer and destroy his animal nature (the biblical Old Adam) and nurture and encourage the divine. The doctrine differed from other systems in the emphasis it placed upon number, and upon the essentially numerical disciplines of geometry, arithmetic and music. A much-quoted Pythagorean principle was 'Number is all'.

Until very recently, this aspect of the teaching was treated with little respect in the modern West. While giving Pythagoras full marks for his geometry, music and theory of the solar system, his so-called 'number mysticism' was believed to be an inherited residue of the superstitious past. It has been said that 'Numbers . . . were conceived at that early stage of thought, not as relations or qualities predicable of things, but as themselves constituting the substance or essence of the phenomena'. However,

since it is now clear that the qualitative distinctions we make between phenomena are fundamentally numerical, the Pythagorean doctrine reappears in modern dress. Our senses operate through the reception of vibrations of differing frequencies. Red is red because of its frequency or 'number', and so with every sense impression we receive without exception.

Creation was explained by the Pythagoreans as the division of the primordial unity into multiplicity and diversity. Other traditions expressed the same idea in terms of myth or legend, with deities representing the various universal principles of birth, love, strife, fertility, growth, maturity, death, renewal and so on, a mode of expression inescapably inviting embellishment and misrepresentation. Conceivably it was to avoid this danger that Pythagoras taught his disciples the numerical, geometric and harmonic bases underlying the myths. But if this was his objective, it failed: once the vows of secrecy were broken, all were free to make what they would of 'All is number'.

Numbers, to the Pythagoreans, were not abstractions as they are to us. They were symbols representing cosmic principles. Each number had a form or forms, made up of unity points, and from a study of these forms and the manner in which they generated sequences of numbers, an understanding of the underlying principles could be achieved. Thus numbers were held to be triangular, square, linear or rectangular by nature.

Though ultimately requiring complex considerations upon many levels, the whole of the philosophy of numbers flowed from distinctions originally created by the primordial division of the One into multiplicity. According to the Pythagoreans this act of genesis necessitated ten opposing categories: odd and even, limited and unlimited, one and many, right and left, male and female, rest and motion, straight and curved, light and darkness, good and evil, square and oblong.

Though at first glance a curious mixture of geometry, biology and ethics, and disparaged by scholars as based upon 'fanciful analogies', a brief geometrical demonstration can show how the Pythagoreans derived at least a few of their categories simultaneously. The number 2, the prototype 'oblong' number, was written ..

the next oblong number was 4

which generated the next, 6

Thus it may be seen at a glance that all oblong numbers necessarily generate rectangles which change shape with each step (tending toward the square but never reaching it). Oblong numbers may therefore be said to be in 'motion', 'unlimited', 'many' and by extension and application, and by analogies perhaps not altogether fanciful, 2 acquired its other properties as well.

Contrast it to 3, the first 'square' number. (Strictly speaking, 1 was not a number, but a symbol for the Absolute containing the possibilities for all numbers within it). The

number 3 generates 5

which generates 7

successive squares which, because constant in shape, may be said to be at 'rest', hence 'limited', hence partaking of the nature of 'one' as opposed to 'many'.

Upon such considerations, the Pythagoreans arrived at specific numbers and specific figures which, embodying certain principles held to be particularly important, were regarded as 'sacred'. The figure known as the Tetractys for example, representing 10 (see NUMEROLOGY), was holy because it summed up in triangular form the principles of 1, 2, 3 and 4; its internal relationships determine the musical octave, the trinity at its core is enshrined in the seven notes of the octave, the harmonic laws upon which all things come into being.

Study of the Tetractys revealed to the Pythagoreans an unfolding and rich world of meaning and significance, and bizarre as this approach may appear to us, it remains a fact that due to recent discoveries in quantum physics, wave mechanics and relativity theory, a number of eminent physicists and mathematicians have been obliged to take a position which they call 'Neo-Pythagorean'.

QUEEN OF SHEBA

WHO ACTUALLY WAS the Queen of Sheba, that mysterious oriental princess who crossed the desert to visit King Solomon? Scholars have tried to solve the enigma of her nationality, and travellers have searched for her country. But no one has yet succeeded in identifying this royal lady who, the Bible tells us, came to Jerusalem 'with a very great retinue, with camels bearing spices, and very much gold, and precious stones'.

The original story (1 Kings 10.1–13) states that the Queen came to see Solomon because she had heard so much about his wisdom; and after she had questioned him, departed, saying 'The report was true which I heard in my own land of your affairs and of your wisdom'. It is also stated that the two monarchs exchanged gifts, Solomon receiving 120 talents of gold and a great quantity of spices; and the Queen 'all that she desired, whatever she asked'.

On the basis of these few facts, an extensive mythology has grown up around the shadowy figure of the Queen of Sheba, especially in Arabia and Ethiopia, both of which countries claim the princess as their own. For a royal lady who travelled in such style strongly appealed to the oriental imagination. And in addition, a king like Solomon who was rich, wise, generous, God-fearing, and the master of a splendid harem, was the ideal monarch. It was only right and proper that two such remarkable people should come together.

In the Arab legends, the Queen is called Belkis, and her kingdom was Saba, which was situated in south-west Arabia, in the region the Romans called Arabia Felix, known today as Yemen. Her capital city was Mariaba (Marib), and here French archeologists discovered the ruins of a great palace, which was traditionally, the royal residence of Queen Belkis.

The official Arab version of the Old Testament story is found in the Koran in those chapters of the Moslem bible (sura 27, 30–31, 45) which describe the Sabaean queen as 'ruling over a people who prostrate themselves to the sun'. In other words, she was a pagan and sun worshipper, though

Scala

The Queen of Sheba adoring a bridge made from the wood of the True Cross: detail from a fresco by Piero della Francesca

this does not explain why Solomon ordered her to come and visit him. At first she was afraid to do so and sent instead a present of 6000 boys and girls, all born on the same day at the same hour.

In a later version of the legend, Solomon, who understood the language of the birds, sent his message to Queen Belkis by means of the hoopoe, who carried the letter under his wing. The message summoned Belkis to the palace at Jerusalem, a journey which was said to take seven years. But so eager was the Queen to meet the King of the Jews that she set out immediately and arrived in the record time of three years. Then the famous interview took place at which she tested Solomon's wisdom by asking him a series of riddles. Jewish legends provide us with several examples, of which this is one: 'The Queen said, "Seven depart. Nine enter. Two pour. One drinks." Solomon replied, "Seven days represents the period of a woman's menstruation; nine months the period of her pregnancy; two pouring is a reference to her breasts; and one drinking, a reference to her baby."'

Woman of Fire

The Arab version of this famous confrontation has a happy ending, for even though Solomon accused Belkis of having hairy legs when he first met her, he did eventually marry her, presumably adding her to his collection of 300 wives, 700 concubines, and the 6000 boys and girls she had already sent him. However, he thought enough of her to bury her, when the time came, in a magnificent tomb in the city of Palmyra, which stood on the northern edge of the Syrian Desert.

The Ethiopians have an even more colourful legend than the Arabs, which explains, incidentally, their claim that their kings are descended from a union of Solomon with the Queen of Sheba. The story is told in an ancient Abyssinian book entitled the *Kebra-Nagasht*, 'The Glory of Kings', in which the Queen is called Makeda meaning 'woman of fire', an Ethiopian princess who first heard the story of Solomon's wisdom from the merchant Tamrinn, the owner of 73 ships and 580 camels.

This man had made a special trip to Jerusalem to see Solomon whose kindness to his servants and slaves impressed Tamrinn as much as his wisdom. Queen Makeda was also impressed, and decided to visit Solomon herself. After a long voyage, she arrived in Jerusalem, where the King assigned her a palace next to his own. They saw each other every day, after which Makeda returned to her palace 'full of delightful thoughts'. Each day the King sent her 45 sacks of flour, 10 fat barons of beef, 5 bulls, 50 sheep, an unspecified number of goats, deer, cows and chickens, a barrel of young wine, a half-barrel of old wine, honey and baskets of fried locusts. It is no wonder that Makeda said to her generous host, 'I would like to be one of your servants and to wash your feet, for I am overcome by your handsome appearance and by your charming conversation.'

In the meantime Solomon had said to himself, 'A beautiful princess has come from the ends of the earth to see me. Who knows if it is not God's will that she should have offspring by me?' Solomon accordingly gave Makeda a great banquet on the eve of her departure at which he plied her with highly-spiced foods – for a reason that will soon become apparent. Then he took her to her room and asked her to marry him. The princess agreed, provided he promised not to touch her. King Solomon accepted this curious condition and added one of his own: that he would not touch her, provided she did not touch anything of his, including the furnishings in the room. During the night Makeda, tormented by thirst, slipped out of bed, tip-toed across the room to the water jug, picked it up, and drank. Solomon, who was staying awake for this eventuality, immediately challenged the princess with breaking her vow. She admitted that she had done so and gracefully conceded that he was no longer bound by his oath.

The next day Queen Makeda left Jerusalem for her own capital, Aksum in northern Ethiopia, giving birth to a fine baby boy on the way. And it was this son of Solomon and Makeda who, as Prince Menelik, was the first of the royal line of Ethiopian kings, officially known from that day as the 'Elect of God' and the 'Lion of Judah'.

Quetzalcoatl

Feathered or plumed serpent god of Central America; god of the wind and the breath of life; also a culture hero and divine king, first ruler of the Toltecs, who taught men the calendar and arts and crafts; there was a legend that he would return and when Hernan Cortes, the conquistador, landed in Mexico in 1519, he was thought to be Quetzalcoatl.

See AZTECS.

Brooklyn Museum

Quicksilver

'Live silver', a name for mercury, referring to its mobility; the fact that mercury combines opposites, being a metal but also liquid, and a liquid but not wet, contributed to its particularly importaut role in alchemy.

See MERCURY.

Ronan Picture Library

'By doing nothing, the soul becomes nothing and returns to its original nature, which is God's own essence'

QUIETISM

QUIETISM in its specialized sense denotes a heretical Christian movement which came into full flower in the 17th century in Spain, Italy and especially France, although its roots stretched far back into the past. The word can also be more generally applied to any doctrine which denies the importance of the human will in the attainment of perfection, and Eastern mystical ideas, as well as Western, contain elements of Quietism.

The essence of Quietism is the belief that unity with God can only be achieved by inaction, through a state of passivity so extreme that the soul itself is annihilated; only so can it be reborn, and return to God. The Quietist's attitude to prayer, meditation and mystical exaltation is based on complete confidence in God's goodness; he adores his Creator, into whose hands he passively entrusts himself, for the best is whatever God decides.

A systematic exploration of one's conscience is the first step on the Quietist path, an often giddy descent into the self, to depths where the soul can rediscover its Creator. This is an essential feature of Quietism; the perception of God takes place beyond the realism of intellect, emotion and sense, in the depths of the self, in a vast region where the Ineffable reigns. The way there is arduous; and it is only by stripping away personality, accumulating suffering, undergoing repeated ordeals that man emerges from the chrysalis of self and is reunited with the Creator.

Descent into the Self

The first requirement of this spiritual discipline is ascetic solitude: pious habits, devout acts, prayer and even the sacraments cannot help to achieve this inner fire which is completely subjective, silent, secret. The consolations of religion cannot be offered. Prayer and confession can offer no effective relief. There is no place here for priests or spiritual mentors; the believer must proceed of his own accord to the descent into the self which will lead him to slough off the old spirit and be regenerated in the Absolute Beyond.

The second requirement is a spiritual stillness, engendering calm and bringing the joy of transcendental peace. By fusing with the divinity, the soul takes part in God's own perfection, finds pleasure there and remains as if in paradise.

'Pure love' constitutes the crowning glory of this extraordinary surge towards the vast light of divine radiance. It can be recognized by its ardour and total detachment. Step by step the Quietist comes to reject even the idea of reward. In the course of this spiritual shedding of the self, he renounces his place in heaven. Some even reach a state of exaltation in which they desire hell, since in accepting damnation their resignation is pleasing to God.

In the Middle Ages, the annihilation of the spirit as a way to enlightenment was recommended by such mystics as Johann Tauler (1300–61) and the great Rhenish intellectuals of the 15th century. The groups known as the Beguines and the Beghards, which grew up in Holland and Germany in the 13th century, not only rejected spiritual effort but sought to free themselves of the burden of all moral responsibility, on the grounds that what happens to the passive believer, including temptation and 'sin', must be what God wills.

A strong stand was taken by the Council of Vienna in 1311, which denounced teachings of this sort as attempts to establish that man represents God's work and is equal to him, without responsibility, without sin, and not subject to the Last Judgement. It considered that the doctrines would give rise to secular apathy, with grave consequences, and that to support them would bring about schism. The Council's decrees were carried out by the Inquisition and the heretical movements were persecuted. In 1329 certain ideas advanced by the great German mystic Meister Eckhart were condemned for their Quietist tendencies (see ECKHART).

The Void of the Will

Despite the Church's attitude, a vein of Quietism is to be found in the teaching of many saints, a number of whom fell under the Church's suspicion before they were canonized. Theologians have noted Quietist traits in St Anthony, St Clement, St Dionysius the Areopagite, St Augnstine, St Catherine of Genoa, St Catherine of Siena, St John of the Cross, St Teresa of Avila, St Francis de Sales and St Jeanne Françoise de Chantal. They are also to be found to a marked degree in the mystical breviary, *The Imitation of Christ*, attributed to Thomas à Kempis.

These great mystics declared themselves devotedly passive in their perception of the Divine. In her ecstatic incantations, St Catherine of Genoa extolled Pure Love, self-sufficient and self-destructive, and the need to return our Creator's love for us, as Pure Love springs from him. She declared: 'My being is God' and, what disturbed the authorities, 'My Self is God, and I recognize no other Self than my God.' Introspection thus reveals God within us; God becomes our self; self equals God.

St John of the Cross (see JOHN OF THE CROSS) went further in his rejection of mental activity. He extolled 'the void of

the will', and was nicknamed 'the Doctor of Nada' or 'nothingness'. He was imprisoned in Toledo, and there his visions were renewed to the point of ecstasy. During this time he described his soul as being 'alive with love' and moved by 'the love of God to the point of total self-contempt'.

St Francis de Sales (see FRANCIS DE SALES) preached that every believer should in his daily life give himself up to the fires of the religion of Pure Love, and extolled obedience, simplicity and self-denial through love of Christ, as the only virtues. 'One loves nothing if not out of love for God's will.' Thus it is God's will which inspires and directs us.

It is clear that this view reveals traces of Quietism. It was St Francis who launched the controversial doctrine of disregard of the self, taken to the point where hell is preferable, if such is God's will, to heaven, if he does not will it. True self-denial concentrates on renouncing heaven and scorning the rewards of virtue. The Christian should not be prey to any anguish; even the fear of sin should not exist for him. The achievement of self-perfection is better than the quest for salvation.

St Jeanne Françoise de Chantal, companion of St Francis de Sales and follower of St Teresa, taught that in order to be known by God, and God alone, complete submission to all that God wills must be cultivated, even if this means suffering, insult and humiliation. She said, 'I have often said to our Lord, in the midst of my labours, that if it pleases him to assign hell as my resting place, providing he ordains that my being there will not insult him and that my eternal torment will be to his everlasting glory, then I shall be content, and he will remain my God for ever.'

The Complete Surrender

In the 17th century, the Roman Catholic Church, caught between the Reformation and Jansenism, saw itself attacked for the barren formality of its rites, the cold-heartedness of its theologians, the spiritual impoverishment of its monks. Anxious to prevent schism, and firmly opposed to the belief that an individual could have direct contact with God without the intermediation of the Church, the authorities harassed the followers of the Quietist leaders Juan Falconi in Spain and Jean de Bernières and François Malaval in France. After Malaval had openly advocated the surrender of personality, abstention from good works, and the right to make one's own way to God, his books were burnt by the Inquisition and he was suspended from that time forward from pastoral duties.

Most eminent among Quietist leaders was the Spanish theologian Miguel Molinos (1627–96), who took Quietist doctrines with him to Rome, where they met with considerable popularity among bishops and cardinals, and even with the Pope himself. His success aroused the hostility of the Jesuits, who instigated his arrest and trial on charges of heresy; he was sentenced to life imprisonment.

Molinos preached that the powers of the soul must be eliminated; the will to act offends God. One must surrender completely to him, like a lifeless body. Good works hinder the achievement of perfection; by doing nothing, the soul becomes nothing again, and returns to its original nature, which is God's own essence; this conversion makes it divine. The soul must not seek to find God, nor think of reward or punishment, death or eternal life. We must return to God our power of free choice and accept his divine will. Any request is a sign of imperfection.

Fénelon and Mme Guyon

There is only one path to mysticism, says Molinos, the inner path. Pious words are superfluous; prayer demands silence. Any deliberate act towards Christ, the Virgin or the saints is reprehensible. God and God alone should fill our hearts. The violence of our temptations is a liberating force and Satan must be allowed to have his way with us, as God wills. Church and bishops have no warrant to direct the soul's inner existence.

It was in France that Quietism entered its

The Quietist principle is that the believer must surrender completely to God, like a lifeless body: two symbolic pictures illustrating passages from the Bible, from *L'Âme amante de son Dieu* by Mme Guyon *Left* 'Lord, all my longing is known to thee, my sighing is not hidden from thee' (Psalm 38) *Right* 'Wretched man that I am! Who will deliver me from this body of death?' (Romans 7.24)

final and most controversial period, in the second half of the 17th century. A French widow, Mme Guyon (see GUYON) wrote a number of influential mystical works of a Quietist nature, and devoted herself to travelling through Europe on an evangelical mission.

Among her converts, who included a number of highly-placed persons, was Fénelon, Archbishop of Cambrai. Fénelon was dazzled by her doctrines and believed her to be a saint and to have supernatural powers, but the Church considered her a dangerous and heretical nuisance. First arrested in 1688, Mme Guyon was again sentenced to imprisonment in 1695. Fénelon did his utmost to save her and himself undertook her defence. His principal opponent was the influential Bishop of Meaux, Jacques Bossuet.

Bossuet attacked the extravagances of Quietism, scorning Mme Guyon's visions, dreams, premonitions and fits of delirium and ecstasy. Fénelon answered by setting out his mystical principles in his *Maxims of the Saints*. Bossuet maintained that Fénelon's Quietist views were inconsistent with Christianity. The theological quarrel became a personal battle, full of acrimony, and the court at Versailles was gripped by this dispute between two men prominent in the Church.

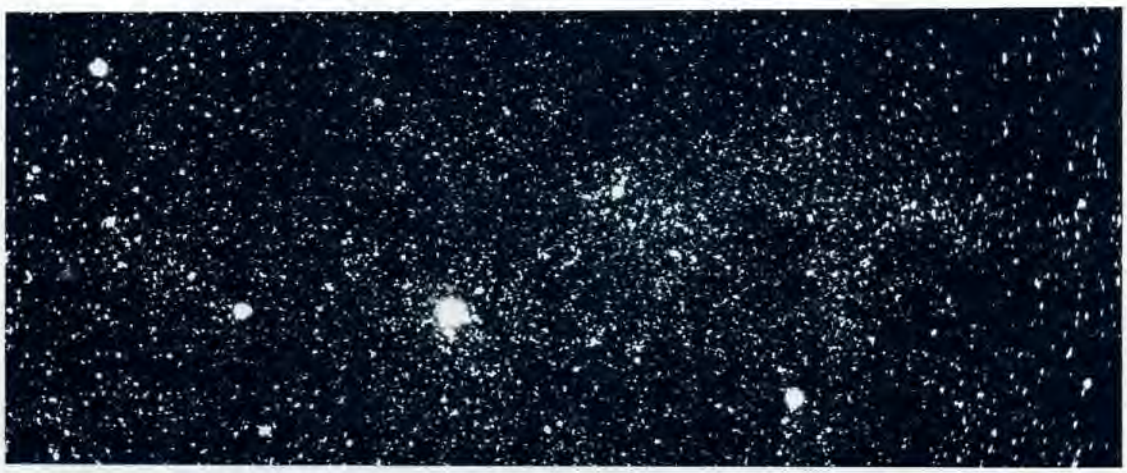
The joust continued for several years. Fénelon appealed to the Pope for a verdict, but at the same time a political intrigue developed, in the course of which he was ousted from the favour of both Louis XIV and Mme de Maintenon, secret wife of Louis and former follower of Mme Guyon.

The King demanded action from the Pope and insisted on a severe sentence on the grounds that law and order in France were threatened. The Pope delayed his decision, unable to conceal his sympathy for Fénelon, but in 1699 he reluctantly condemned *Maxims of the Saints*. A papal letter was issued, criticizing 23 chapters of Fénelon's work which were said to be redolent of Quietism. Fénelon bowed before this condemnation, withdrawing to his diocese and remaining there until his death in 1715. Mme Guyon was finally freed from imprisonment in 1702.

FRANÇOIS RIBADEAU DUMAS

Quintessence

'Fifth essence', a term used in alchemy and in ancient and medieval philosophy for a fifth element, additional to the normal four (see ELEMENTS); it was thought to be the material of which the heavenly bodies were made and to exist in latent form in all earthly things; hence the most characteristic part or quality of a thing.



Rabbi

'Master' or 'teacher', a title given to Jewish teachers and scholars; the rabbi officiates at services in the synagogue or temple and his chief function is to expound the Jewish religion, but he is not a priest and little remains in Judaism of the old hereditary priesthood; a rabbi should receive ordination, or formal authority to act as a rabbi, which traditionally may be conferred on him by any recognized scholar but in practice is normally granted by his theological training school.

See JUDAISM.

Keystone

Rabbit

Animal to which many hare beliefs have been transferred; a rabbit's foot is a lucky charm; the first day of a uew moon should be greeted with a shout of 'Rabbits' or 'White Rabbits' first thing in the morning, before any other word has been spoken, and some consider it necessary to shout 'Black Rabbits' last thing the night before; in America the Easter Rabbit has replaced the Easter Hare of Europe as the producer of Easter eggs.

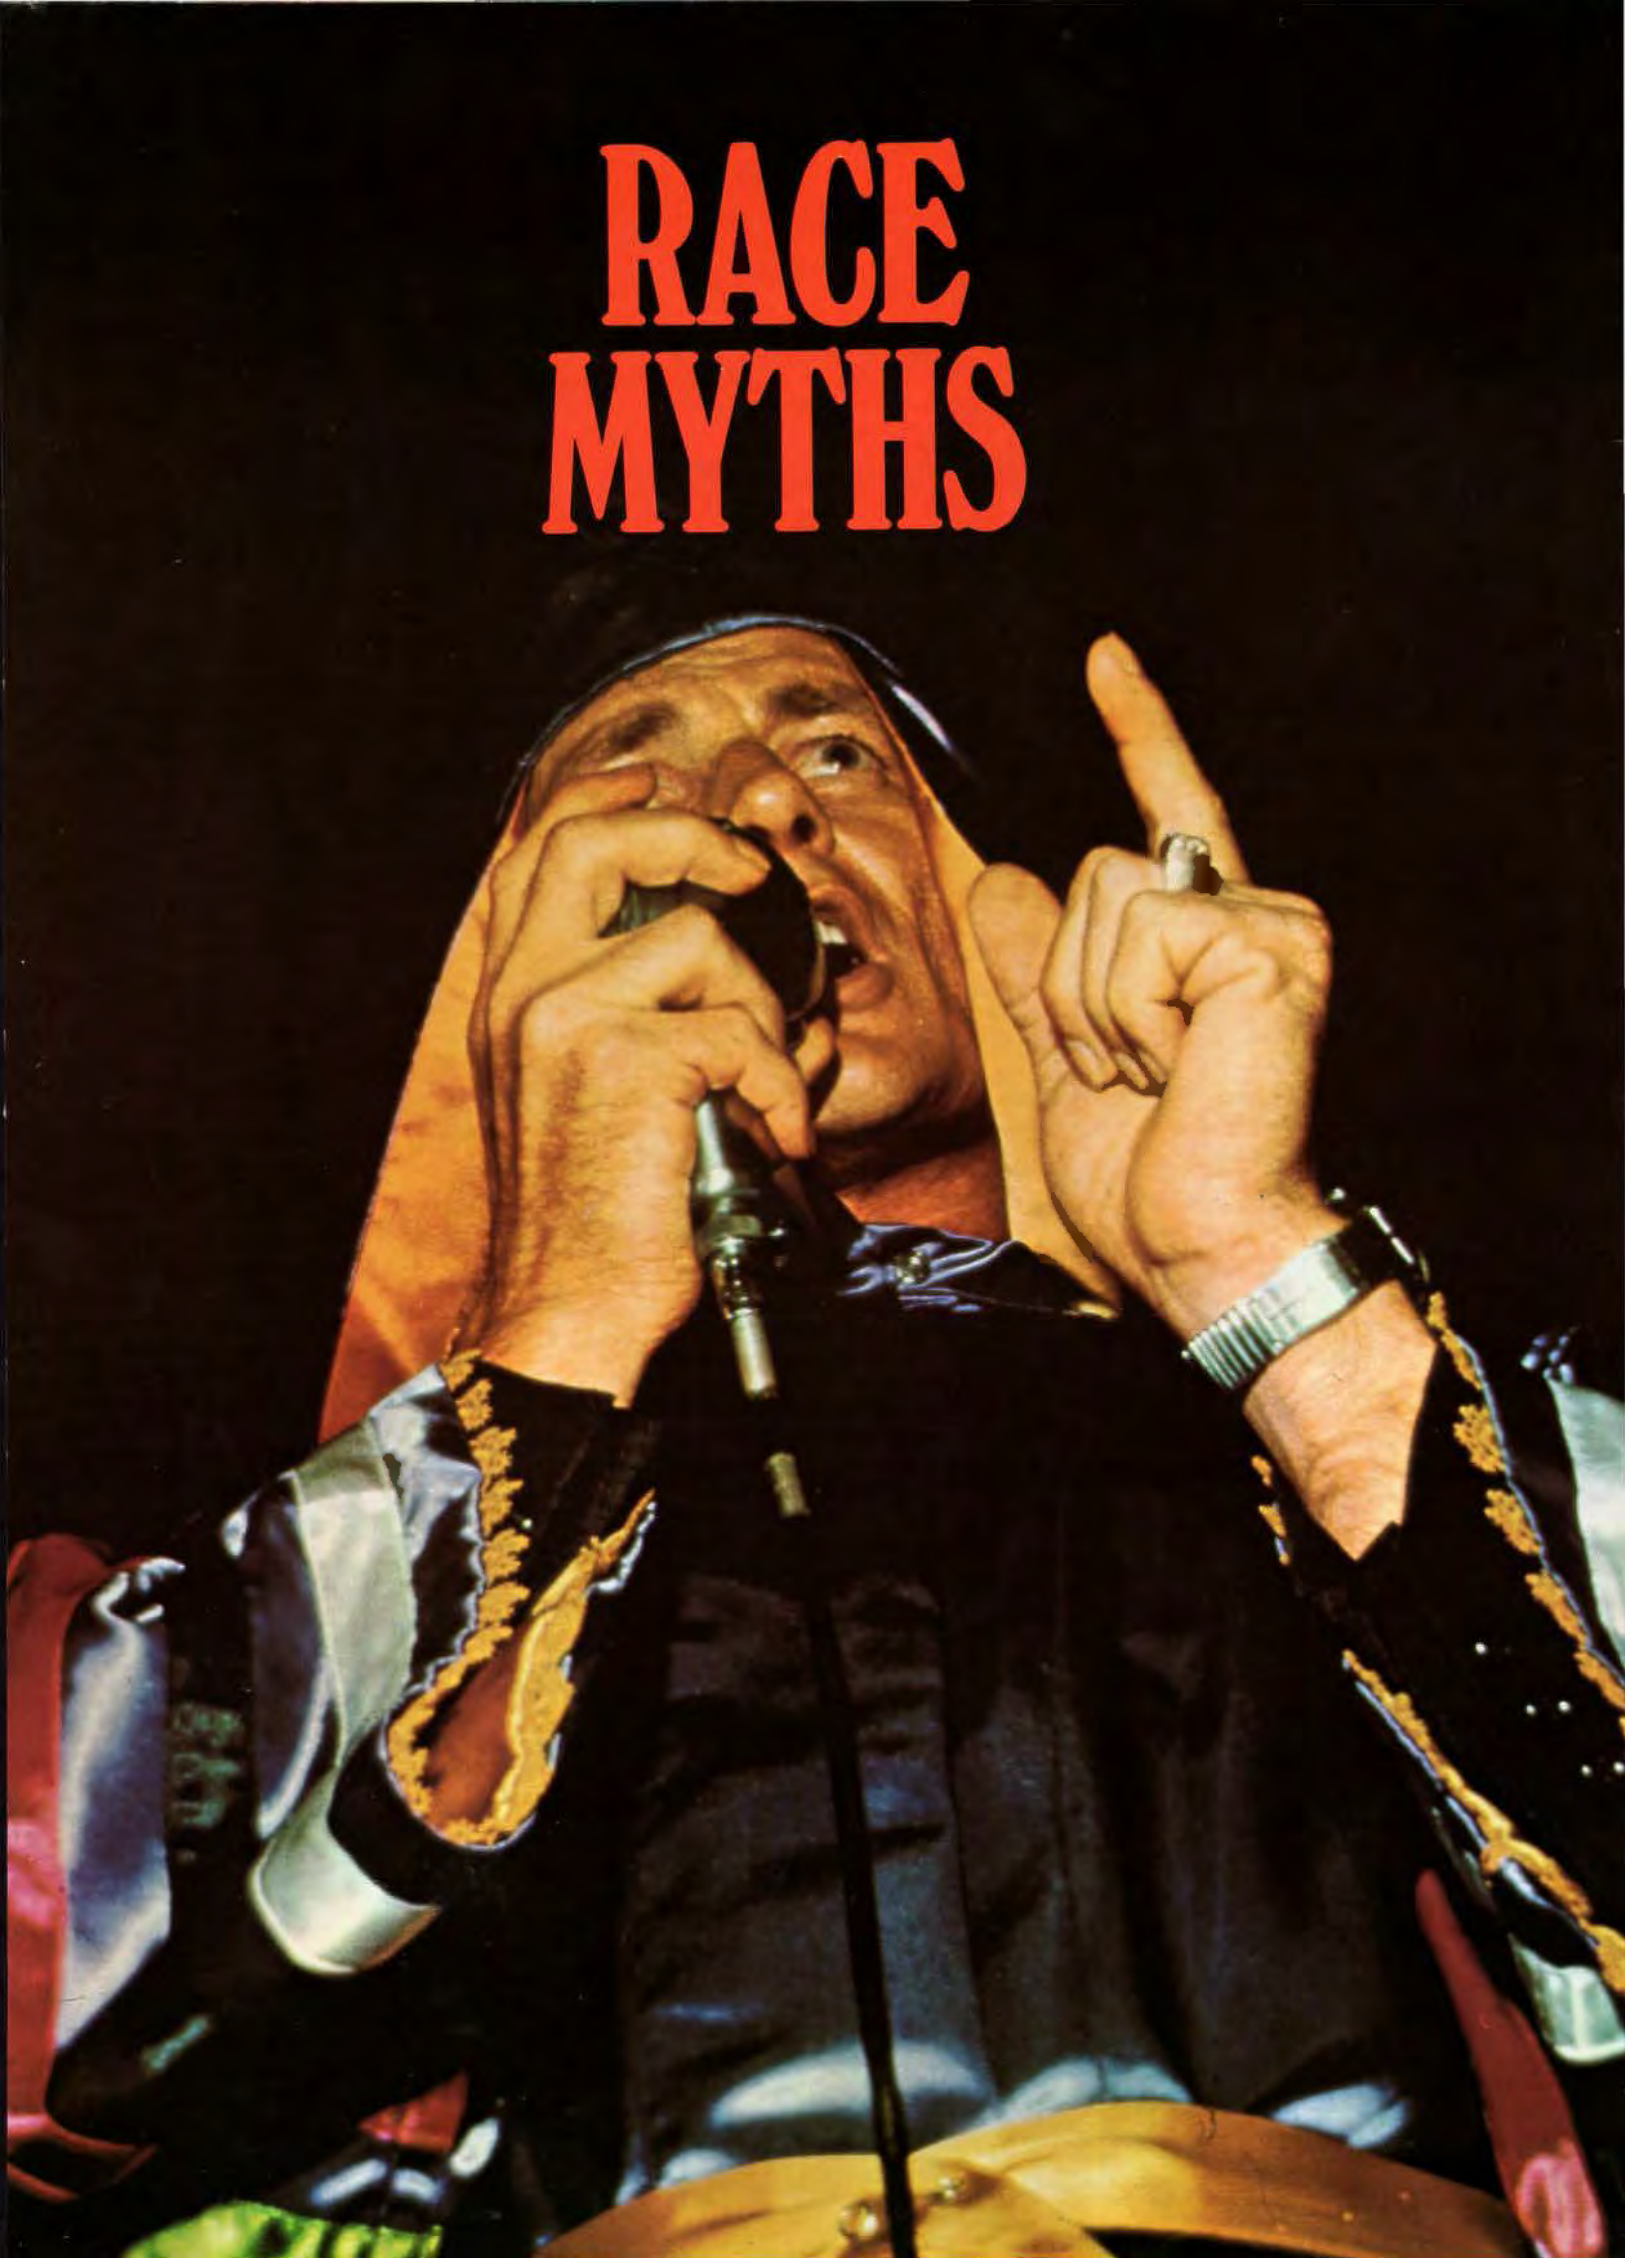
RACE MYTHS



Popperfoto

Race hatred has its origins in the irrational depths of the mind; the farrago of nonsensical myths which have grown up around the African and the Jew would be ludicrous, if they were not tragic

'PEOPLE WILL USE such a word as race in the loosest manner,' wrote H. G. Wells, 'and base the most preposterous generalizations upon it.' These generalizations are the misconceptions, fallacies and distortions of bigotry, the myths of race prejudice – myths in the sense of lies, not in the sense of illuminating containers of spiritual truths. In spite of all their contradictions and absurdities, they are attempts to rationalize the wholly irrational fear and loathing some people feel for members of other races.

In its colloquial uses, the word 'race' itself is often misconceived and distorted. It is useful as an abstract concept, when considering the broad history of mankind. It is less useful as a device for classifying modern man in terms of inheritable racial homogeneity.

Certainly it is wrong to speak (as many do who should know better) of a British or German or Scandinavian or Welsh *race*. These groupings and others like them are ethnic or national or linguistic; they have nothing to do with hereditary homogeneity. So, too, there never was an Aryan race, in spite of Nazi propaganda. 'Aryan' is a linguistic term describing a group of related ancient languages.

But the mythic idea of racial purity remains in our language, symbolically potent. So does the related idea that racial characteristics exist, like flotsam, in the *blood*. This notion recalls ancient beliefs in the magical qualities of blood; it predates genetics, and its hold on our imaginations and subliminal mental processes remains strong. 'Blood will tell,' we say – meaning that if a person has 'foreign blood' in his veins, that inheritance will eventually show up in his actions.

And so bigots insist that blood can be racially tainted. One drop of Negro blood, on this view, makes a person a Negro (or, in South Africa, a Coloured). Oddly, one drop of 'white blood' in a black man's veins does not have the reverse effect.

This line of thinking – which is not really thinking but subconscious reacting, to symbols of great power – goes back to a central myth about race. It began to be current in the 17th and 18th centuries, when men first thought of subdividing humanity racially; the early racists developed the idea that there had once been a Golden Age when all humanity's races were separate and 'pure'. The word 'pure' is emotionally loaded, as is its opposite in this context, for the myth adds that as time passed racial mingling occurred, leading to impurity.

From this myth grew the belief, still to be found in Europe and America, that racial intermarriage always means degeneration, which is to say pollution of the 'pure' strains. So, this belief says, the halfbreed is a poor specimen. And this in spite of the fact that the European, and the American more so, is the most complex mixture of racial heritages.

Previous page **A leader of the Ku Klux Klan addresses a meeting *Above* White women protesting against school integration in America *Right* Race is an extremely vague term and 'racial' antipathy may take as its target any foreign group, inside or outside a society, which is felt to pose a threat *Above* Segregated foot bridge in Capetown, South Africa, with signs indicating which side is for whites and which for non-whites *Below* The severed head of a Punjabi officer is displayed by Bengalis during the civil war in 1971, in which atrocities were committed by both sides**

In any case, the white racist is rarely concerned with his own racial background, as long as he can be sure that his ancestors in the recent past were all whites. He would deplore the mixing of races, the tainting of white blood with dark, because he believes the 'coloured races' to be inferior in every way – including genetically. For, from the white man's first encounter with the black man, the myth arose that the black man had reached a lower stage of evolution than the white.

The Negro tribesman met by the white empire builders was not thought merely to be culturally and technologically undeveloped. He was thought to be of another species, *homo* perhaps but not *sapiens*. Many books were written to prove this point, like one dated 1900 whose author, C. Carroll, offered 'Biblical and Scientific Proofs' that Negroes were not human but simian.

Some of these 'proofs' were probably physiological, for many supposed authorities have advanced the idea that Negroes'

John Hillelson Agency

Myths concerning the sexuality of the Negro stem from the basic belief that the black man is invariably far more sensual, less inhibited, than the white

cranial capacities are smaller than those of whites. Simple measurement disposed of that idea, but related myths persist: that Negroes are basically less intelligent, less educable.

So southern African whites assert that black Africans are incapable of learning to handle civilized benefits – such as democracy or the vote – and will be incapable for hundreds of years, or forever. In America and Britain, now and then, statistical studies purport to show that the Negro IQ is fundamentally and irrevocably lower than the white IQ. Such studies generally fail to note how social, economic and environmental differences might affect individual performances in the IQ tests.

'A Grinning, Dancing Creature'

Perhaps only the most rabid bigot today would insist that the 'coloured' peoples are literally sub-human. But some race myths or fallacies, still widespread in the 1970s, are the direct spawn of the 'sub-human' slander. Many Americans, for instance, firmly believe that all Negroes are shiftless and lazy – possibly because the idea first grew up during the days of slavery, a condition that rarely makes for cheerful and willing workers. American Indians, bitter and oppressed on their miserable reservations, come in for the same accusation – unless, like the steel-working Mohawks, they have gained fame for their labours in some specialized work. Then they are accused of trying to steal white men's jobs. That accusation is also common in Britain; indeed, English racists can often accuse black immigrants of arriving both to live off the dole and to take white jobs.

Also rooted in the 'sub-human' slander is the concept of Negroes as innately musical and rhythmic beings. The British writer Carlyle, in 1849, described the Negro as 'a merry-hearted, grinning, dancing, singing, affectionate kind of creature'. The simian implication, the Negro as performing monkey, is clear. For decades Hollywood perpetuated this myth, as it perpetuated the idea that all Negroes were incredibly superstitious. This notion grew mainly out of the Christian view of African 'heathen' religion as superstition, and was strengthened when the altered remnants of that religion were handed down through generations of slaves, far removed from Africa (see also AFRICA; NEGROES).

This view of Negro 'superstition' also grew from the general concept of the black man as not quite human, and so not the 'rational being' that the white man claimed to be. Again, being closer to the animal state and therefore more physically oriented, the Negro race – says another current myth – must be more athletic than the white. If Negroes take top honours in athletic competitions, the white man can assure himself that the black man has cheated – by being born athletic, while the white man must work at it.

The animalistic or sub-human myth comes out most clearly in the deeply rooted notion that Negroes smell. People who do not really think of themselves as prejudiced will mention – or complain of – this smell. And they will believe that it emanates from even the most obviously well-groomed Negro. The smell is described, often and revealingly, as 'musky' or 'an animal odour'.

In the history of race relations we might find scores of references to the offence given to Asian noses by the smell of Europeans. In the 18th or 19th centuries, European views of cleanliness and personal hygiene lagged far behind the fastidious traditions of, say, the Japanese, or high-caste Indians. Probably they still do. But no European would accept that he had a special smell, an animal odour that was ever-present however clean he was. He would call that a myth. Equally unlikely is the idea that all Negroes smell, all the time.

Sexual Jealousy

The myths concerning the sexuality of the Negro stem from the basic belief that the black man is invariably far more sensual, less inhibited, than the white. But no compliment is intended. Those who hold this belief are saying that Negroes are morally loose, degenerate, dirty – that they are animals in terms of sex as well as hygiene, physiology and the rest.

Clearly such ideas about both sex and Negroes are fed by the ugly psychological distortions, the warped puritanism, which characterize so much of the white man's thinking about sex. And people with any colour prejudices whatsoever, in this age, will share some common fallacies about black sexuality. The first of these is always that the black person is promiscuous and over-sexed.

Such sex myths have been attached, in the past, to a great many other oppressed minority groups. American pioneers believed the same thing to be true of the Indians. The British certainly believed it to be true of the real Indians, in India, failing to see the true meaning of Hindu religious eroticism. Europeans centuries ago imputed this sexual 'degeneracy' to the Jews.

If the Negro is loose and over-sexed, the myth says, then he must also be given to all kinds of unnatural practices – for the racist would not accept that the Negro could have the white man's sense of 'decency' or sexual taboos. Furthermore, these sexual race myths assert that the Negro man is himself unnatural physically – being invariably endowed with an uncommonly large sexual organ.

At this point the note of sexual jealousy creeps in. According to the myth, Negro men are highly sexed and highly virile (for a common sexual fallacy equates size of penis with potency). The Negro woman is similarly said to be compulsively sexual, and innately expert. If these ideas were invariably true, and if all Negroes did lack the inhibitions, guilts and frustrations that accompany sex in many white minds – why, then the Negro would seem to be quite fortunate. So the sex-obsessed white racist had to develop another myth, to impose a few frustrations on the Negro.

The belief grew that all Negroes yearned to make love to white women – so much so that rape was an ever-present danger. Thus the white man could believe that he had something, sexually, which the black man did not have but wanted to have – the white woman. At the same time, the white racist would spend a great deal of sexual energy in pursuit of the black woman – partly to assert his dominance over the black man, partly because of the myth of the near-nymphomania of every black woman.

It has all led to a situation that is literally insane – if insanity means patterning one's life in terms of unreal, irrational fantasies. South Africa's obsession with the myth of black sexuality has led to laws against miscegenation (the so-called Immorality Law), under which a great many white South African men have been embarrassingly tried, and many harmless interracial couples persecuted. In the United States, the same obsession has led to a

John Hillelson Agency

May Day demonstration at Yale in 1970: in reaction against the stereotype white picture of the black man as a subhuman animal, black activists have built up their equally stereotyped picture of the wicked 'Whitey'

fearful history of lynchings, burnings and so on – during which the Negro victims were frequently emasculated, a clear sign of white sexual jealousy. If such violence occurs rarely today, there has been no lessening in the undercurrent of sexual-racist sickness to be found at every level of American society. Calvin C. Hernton makes the point clear when he writes that 'coloured men and women become the objects onto which all kinds of sexual derangements of the culture, as well as those of individual whites, are projected.'

But there is another broad and basic view of the Negro: in the old Christian picture of the Devil, one of his most frequent guises when appearing to humans was as a black man. The European witch trials are full of such descriptions of the Devil who, according to the 'confessions', chose to preside over the sabbaths as a black goat or as a giant, jet-black man. Other witches spoke of being tempted in lonely places by the Satanic black man. But of course black has been the dominant colour of the supernatural in any of its evil guises – black magic, the Black Mass, and so on. And in the Middle Ages the word 'black' was used synonymously with ugly, dirty, foul: black was the colour of anything considered to be offensive or bad. So when the existence of black people, who were also unclothed and heathen primitives, became known, the connection seemed obvious.

In other words, white Europe had found in the African a living embodiment of the symbolic and psychic being which C. G. Jung calls the 'shadow'. In the Jungian view, the shadow is a container for all those sordid, evil and nefarious urges that the ego prefers to repress. It is, in short, the dark side of the ego. The white man projects onto the black man all the contents of his, the white's, shadow being – the repressed fantasies and wishes, predominantly sexual, that Western civilization has for so long equated with sin.

Antisemitism

Antisemitism is best defined as an attitude of hostility which is aimed specifically against all Jews, but at the same time does not discriminate between Jews. As such it was fostered on religious grounds by the Christian Church in the Middle Ages, and on political and social grounds by various movements in the 19th century. But it was not until the 1930s that antisemitism was made a mainspring of public policy in Germany under Hitler, with the result that millions of Jews were put to death in concentration camps.

In its most extreme and terrible form, antisemitism is a modern phenomenon, hut it is one which has very ancient roots. Although the fact that the Jews have always been a minority in Christendom has been the most important single factor in the history of antisemitism, antisemitic tendencies appeared before Christianity.

At the end of the 4th century BC, large numbers of Jews were settled forcibly in Alexandria, and it was in that city that the first antisemitic riots recorded in history took place. This pagan antisemitism seems to have been a reaction against Jewish exclusiveness, but as the Jews, who made up one-seventh of the population, were mostly engaged in trade and finance, there were probably economic motives as well behind it.

The Romans annexed Judaea in 63 BC, and outraged Jewish feelings from the start by their disregard of Jewish religious observances. But Roman antipathy towards the Jews dated from the century before, when in 139 BC they expelled the Jewish community from Rome, probably for trying to win converts to their religion, which was incomprehensible to the Greeks and Romans. The insular, self-sufficient nature of the Jewish community has allowed myths to build up around it throughout the centuries. Hazy ideas about Jewish religious practices gave rise to the myths that Jews killed little Christian baby boys so that they could drink their blood at the Sabbath, and that they poisoned wells that Christians used. This crude type of myth, along with fear of witchcraft, has largely disappeared, though other more insidious myths endure.

One, current today, especially in Soviet Russia, assumes a vast Jewish conspiracy to take over the world, master-minded by the Elders of Zion. Those that believe this myth insist that Jews are working, in apparently innocuous ways, towards this goal.

Tacitus, writing early in the 2nd century AD, ascribes depravity and meanness to the Jews: nowadays the latter attribute is something of a cliché. It gained strength at a time when Jews were debarred from all professions but money-lending, so that they became disliked in the community and the reputation for usury was established.

The Crucifiers of Christ

In early Christian times, Jews and Christians were both persecuted by the authorities, but antisemitic sentiments were rife among many converts to Christianity, who looked upon the Jews as the crucifiers of Jesus Christ, and accused them of misinterpreting the passages about the Messiah in the Old Testament. In 325 AD Christianity became, in effect, the official religion of the Roman Empire and a new period of oppression was ushered in for the Jews.

Although the position of the Jews improved in the early Middle Ages, when the secular authorities were inclined to tolerate, and even sometimes to protect them, the 8th to the 12th centuries were a period of increasing persecution, during which antisemitism owed most of its impetus to the teaching and example of certain Christian bishops.

Church Councils in 1179 and 1215 obliged the Jews to wear a distinctive badge, and forbade Christians to lodge among

Antisemitic sentiments were rife among many converts to Christianity, who looked upon the Jews as the crucifiers of Jesus Christ

Jews. Segregation of Jews into separate quarters seems to have been first enforced in Poland, where the Church Council of Breslau decreed in 1266 that the section inhabited by Jews in Gnesen (the oldest Polish diocese) should be 'separated from the general dwelling place of the Christians by a hedge, wall or ditch'. The same Council instituted a special Jewish dress, ordered Jews to hide indoors when Christian processions passed by in the streets, and threatened Christians who had any social dealings with Jews, or bought food from them, with excommunication. The institution of the ghetto – the exclusively Jewish quarter in a town – dates from the 13th century at least, although the word did not come into use until the 16th century.

A State Within the State

The medieval period saw frequent riots against Jews and massacres such as those in Germany in 1348–49, when the charge against them was that they spread the Black Death. It was also during this period that the Jews were restricted to certain trades, such as money-lending, which greatly increased the hatred with which they were regarded by the general populace. The Jews were expelled from England in 1290, from France in 1306, and from Spain (where they had also been the victims of massacres in 1391) in 1492.

Down to modern times, the religious motive was the primary one in antisemitism, although the peculiar economic role of the Jews, for which they themselves were not responsible, was also an important factor. But in the late 18th and 19th centuries, two new developments laid the foundations of the distinctively political and racial antisemitism which has been a conspicuous feature of modern history. The first was the political emancipation of the Jews. In England the right to sit in Parliament was granted to Jews in 1858, and from 1870 they were allowed to hold cabinet rank. Jews were emancipated in France in 1791,

Black into White

All folks was born black, an' dem what's turnt white, dey jest had more sense. Angel of de Lord come down an' told de ontire bunch to meet on de fo'th Friday at de dark o' de moon an' wash deyselves in Jordan. He oxplained to 'em dat dey'd all turn white an' straighten de kinks outen deir hair. Angel kept preachin' an' preachin', but dem fool niggers didn't pay him no mind. Angel can't teach a nigger nothin'. When de fo'th Friday come a mighty little sprinklin' of 'em went down to de river an' commenced to scrub. Water was mighty low. 'Twarn't like Old Missip' – 'scusin' de Lord's river – 'twarn't no more'n a creek. You jest oughter seed dat crowd o' niggers settin' on de fence snickerin' at dem what went in washin'. Snickerin' an' throwin' slams. More niggers dan you ever see in Vicksburg on circus day.

Dem what went in de river kept scrubbin' and washin', special deir hair to get de kinks out. Old Aunt Grinny Granny – great-grandmammy of all dem niggers – she sot on a log all day long, eatin' cheese and crackers and lowratin' dem what was washin'. When fust dark come, she jumped up and clapped her hands: 'Fore Gawd, dem niggers *is* gittin' white!' Grinny Granny jerked off her head handkercher an' went tumblin' down de bank to wash her hair, an' all dem fool niggers followed her. But de water was all used up, jest a tiny drap in de bottom, no more'n enough to moisten de palms o' deir hands and de soles o' deir feet. So dat's why a nigger is white in dem places.

Folktale quoted in Erik H. Erikson
Childhood and Society

and in other European countries during the next century, although in Russia they had to wait until 1917. The second factor behind modern antisemitism was the rise of nationalism, and with it the idea that the Jews represented a 'state within the state'.

In addition the 19th century saw the rise of large industrial cities, where Jews came into prominence in banking, finance and commerce. As some professions were still in effect closed to Jews, they tended to concentrate in others, such as the law, medicine, the theatre and the Press, where they became conspicuous either through their wealth or because they were directly involved in activities which by their very nature attracted publicity. Because the old restrictions and degradations under which the Jews had laboured in the past were associated with the conservative forces in society, Jews frequently supported radical movements in politics, and were often represented in the new political parties to an extent out of proportion to their numbers in the population.

It was against this background that new antisemitic movements appeared in Austria and Germany from the 1860s onwards. In 1867 there was a move in Austria to withdraw civil rights from people who had any Jewish forbears in the previous three generations, but it came to nothing. Then, during an economic crisis, latent antisemitic feelings were stirred up by the publication in 1873 of a book by a Hamburg journalist Wilhelm Marr, *The Victory of Judaism over Germanism*. This purported to give a semi-scientific basis to certain nationalistic sentiments which were particularly strong in Germany after the defeat of France.

An antisemitic league was founded in Berlin and Dresden in 1879. This movement was supported by the political philosopher Treitschke, who appealed to his compatriots to repel 'everything which is foreign to the Germanic nature . . . Whenever he finds his life sullied by the filth of Judaism, the German must turn from it.' The movement gained considerable popular support, and bills were presented to the Reichstag calling for the expulsion of Jews from the schools and universities. Some of the more fervent antisemites included Christianity, as an offspring of Judaism, among the objects of their hostility.

In the 18th century, more than a million Polish Jews had become subjects of Russia. They were confined to the western provinces in the so-called Pale of Settlement, extending from the Baltic to the Black Sea, near Odessa. The German antisemitism of the 19th century was echoed in Russia, where the Jews were caught between the nationalistic pro-Slav sentiments of the Russian ruling classes and the discontent of the oppressed masses. Riots and massacres of Jews followed the assassination of Tsar Alexander I in 1881, and repressive measures against the Jews were enacted in the 'May laws' of 1882, when the Jews were confined more strictly than ever to the urban ghettos.

Persecution of the Jews in Russia and eastern Europe caused many of them to emigrate, chiefly to England, France and the United States. The Jewish population of France more than doubled in the last decade of the 19th century, and this alone was a great stimulus to the antisemitic movement there, which had been launched in 1885 with the publication of a sensational book by the journalist Edouard Drumont, *La France juive*, which ran through many editions. Drumont founded an antisemitic league in France and started a newspaper to propagate his ideas. One of the earliest series in this paper was called 'The Jews in the Army', and Drumont helped to create the atmosphere for the notorious Dreyfus case, in which a Jewish officer was falsely accused of espionage and served four years solitary confinement on Devil's Island.

Nazi Germany

In spite of all the propaganda directed against them, and the activities of the antisemitic leagues and other dubious political movements, the legal rights of Jews were on the whole upheld by the authorities in France, Germany and Austria before the rise of National Socialism in Germany. It was not until Adolf Hitler became Chancellor of the German Reich in 1933 that antisemitism became an official state doctrine and policy, founded on a pseudo-scientific theory of the superiority of the 'Aryan' races to other breeds, particularly the Jews.

The Nazis took their racial theories from 19th century writers such as the English-born Houston Stewart Chamberlain, who wrote a book in German of which it has been said that it first revealed the glory of Teutonism to Chamberlain's adopted people, the Germans. Under Hitler's 'Aryan Paragraph' full civil rights were granted only to Aryans – Nordic 'long-headed' citizens – and Jews were expelled at first from the German civil service, and later from all the learned professions.

As the Second World War approached, Jewish business was boycotted in Nazi Germany, and trades union officials of Jewish descent were removed from office. Many Jews fled from Germany, but millions were overtaken by the war and died in concentration camps.

Antisemitism did not disappear from the world with Hitler, however. Since the war, it has been revived in a new form in Soviet Russia, where Jews have been sentenced to savage terms of imprisonment for alleged currency offences, and where Jewish writers have been the chief victims of state censorship and persecution. In the Arab world too, a new form of antisemitism has appeared as a result of the establishment of the state of Israel in 1948. In fact, in the world at the present time, antisemitism is probably strongest in the country in which it first arose, Egypt.

The Tangled Roots

There is no simple explanation to be had of a phenomenon so pervasive and so persistent as antisemitism. In recent years the psychological basis of antisemitism has been investigated, and it has been found that antisemitic reactions are closely related to a number of other social attitudes, among which are an excessive respect for authority, an exaggerated adherence to conventions, a preoccupation with the ideas of dominance and submission, and a tendency to project one's own internal conflicts onto the outside world. But we have no means of testing these findings for past ages, and the social and economic causes of antisemitism still deserve primary consideration in any investigation of the problem.

RADIESTHESIA

THIS TERM, which will not be found even in the Supplement (1933) to the *Oxford English Dictionary*, refers to a science dealing with divining or dowsing. The practice of water divining is well known and the skill of some who do it is accepted without question (see DOWSING). This is not the case with the application of so-called radiesthetic techniques for medical diagnosis and therapeutic procedures. By and large the medical Establishment turns its back on everything relating to radiesthesia and radionics, although a few physicians believe in and practise these techniques. Nevertheless, radiesthesia is still very much a department of 'fringe' medicine.

We are asked to consider two concepts: first, that all matter radiates on its own wavelengths; and second, that living organisms, meaning human beings, animals and even plants, emit electro-magnetic wave radiations which depend for their intensity and frequency upon general vitality and metabolism, and in the case of human beings, and perhaps even animals, on psycho-physical tone.

Thus given the identification of a 'wave length' that appears on the basis of past experience to reflect some kind of pathological or psychic imbalance, the radiesthetic practitioner will attempt to correct the imbalance. This may be done by prescribing the appropriate medicines and it is interesting to note that many specialists in this field use the homoeopathic *materia medica* (see HOMOEOPATHY) probably because of the appeal of Samuel Hahnemann's law of affinities between certain drugs and the complaints which they are said to cure. Alternatively, some use radionic instruments to 'broadcast' treatment to distant patients.

For the pre-history of radiesthetic theories one must look in the direction of Anton Mesmer's concept of 'animal magnetism' (see MAGNETISM; MESMER). He believed that there is a mutual influence, carried by an all-pervading but undefined fluid, between the celestial bodies, the earth and animated bodies. Baron Carl von Reichenbach (1788–1869), a distinguished chemist who was interested in Mesmer's work, discovered what he called the Odic Force, the manifestation of matter, alive or dead, which could be seen by sensitives.

From Reichenbach we proceed to the many theories about the existence and nature of the human aura (see DOUBLE). This may be considered, perhaps, as a field of magnetic force surrounding the individual human body. Another name for it is the 'etheric body'. According to Dr H. Tomlinson, a British physician who practises radiesthesia and at the same time has a highly-esoteric approach to the subject: 'The magnetic field of the etheric is not the soul or essence of the human body – it is simply a magnetic field of influence which is detectable by the pendulum.'

The great modern pioneer of radiesthesia, especially in relation to the application of instruments to measure human emanations,

Aura of 'the Developed Man', from C. W. Leadbeater's *Man Visible and Invisible*: radiesthesia depends on the theory that living organisms emit electro-magnetic wave radiations, which can be used in diagnosis and treatment of disease

was Dr Albert Abrams (1863–1924), Director of the Medical Department of Stanford University, California, who was certainly not esoterically minded. He was one of the first physicians to turn his attention to human 'wireless waves'.

Abrams became aware of the electromagnetic waves emitted by the human body when studying spinal reflexes by means of percussion. By chance he discovered that all tubercular patients gave a dull sound when percussed at certain spots on their backs, and that this dullness was evident in all cases of tuberculosis whether or not there was a tubercular lesion at that place or not. This only occurred when the patient was facing east or west, suggesting a relationship between the electro-magnetic field of the earth and that of the individual.

Next he found that if he held a tubercular specimen, a piece of tissue, for example, over the back of the neck of a healthy person, the same dull effect happened on percussion. The next stage in these experiments was to link a patient and a healthy person by a wire. One end of the wire was placed on the patient's lesion and the other end on the cervical vertebra of the healthy person. He found that when he

percussed the back and abdomen of the healthy person he obtained the same dullness as when percussing the ill person. Hence 'waves' from the patient passed along the wire and temporarily altered the electromagnetic condition of the healthy one, who was called the 'subject'.

What was missing was a method of measuring these wave-lengths, because theoretically every disease would manifest its own wavelength. Hence a scale relating 'disease x' to 'wavelength y' was needed for diagnostic purposes. Abrams then devised a coil wound with resistances marked in ohms on it. The coiled wire resistance was interposed between the patient or the specimen, a tube containing tubercular bacilli for instance, and the 'subject'.

The next stage was to establish the necessary tables. For instance, he discovered that in cases of malaria, dullness (when percussing) occurred with the rheostat set at 32 ohms, tubercular disease was equated with another 'rate', and so on for a variety of diseases. All radiesthetic procedures, no matter whether a simple pendulum or a more complicated instrument be used, require some table of 'rates' or measuring process.

The Black Box

Since diagnosis was logically followed by therapy, Abrams experimented with a number of different drugs but was not satisfied with the results experienced. This led to his invention of the Oscilloclast, often known as 'Abrams' Box' or simply 'The Black Box'. This was a relatively simple apparatus. It was supposed to destroy infections through the application of measured vibrations, provided by a battery or mains supply, to break down the disease in the patient.

The Abrams' 'Box' proved to be a dead end, but stimulated research on the part of others, notably Dr Guyon Richards, an English physician whose instrumentation and measurement techniques were far more sophisticated. He was interested in diagnosis and did not use any apparatus for therapeutic purposes. Instead he prescribed homoeopathic remedies.

L. E. Eeman, a lay researcher, found that if a number of people are linked in a certain way with copper wire, an energy is transmitted along the wire from one person to another and that if a drug is introduced into the circuit its expected effects are experienced by those thus linked.

A later development of the 'human emanation' principle was the theory that the physical presence of the patient was not necessary. The practitioner simply has a spot of the patient's blood, or perhaps a specimen of urine, on a piece of white blotting paper. It is proposed by some that even a handwritten letter or a photograph is sufficient. Again, as in 'map dowsing', a preliminary procedure used by dowsers searching for water, oil or minerals before the actual field work begins, a chart of the organs of the body can be used to find the location of the disease.

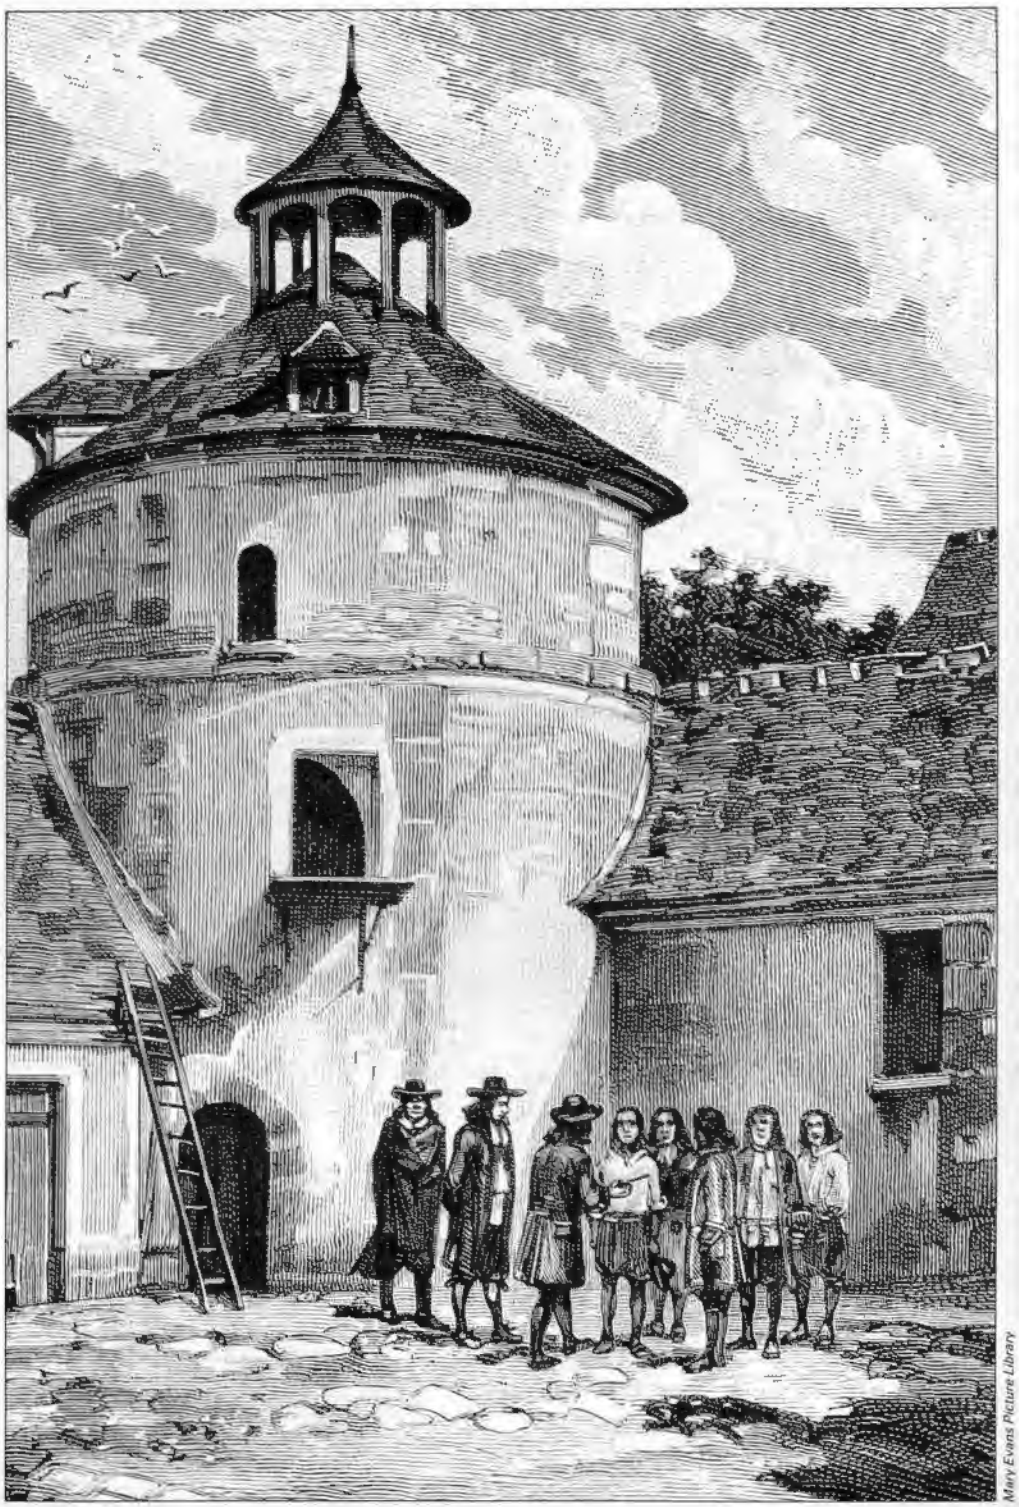
Radionics is the expression currently used for instrumented radiesthetic work. There are two kinds of instrument: those for diagnosis and those used for treatment. They are not automatic and it is said that human reaction and skill are needed for their employment.

The general principle is that the instrument is 'tuned' to the bloodspot or other sample provided by the patient and a diagnosis is then made. Specific radiations are broadcast through the ether by another instrument to the patient wherever he happens to be. Thus it is not necessary for the practitioner to see the patient, who can be thousands of miles away from him.

Among the best known radionic diagnostic instruments in current use are those devised by Dr Ruth Drown in the United States and by the late George de la Warr in England.

The de la Warr instrument resembles a fairly large old-fashioned portable radio receiver. It opens out like a suitcase. On the right above the tuning knobs, of which there are nine, there are two small cups in which blood or other samples are placed.

The diagnostic procedure is based upon finding the correct 'rate', by a process of 'tuning in' for any particular disease. Suppose, for example, that the patient is said to be suffering from a liver infection. The 'rate' in question is found in the appropriate printed table and the apparatus



Mary Evans Picture Library

Dowsing to find water is an old and well-established practice but rods, pendulums and other more complicated devices have been used to divine disease or crime, as in this picture of a thief revealed by a divining rod

is 'tuned' by setting nine different dials, accordingly. The diagnosis is confirmed or otherwise by stroking a thin rubber sheet, mounted at the base of the instrument, with the fingers of the right hand. The rubber will normally resist the movement of the fingers. The operator knows that he is on the track when he obtains what is known as a 'stick', when a crisper note or sound is obtained from the rubber strip.

The investigation is continued, using the dials in relation to more specific vibration rates and checking the results in terms of the 'sticks' obtained and the dial settings. It is claimed that a complete diagnostic picture can be achieved. No mains or battery supply of electricity is involved.

Then there are the radionic instruments used to 'broadcast' treatment to distant patients. The 'rates' are selected according to information provided by the bloodspot or other sample and the patient's progress is checked by using the diagnostic instrument. V. D. Wethered, a radiesthetic practitioner, suggests that different people appear to differ very considerably in susceptibility to radiations of this kind, some being impervious to them while others are definitely affected.

In c1938 Dr Brown invented a camera by means of which it was claimed that any part of the body could be photographed from a blood spot. Much later George de la Warr produced a camera for which similar claims were made. It is said that by photographing a homoeopathic potency of aconite, a picture of the aconite flower was revealed on the photographic plate – hence we have either a myth or 'magic' of a sensational kind. But as long as orthodox medicine refuses to investigate all the claims made on behalf of radiesthesia and radionics, the whole issue will remain doubtful.

Ragnarok

The 'Doom of the Gods', or 'Twilight of the Gods' in Scandinavian mythology, the destruction of the gods and the world by evil monsters, the forces of chaos; afterwards a new heaven and a new earth will appear, ruled by Balder and the sons of the old gods; the myth is told in the medieval Icelandic poem *Völuspa*.

See END OF THE WORLD: SCANDINAVIA.

Radio Times Hulton Picture Library

Rain

Essential for the continuance of life, and so rain gods and rain rituals are important in many parts of the world; in ancient and primitive mythology, often regarded as the emission of a sky god which penetrates and fertilizes the earth; rain-making or rain-averting magic ranges from the dropping of small images into the Tiber to bring rain at Rome, to the simple chant of 'rain, rain, go away'.

See EARTH: RAINBOW; SKY; WEATHER MAGIC.

RAINBOW

IN THE BOOK of Genesis (9.11–17), it is stated that when the waters of the Flood had abated, Yahweh made a covenant with Noah, and promised that never again would he send a flood to destroy the world. As a visible sign of that promise, which all men might see, he set a rainbow in the sky, and he said to Noah: 'I set my bow in the cloud, and it shall be a sign of the covenant between me and the earth. When I bring clouds over the earth and the bow is seen in the clouds, I will remember my covenant which is between me and you and every living creature of all flesh; and the waters shall never again become a flood to destroy all flesh.'

This is the tradition of the rainbow's origin that is known to Christians and Jews all over the world. Other men, in different regions and different ages, have accounted for its existence and its intermittent appearances in a number of ways. In some mythologies, the rainbow is a living spirit, either a divinity or a demon. In ancient Greece the rainbow goddess was Iris, the wife of Zephyrus the west wind, and sister of the dreaded Harpies. She was also the messenger of the gods. On the other side of the world, in central Australia, the men of the Kaitish tribe believed that the rainbow was the son of the rain, and that he was often the cause of drought because, as a dutiful son should be, he was always anxious to protect his father from falling down. Consequently, if a bow appeared in the sky at a time when rain was desired, it was necessary to drive it away. Sir J. G. Frazer describes in his *Magic Art* (1926) how this was done by means of an elaborate ritual. The rain-maker went to the sacred storehouse of the group and painted the holy stones there with red ochre, and poured water over them and himself. Then he painted three small rainbows, one on the ground, one on his own body, and a third upon a shield which was also marked with jagged white lines to represent lightning. The shield was carefully hidden in a safe place, so magically imprisoning the real rainbow and keeping it out of the sky, until after the life-giving rain had fallen.

Thirst of a Murderer

The Karens in Burma believed the rainbow to be a malignant and dangerous demon which could, and often did, destroy human beings by devouring their *ka-la*, or spirit. Any man who died by drowning, or through a fall, or who was killed by wild beasts, or came otherwise to a sudden and violent end, was thought to be one of its victims. When it had destroyed a person thus, it became thirsty, and was seen in the sky, drinking water. Its appearance was usually followed by another violent death, and children at play were hastily called home as soon as it was seen, lest they should be the next to fall into the demon's power.

Zulus also feared the rainbow, which they associated with snakes. It was said to live with a snake, or at least, one always appeared whenever the bow was visible. When it was seen with its end touching the earth, it was believed to be drinking from a pool. Sometimes it lived in a large pool, and men were afraid to bathe in such waters, for fear that the rainbow might seize and eat them. On dry land, it poisoned any man it met, or afflicted him with disease. If it actually rested upon anyone, that person was certain to suffer some misfortune of a serious kind.

Amongst some Polynesian peoples, the rainbow was believed to be a ladder up which heroes climbed to reach heaven. In Hindu mythology, the great god Indra, hurler of thunderbolts and lord of the storm, used it as a bow with which he shot his lightning-arrows. The same belief was held in Finland concerning Ukko, leader of the Finnish gods, who also controlled the thunder and brought rain, and shot fiery copper arrows of lightning with the rainbow.

Bridge in the Sky

Bifrost, the sacred bridge of Scandinavian myth, was a rainbow bridge which linked heaven and earth. It was made of fire and air and water, and the bright colours of these three elements were seen glowing in its high-springing arch. The gods rode along it when they visited Midgard, the world of men; and they passed over it every day on their way to hold council by the Well of Urd, a spring which lay at the foot of Yggdrasil, the World Ash-tree. All came to the meeting of the council on horseback except Thor, the god of thunder, slayer of

Sonia Halliday

giants and defender of Asgard, the home of the gods. He came on foot, wading through the deep rivers that Bifrost spanned, for fear that his great size might make him too heavy for the delicate bridge, or that the heat of his lightnings might injure it.

Only the gods could cross Bifrost, and the souls of certain warriors slain in battle, who had been chosen by the Valkyries and carried by them over the bridge to Valhalla, that splendid shield-roofed hall in Asgard, where the heroes spent their time in constant fighting and feasting. To defend the rainbow bridge from the frost giants and prevent them gaining access to Asgard across it, the god Heimdall lived beside it and kept constant watch and ward over it. He was a good guardian, for he could see what was happening 100 miles away, and his hearing was so keen that he could hear the grass growing on the ground and the wool growing on the backs of sheep. Moreover, when he sounded his horn Gjallar, its note could be heard through the whole universe. In his charge, Bifrost was safe, and would be so until the time of Ragnarok when, according to Norse belief, all things would be destroyed. On that day, Gjallar would sound for the last time to rouse the gods, against whom all the forces of evil would be unleashed. From Muspell, the region of fire, the giant Surt and his followers would come riding with drawn swords over Bifrost, and beneath their weight the rainbow bridge would at last be broken.

Traces of belief in the sacred nature of the rainbow survived in the folklore of many countries long after Christianity had replaced the old pagan mythologies. The ghost of Bifrost lingered almost to our own day in Germany and Austria – and perhaps does so still in some localities – in the tradition that the rainbow was a soul bridge, over which the dead who had died in a state of grace passed into heaven. Children were guided along the airy arch by their guardian angels; but

the souls of the wicked and the unrepentant could not overcome the perils of the way. They were consumed in the raging fire which is visible here below as the red band in the bow. Two modern superstitions which also associate the rainbow with death have been recorded by Wayland Hand in his *North Carolina Folklore* (1964). There it is said that if a rainbow spans a house, there will be a death in that house before long; and if any person walks through the end of a bow, some member of his or her family will die within the year.

A common tradition, found in many regions, is that it is extremely unlucky to point directly at a rainbow, as indeed it is to point at the sun, or the moon, or any star. Another is that a wish formed when the bow first appears in the sky will be granted. A faint memory of old dreads seems to linger in the ritual whereby children in the English northern counties try (at least until very recently) to drive the rainbow away by 'crossing it out'. As soon as it is seen, two sticks, or two straws, are laid crosswise on the ground, with a small stone in the centre, or sometimes with a stone at each end of the cross. In north-eastern Scotland, the children shout at the tops of their voices a banishing rhyme which runs:

> Rainbow, rainbow, brack and gang hame,
> The cow's wi' a calf, the yowe's wi' a lamb,
> And the cow wull be calvit or ye win hame.

A well-known magical method of charming the rain away is for the charmer to say 'Rain, rain, go away; come again another day', or some other variant of the rhyme, whilst looking steadily at a rainbow. Country people still read weather signs from the manner and time of the bow's appearances. If broken parts of it are seen in the clouds, these foretell stormy, blustery weather, and are sometimes known as wind-dogs, or weather-galls. Seen in the morning, it is a warning to shepherds or, along the coasts, to sailors; but 'a rainbow at night, the rain is gone quite'. These prophecies, however, are not rooted in ancient myth or magic, but are based on the practical experience of generation after generation of countrymen.

CHRISTINA HOLE

RAMAKRISHNA

ONE OF THE WORLD'S great mystics, Ramakrishna wrote little or nothing himself, but his sayings and parables are recorded in numerous collections. Far from scholarly, he was sought out by some of the best scholars of India. He did not set out to create a new religion, yet ended by reforming one of the oldest religions in the world. The missions founded in his name extend from Calcutta to San Francisco: there are twelve Ramakrishna Missions in the United States alone.

He was born in 1836 of orthodox Brahmin parents in an obscure village in Bengal, his father being the village priest. Later he was said to have been miraculously conceived and fabulous tales grew up concerning his birth, as indeed much of his life. He died in 1886.

Ramakrishna's first mystical experience came to him when he was seven. It happened just before a heavy downpour and black clouds were massed in the sky, when he suddenly saw a flight of snow-white cranes winging their way across the dark background. Dazed by the sight, he fell into a trance and lay unconscious for several hours. From then on throughout his life he remained precariously poised on the threshold between normal and trance states. At the age of nine, while appearing as the god Shiva in a village play, he was so carried away by his exalted role that he fell into an ecstatic condition and remained enraptured for three days.

When he was 20, Ramakrishna was appointed chief priest at the Dakshineshwar temple near Calcutta, dedicated chiefly to the goddess Kali (see KALI). In the Hindu pantheon this deity is one of the manifestations of Shakti, the great mother goddess, in whom are comprehended all the power and majesty of the cosmos. Her worship now became the focus of Ramakrishna's undivided attention and such was his ardour that he began to neglect his other temple duties.

Hoping that the responsibilities of married life might stabilize him emotionally, his parents arranged a marriage for him three years later. His bride was a girl of five. Ramakrishna and his child bride did not live together after their marriage: she went back to her parents and he resumed as best he could the work at the temple. He continued to abstain from sexual intimacy for the rest of his life. One of the great obstacles to the higher life, as he saw it, was the aggregate of lustful and voluptuous sensations inevitably associated with the sexual act, and he could not reconcile this all-consuming, though transient, passion with the decision he had taken to devote himself completely to the service of the goddess.

Ramakrishna believed that 'however God may be worshipped, he is still the same Supreme Being, just as water is called by various names in different climes': many of his sayings have been recorded and the missions founded in his name extend from Calcutta to San Francisco

The Wishing-Tree

A man sitting under the shade of the Kalpa-vriksha (wishing-tree) wished to be a king, and in an instant he was a king. The next moment he wished to have a charming damsel, and the damsel was instantly by his side. The man then thought within himself, if a tiger came and devoured him, and alas! in an instant he was in the jaws of a tiger! God is like that wishing-tree: whosoever in His presence thinks that he is destitute and poor, remains as such, but he who thinks and believes that the Lord fulfils all his wants, receives everything from Him.

F. Max Müller
Râmakrishna, His Life and Sayings

Ramakrishna had no illusions about human nature. Some of his parables in simple homespun language are wonderfully to the point. The following example aptly conveys the irony of the human situation. 'Two friends were walking past a place where the word of God was being preached. One said, "I must go and hear this sermon and join the pious congregation in the worship of God." But from across the road came the sounds of revelry and the second friend said, "I think I prefer to join the merrymakers and flirt with the dancing girls." The two friends parted company, one to enter the temple, the other to sport with the revellers. In a short while the one who had chosen the house of pleasure tired of his amusement and was struck by the folly of what was taking place around him. He said to himself, "What am I doing? Why have I come here when I could have joined my companion in hearkening to the word of God?" Across the road his companion, bored with the monotonous drone of the preacher, said to himself, "I wish I had joined my companion in his fun instead of listening to this rigmarole." Which of these two, the sage might well ask was the better man? Or were they not both the same person? Two beings that dwell in each one of us.'

Many Paths to One God

The conviction grew upon Ramakrishna that only through personal experience could man perceive the truth, otherwise truth was impossible to grasp since it was several removes from the phenomenal world we see around us. To illustrate this, he gave the tale of the blind man who wanted to know what milk looked like. 'White, like a crane,' he was told. 'What is a crane?'

he asked, and received the reply, 'Like a sickle'. And in response to further questioning he was told that a sickle resembled a bent arm. 'Ah!' he exclaimed, as though suddenly enlightened, 'milk is like a bent arm.'

While in service to the goddess Kali, Ramakrishna's ecstatic raptures increased and he remained for long periods wrapt in contemplation before her image. He came to believe that the idol breathed and was alive, and that it heard and understood him as he spoke and sang hymns to it. After some months his fervent devotion was apparently rewarded for, he declared, one day the goddess revealed herself to him face to face.

Desirous of seeing the god Krishna, he dressed like a woman and imagined himself to be Krishna's favourite milkmaid, Radha. While immersed in this role he had a vision of the god. Similarly, in order to induce a vision of Rama, an incarnation of Vishnu, he took on the part of Rama's favourite general, the monkey god Hanuman, and lived on nuts and climbed trees.

Ramakrishna had little time for asceticism and the alleged powers it bestowed. He said, 'If twenty years of asceticism merely enables you to walk on water, better pay the boatman and save your time.' Nor had he any patience with 'theoretical' religion. He felt that religion was not a matter of creed and ritual but of inner experience, and was convinced that actual spiritual participation in other faiths was necessary for his own understanding of other people's beliefs and so ultimately of his own. He held that however God may be worshipped, he is still the same Supreme Being, just as water is called by various names in different climes, and may be drunk from silver goblets, from earthenware, or straight from the cupped hands, but it remains the same water and has the ability to quench man's thirst in whatever manner it is drunk.

After having personally experienced the presence of God in various faiths, Ramakrishna concluded that all religions were true and that fundamentally all were one, each tracing a different path to the same great goal.

(See also HINDUISM.)

RAMANA MAHARSHI

AT THE SOUTHERNMOST tip of India is a holy mountain named Arunachala; the very thought of it is said to liberate the soul from bondage. At its foot nestles the great temple of Arunachaleswara (Lord of Arunachala). From remote antiquity this hill has been reputed to be the earthly embodiment of Shiva the Auspicious One, the Lord of Perfect Knowledge and Supreme Bliss. Sometimes it attracts to itself a human form which it indwells as Shiva; such a form was Sri Ramana Maharshi, who heard and responded to the hill's compelling call.

Born in 1879, in the village of Tiruchuzhi in South India, as a boy Ramana showed no indication whatever of his future greatness. His father held a respected position in the village and Ramana's prospects were good in a worldly sense. But Shiva decreed otherwise.

Shortly before his 16th birthday, Ramana asked a relative where he had just come from. 'From Arunachala,' came the reply. This information affected the boy strangely. He knew that Arunachala was believed to be Shiva in the form of a hill, but he did not realize that it was an actual hill. When he found that Arunachala was merely the Sanskrit form of Tiruvannamalai – a district not far distant by rail – his interest evaporated. But from that time on, the name Arunachala began its work of transformation. A current of awareness began vibrating within him; it was not awareness of any 'thing' by any 'person', but a subtle sense of identity with something nameless and formless, something that was more himself than anything he had ever known. It was a foreshadowing of the Supreme Experience: total awareness of the *Atman* (Self), the eternal Self as distinct from the impermanent ego (see BRAHMAN). He became less keen on boyish pastimes and his interest in school-work vanished. Spells of prolonged introspection possessed him; he sat motionless for hours, oblivious of external things.

After the death of his father, in 1891, Ramana and his brothers went to live in an uncle's house in Madura, and it was here that he underwent a decisive spiritual experience. He was alone in his uncle's house when the dread of death assailed him. Characteristically, he did not think of getting help, but simply went into his room, lay down and awaited the end. Something made him slow down his breathing; then a power within him took charge of what followed. The violent shock had introverted his mind so intensely that it penetrated an entirely strange region of consciousness. He asked himself what it all meant; his breathing stopped completely and he sensed the imminence of death: 'All this was not a mere intellectual process,' he recalled, 'but flashed before me vividly as living truth; something which I perceived immediately, without any process of thought. "I" was something very real, the only real thing in that state, and all the conscious activity that was connected with my body was centred on it. The "I", or my "Self" held the focus of attention by a powerful fascination from that time forwards. Fear of death vanished at once and forever. Absorption in the Self has continued from that moment right up to the present.'

In 1896 he decided to leave home and go to Tiruvannamalai. When he entered the precincts they were empty, which was strange, for the temple normally hummed with activity. Stranger still, the doors of the inner sanctum lay wide open as if Ramana's coming was expected. He entered, and with tears of joy streaming down his face declared to the Holy of Holies that he had come in answer to an inner call.

Dispenser of Grace

Ramana began his life-long stay at Tiruvannamalai by meditating in the thousand-pillared *mantapam* (stone hall) in the temple grounds. At this period his youthfulness made him the butt of practical jokes and offensive attentions from ignorant people. An aged recluse named Seshadriswamy tried to ward off the hooligans, but it did not ease the situation for he was thought to be crazed. Ramana therefore left the mantapam for the dank cave hollowed out beneath it. Here again he steeped himself in meditation. He became emaciated, his hair grew long and his nails curled. Vermin attacked the flesh of his body and drank his blood. He ate only the little which the old recluse managed to force between his lips. This went on until a mendicant, horrified by his appearance, fetched a *sadhu* (holy man) to help him carry out the Buddha-like figure, which they reverently placed before a shrine of Shiva.

The uncanny silence of the youthful sage attracted attention and people flocked to receive his *darshan* (spiritual blessing). They sensed a tremendous concentration of divinity. Ramana then moved away to Pavalakunru, high up the hill, where, in 1900, his mother and elder brother found him after much searching, but failed to persuade him to return home.

Ramana was regarded as a *jivanmukta*, one who had realized identity with the Supreme whilst still in the body. By 1916 crowds of people assembled daily. He was called *Bhagavan* (Lord) and *Sri Maharshi* (Great Sage) by those who sought spiritual guidance. An *ashram* (spiritual colony) grew around him; visitors sat in a large hall where he gave darshan and answered questions about yoga and enlightenment. Sitting in the hall, or performing daily *pradaksinam* (ritual circumambulation) of Arunachala, Bhagavan gave peace, hope and happiness to all who approached him, regardless of sex, age, status, religious or political beliefs. His field was the whole of humanity; his teachings a unique interpretation of the age-old wisdom of the *Upanishads*.

In 1948 appeared the first signs of the cancer that was to deprive his devotees of the beloved presence that for more than 50 years had radiated happiness. Yet throughout his illness his spirit glowed even more serenely, more brilliantly, than ever before. Right up to the last day he insisted on giving darshan to the stream of visitors.

The end came in April, 1950, when Ramana was re-absorbed into Arunachala-Shiva – the Source of All. But people who visit Tiruvannamalai today declare that Bhagavan's presence is as potent as it was during his earthly life, and that his grace still flows swiftly into those who open their hearts and surrender to the spell of Ramana-Arunachala.

Photograph of Rasputin with some of his admirers: he was regarded with reverence by the Empress Alexandra and her confidant, Anna Vyrubova. When he was murdered in 1916, the Empress had his body buried in a special chapel, to which she went for spiritual comfort

Half a century after the assassination of Rasputin, much remains enigmatic about the life of the 'Holy Devil' from Siberia who gained an extraordinary influence over the Russian Imperial court

RASPUTIN

GRIGORI RASPUTIN was born c 1871 in Siberia at Pokrovskoe on the post road to Tobolsk. His father, Yefim, and mother were peasants owning land and stables. In the winter the family slept on the stove; in the summer on a shelf below the roof. Pokrovskoe was pious and many pilgrims set off for Verkhoturie where the relics of St Simeon are preserved. There lived Makari, a *starets*, a holy man to whom pilgrims went for advice. Yefim picked up many roubles by driving passengers from the posting station and as Grigori grew up he often took this job off his father's hands. He picked up many stories from his fares and when he retold them he embellished them from his own imagination.

An accident which occurred when he was 12 years old profoundly moved him. He was bathing in the river Tura with his brother Misha when the latter got out of his depth. He tried to save him, and his cries attracted a peasant who dashed into the river and collected them; Misha died. But why should he be saved and his brother lost? He decided that he must have been preserved for a special purpose. Three years later he surprised his parents by deciding to make a pilgrimage to Verkhoturie. So with pack on back and staff in hand he set off secretly, but his father overtook him and beat him and brought him home.

When he was 18 he had to drive a monk to the monastery of Abalask. They talked of religion all the way, which stimulated the young man's interest in monastic life.

Abalask was celebrating a festival and was thronged with visitors, and there Grigori was presented to the Bishop of Barnaul, whose conversation reinforced Grigori's religiosity. At Abalask he met Praskovia, a peasant girl, and fell in love. The following year they were married and went to live in the family home. In due course Praskovia gave birth to a son who died prematurely. Grigori was prostrated with grief and went to consult the starets Makari in his forest hut.

He found Makari weighed down with chains which had worked deep grooves on his meagre body, but a benevolent face gazed out from the wilderness of hair. He was only 50 but he looked eternal. About Praskovia's lost child he said, 'Only six months old, he died without sin and will be gathered to the Lord of little children. Do not grieve my son, God has marked you out for one of his own.'

There was a bevy of cocks and hens outside the hut and when the starets came out one hen fluttered to his shoulder and began pecking at his mouth as if kissing him. The rest of the poultry followed him about, all clucking. 'My hens are talking about you,' said Makari, 'they say a man with your eyes is now going home but he will go far and further than far.' Grigori picked up a brown feather. 'This will remind me,' he said, 'I am going further than far, perhaps to Kiev.'

Among those listening when Grigori arrived home and recounted his adventures was his close friend Dimitri Pecherkin. He was deeply religious and was greatly moved by the reception Makari had given Grigori. Next day they went fishing but Dimitri was more interested in the starets than in fish. 'He said I was going to travel,' said Grigori. 'You can believe it,' replied Dimitri. 'He foresees, it has been proved.'

The Men of God

Some years passed. Praskovia bore him another son and two daughters. Grigori worked and fished and went to church and day-dreamed. One day, coming home from the fields, there was a flash from the sun and he saw the Holy Virgin. It was only for a moment and the vision was gone. He hurried home to tell his family, who did not know what to make of it. Grigori, greatly perplexed, discussed the vision with Pecherkin, who advised him to seek advice from Makari. So he set off once more for Verkhoturie and the forest hut, accompanied by his friend. Makari had no doubts about the matter. Such visions of the Holy Mother were not uncommon. 'It may mean you are to become a starets,' he said, 'you must go to Athos and pray for light on your way.'

Mount Athos was a long way off, in Greece, but Pecherkin was enthusiastic, and volunteered to make the pilgrimage with Rasputin. They set out, accepting lifts by river and waggon when these were offered, and when there was no other mode of transport, they walked. From Odessa they were deck passengers across the Black Sea, the cost being defrayed by a pilgrim society.

Eventually the ship came in sight of the Holy Mountain and they went ashore at the monastery of St Pantaleimon. As ordinary pilgrims, they were free to stay as long as they liked but, if intending to reside there, they had to work in the fields and workshops. For five days they fulfilled their religious duties with a joyous spirit but then Rasputin expressed a wish to return home. He had not received any special enlightenment.

It was two years before Rasputin returned home and during this period he joined a sect known as the Khlysty, or Men of God. Up to the time of his death, Rasputin's enemies were to denounce him as a Khlyst. It is curious that when the Tsar first met him he noted in his diary, 'Today I met a Man of God from Siberia.'

The Khlysty held that the Holy Spirit had power to inspire young virgins to become begetters of Christs. At their meetings there would be *Bogoroditsi* – Christ-bearers, Christs and candidates. The chief mass was a *radenie* or 'fervour', in which all danced round a jar of water heating by a stove in the centre. The participants were in white cotton and the virgins held wands of twigs rolled in towels with which they beat the dancers, urging them to go faster and faster until they fell in hysteria. It was alleged that the hysteria was followed by promiscuous copulation, but this has not been proved. The task of the Christ-bearers was to inculcate the gift of prophecy, to teach the technique of healing through prayer and to learn how to expel demons, in all of which Grigori Rasputin became proficient. He also accepted the heretical dogma that to repent one must first commit sin. On the other hand he grasped the power of the inward turning of the Spirit.

Soon after his homecoming Rasputin began to turn a barn into a temple, painting it white and covering the interior walls with icons, raising a circle of earth in the middle and making a place for the boiling pot. He taught the young folk of the village the practices of the Men of God, which so angered the local priest that he denounced him to the Bishop of Tobolsk as a Khlyst. The Bishop sent two police officers to the village but Rasputin foresaw the move and set off on a pilgrimage to Kiev. Rasputin then appears to have reverted to Orthodoxy, acknowledging to himself that he was a 'failed Christ' but retaining his miraculous powers.

Rasputin and the Tsarevich

It is strongly suspected that a decrease in emotional stress has a beneficial effect on bleeding. As calm and a sense of well-being return to a patient, his capillary blood flow will decline and the strength of his vascular walls increase. In this context, the question of whether Rasputin hypnotized the Tsarevich becomes a matter of degree. If, technically, it was not hypnosis that he practised, it was nevertheless a powerful suggestion – Prince Yussoupov's account gives an indication of its strength. When Rasputin used this power on Alexis, weaving his tales, filling a darkened room with his commanding voice, he did in effect cast a spell over a boy overwhelmed by pain. Then, as Rasputin assured him in tones which left no room for doubt, Alexis believed that the torment was receding, that soon he would be walking again, that perhaps they would go together to see the wonders of Siberia. The calm and sense of well-being produced by this powerful flow of reassuring language produced a dramatic emotional change in the Tsarevich. And as if by a miracle, the emotional change affected Alexis's body. The bleeding slowed, the exhausted child dropped off to sleep and eventually the bleeding stopped altogether. No one else could have done it, neither the anguished parents nor the terrified doctors. Only a man supreme in his own self-confidence could transmit this self-confidence to a child.

Robert K. Massie *Nicholas and Alexandra*

Introduction to the Tsar

As a *strannik*, or wandering pilgrim preacher, Rasputin with his long hair, piercing gaze and voice which compelled attention, attracted crowds, and many people went to church just to hear him discoursing afterwards at the church gates, or followed him to beer houses to discuss religion. His followers diverted him to markets, fairs and festivals off the main route to Kiev. The rumour of his coming, and with it the belief that he healed the sick, went ahead of him. When he neared Kazan many students from the seminary came out to meet him and led him to the hall of the theological college. He was an unqualified success and answered many questions concerning the true meaning of passages of the Bible.

After some months Bishop Michael of Kazan directed a monk to take Rasputin to St Petersburg and present him to Bishop Theophan. He also carried an effusive recommendation to the Seminary at St Petersburg. Rasputin decided that he must go to Kronstadt to meet Father John, a celebrated miracle-worker, who when he noticed Rasputin among the crowd in the cathedral called to him to come forward and receive Holy Communion before all others. Some days later Rasputin had an intimate conversation with him. Father John's introduction unlocked many doors in St Petersburg to Rasputin, and Bishop Theophan presented him to the Grand Duke Nicholas and Anastasia Nikolaevna. The Grand Duke was deeply interested in Rasputin and had a presentiment that he could be used politically. He decided to present Rasputin to the Tsar.

On 31 October 1905 the Grand Duchess Militsa Nikolaevna and her sister Anastasia Nikolaevna gave a dinner party for the Grand Duke Nicholas, at which the Tsar and the Tsaritsa were present. They talked much of the starets whom they had discovered. The party rose late and in the morning Militsa presented Rasputin to the Tsar. The Tsar noted in his diary for 1 November 1905: 'Today we came to know Grigori, the Man of God from the province of Tobolsk.' This was a grave turning point in the career of Rasputin, and of the Tsar himself.

In the previous year the Tsaritsa had prayed to the starets Serafim, at his shrine

in Sarov forest, that she might bring forth a son and heir. The prayer was answered and Alexis was born. The Tsar in his great joy decreed that Serafim be made a saint and, mustering the Grand Dukes, he went to Sarov to shoulder the ancient relics of the starets Serafim in the ceremony of canonization.

The Tsaritsa felt that she would have the protection of the old peasant saint for the infant Alexis, who suffered from haemophilia, so that whenever he bled, even from a scratch, no aid short of the miraculous could stanch the blood. The role of saintly protector was transferred from St Serafim to Rasputin, who was always summoned to pray when the doctors had failed.

Rasputin first saw the child when he was two years old, when he was present at tea at the palace one afternoon. He brought presents of icons for the children who seemed to like him. On Alexis's third birthday the boy injured his leg and Grigori was sent for. When Alexis saw the burly peasant entering his bedroom he laughed, and so did Rasputin, and when Rasputin touched the injured leg the bleeding stopped. Turning to their Majesties, he said: 'Do not be alarmed, your son will live and at last the disease will disappear.'

Although it was not officially announced that Rasputin had been called in to heal the Tsarevitch, it soon came out in court gossip. Nothing could repress the Grand Duchess Militsa who had made Rasputin her pet, clothed him, built him a new house at Pokrovskoe and was forever praising the starets and magnifying his deeds.

Rasputin now had the backing of the higher clergy and Bishop Theophan went to stay at the new house at Pokrovskoe; he reported a godly establishment, furnished with the utmost simplicity. Rasputin also began to take a hand in politics, checking the impulsive Tsar when he thought of going to war in 1912: he was against any war which boded ill for Russia.

Miracles of Second Sight

The monk Iliodor, the 'mad monk', having graduated from St Petersburg, set out to imitate Rasputin, preaching and healing, and obtained a large following in eastern Russia. He became jealous of Rasputin's success and stole an affectionate letter which Rasputin had received from the Empress. Iliodor had it copied and circulated to members of the Duma, the state council. He nursed a suspicion that most of Grigori's miracles were achieved through copulation. Matters came to a head when Iliodor took Rasputin by surprise by denouncing him to the pious Bishop Hermogen and others. A free fight ensued and Rasputin barely escaped with his life. He hastened to take the story to the Tsar and Iliodor and Bishop Hermogen were both exiled. The monk had his revenge by sending to Pokrovskoe a woman who stabbed Rasputin in the stomach, exclaiming, 'I have killed the Antichrist'.

The gift of second sight does not seem to have warned Rasputin of this attempt on his life, but in 1911 there was evidence of his possessing it. He was in Kiev when the carriage of the prominent politician Stolypin passed, and Rasputin shouted after him 'Death is for you. Death is approaching.' Next night Stolypin was shot and wounded by a revolutionary while at the theatre, dying a few days later.

Radio Times Hulton Picture Library

Tsar Nicholas II of Russia and his family, about 1905: Nicholas and Alexandra were haunted by constant anxiety for their son Alexis, the heir to the throne, who suffered from haemophilia, and Rasputin's influence with them stemmed from his mysterious ability to stop the bleeding

Later, hearing that his reputation was being destroyed by mounting scandal, Rasputin cut short a pilgrimage to Jerusalem and hurried back to the capital. The most damaging of the stories circulating about him was that a woman named Anna Vyrubova had become his mistress. Anna Vyrubova had a small house near the palace. She was poor and did not even possess a new dress, but she was the intimate companion of the Empress. The house was a 'home from home' for the Imperial family and Rasputin was a frequent guest.

In January 1915 Anna was involved in a railway accident; she was thrown onto the carriage floor, her skull was fractured and her legs crushed and broken. The Tsar and Tsaritsa hastened to the scene to find her unconscious. Anna was taken to hospital and then transferred to the palace, Rasputin being summoned by telegram. When he arrived at the palace it was to find that Anna had not regained consciousness and

the doctors despaired of saving her life. Avoiding the Tsar and Tsaritsa who were standing by the bed, he stared at Anna and whispered to her 'Annushka, open your eyes.' Astonished, the Emperor and Empress saw her obey. 'She will live,' Rasputin said, 'but will be a cripple for the rest of her life.' Staggering on his feet, his face covered in heavy sweat, he fell in a faint at the doorway.

Rasputin had temporarily fallen out of favour at court shortly before the First World War. The Tsar had not accepted his second sight about the impending war in Europe. Rasputin sent a letter to the Tsar warning him against becoming involved in the war, lest he plunge Russia into a 'sea of tears without shore'. This letter irritated the Tsar but things changed after the Vyrubova 'miracle' the following year.

Poisoned Cake at Midnight

From 1915 until his death in the following year Rasputin lived in an apartment on Gorokhovaya, paid for by the Tsar, with his wife and two daughters. For most of the day the samovar was hissing on the table and all were welcome to have tea with him. The house and stairs were crowded with beggars and petitioners, almost all of them strangers. On the wall were pinned scraps of paper bearing all manner of pleas: 'Your prayers are asked for my wife who is dangerously ill', 'My daughter is in prison for stealing bread, can you get her set free?'. There were also many requests from businessmen for contracts, which caused a widespread rumour that he was being used by German agents.

In 1915 a sharp reverse in the fortunes of war, in which Russia had ranged herself against Germany, led to an outbreak of spy mania. Somebody must be to blame, probably the Empress and her crony Rasputin who must be selling secrets to the enemy. The Grand Duke Nicholas, commander-in-chief of the army, had been betrayed. When in the early spring a well-trained German army appeared advancing over the hills, the vast but ill-trained forces of the Grand Duke took to headlong retreat. By August 1915 the Russian army was on the brink of total collapse and Russia herself on the eve of revolution. Rasputin and the Empress were strongly against the Grand Duke, and on 23 August the Tsar himself assumed the high command.

Mansell Collection

'A man with your eyes will go far': many who knew Rasputin commented on the hypnotic power of his eyes

The year 1916 was one of conspiracy and intrigue. Among the various factions was the 'English' party, who above all wished to make the conclusion of a separate peace with Germany impossible, and wanted to bring about the abdication of the Tsar, and a smaller group which plotted to contrive the murder of Rasputin, which would be a signal to the English party to go ahead with its plan for a palace revolution. Prince Felix Yusupov made himself responsible for the murder. Feigning friendship with Rasputin over several months, he eventually invited him to his palace at midnight, where he had prepared a dish of cakes impregnated with cyanide and a bottle of poisoned wine. He was also armed with a revolver. The meeting was on the ground floor, but there was a noisy party of conspirators upstairs.

After talking for an hour or so, Yusupov invited Rasputin to take some cakes; Rasputin ate two or three. To the astonishment of Yusupov, Rasputin then became merry and said 'Come on, get your guitar and sing to me, let's go to the gypsies.' Yusupov poured some wine into one of the glasses. 'Good,' said Rasputin, 'now let's go to the gypsies.' As he stood up, Yusupov pulled out the revolver and shot him in the neck. Leaving Rasputin flat on the floor, Yusupov in great excitement rushed upstairs and told the other conspirators. Some of them went down and saw Rasputin, far from dead, blundering from door to door, each of which was locked. Shots rang out. At length Rasputin hurled his weight at a door and burst it open. He was in full flight when one of the conspirators, Purishkeyevitch fired the fatal shot. They tied his wrists together, bundled him along to a waiting car, and drove to the Neva, where they broke a hole in the ice. But according to some accounts, Rasputin was still alive when they pushed him in: he had managed to get one hand free. When his body was discovered, his right hand was found frozen to his chest, with three fingers clutched together. He had apparently died making the sign of the Cross.

Raven

Large black bird of the crow family, possessed of a harsh croaking voice and an appetite for carrion, and generally of disturbing and sinister character in folk belief; frequently associated with battlefields, corpses and death; two ravens acted as the spies of the god Odin; Raven is an important figure in the mythology of American Indians of the North Pacific coast.

See CROW; ODIN; PACIFIC NORTH-WEST INDIANS.

Re

Or Ra, sun god and 'great god' of ancient Egypt, closely connected with the kingship of the pharaohs; as the sun at dawn, represented as a beetle or beetle-headed man; as the declining sun, he was Re-Atum, an old and wise man; linked with the god Amun at Thebes; frequently linked with the falcon-headed sky god Horus.

See EGYPT: SUN.

Red is the colour of war and conquest, of violent destructive energy, and of the triumph of the rising sun: the red flag of Turkey

Sonia Halliday

RED

FOR MOST PEOPLE red is a symbol of dominance and success. It represents the positive side of the personality, and is one of the favourite colours of men and women all over the world. A primary colour, red varies from bright scarlet or crimson to reddish yellow or brown. It is the colour of blood, fire, the poppy and the rose. As with other colours its symbolic meanings are very various. As the outward sign of health it is a happy colour; but because it is also the colour of blood it is a universal danger signal, the symbol of murder, anarchy and war, associated with the red planet Mars and with fierce energy and destruction.

The reddish brown of the harvest represents success and fulfilment and, in Nature, the end of life. In ancient Rome red-haired puppies were ritually sacrificed to influence the ripening of the corn. The ancient Egyptians buried red-headed men alive as an act of homage to the god Osiris.

It has been suggested that the choice of red by kings in ancient times was because of the rarity of Tyrian purple, but this is probably a rationalization as red is a universal symbol of power. Survivals of this belief are reflected in the naming of *The Red Book*, the old directory of the court and nobility, and in the red carpet which is unrolled for important people. In heraldry red signifies magnanimity and fortitude, extremely desirable qualities for any monarch and 'heraldically it representeth fire', according to an old writer. It is the colour of the vestments worn by popes when they hear Mass, and the hats of cardinals were traditionally scarlet. In the spiritual sense red symbolizes zeal for faith, charity and love; in Spenser's *Faerie Queene* the Red Cross Knight personifies St George of England who typifies Christian holiness.

The People's Flag

In church decoration, red is the colour of martyrdom and a martyr may be symbolically represented by a red rose. In an associated sense, the colour also stands for cruelty and blood-guilt. The term 'red-handed', for instance, implies that someone has been caught in the very act of committing a crime, like a murderer discovered with the blood of his victim still on his hands.

The blood-coloured fighting banner of revolutionaries, adopted from the Romans to whom red meant war and a call to arms, may be seen as a reaffirmation of blood brotherhood, the bond that unites the poor when they storm the citadels of power. The same symbolism is recognizable in the red caps worn by French Revolutionaries, the red shirts of Garibaldi's legions, and more recently in the Communist anthem *The Red Flag* with its stirring lines:

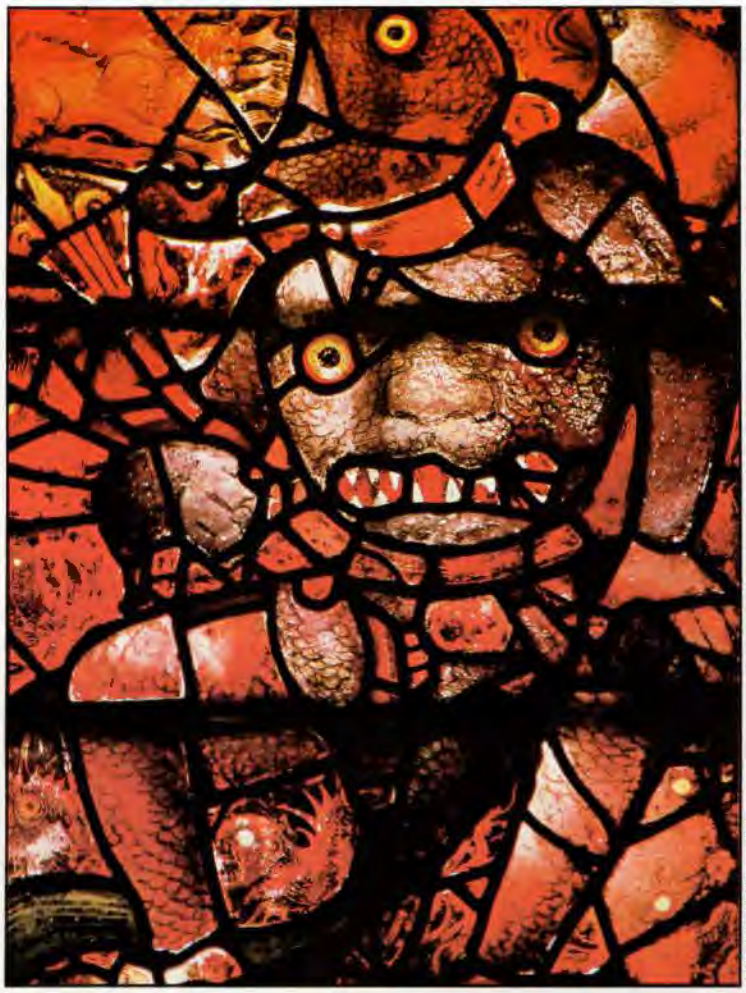
> The People's flag is deepest red.
> Within its shade our martyrs bled.
> And ere their limbs grew stiff and cold
> Their life-blood dyed its every fold.

It is evident that the more dynamic aspects of red are derived directly from the powerful mystique of blood, the life essence. In order to endow people who had died with renewed life, primitive men sometimes painted the corpses red.

Many of the symbolic and magical qualities of red arise from its close association with the crimson tongues of fire which the alchemists linked with the idea of purification. They also called the purest gold 'red', and one of the names of the Philosophers' Stone, which was supposed to transmute base metals into gold, was 'the red tincture'. One of the five colours of Chinese symbolism, red is related to fire and corresponds to the south. A Chinese official of the highest rank wore a red button in his cap as a badge of honour.

An association of ideas arising from the protective role of the glowing red fire as a barrier against beasts of prey, may have led to the choice of red objects for defence against psychic attack (though conversely, because of its connection with Mars, red may also be used in mounting such an attack). Scarlet bedding was once in general use for smallpox patients, and a skein of red silk about the neck was supposed to prevent nose-bleeding. As late as the 1830s 'tongues' of scarlet cloth were on sale in London for sufferers from scarlet fever. Today, red flannel is still sometimes recommended for the treatment of rheumatism and is perhaps one of the few surviving examples of folk medicine based on the principle that 'like cures like' or, in this instance, that fire drives out fire.

Red was once thought to provide an effective defence against the Evil Eye, and red coral was used for this purpose



Adam Woolfitt/Susan Griggs

Adam Woolfitt/Susan Griggs

Left **Detail from a stained glass window in Fairford church, Gloucestershire, showing the Devil; sin is scarlet, according to the Bible, and evil spirits are traditionally associated with this colour** ***Right*** **Red is often used to symbolize lust, as in the Scarlet Woman of the book of Revelation: prostitute wearing a red dress, in a house in Amsterdam**

from Roman times onwards. In the 16th century Reginald Scot, author of *Discoverie of Witchcraft*, wrote that 'the coral preserveth such as bear it from fascination or bewitching, and in this respect they are hanged about children's necks'. In medieval Europe a piece of red rag was supposed to protect the wearer against fascination, and in 17th century Yorkshire a sick child might be treated by burying a heart-shaped piece of red cloth in the earth, together with nail clippings and tufts of hair, to offset the spell that had supposedly caused the illness.

Badge of Shame

Because of their ruddy hue, certain plants and trees, particularly the rowan (see ROWAN), were supposed to have the power to drive away evil spirits and were placed near houses for this reason. The fact that evil spirits themselves were frequently red-coloured may seem paradoxical but this was possibly because they were generally fire elementals, dwelling amid flames and sulphur deep in the bowels of the earth. Mephistopheles wore red, and the devil of the tempests on the stormy Breton coast, who was popularly supposed to have warned Napoleon Buonaparte of his downfall, was called the 'Red Man'.

According to the Bible sin is not only evil but scarlet: 'though your sins are like scarlet, they shall be white as snow' (Isaiah 1.18). Nevertheless it was a sacred colour among the Jews and was used for the adornment of the tabernacle.

Red is the colour of witchcraft and, in the words of the poet W. B. Yeats, it was 'the colour of magic in every country and has been so since the very earliest times'. Irish witches wore little red caps which they placed upon their heads before flying to their coven meetings; and Granny Smith, a fearsome witch in Sussex, was nicknamed 'Old Mother Redcap'.

Psychologically, red both attracts and repels. Some people have an almost instinctive aversion to those with red hair, which in Europe may be connected with the tradition that the treacherous Judas had red or ginger hair. In India Brahmins at one time prohibited marriages between their men and red-haired girls.

Red is closely associated with the emotions of love and hate. A bright red symbolizes courage and self-confidence, deep crimson primitive animality, and scarlet anger. Red is often associated with lust, as in the Scarlet Woman of the book of Revelation. This was freely recognized in 17th century New England, where adulteresses were compelled to wear a scarlet letter 'A' as a badge of shame. Most brides continue to honour the old maxims: 'Marry in red, better be dead' and 'Green's forsaken, red's brazen'.

Red is the most positive of all colours. A red light is a clear warning of trouble ahead, and even at the most mundane levels the colour cannot be ignored. A red sky in the morning remains today, as in the past, the shepherd's warning.

ERIC MAPLE

Red Horses of Death

Fantastically coloured horses are a regular feature of the happy Celtic otherworld, and one of the great pleasures to be anticipated were the horse-races to which the Celts were so attached. Red is the colour usually associated with death in the Celtic world, and as a result red horsemen are sometimes represented as constituting an omen of disaster. The three horsemen from the kingdom of Donn appear at a critical stage in the story of Dá Derga's Hostel. The doomed king sees the three Reds (*na trí Deirg*), men with red hair and red equipment, riding on three red horses. Like so many otherworld riders who come to interfere with the world of men, they cannot be overtaken. Again, in the story of the *Táin*, Cú Chulainn goes out in his chariot to attempt to locate a terrible cry which he has heard. He sees a chariot approaching, to which a single red horse is harnessed. The horse has only one leg . . . A red woman, the war goddess, is in the chariot, and she is accompanied by a man carrying a fork of hazel.

Anne Ross *Pagan Celtic Britain*

REDON

BORN AT BORDEAUX in 1840, the French painter and graphic artist Odilon Redon was an exceptional man of visions and dreams, who stands out as an artist apart in a realistic age. He came to maturity at a time when others were developing the science of Impressionism but he was entirely out of sympathy with this effort to translate the external aspects of Nature into terms of colour. Commenting in 1868 on the Salon of that year, he saw nothing more in the work of Manet, Renoir, Monet and Sisley than 'the direct reproduction of reality'. In a later reference to the Impressionists he went so far as to describe them as 'the parasites of the object'.

Unduly prejudiced as he may now seem against a movement that produced paintings of great beauty, Redon was true to his own aims. His way of thought is implicit in his remarks on what the Impressionists lacked. He sought for, as he himself put it, 'all that uplifts the spirit into the realm of the mysterious, the disturbance of the unresolved . . . all the suggestion that art may give of the unexpected, the undefined or undefinable'. Eschewing colour, he conveyed these sensations in shadowed drawings and lithographs, his 'Blacks', that mainly occupied him until late middle age.

Full of strange fancies, expressive of the lost and lonely feeling of humanity surrounded by the unknown, they were the products of an extreme sensibility that showed itself at an early period. He is portrayed as a melancholy youth, tall, thin, pale, taking refuge from the rough impact of everyday life in the peaceful solitude of the family country house, La Peyrelebade, welcoming the night as a relief from the harshness of day and its transformation into another world. It was a torture to him to study art for a while under the uncongenial auspices of the academic painter Gérôme. But he had other mentors who encouraged his individual bent.

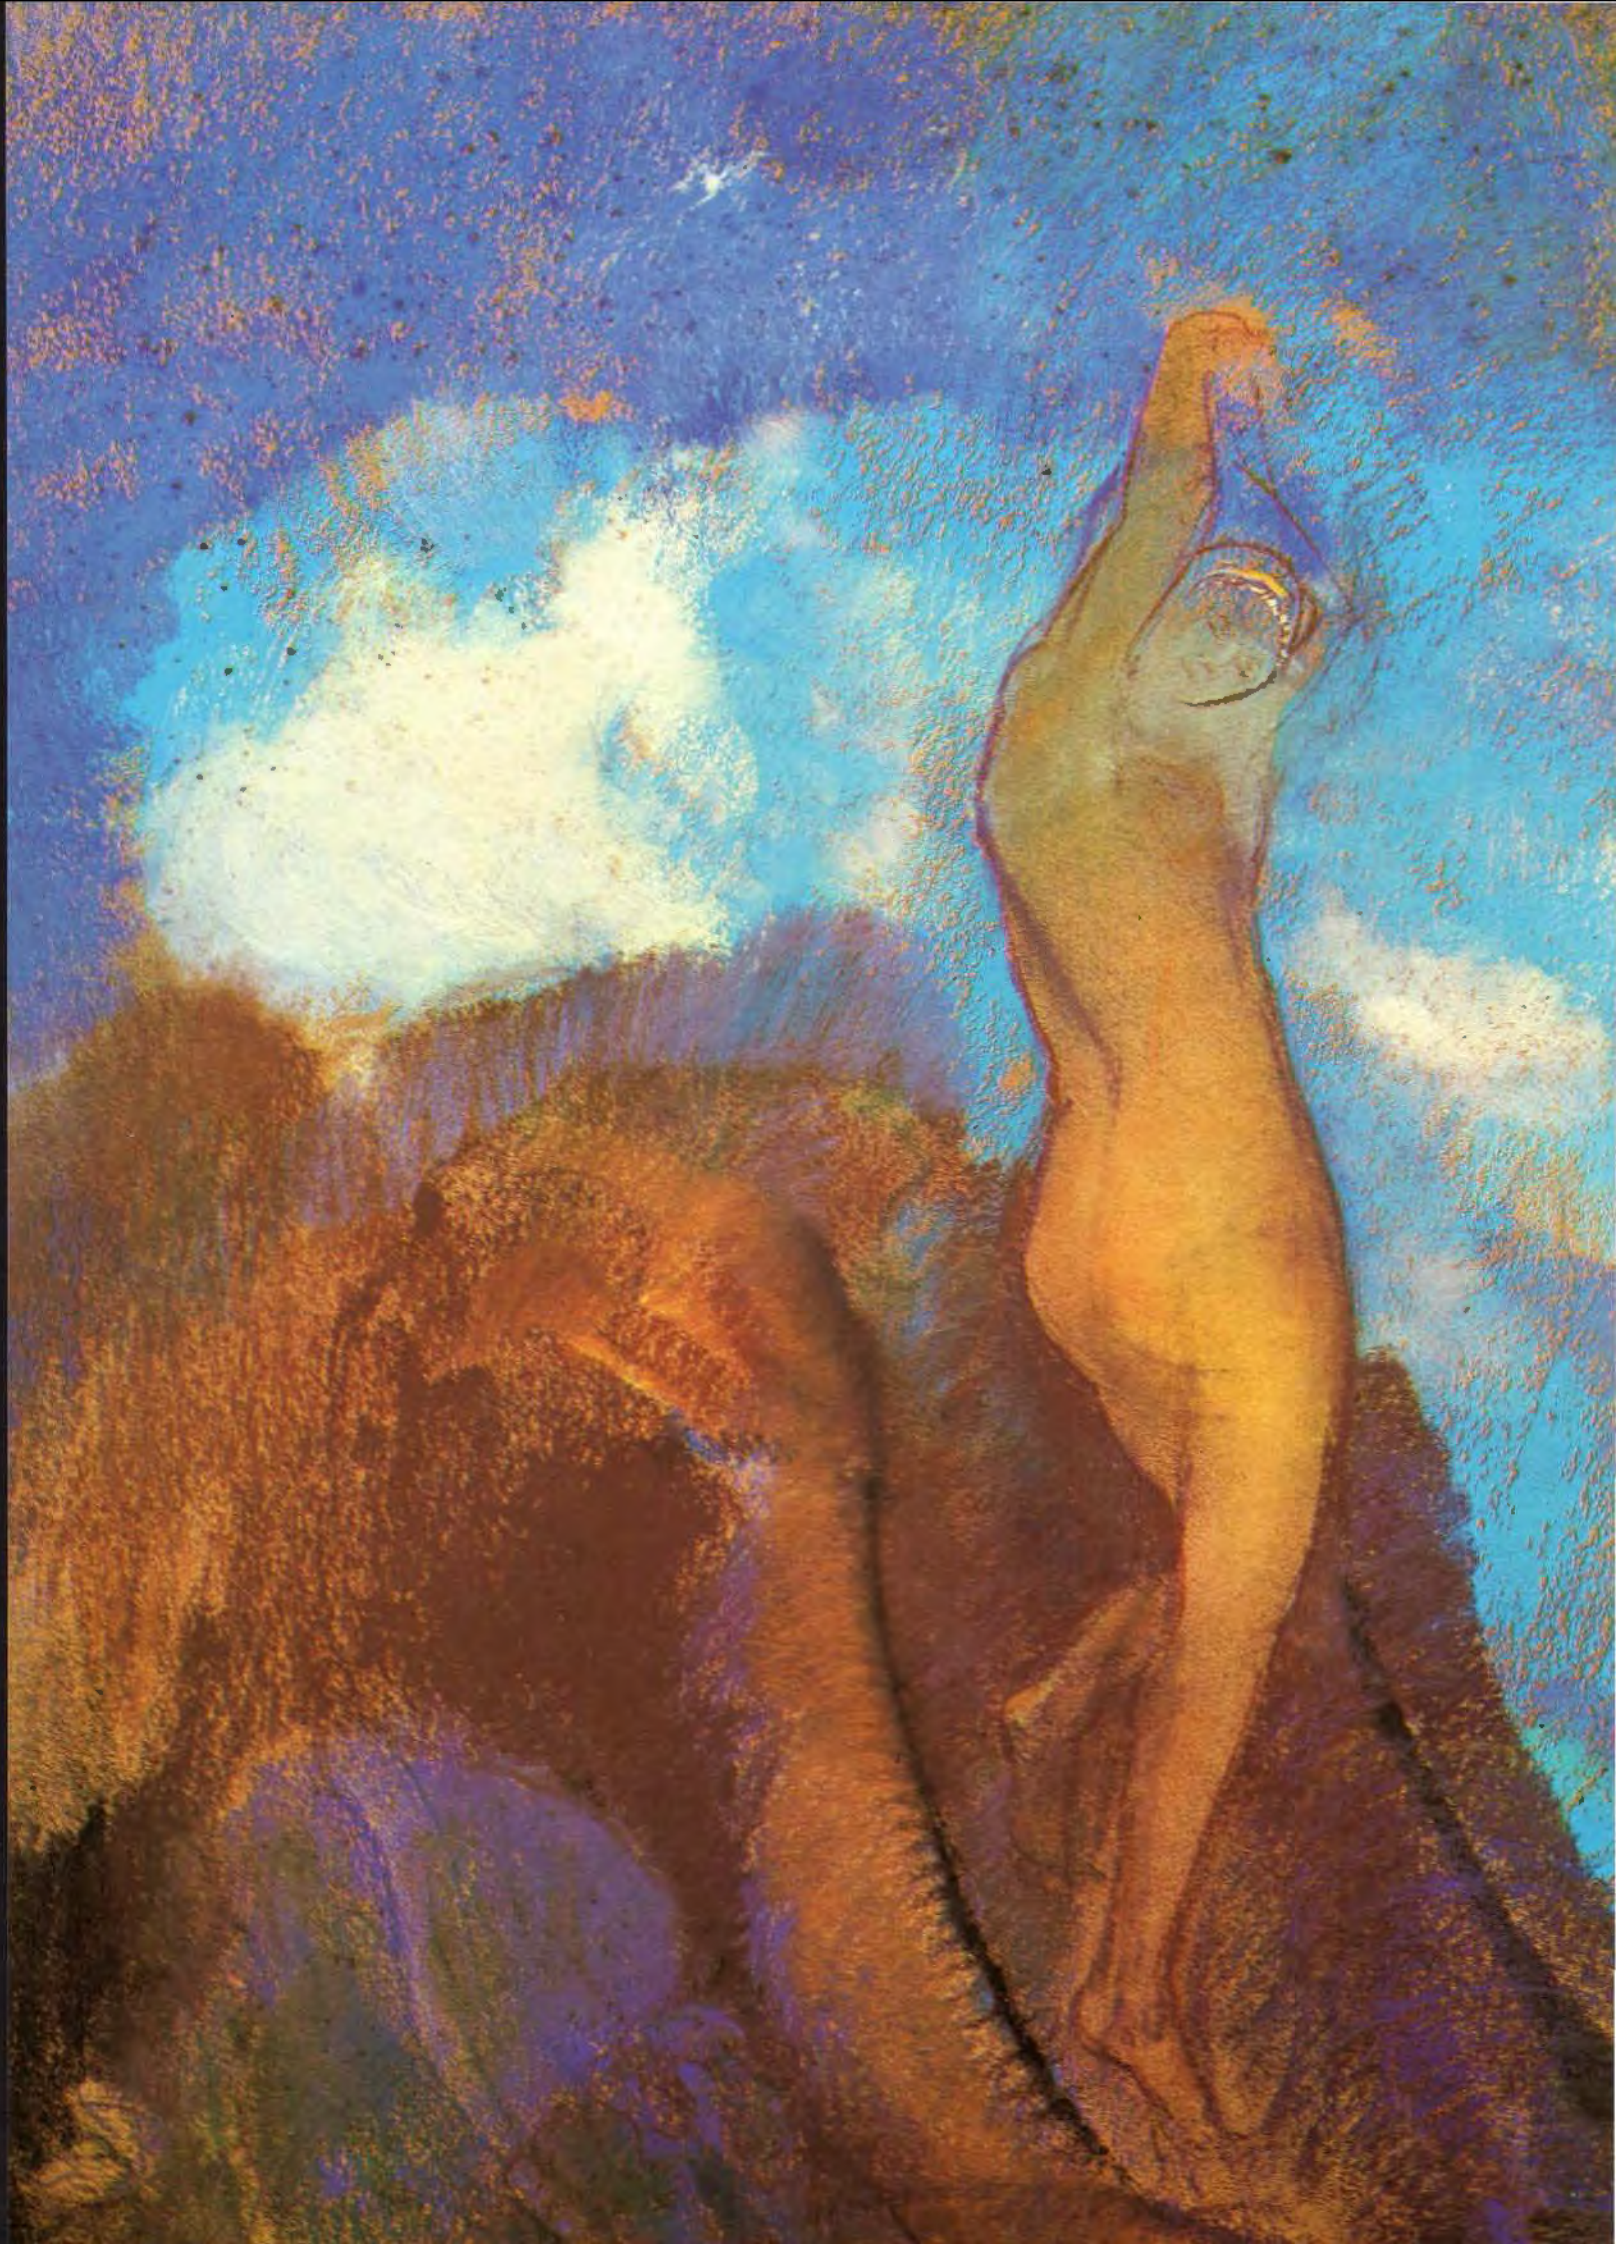
Stanislas Gorin, an artist in the Romantic tradition, aroused Redon's enthusiasm for Delacroix and for Gustave Moreau. The influence of the former is reflected in early etchings of warriors at single combat in a wild and empty landscape. Moreau's *Oedipus and the Sphinx* stirred his interest in myth. Friendship with the Bordeaux botanist, Armand Clavaud, who investigated the relation between plant and animal life, caused him to regard this indeterminate frontier from an imaginative viewpoint. He saw the botanist's scientific research turned into fantasy in the paintings of another acquaintance, Roger Bresdin, who would convert the tendrils of a creeper into snakes and give birds and flowers human faces. Hindu poets, German philosophers, the tales of Edgar Allan Poe, the *Fleurs du Mal* of Baudelaire, added esoteric literary influences.

Thus inspired, Redon produced the remarkable charcoal drawings and the lithographs published in albums at intervals in the 1870s and 1880s. They include such memorable conceptions as the spider with its wickedly alive compound of insect and human character that J. K. Huysmans described in his 'decadent' masterpiece *A Rebours* in 1884; the *Vision* (in the album *Dans le Rêve*) in which a huge eye floats balloon-like, upturned to the infinite; *The Masque of the Red Death*, a theme taken from Poe; and the symbolic and intensely mournful *Prisoner* (now in the Museum of Modern Art, New York), in which a figure taps feebly at the barred window of his cell. Long ignored and solitary, Redon gained three devoted admirers in the 1880s: the journalist Emile Hennequin, who wrote of him as deserving, like Baudelaire, 'the superb eulogy of having created a new thrill'; Huysmans, who somewhat distorted appreciation in picturing him as a poet of Satanism and delirious fancy; and the poet Stephane Mallarmé who probably best understood the artist's 'lucid despair'. As a result of growing interest Redon was encouraged to exhibit, and from 1890 onwards he abandoned the dusky monochrome which he had peopled with melancholy phantoms and turned to colour in oil painting and pastel.

There was a change also in the mood of the time as the end of the century approached. An impatience of the kind that Redon had shown with the realism of the Impressionists

Andre Held/Joseph P. Ziolo

Redon was described by one admirer as deserving 'the superb eulogy of having created a new thrill', and by another as a poet of Satanism and delirious fancy: 'The Buddha', c 1905



was felt by others. The isolated dreamer now became an inspiring force to those who sought for new and imaginative expression.

The English writer Arthur Symons, whose book *The Symbolist Movement in Literature* influenced the spread of Symbolism in England, described Redon as 'the French Blake'. The painter Maurice Denis in his group portrait *Hommage à Cézanne* placed him foremost in the group proclaiming the spirit of a new age. Yet Redon, never a man of 'movements', still pursued an independent course. The feeling of suffering so strongly marked in the 'Blacks' remained for a time in works devoted to the mystical portrayal of Christ though it was now suffering to which spiritual force was superior. His happy marriage in 1880 to the young Camille Falte may have been one of the reasons for a growing optimism.

A new sense of emancipation and delight animates his work after the religious phase of the 1890s. He reverted to classical myth but not simply in order to illustrate its characters and episodes. His *Pegasus and the Dragon* is an energetic symbol of triumph over the powers of darkness. His *Chariot of Apollo* soars aloft in exultant movement and cascades of iridescent colour, towards the source of light.

In his later work Redon was also deliberately aiming to recover an equilibrium between the external and internal world. There are portraits and landscapes, delightful in themselves though without the imaginative quality that was his unique gift. But in his brilliant pastel flower-pieces he succeeded in bringing external Nature and the contemplative inner vision into harmony. More than flowers seen, they are scents made visible and sensations experienced. Living until 1916, a witness of the opening excitements of 20th century art, he retained to the end his singular independence of vision.

WILLIAM GAUNT

Redon described himself as seeking for 'all that uplifts the spirit into the realm of the mysterious, the disturbance of the unresolved . . . all the suggestion that art may give of the unexpected, the undefined or undefinable'; three of his later works are *(facing page)* 'The Birth of Venus' and *(below, left to right)* 'Dream' and 'Sphinx leaning on a rock'

REFRIGERIUM

A LATIN WORD meaning 'refreshment', *refrigerium* was adopted by early Latin-speaking Christians to describe the hoped-for bliss that would reward the faithful after death. The term implies a concept of the afterlife in which refreshing coolness was regarded as a most desirable thing. As used in Christian texts, a reference is often implied to the parable of Dives and Lazarus, the rich man and the beggar (Luke, chapter 16). For after death the rich man implores Abraham to send Lazarus 'to dip the end of his finger in water and cool my tongue; for I am in anguish in this flame'. Dives seeks this refreshment because he is in a fiery hell – a fate that he deserved for his former way of life. But the idea that the dead were in need of cool water is far older than Christianity.

As far back as the Pyramid Texts (c 2400 BC), the dead pharaohs were assured that libations of water would be made for them. In subsequent Egyptian tomb-paintings and in the vignettes of the Book of the Dead the deceased is frequently depicted receiving draughts of water, often from a goddess. And in the Hellenistic period inscriptions abound with formulas such as 'May Osiris give thee cool water'. But the most significant of all is doubtless this inscription, dating about 46 BC, in which a dead woman addresses her husband from the tomb: '. . . The living water of which the earth hath for its dwellers is stagnant water for me . . . I no longer know where I am, now that I have arrived in this valley (of the dead). Would that I had water to drink from a running stream and one to say to me, "Remove not thy pitcher from the stream!" O that my face were turned towards the north wind on the river bank that the coolness thereof might quiet the anguish of my heart!'

This belief that the dead crave for fresh water and cool breezes also found expression in ancient Mesopotamia. In the famous Epic of Gilgamesh (see GILGAMESH) it is said of the dead that 'dust is their food and clay their sustenance', and they long for offerings of water to be made to them by their surviving relatives. The evidence of tombs often reveals the provision made to convey liquid offerings to the dead: for example, in the ancient

Andre Held/Joseph P. Ziolo

The belief that the dead were parched and in need of cool water was natural in dry, hot lands: Egyptian coffin painting, c 200 BC, showing a soul in the form of a bird with a human head, receiving water from a tree goddess

Michael Holford/British Museum

Canaanite city of Ugarit (modern Ras Shamra) many graves were equipped with pipes leading down from ground level.

That the dead should be regarded as parched and in need of cool water is an idea that naturally occurred in the dry hot lands of the Near East. And the image of a celestial stream or fountain of refreshing, life-giving water, which appears in many of the ancient religions of this area, found dramatic expression in the culminating vision of John in the book of Revelation (chapter 22): 'Then he showed me the river of the water of life, bright as crystal, flowing from the throne of God and of the Lamb . . . The Spirit and the Bride say, "Come" . . . And let him who is thirsty come, let him who desires take the water of life without price.'

The words *refrigerare* and *refrigerium* abound in early Christian funerary inscriptions and liturgical formulas, expressing the intuitions of a faith that had its roots in the hot Mediterranean lands. This southern aspiration for an eternal state of refreshing coolness contrasts notably with the view of the northern barbarians, who imagined Valhalla as a hall, brightly lighted and closed against cold and damp, where dead heroes warmed themselves by drinking the intoxicating liquor that flowed from the goat Heidrun.

'The Personality which animates each one of us is immeasurably ancient, having been forged in many fires'; exponents of reincarnation believe that the soul must pass through a recurring cycle of birth-death-rebirth until ultimately achieving salvation

REINCARNATION

ONE OF THE MORE controversial religious beliefs, reincarnation has long been accepted by Hindus and Buddhists, and is today being increasingly adopted as an article of faith by a large number of people in other religious denominations. Reincarnation implies the state of being 'embodied anew'. That is, that the soul of a deceased person, after an interim period in the otherworld, is reborn in accordance with the merits acquired during its previous lifetime.

The human soul, it is believed, is a fragment of the divine, and will ultimately return to its divine source. But it is necessary for its own evolution that it should savour to the full the various experiences that life provides, and learn to distinguish the good from the bad, the eternal from the temporal. However, its ultimate destiny is far too great for this education to be completed in one brief sojourn on earth, and in the limited range of one lifetime and a single bodily form. For instance, the psycho-physical experience of a male is totally dissimilar to that of a female, and it is essential to have both if half of a fundamental experience is not to be missed. Obviously the soul must cover a wide range of knowledge and suffering in order to mature satisfactorily and only the soul that has been through tribulation can hope to be fit for the divine purpose for which it is intended.

Slowly, in the course of its successive rebirths the soul rids itself of its accumulated and inherited impurities, and evolves towards the goal of perfection. The novelist Sir Henry Rider Haggard, who was extremely interested in reincarnation, said: 'The Personality which animates each one of us is immeasurably ancient, having been forged in many fires.'

Belief in reincarnation is very old, and is found in widely scattered primitive and preliterate communities. Its postulates are basic to Hinduism and most schools of Buddhism. Roman writers said it was prevalent among the Gauls and Druids. Several Greek schools of thought, notably the Orphics and Pythagoreans, subscribed to it, and Plato mentions it in the concluding part of his *Republic*. In later times the doctrine was adopted by the Essenes, Pharisees, Karaites and other Jewish and semi-Jewish religious groups. The Neoplatonists and Gnostics also held the theory, and it formed part of the cabalistic theology of medieval Jewry.

St Jerome (340–420) said that reincarnation in a special sense was taught among the early Christians and was given an esoteric interpretation that was communicated to a select few. Origen (186–253) thought that only in the light of reincarnation could certain scriptural passages be explained. But it was condemned by the Second Council of Constantinople, convened by the Emperor Justinian in 553, and became for a time a heretical doctrine. 'If anyone assert the fabulous pre-existence of souls,' decreed the Council, 'and shall submit to the monstrous doctrine that follows from it, let him be anathema.' Some scholars nonetheless believe that they can detect traces of the teaching in the writings of St Augustine, St Gregory and even St Francis of Assisi. Among its modern exponents are Theosophists, Anthroposophists and certain Spiritualists.

The Law of Destiny

Many people feel that the theory of reincarnation is in keeping with the idea of evolution and human progress and perfectibility. If man has shown a progressive advance from the lower animal forms to his present state of intellectual and moral development, it is clear that further progress is part of the plan for his future. The physical universe provides the environment for this advance to perfection, and it is here that he must work out his own destiny.

If the ultimate reasonableness of the cosmic purpose is accepted, a theory that can so logically account for the birth of congenital idiots, for those who die in childhood, and for others who have been given no chance to live out their lives, should clearly be given serious consideration.

The orthodox Christian finds it hard to explain the existence of a child who dies in infancy, bringing nothing but heartbreak to his parents. What is the purpose of the infant's transient passage through this world? What is his final destiny? Does he go to heaven?

If he does, it would seem to be unfair to the adult who must face the vicissitudes and temptations of a long life, and in the end perhaps find himself condemned to be punished for having succumbed to the temptations to which he was inevitably exposed. By a stroke of good luck the child, who has never encountered such pitfalls, goes straight to the happy lands reserved for the blessed.

According to reincarnationists, the stillborn baby, the mongol, the child who dies in infancy, are all merely adjusting the balance sheet of their own previous lives by these temporary shifts and accommodations. Some are receiving their reward, some their punishment, for what they have done before. It will all work out equitably in the end. There is a mathematical precision about the way the law of destiny operates. No one can escape its clauses. The fate of mortals must be worked out in accordance with strict principles and all the apparent inconsistencies, injustices and contradictions will be sorted out in future lifetimes.

The doctrine of reincarnation, say the believers, therefore absolves God from any charge of injustice, favouritism, cruelty or caprice. Each person is ultimately responsible for his own destiny. Much that seems inexplicable in the situations that confront man in this life can be reviewed against this background, for they are the result of events that occurred in a past incarnation. The pattern of our destiny is woven with the threads that we ourselves have spun.

In what form does the soul return to earth? Some schools of belief, particularly in Hinduism, hold that a man does not necessarily assume a human form in his next incarnation. Certain Hindu sects teach that the soul may be reborn as a plant, or an animal. Someone who has lived a life of vice or crime may be re-embodied as a cactus, a poison ivy, a lizard or a toad. According to the early Hindu law-giver Manu, the slayer of a Brahmin enters the womb of a sow or she-ass; a drunkard will be reborn as a bird that lives on dung; and other sinners and reprobates will become hyenas, rodents, insects and creatures of low and repulsive estate. Those who have done well will return as men and women.

Plant and animal transmigrations are not as a rule accepted by Western reincarnationists, who believe that once a soul

National Library of Scotland

Above **A modern writer, A. J. Stewart, who believes herself to be a reincarnation of James IV of Scotland described her life as the King in a book called *Falcon*: portrait of James IV** ***Right*** **Certain advanced beings return voluntarily to earth to help humanity, according to reincarnationists; one of these Masters is said to have lived as the philosopher Proclus in the 5th century AD, and as Francis Bacon, among other incarnations: portrait of Bacon, in the National Portrait Gallery**

has reached the human stage in its evolution it never returns to animal form. Human beings can only be reborn as men and women, and have the status and grade commensurate with their deserts, earned in their previous lives. One may be born a prince, a blind man or a leper.

Other questions are: how often does the soul return? Is the process indefinite? Considering that all men fall woefully short of the glory of God, what hope is there for anyone to attain the state of perfection required under the terms of this belief?

The number of chances each person has is said to range from three (once as a man, once as a woman, and once in the sex in which the soul fared better) to many thousands, some of which started at the beginning of Creation and may continue to the end of time. But it is generally believed that the cycle of birth-death-rebirth can be terminated by one or more of the various disciplines prescribed in the religious texts. Among them are renunciation, asceticism, good works, prayer, ritual and faith.

The Plain of Forgetfulness

The length of time for which the soul remains in the otherworld between incarnations is said to be determined by a number of factors. It seems to depend primarily on the condition of the soul concerned. In some cases it may return immediately, and in others after years, even centuries.

Certain advanced beings do not have to return at all, but do so voluntarily in order to assist the efforts of other men in their evolution towards perfection. In Buddhism such evolved beings are called Bodhisattvas, and it is believed that some of them have reincarnated again and again, and will continue to do so until all men are saved (see BUDDHISM).

The Tibetans believe that the Bodhisattva named Avalokitesvara became incarnate as their spiritual head, the Dalai Lama, and that each successive Dalai Lama is the embodiment of that august being. This idea determines the choice of successor to their deceased pontiff. When a Dalai Lama dies his soul does not wait in the otherworld as do the shades of lesser mortals, but immediately occupies the body of a child born at the precise moment of his death. It is the task of a special committee of senior lamas to find the child in question (see LAMAS).

What the soul does while it awaits reembodiment is again a matter of opinion among the various schools. Generally it is thought that in the next world it reaps its crop of rewards and punishments and learns its lessons before being despatched to earth again. Some dim vestige of memory survives this experience and is brought back to earth.

According to the Platonic theory the soul participates in the transcendental world of Ideas before it enters the earthly body at birth. These Ideas are Truth, Beauty and Goodness, of which the soul continues to receive intimations during its sojourn in bodily form. This recollection arouses in the individual a desire to regain the lost glory of his former estate. Man can, consequently, find true knowledge by remembering truths known to him before he took on a mortal frame. This idea is combined with another Platonic notion of what happens between incarnations. In his *Republic* Plato relates the legend of the warrior, Er the Pamphylian, son of Armenias, who was killed in battle and was found some days later, brought home for cremation, and suddenly came back to life. He described what occurred after death.

Each soul, he said, was given a chance to select the form of its next incarnation, but the choice was hampered by its own shortcomings, for whether it chose wisely or foolishly now depended on the insight and wisdom acquired during its past life. The responsibility was entirely its own. Heaven was guiltless. It was a wonderful sight, he said, at once melancholy and ludicrous, to watch how everyone made their choices. After their selection they had to drink of the river situated in the Plain of Forgetfulness, so that they lost all remembrance of the past. They were then sent earthwards this way and that, like shooting stars.

Chinese Buddhism speaks of Meng P'o, the presiding goddess of the underworld, who makes all souls assigned to her dread domain between incarnations partake of a drink of broth before they go back to earth to live out another life. This broth is both bitter and sweet and causes all that happened before to be forgotten. It is because they have quaffed the drink of forgetfulness in Meng P'o's kitchen that men do not remember the acts of their previous existence.

But there have been highly evolved souls who claimed to be able to recollect their past lives. The Greek philosopher Empedocles, who lived in the 5th century BC, is said to have remembered himself as a fish, a bird, a maid and a youth, and several other thinkers among the ancients made similar assertions.

Modern exponents of the doctrine of the transmigration of souls also claim to remember their past lives, some going back to Rome, Greece, ancient Egypt or prehistory. The Theosophist Annie Besant (see BESANT) believed that she had lived as the female Neoplatonist martyr Hypatia (d. 415 AD), and as the philosopher and martyr Giordano Bruno (d. 1600). Her colleague Colonel Olcott had been a prince in Atlantis, and then Odysseus, as well as other eminent people.

A fact that creates a certain suspicion in the minds of sceptics is that advocates of the rebirth philosophy generally claim to have been Egyptian pharaohs, Babylonian kings, Persian rulers, Chinese princesses and so on; few indeed believe that they lived humble lives as ordinary men and women. Among various explanations, this could be due to a subconscious wish in the minds of those bound down by the drudgery of the workaday world for the more spacious days of the past.

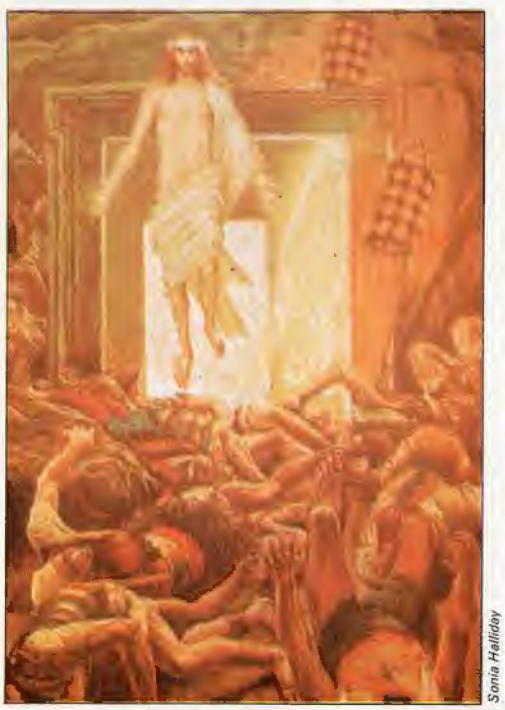
Critics of the theory of reincarnation also argue that if the soul is sent to earth in another body in order to progress in its spiritual evolution, it would seem reasonable that it should remember its past so that, knowing its shortcomings, it might benefit from its experience. However, they point out that, except for a handful of adepts, hardly anyone remembers what his past has been and where he has failed. How then do we know that we have had any previous identity, and what is there to link us with it?

Reincarnationists point out that forgetting a previous existence need not preclude the idea of one continuing personality, and the identifying of a man's present self with his earlier forgotten selves. Human beings spend about one-third of their lives in the mysterious phenomenon called sleep, about which they remember virtually nothing when they awake; yet no one can deny that he is the same person before and after sleeping.

The curious phenomenon of child prodigies may provide further evidence that people recapture flashes of their forgotten lives. In the 18th century, for instance, Jean Cardiac knew the alphabet when he was three months old, could converse in his mother tongue, French, when a year old, in Latin when three, in English when four, and in Greek and Hebrew at six, apart from various other languages. He also picked up a number of arts and skills before dying in 1726 at the age of seven. The famous 'Infant of Lubeck' in Germany, born in 1721, talked within a few hours of his birth, knew the chief events of the early parts of the Bible at the age of one, of the whole Bible at the age of two, and of world history at the age of three. At the same time he acquired a knowledge of Latin and French. He was sent for by the King of Denmark and astounded the monarch who had refused to believe in his powers. The child predicted his own death, which occurred when he was four.

Cases of mathematical prodigies of astonishing ability are also well attested.

Below **Jesus is believed to have appeared on earth after his death on the cross, and many Christians have awaited his Second Coming in the future: 19th century painting of the resurrection of Christ, by James Tissot** ***Right*** **In Hinduism gods are believed to appear in the world in bodily incarnations age after age: the god Vishnu, in his incarnation as the boar Varaha, raising the earth goddess from the primeval ocean; 12th century AD**



Sonia Halliday

C. M. Dixon/Victoria & Albert Museum

Many of these children answered in a matter of seconds intricate mathematical problems involving astronomical numbers, their minds apparently working like computers. Musical prodigies are also well known. Mozart, for instance, could compose at the age of five. Another famous prodigy was Pascal who discovered a new geometrical system when he was 11 and wrote a treatise on acoustics the following year. According to the reincarnationists, all these children brought with them knowledge remembered from their past lives; they picked up their talents where they had left off.

Returning to the Past

There is also the curious, and not uncommon, phenomenon of *déjà vu* (French for 'already seen'), in which people claim to have seen something, or known certain people, or had an encounter, not in this life but at some period that can only have been in another existence. A person brought up in England who has never travelled abroad before may pay a first visit to Norway, for instance, and while touring a remote village in the interior he may be suddenly gripped with the conviction that he has been there before. His surroundings lose their strangeness, and take on a semblance of familiarity. He is certain that he has been here before, although he is just as sure that he has never been anywhere near the place in his present life. People in similar situations have been able to describe what they would see when they turned the corner and what lay over the crest of a hill, or behind a certain street.

Although this kind of experience can be explained as being a recollection of scenes viewed in a travel book or film travelogue or, more rarely, during an astral journey, reincarnationists tend to accept such instances as evidence of the person concerned having been there in a past life.

There is at present at least one researcher doing practical work on the subject of reincarnation. He is Professor Hemendra Banerjee, director of the Department of Parapsychology in Rajasthan University, India, who has devoted over 12 years to the subject. He has investigated the claims made on behalf of rebirth, and tested girls and boys as they led him or members of his team to former homes where they recognized relatives and identified their belongings.

A well-known earlier case was that of a young girl named Shanti Devi who was born in Delhi in 1926. She insisted that she had lived before, and named the city of her former birth. On being taken there she pointed out correctly the secret places where she had hidden her toys, indicated her favourite haunts, and identified her relatives and her former husband.

In Europe practical work has been conducted in what is called age-regression which, according to some reincarnationists, has provided further reinforcement of their claims. Experiments involve putting a subject under hypnosis and making him go back, by suggestion, to his childhood and even his infancy, to re-live his early years. In certain cases this regression can ostensibly be carried back into what is claimed to have been a previous existence. Early in this century a French investigator, Colonel Eugene Rochas (d.1914), allegedly took hypnotized subjects back to their past lives.

One of the most celebrated of this sort of case was recorded in 1952. A young housewife called Ruth Simmons living in the U.S.A. was able to recall a past in Ireland as a woman called Bridie Murphy. It was alleged by those who challenged her story that although she had claimed to have had no contact with Irish people and culture, she had lived close to an Irish family as a child, and that there was a woman in the family known as Bridie Murphy. Despite such rebuttals, hypnotherapists still use the technique (see ARTHUR BLOXHAM). A 1976 book by Jeffrey Iveson called *More Lives Than One* describes Bloxham's work.

Camera Press London

Some souls are thought to spend many years in the otherworld between incarnations, while others return immediately to earth: Tibetans believe the Dalai Lama *(above)* to be an embodiment of Avalokitesvara, whose soul enters a child's body at the moment of a Dalai Lama's death. Aleister Crowley *(below)* believed he was a reincarnation of Eliphas Levi, who died the year that Crowley was born

Opponents of the doctrine of reincarnation have not been slow to point out its shortcomings as an acceptable philosophy of life. Flowing from its teachings is the corollary that victims of poverty, chronic ill-health, or inherited diseases are only suffering for their own past misdeeds, as retribution for the iniquities of their previous lives. If this idea is carried to its logical conclusion it would seem that attempting to relieve the distress and misery of others is almost meddling in the affairs of providence. If a person has been put into this world to redress the balance of his own wicked past, what business is it of ours to interfere and disturb the ordinances of God?

There is also the demoralizing effect that such a belief could have on a person's character. Why keep the faith and fight the good fight? What inducement is there to resist temptation? Would it not be an act of folly to spurn delights and pleasures if the chance to enjoy them is there? If destiny has put these glorious opportunities in a man's way, why should he not make the best of them? If his actions turn out to be sinful and are marked on the debit side of the ledger, there is always another chance.

The 18th century Swedish mystic Emanuel Swedenborg (see SWEDENBORG) rejected reincarnation on principle. He held that every man is a new creation and has never existed before, and explained recollections of past lives as being the work of evil spirit-entities who projected these false histories on the minds of those susceptible to receive them. Belief in the doctrine naturally made the mind receptive to the false clues provided by the evil spirits.

Another note of caution was sounded by Dr Carl Wickland of Chicago who devoted his life to the subject of after-death experiences, so-called spirit possession, and other related matters. Dr Wickland, who published his findings in 1924, said that persons who die convinced that they will ultimately be reincarnated impede their own further evolution. Belief in the theory is not only false but harmful, for it acts as a psychic barrier against progress to the higher spiritual planes after death.

Reincarnation may not be universal. The intensity of a man's faith may ultimately determine what happens to his soul in the next world. To the Christian the cycle of birth-death-rebirth, if indeed there is any such cycle, is broken by Christ's atoning sacrifice. Faith in its redemptive power not only dissolves the bonds of Satan but also releases the soul from the wheel of eternal return. In other words for the Christian the belief is superfluous; he does not need it.

RELICS

A DEAD BODY does not decompose overnight. Years, even centuries later, identifiable bones or ashes may still exist, as well as garments and other possessions. Such mementoes have often been preserved with high honour and religious awe. They are then known as relics, from the Latin *reliquiae*, 'remains'.

In societies with a strong belief in magic, people may revere a corpse, and endow portions of it with special powers. The result is not always preservation; it may be the opposite. Some cannibals expect to absorb a dead man's qualities by eating a piece of him. But human remains can also become amulets, and this approaches more closely to the conception of a relic. In the Andaman Islands in the bay of Bengal, a necklace of bones is a charm to ward off evil, because the ghost is flattered and therefore friendly. Elsewhere, skulls are favoured. The ancient Celts attributed potency to heroes' heads and that of Bran buried on Tower Hill, protected Britain against invasion (see HEAD).

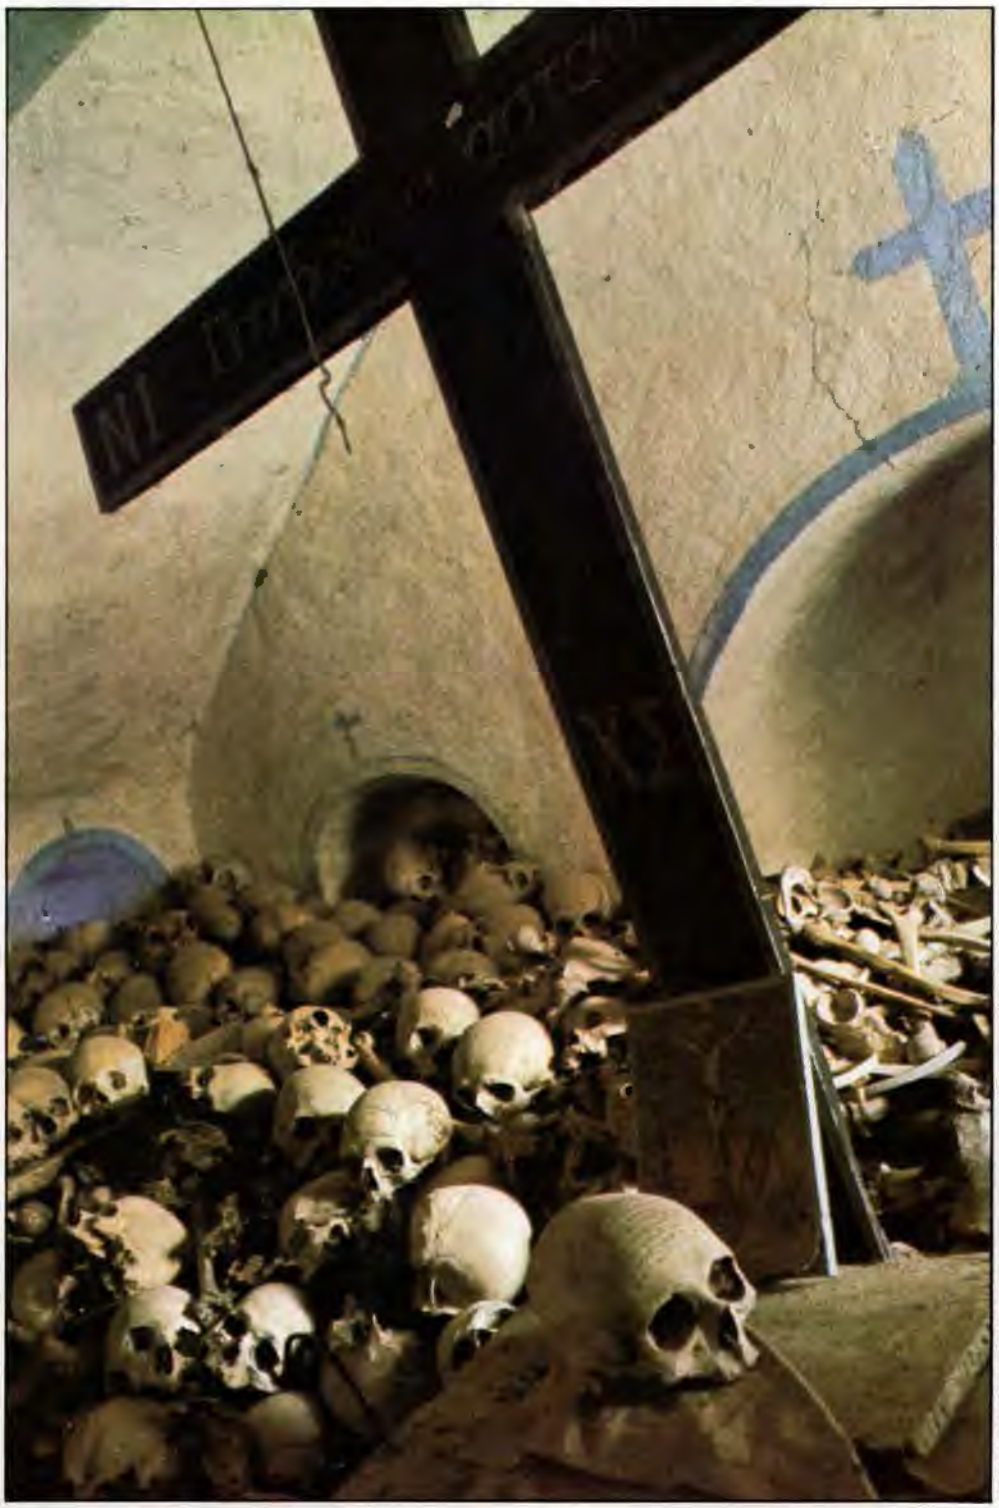
Things associated with the dead, but not actually part of them, are also treasured in several primitive cultures. The *churinga* of central Australia – magical objects handed down from totemic ancestors – are kept in shrines and credited with powers of healing.

Three major religions have attached importance to relics: Buddhism, Greek paganism, and Christianity. Buddhism began as a movement within Hinduism led by Gautama (see BUDDHISM; GAUTAMA). There was not much veneration of relics in India before him, probably because Hinduism lacked historical founders. Gautama's disciples, seeing him as the unique Enlightened One, gave him personal devotion of a new kind. The remains of his cremated body were divided among eight of them. Seven principal relics (real or alleged) came down to posterity – the four canine teeth, the frontal or forehead bone, and two pieces of collar-bone. These and smaller fragments have been kept for thousands of years. The most famous is a tooth in Kandy, Ceylon. Such souvenirs of Buddha and other saints are richly housed in *stupas* or shrines. Modern India supplies a Hindu parallel in the treatment of Mahatma Gandhi (see MAHATMAS). After his cremation in 1948, particles of ash were given to several associates. One is enshrined at Juhu near Bombay.

While Buddhism was taking shape, respect for relics was being carried at least as far in the contemporary cults of the Greek city states. Many temples had parts of the bodies of legendary heroes, or their supposed possessions. The relics were often kept in a chapel or *heroon* and were thought to protect the city. Athens possessed the remains of Theseus, brought there from the island of Scyros with a civic ritual which is described by Plutarch. Epidaurus had the bones of Asclepios, and in a bronze coffer in the temple of Zeus at Elis lay the shoulder-blade of Pelops. The city of Argos hoarded the bones of his father Tantalus in a similar vessel. Sometimes the sacred objects were hidden, with a taboo or spell attached. At Libethra there were relics of Orpheus, which had to be kept out of the sunlight. If it fell on them, the city would be destroyed.

Besides these bodily remains, Agamemnon's sceptre received daily homage at Chaeronea; the spear of Achilles, Helen's sandals, the shield of Pyrrhus, were all carefully preserved. Marsyas's flute was in the temple of Apollo at Sicyon; and Orpheus's lyre was in more temples than one. The more far-fetched items included some unused scraps of the clay from which Prometheus made men, and one of the eggs laid by Leda after her encounter with Zeus in the shape of a swan.

The mystical trend of later Greek religion brought with it a contempt for matter, and a corresponding decline of interest in relics. However, the cult was revived by the Christian Church, and taken much further. God had become man in Jesus Christ, therefore he had hallowed the body, and matter generally. Christ's resurrection, the pledge of the resurrection of all, meant that this hallowing was universal and everlasting. The bodies of saints were temples of the Holy Spirit, destined to be raised and glorified. Through them God bestowed



John Marmaras/Susan Griggs

The head of a saint or holy man has been regarded with particular awe in many cultures as it is thought to contain the essence of a person's life-energy and character: skulls of monks, in a monastery on Mt Athos, Greece

British Museum

benefits on mankind which did not cease at death. Furthermore, objects connected with the saints might carry a share of supernatural virtue.

In support of these doctrines, theologians quote Exodus 13.19 and Joshua 24.32, referring to the Israelites' care for the bones of Joseph; 2 Kings 13.21, where a corpse comes to life after contact with the remains of the prophet Elisha; and Acts 5.15 and 19.11–12, where the sick are healed by Peter's shadow and by cloths which Paul has handled.

In the Roman Catholic tradition it is held proper to 'adore' a relic as a means of communion with the saint on whom it fixes the mind, and as a channel of divine power and grace. A few Fathers of the Church, notably Cyril of Jerusalem, maintained that a relic could have power in itself. This semi-magical idea never received the Church's endorsement. If miracles happen when a relic is present, God is the worker. The relic is, so to speak, the occasion.

The oldest reliable Christian relic-story concerns St Polycarp. A letter issued by his disciples in Smyrna, in 156, describes how he was burnt at the stake. It goes on: 'We took up his bones, more precious than jewels and finer than refined gold, and laid them in a suitable place where the Lord will permit us to gather ourselves together, and celebrate the anniversary of his martyrdom.'

By the 4th century the Christian cult of relics was far advanced. Special caskets called reliquaries were made to keep them in. Not only the remains of whole bodies, but chips of bone and parcels of dust, were prized. The whole concept was also being enlarged. When St Vincent was martyred in 304, bystanders dipped pieces of linen in his blood, which became heirlooms.

The first clearly-reported Christian relic that was not in any sense a part of a body is the True Cross, on which Jesus was crucified (see CROSS). After Constantine's conversion in 312, his mother Helena directed excavations in Jerusalem and announced its discovery. Soon slivers of the holy wood had been distributed to Christians throughout the Empire.

About the same time, there is an allusion to St James's chair; and some decades later Augustine wrote of miracles performed by soil from the Holy Land, oil from the lamps in a martyr's church, flowers fresh from contact with a reliquary.

There is no sign of any protest. The principal Fathers of the Church at this period – Augustine himself, Jerome, Ambrose – take relics for granted as part of the apparatus of religion. Gregory of Nyssa speaks of the desire of Christians to be buried near the tombs of martyrs. The only disagreement is over certain proprieties. Eastern Christians had few scruples about breaking up a saint's body; Western Christians were averse to dismemberment. Pressed for relics to go into new churches, Rome tried an expedient. During the 6th century it was customary to lower a box containing pieces of fabric onto the tombs of the apostles Peter and Paul. As soon as the box touched the tomb, these counted as relics. But the Second Council of Nicaea, in 787, decreed that every church must have a relic under its altar, and the demand finally overbore resistance: the saints, in the West as in the East, were dissected without limit.

It was now the West – Merovingian and Carolingian France, Anglo-Saxon England, Celtic Ireland – that ran to extremes of adoration. The faithful visited relics to kiss them, to be cured by them, to take oaths on them. In the high Middle Ages, reliquaries grew ever more gorgeous, the ritual of enshrinement ever more splendid.

Abuses were bound to occur. Even in Roman times Augustine complained of tricksters disguised as monks, selling holy fakes. Bishops tried to forbid the sale of any relics – in vain. The export of fragments of deceased martyrs from Rome became a regular trade. Relics were hotly denounced by the Reformers, especially Calvin. The attitude of Protestant Christianity has always been restrained.

During the ages of faith – or in this case, credulity – the limits to what might be alleged were purely doctrinal. With Christ and Mary dogma imposed vetoes. Since Christ himself had risen to heaven, few remains of his actual body could exist on earth, apart from congealed drops of blood (as at Fécamp in Normandy). Much the same restriction applied to Mary, whose son had taken her to himself after death, leaving an empty tomb. Apart from what was thus excluded, almost anything might be produced as a relic.

Relics multiplied during the Middle Ages, and devout Christians went on pilgrimages to worship them *Below* Reliquary containing the hand of St Attale, in Strasbourg *Facing page* Christ's features are said to have been miraculously imprinted on St Veronica's veil when he used it to wipe the sweat from his brow while on the way to Calvary: illustration from a 15th century German manuscript showing St Veronica holding the relic; the original veil is said to have been in Rome from the 8th century

Giraudon

This raises the whole question of authenticity. Many relics of recent saints are well attested; those of earlier dates are more doubtful, and often incredible. Rivalry among medieval shrines led to serio-comic disputes, with several claiming the same saint or the same object. Glastonbury Abbey in England professed to have the remains of St Patrick, St Dunstan, and many others, in defiance of competitors with far stronger claims. It also possessed a splinter from the table of the Last Supper, and one of the stones which Christ refused to turn into bread. Outside England, the more surprising relics included a feather from the wing of the angel Gabriel; a jar full of the darkness inflicted on Egypt by Moses; rays from the Star of Bethlehem; samples of the Virgin's milk; and a whole wardrobe of her chemises.

There are records of early attempts at verification. Most, however, consisted merely in seeing whether a relic worked miracles. The most famous case is that of the True Cross itself. When Helena searched for it, she unearthed the timbers of three crosses, and picked out Christ's by its ability to cure a sick man. Other relics were 'authenticated' by manuscripts and even labels, palpably forged. Objective scrutiny is a fairly modern development, and its conclusions are usually adverse. At best the results of study are seldom more than negative, in the sense of showing that a relic is not demonstrably bogus.

An interesting relic of Christ, from a non-devotional point of view, is the Holy Shroud of Turin. It bears the imprint of a body wounded in the correct places, which, if artificial, implies a knowledge of anatomy and the effects of crucifixion hard to account for in the Middle Ages. The Roman Catholic Church, however, does not pronounce on the authenticity of this or any other relic. After the Counter-Reformation, many of the more absurd ones were quietly got rid of. Yet caution rather than iconoclasm has remained the norm. The Jesuit Herbert Thurston, an erudite and sceptical historian, defended bishops who left matters alone, on the ground that in many places religion is so closely bound up with 'some ancient special devotion' that it would be hard to disentangle the false from the true.

From a Catholic point of view the genuineness of a relic is not as crucial as might appear. So long as the object is regarded not as having magical power of its own, but as orienting the worshipper toward a Presence behind, it can be highly suspect without invalidating the cult. It becomes scandalous only where the faithful are led to believe, literally, a flagrant falsehood.

GEOFFREY ASHE

RELIGION

Comparative religion is a modern discipline but interest in the origin and essential nature of religion is very old, and many conflicting theories have been advanced: despite Kipling's words, East and West have met in this field, and the interaction between Hinduism and Christianity is an interesting case-history of what happens when two religions meet: religious architecture is not only a delight to the eye but a symbolic expression of some of the profoundest beliefs of men

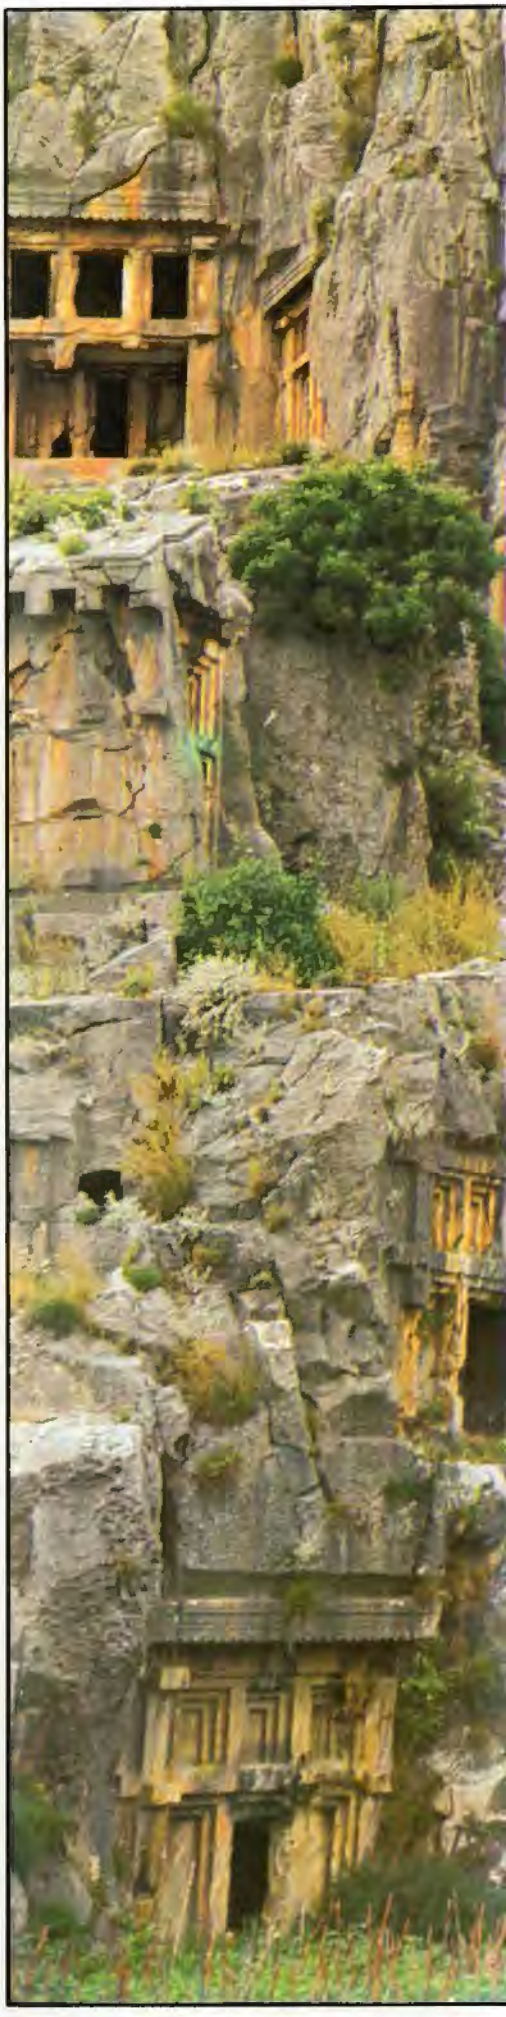
THE TERM 'comparative religion' has become the established designation for the discipline more correctly described as 'the comparative study of religion'. Among English-speaking scholars comparative religion generally includes what Continental scholars tend to regard as two separate subjects, the history of religions and the phenomenology of religions. But these subjects are essentially interrelated, for no serious comparative study of religion can be undertaken without both a sound knowledge of the history of the religions concerned and a wide acquaintance with the variety of forms in which religious faith and practice have found expression.

Religion, in two of its basic concerns at least, can be traced back to the very beginning of human society. The peoples of the Old Stone Age ritually buried their dead and practised fertility rituals (see PREHISTORIC RELIGION). At this remote period religion was doubtless largely the practical expression of deep-felt emotions awakened by the mysteries of birth and death. Some reasoning about these issues must certainly have informed the ritual action, but in the absence of written records we can know nothing of its nature or content. However, it would seem improbable that these remote ancestors of our race would have been mentally capable of looking critically at their religious customs and asking how they had originated.

Evidence of such ability is clearly found in the earliest writings known to us, which date from the third millennium BC in both Egypt and Mesopotamia. On the so-called Shabaka Stone, now preserved in the British Museum, a text in honour of Ptah, the god of Memphis, the earliest capital of Egypt, briefly tells how religion started. Ptah, it claims, 'created the gods, he made the cities . . . he set the gods in their cult-places, he established their offerings, he founded their shrines'. The claim is a naive assertion by the priests of Ptah that their god was the creator of all the other Egyptian gods, and that he had arranged for their ritual service. However, despite its naivety, the claim has a great significance. It shows that already in Egypt people were interested in the origin of religion. A similar significance attaches to a Sumerian text of about the same period which tells how the gods had to labour to provide their food until the wise god Enki made men of clay, to be their servants. In other words, according to ancient Sumerian thought, the purpose of the human race was to feed the gods by sacrifices and house them in temples.

These primitive theories, if such they may be called, about the origin of religion were in no sense adversely critical of religion as an institution. Indeed, they obviously regarded it as being of divine origin, and constituting the reason for the existence of human society. It was, characteristically, in the world of Greek culture that a sceptical appraisal of religious origins first appeared. The philosopher Xenophanes of Colophon, writing in the 6th century BC, perceived that the conception of deity is essentially conditioned by ethnic factors, as well as being basically anthropomorphic. He pointed out that the Thracians thought of their gods as Thracians, with grey eyes and red hair, whereas the Ethiopians naturally conceived of theirs as having negroid features. And he cynically remarked that horses and oxen, if they could carve, would undoubtedly represent the gods in their own animal forms.

Xenophanes was followed by many other thinkers who could detach themselves from the religious beliefs and practices of their environment, and speculate freely on the nature and origin of religion as a human institution. One of the most notable of these thinkers was Euhemerus of Messene (c 300 BC). He hit upon a novel means of propounding his theory. In a fictitious travel-narrative, he described how he had found an inscription on an island in the Indian Ocean which revealed that the Greek gods had originally been great kings who were



Tombs built into the rocks at Myra in Turkey, a survival of the ancient belief that the mysterious nature of caves made them proper places for contact with the supernatural

The Renaissance artists began to depict the gods of Greece and Rome in splendid human form instead of as demons, as did the artists of medieval Christianity

subsequently deified. This theory, known as Euhemerism, is not entirely without foundation, although it is not a sound explanation of the origin of the chief gods of ancient Greece. A remarkable instance of its truth is the deification of Imhotep (see IMHOTEP); but it is unlikely that Euhemerus knew of this instance.

The religious syncretism of the Graeco-Roman world also prompted a comparison of deities. Already in the 5th century BC, the historian Herodotus had identified certain Egyptian and Greek deities; but the most notable example of this practice occurs in the beautiful description of the Egyptian goddess Isis by the Latin poet Apuleius (2nd century AD) in his famous romance *The Golden Ass*. Isis reveals herself as the Great Goddess, who is worshipped by many peoples under various names (Minerva, Venus, Ceres and many more) but under her true name of Isis by the Egyptians.

The famous saying of the Latin poet and philosopher Lucretius (1st century BC) epitomizes his evaluation of religion: *tantum religio potuit suadere malorum*, 'so great is the power of religion for evil'. According to Lucretius, religion arose out of the exploitation of man's fear of death and the unknown by unscrupulous priests and seers; and he laboured to free his fellow-men from this evil by arguing that death is personal extinction, beyond which there is nothing more to fear.

The great variety of religions that competed for allegiance in the Graeco-Roman world, and their tendency to mingle with each other, led other thinkers to find less sceptical explanations of religion's origin. For example, Maximus of Tyre (c 125–185 AD) argued that since God, the Creator and Sustainer of the universe, is both ineffable and invisible, men have been obliged to worship him under whatever form has seemed intelligible to them: hence the Egyptians worshipped animals and the Greeks conceived of God in human form. Sallust (c 363 AD) rationalized many myths; for example, he explained that of Cybele and Attis in terms of her being a life-giving goddess and Attis the creator of 'things that come into being and perish'.

Such attempts to explain the origin of the complex mythology of Greek religion ceased

The temples of ancient religions reflect the beliefs of the people who worshipped in them *Far left* To the Egyptians a temple represented heaven, and rites performed inside it were believed to ensure security for the land and its people; worshippers moved gradually from the strong sunlight of the secular world through the deepening darkness of great halls into the intense blackness that shrouded the shrine that contained the god's image: one of the pylons at the entrance to the temple of Amun at Karnak *Left* The Acropolis in Athens, dominated by the Parthenon. This temple is a supreme example of the architectural perfection with which the Greeks honoured their gods; the cult image usually dominated the interior of each temple *Above* Roman temple at Dougga in North Africa

with the triumph of Christianity and the defeat of paganism. And since Christianity dominated the medieval society that followed the break-up of the ancient world, the origin of religion was no more a subject for speculation. For Christianity saw itself as the only true religion, and its origins were divinely revealed in the Bible. So far as the 'false religions' were concerned, it was enough to condemn Judaism as the miserable remnant of a faith that had failed to understand God's purpose, to account for Greek and Roman paganism as the invention of the Devil, and to denounce Islam as a damnable heresy. There were some attempts by individual Christians to study Islam for missionary and disputative purposes, a notable example being Raymond Lull (see LULL); the Crusades, however, represented the typical Christian reaction to the religion of Mohammed. Of the great religions further east, medieval Christians had scarcely any knowledge, owing to their geographical isolation – it is significant of the degree of their ignorance that the story of the Buddha filtered through in such a garbled form that the founder of Buddhism was believed to be two godly persons, Barlaam and Joasaph, who were duly canonized as saints in the Eastern Church.

The re-awakening of interest in the other religions of mankind had to await the humanism of the Renaissance and the development of maritime exploration. Thus the new passion for classical antiquity in the 15th and 16th centuries caused statues of pagan gods to be highly prized, and the Renaissance artists began to depict the gods of Greece and Rome in splendid human form instead of as demons, as did the artists of medieval Christendom. Through trade and missionary enterprise contact was gradually established with the great and ancient civilizations of India and China, and many European scholars came to admire the cultural achievements of these eastern peoples. Trade and colonization also made Europeans acquainted with the cultures of the primitive peoples of Africa, Australasia and the Americas.

Already by the 17th century the stimulus of all this new knowledge about other religions was bearing fruit. In 1724 a Jesuit scholar, Joseph Lafitau, who had served as a missionary in Canada, published a book entitled *Moeurs des savages amériquains comparées aux moeurs des premiers temps*. The work constitutes a veritable landmark in the study of religion; for in it Lafitau noted similarities in the religion of the American savages, the ancient cults of Bacchus, Cybele and Isis and Osiris, and Catholic Christianity. These similarities seemed to him to point back to a common origin, to a single original revelation.

The 18th century saw other notable studies in comparative religion. In 1760 Charles De Brosses, in a work entitled *Du culte des dieux fétiches, ou parallèle de l'ancienne religion de l'Égypte avec la religion actuelle de Nigrite*, sought to explain the animal-headed gods of Egypt in the light of the religious practices of contemporary savages. Even more revolutionary perhaps was the attempt of Charles-François Dupuis, in 1795, in his *Origine de tous les cultes*, to discern behind the figures of Christ and Osiris, of Bacchus and Mithras, a common tendency to personify the sun in its annual course through the heavens.

These attempts to rationalize the complex phenomena of the religious ideas and practices of mankind prepared the way for the more scientific approach of later times. The commercial and political domination, which the leading European nations had gradually built up in Asia and Africa, was also producing a rich academic harvest. Art treasures and manuscripts brought home from the East provided the material for scholarly research, encouraging especially the study of oriental languages. Notable pioneers in this field were Anquetil-Duperron, who in 1771 produced the first translation of the *Zend-Avesta* into a Western language and thus provided the key to the study of Zoroastrianism, and Sir William Jones (1746–94), whnse Sanskrit studies opened the way to the sacred literature of India. Early in the 19th century the decipherment of the long-forgotten languages of Egypt and Mesopotamia was gradually achieved, so making possible for scholars the interpretation of the earliest religious texts of mankind.

This linguistic preparation for the scientific study of religion was accompanied by the accumulation of an increasing mass of data about the beliefs and ritual practices of the so-called primitive peoples of Asia, Australia, Africa and the New World. Much

Mysterium Tremendum

Let us consider the deepest and most fundamental element in all strong and sincerely felt religious emotion. Faith unto salvation, trust, love – all these are there. But over and above these is an element which may also on occasion, quite apart from them, profoundly affect us and occupy the mind with a wellnigh bewildering strength. Let us follow it up with every effort of sympathy and imaginative intuition wherever it is to be found, in the lives of those around us, in sudden, strong ebullitions of personal piety and the frames of mind such ebullitions evince, in the fixed and ordered solemnities of rites and liturgies, and again in the atmosphere that clings to old religious monuments and buildings, to temples and to churches. If we do so we shall find we are dealing with something for which there is only one appropriate expression, '*mysterium tremendum*'. The feeling of it may at times come sweeping like a gentle tide, pervading the mind with a tranquil mood of deepest worship. It may pass over into a more set and lasting attitude of the soul, continuing, as it were, thrillingly vibrant and resonant, until at last it dies away and the soul resumes its 'profane', non-religious mood of everyday experience. It may burst in sudden eruption up from the depths of the soul with spasms and convulsions, or lead to the strangest excitements, to intoxicated frenzy, to transport, and to ecstasy. It has its wild and demonic forms and can sink to an almost grisly horror and shuddering. It has its crude, barbaric antecedents and early manifestations, and again it may be developed into something beautiful and pure and glorious. It may become the hushed, trembling, and speechless humility of the creature in the presence of – whom or what? In the presence of that which is a *mystery* inexpressible and above all creatures.

Rudolf Otto *The Idea of the Holy*

of this information was first acquired incidentally by Christian missionaries who sought to convert the peoples concerned; but gradually special investigation was undertaken as the sciences of ethnology and anthropology were established and developed.

A Disease of Language

The comparative study of religion during the 19th and early 20th centuries was characterized by the rise and decline of various 'schools' of thought, which sought to explain the origin and essential nature of religion according to some preconceived principle of interpretation. This phase in the development of the discipline was doubtless inevitable, because theological interest in the subject was then predominant. Thus Friedrich Max Müller (1823–1900), who may justly be regarded as the pioneer of the scientific study of religion, attempted to explain the origin of religious myths through comparative philology. He argued that language-analysis will often provide the key to the origin of a deity. The following example shows his method: the Sanskrit word *dyaus*, which originally meant 'bright', came to denote the (bright) sky. Since thunder was heard from the sky, the Aryans, who spoke Sanskrit, would say the *dyaus* (the sky) thunders. This usage led to the personification of *dyaus* as the Power manifest in the sky, and so on to the concept of a sky god Dyaus, who announced his presence by thundering. Max Müller traced religion itself back ultimately to 'an ineradicable feeling of dependence' upon some higher power that was innate in the human mind. Its expression in mythology was essentially due to an inherent 'disease of language', in the manner described. Müller did much invaluable work for comparative religion, particularly in editing the *Sacred Books of the East*, a series of translations which made the literature of Hinduism, Jainism, Buddhism, Zoroastrianism and Confucianism available to English-speaking students.

Anthropology soon concerned itself with the question of the origin of religion. For there was a tendency with the early anthropologists to assume that the beliefs and ritual practices of the so-called primitive peoples represented the earliest forms of religion. Out of this new science came one of the most notable theories of the origin of religion, 'animism' as propounded by Sir Edward Tylor (see ANIMISM).

The other great exponent of the anthropological approach to the study of religion at this early stage of its development was Sir James George Frazer. In *The Golden Bough* he defined religion as being 'a propitiation or conciliation of powers superior to man which are believed to direct and control the course of nature and of human life'. But he maintained that religion emerged after magic. At the earliest stage of human culture, according to Frazer, 'man essayed to bend nature to his wishes by the sheer force of spells and enchantments'. When experience taught him that magic did not work, man resorted to prayer and sacrifice to 'mollify a coy, capricious, or irascible deity'. Frazer also showed how agriculture had profoundly influenced man's religious ideas and practices. It inspired the two basic concepts of the fertility goddess and the vegetation spirit, who annually dies and rises to life again (see DYING GOD; MOTHER GODDESS; VEGETATION SPIRITS).

The early years of the 20th century saw a great proliferation of theories about the origin of religion. The dominance of anthropology led to emphasis being placed upon the communal aspect of primitive society and a diminution of the importance of the individual within it. Hence the origin of religion was sought in communal consciousness. The distinguished French sociologist Emil Durkheim interpreted totemism as a factor of basic import for understanding the social origins of religion. In the totem deity he saw the personification of the clan itself in the form of an animal or vegetable. Unconscious of themselves as individuals, its members were inspired with a sense of their integration with this deity during their worship and service of it (see TOTEM).

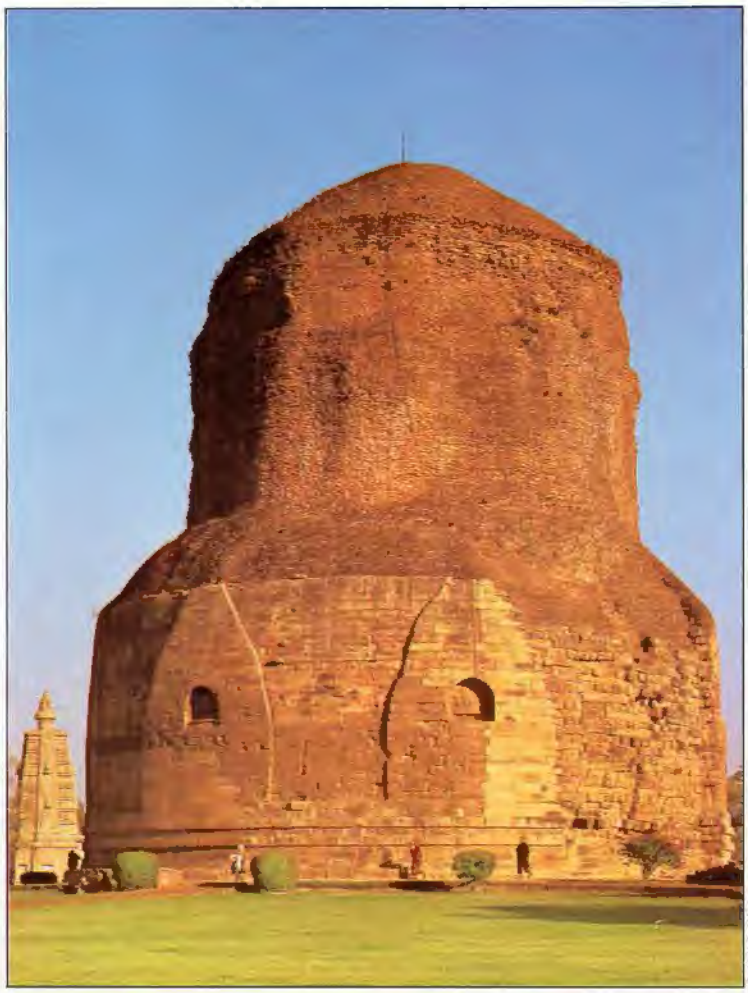
The emergent science of psychology also contributed to the speculation about the beginnings of religion. Sigmund Freud (1856–1939) found the origin of religion, or its primordial form, in 'an infantile obsessional neurosis' which centred on the primal father-figure. He conceived of human society as originally comprising a 'primitive horde', ruled over and controlled by a father who kept all the females for himself and repelled his growing sons. The sons, who both hated and admired their father, finally united in killing and eating him, to absorb his strength and virility. Then, stricken with a sense of guilt, they invented rites of expiation, which involved totemism, taboo and all the other institutions of primitive society. This presentation of the Oedipus complex as the source or cause of religion had the support of no archeological or anthropological evidence, but it excited much interest and won great publicity.

Freud's distinguished successor C. G. Jung (1875–1961) greatly concerned himself with the psychological interpretation of religion, although he was more interested in its basic forms than its origin. The latter he traced to 'a peculiar attitude' of the human mind to its experience of environmental factors that are variously powerful, dangerous or helpful. He sought in myths, as evidence of the collective unconscious, for 'archetypes' or primordial images that have exercised a formative influence upon human thought and behaviour (see JUNG). Jung's influence in the field of religious studies is still immense.

From the fact, noticed by Andrew Lang (1844–1912), that many 'primitive' peoples believed in a supreme Creator god, designated as a 'High God' or 'All-Father', Wilhelm Schmidt (1868–1954) deduced that the earliest form of religion was monotheism. This belief resulted from early man's rationalization of his experience of the natural world. Schmidt set out this thesis in a 12-volume work entitled *Der Ursprung der Gottesidee* (1926–55; there is an English epitome, *Origin and Growth of Religion*, 1931). He maintained further that polytheism was a degenerate form of the primeval monotheism. Schmidt's interpretation was congenial to Christian theology; but it is not borne out by the evidence of Paleolithic archeology.

The Numinous

Another interpretation of the origin of religion which has much commended itself to theologians is that presented by Rudolf Otto (1869–1937) in his book *Das Heilige* (1917), which was translated into English as *The Idea of the Holy* (1923). Otto was particularly concerned to show that religion did not originate from early man's rationalizing of his experience of his natural environment, as earlier scholars had



A. F. Kersting

Michael Holford

The most characteristic architectural structures of Buddhism, *stupas* were originally primitive burial mounds built to contain relics; later they were erected to commemorate important events, and even became objects of worship. Over the years each Buddhist country developed a style peculiar to itself *Left* The Dhamek stupa at Sernath in India marks the spot where Buddha preached his first sermon *Right* The Silver Pavilion at Kyoto, Japan

assumed. Instead, according to Otto, man is endowed with the ability to sense the 'numinous'. This term was derived from the Latin word *numen*, which meant a supernatural non-personalized entity. It constituted something that was in essence 'wholly other' from all normal objects of human experience. The presence of the numinous was sensed under two different forms of manifestation, the *mysterium tremendum* and the *mysterium fascinans*. The former induced the feeling of terror associated with the eerie and uncanny, and was essentially 'awe-ful'. As the *mysterium fascinans*, the numinous exercised a strangely compelling force, drawing those who experienced it on to a closer communion. Otto sought to show that the idea of 'the holy' stemmed from such experience. For that which was associated with the presence of the numinous had to be treated with circumspection; it became 'holy', and contact with it was carefully controlled by taboos. Otto accounted for the various forms of primitive religion, such as a belief in a multitude of spirits, totemism and the cult of the dead, as due to man's subsequent rationalization of his numinous experience.

Otto was certainly justified in emphasizing the importance of non-rational emotive factors in religious faith and practice; but his thesis rests upon assumptions about the experience of primitive man for which no possible means of verification exist. It is, moreover, difficult to conceive of human experience divorced from ratiocination.

Great insight into the fundamental springs of religion was shown by the philosopher A. N. Whitehead (1861–1947). In contradistinction to those who sought to find the origin of religion in the corporate consciousness of a community, Whitehead stressed the essentiality of personal experience. He wrote: 'Religion is what the individual does with his own solitariness' (in *Religion in the Making*, 1927) and he saw it as a 'transaction from God the void to God the enemy, and from God the enemy to God the companion'. He distinguished four basic aspects or factors of religion: ritual, emotion, belief, rationalization, and he evaluated them as four successive stages in the evolution of religion.

In 1935 a series of essays entitled *Myth and Ritual*, edited by S. H. Hooke, initiated a new line of interpretation for the religions of the ancient Near East. The present writer has suggested (in *History, Time and Deity*, 1965) that religion stems from the time-consciousness of man (see TIME).

Such variety of interpretation can be perplexing for newcomers to comparative religion; but the histories of other subjects are equally strewn with the debris of rejected or outmoded theories, and conflict of opinion is generally evidence of vigorous critical thinking that makes for progress. Comparative religion, however, has also been subjected in the past to the pressure of non-scientific interests. Since religion concerns the fundamental issues of human life, many people have sought in its comparative study for the revelation of some desired truth. Such interests are understandable, and they are still felt; but they must not be allowed to obscure the fact that comparative religion is essentially a discipline concerned only with the scientific investigation of the religions of mankind.

The Beginnings

Speculation about the beginnings of religion long preceded the acquisition of archeological data concerning the earliest forms of human culture. Indeed, it has only been in the more recent decades of the present century that the study of prehistory has become established as a scientific discipline. We are better situated today for knowing something of the earliest forms of religion than were previous generations though we cannot, of course, penetrate back to the actual origin of religion, which could scarcely be documented by archeological data. But we can form some idea of the religious beliefs and practices already existent at the dawn of human culture, c 30,000 BC. Our knowledge can, inevitably, be only of an inferential kind from archeological material, since no written records then existed, or would exist

A. F. Kersting

Christian architecture was originally functional, and churches were designed primarily as places where the faithful could assemble for worship; contemporary architectural styles were usually followed, and there was no attempt to incorporate specifically Christian symbolism: Byzantine church at Daphni, Greece

until some 27 millennia had passed.

The fact that the Old Stone Age peoples not only buried their dead, but placed food and equipment of various kinds in the graves indicates that they envisaged some form of life after death. In other words, these burial customs show that, in contrast to all other animals, man was already concerned about death. This means that he was able to abstract himself from the business of living and ponder on the phenomena of its cessation. It means also that he did not accept the physical evidence of death as attesting the definitive end of a human person. For in some crude way he thought that the dead still needed the necessities of life, and that it was the duty of the living to provide them. A certain variety of burial customs suggests also some variation of ideas about the state of the dead. We can infer that, from the very appearance of man in the archeological record, the cult of the dead was already an established practice. How this practice started we cannot tell; but it is significant that the so-called Neanderthal Man, a sub-human precursor of true man, also buried his dead ritually.

On many Paleolithic sites carved figurines of women have been found. They exhibit two notable characteristics: the maternal features are grossly exaggerated while the faces are left blank. A clue to the significance of these figurines is provided by a similar, but larger, figure in bas-relief which was found as the central object of a Paleolithic rock-sanctuary at Laussel in the Dordogne area of France. Generally known as the 'Venus of Laussel', this figure has the same features as the figurines but holds a bison's horn in its right hand (see HORNS).

The emphasis upon the maternal attributes and the blank faces of these figures suggest that they were not intended to be portraits of individual women, but attempts to portray 'woman' as the source of life. Such an intention is intelligible, since the phenomenon of birth provided primitive man with visual evidence of the emergence of new life from the maternal womb. The importance of the production of new living beings to these Paleolithic peoples needs no stressing. And it is easy to understand their awe and respect for the mystery of maternity. There is reason for thinking that a figure such as the Venus of Laussel is an anticipation or prototype of the Great Mother Goddess of the later religions of the ancient world.

Such, on a brief analysis, are the indications that the evidence of Paleolithic culture gives of the sources of concern that inspired the earliest known religion. The mysteries of birth and death must naturally command human attention, and their influence is to be discerned in the most sophisticated religions, as in the most primitive.

S. G. F. BRANDON

Meeting of East and West

When two religions meet, problems are crystallized in a new way; beliefs and practices are called in question; changes take place. When the two religions in question are as distinct as Hinduism and Christianity, and when each is bound up with a culture and a way of life, the encounter becomes doubly interesting as an epitome of the meeting of East and West.

The beginnings of the encounter between Hinduism and Christianity are inaccessible to the historian. Tradition has it that the apostle Thomas preached the gospel in India, but it is impossible to know whether this is true. Certainly there has been a Christian community in India for at least 1500 years, and Hinduism may have been in a position to receive Christian impulses ever since the Apostolic Age. The reverse flow – from India to the West, following the campaigns of Alexander the Great – can probably be seen in some of the schools of Gnosticism (see GNOSTICISM) which gathered round the fringes of the Church during the early centuries of Christianity. But the serious encounter began with the start of what has been called the 'Vasco da Gama epoch' of Western colonialism at the end of the 15th and the beginning of the 16th centuries.

From the first, colonialism and Christian missions followed parallel paths, and shared similar attitudes toward India and Hinduism. The Portuguese colonists were accompanied by mainly Jesuit missionaries, with a view to reinforcing secular with

Early Christian missionaries to India took pains to acquaint themselves with the beliefs of Hinduism, but only as a general acquaints himself with enemy-occupied territory

spiritual conquest. Contempt for Hinduism was the rule, but a notable exception was Roberto de Nobili. Born in Rome of a noble family in 1577, he went to Malabar in 1606 as a newly-ordained priest. Observing that the Jesuits were ruining their chances of success by their utter contempt for the Indian way of life, he determined to become 'a Hindu to the Hindus'. He adopted the dress and customs of a Brahmin holy man, even avoiding contact with his fellow-Europeans as far as possible. He became fluent in both the vernacular and Sanskrit, and compiled manuals of theology and devotional books for the use of converts and for those who were being instructed in Christianity. His methods aroused considerable disapproval among his colleagues, and he was denounced to Rome, on charges of simulation, connivance at idolatry and schism. However, he defended himself successfully, and eventually won provisional recognition from the Pope. But it was virtually impossible for the majority of missionaries to go to the extreme lengths that he did in his self-identification with the Hindu. His work was not followed up, though the principle of 'accommodation' to the locality has since become standard Roman Catholic missionary practice.

An Old Pestilent Religion

The entry of Protestant Christian missions into India was effectively delayed until after 1813 by the attitude of the East India Company (earlier, small-scale efforts having been limited to non-British territory); 'John Company' was in principle tolerant towards Hinduism, but this tolerance was not shared by the growing band of missionaries in the 19th century. They were normally convinced that the 'heathen' in his darkness was doomed to perish in his sins; unless given the gospel, he was sure to be damned. Hinduism, in common with all other non-Christian religions, was the work of the Devil, a 'false religion', 'an old, pestilent religion', 'the grandest embodiment of Gentile error'. Many of them took pains to acquaint themselves with the beliefs and practices of Hinduism, but only as a general acquaints himself with enemy-occupied territory. They felt that Hinduism fell short of the Christian ethical ideal, and could even speak of 'the loathsome link between Indian piety and Indian impurity'; in the circumstances, the only thing to be done was to work for the utter destruction of everything that Hinduism stood for, either directly, by the preaching of the gospel and the removing of converts into Christian communities; or indirectly, by providing education on a Western pattern, which it was hoped would undermine the social and intellectual foundations of Hinduism. It is true that there were individual Christians who saw more in Hinduism than merely 'heathen darkness'; but these were the exceptions, at least until about the 1870s.

However, while this was happening in India, Hinduism was gradually becoming better known in the West. The earliest translations of Hindu scriptures began to appear in the late 18th century: for instance, that of the *Bhagavad Gita* by Sir Charles Wilkins in 1785; and in Europe and America scholars and men of letters began to realize that the spiritual tradition of India deserved their serious attention.

The latter half of the 19th century witnessed a number of developments that were to change entirely the pattern of Hindu-Christian encounter. In the West, the emergence of the doctrine of evolution, and its application to religious thought, had the effect of lending legitimacy to the scholarly study of religion as a factor in the development of mankind; and although scholarly and missionary concerns were far from identical, it was only a matter of time before the two were combined. Increasing knowledge of the beliefs of Hinduism (as opposed to its popular practices) was making it clear to many Christians in the West that Hinduism was by no means devoid of the good, the true and the beautiful.

Hinduism, too, was changing. Reform movements, such as the Brahma Samaj, founded in the 1820s by Ram Mohan Roy, were beginning to show a social concern similar to that of Christianity; the Arya Samaj and the Theosophical Society (see THEOSOPHY) followed similar paths from the 1870s on, though with greater insistence on the ancient treasures of the Hindu heritage; and most important of all, the growing movement of Indian nationalism was entering into an alliance with Hinduism as being the only appropriate religion for a patriotic Indian.

In 1893, in America, the stream of encounter began to flow in the opposite direction. Until then, contacts between Hinduism and Christianity had been made mainly on Indian soil. At the World's Parliament of Religions, held in Chicago, a Hindu monk, Vivekananda, made a profound impression with his preaching of the gospel of universal religious toleration. The Parliament as a whole was received coolly by the missionary agencies; but it cannot be denied that the Hindu 'mission' to the West dates from this occasion.

Vivekananda said, among other things, that he was proud 'to belong to a religion which has taught the world both tolerance and universal acceptance. We believe not only in universal toleration, but we accept all religions to be true.' The Parliament over, Vivekananda travelled widely in the West, laying foundations on which other Hindu 'missionaries' were later able to build; on his return to India, he founded the Ramakrishna Mission, its name indicating the source of its inspiration – Ramakrishna, the Bengali prophet who so energetically upheld the unity of all religions (see RAMAKRISHNA).

At the turn of the century, Christian missionaries in India began to be aware of the challenge of the new situation. The old attitude was coming to seem more and more untenable; and, in view of increasing nationalist sentiment, more and more dangerous. The 'new' Hinduism was gaining ground rapidly. One solution was to set forth Christianity as the 'fulfilment' of Hinduism; in this way, it was believed, ample justice could be done to the Indian religious and cultural heritage, while preserving the uniqueness of Christ.

Outstanding among those Christian missionaries who put forward this view was the Scotsman John Nicol Farquhar; his book *The Crown of Hinduism* (1913) set the tone for a whole generation. Farquhar was concerned to do justice to Hinduism without compromising his sincerely-held belief in Christianity. Although his book found wide acceptance among Christians, it left Hindus for the most part unmoved. But he did succeed, virtually single-handed, in impressing on Christians an attitude of genuine sympathy for Hinduism.

The question of Hindu-Christian relations has always been immeasurably complicated by the fact that what is to the Christian a theological problem of the first order, is

F. H. C. Birch/Sonia Halliday

Like early Christian churches, mosques are essentially functional in design *Left* The Blue Mosque in Istanbul, showing the six minarets from which the muezzin call the faithful to prayer *Right* The Virgin and Child, and the angels, look down beneficently upon the faithful from heaven, represented by the dome: from the former church of St Saviour in Constantinople, afterwards turned into a mosque

scarcely a problem at all to the average Hindu. For the most part, the Hindu does not need to be taught sympathy; he is happy to accept Christianity as an alternative way to God – but only one way among many. The Christian has always been made somewhat uneasy by the example of a Hindu leader such as Gandhi, for whom Jesus Christ was a constant example, and to whom the New Testament was a source of inspiration, but who never felt the need to join a Christian community. Similarly, the philosopher Sarvepalli Radhakrishnan, who became President of the Republic in 1962, was able, though himself a Hindu of the Hindus, to urge all people to practise the principles of Jesus, on the grounds that this 'will mean a society of all mankind, a society in which we bear one another's business and sympathize with each other in joy and sorrow'.

This emphasis on the ethical principles of Jesus is characteristic: for while the Christian looks on him as the unique Saviour, the Hindu sees him as a *guru*, a teacher – and, as such, is prepared to listen to what he has to say. At the same time he is prepared (not without reason) to criticize the Christian Church for not putting the principles of Jesus into practice. The Hindu may accept, in an ethical sense, 'Christianity'; he refuses to accept what he calls 'churchianity', and particularly the idea of conversion.

This is, however, far from being the whole story. There are still Hindus who look upon Hinduism as being the national religion of India, and who are opposed to Christian activities in India on political, as much as on religious, grounds. The 'anti-conversion laws' recently passed in certain north Indian states are the results of such attitudes as these.

From the Christian point of view, the situation is as complex, if not more so. On the one hand, conservative evangelical Christians are apt to think in terms of Hinduism as 'heathen darkness', and to act accordingly, an attitude that is becoming progressively less widely held. At the opposite extreme, there are Christian individuals who insist that to be a Christian in a Hindu setting necessitates the acceptance of Hindu practices and thought.

Since the Second Vatican Council in 1962–63, this attitude has come to be held by an influential section of Roman Catholic opinion. In these circles, the ideal is to engage in 'dialogue' with the Hindu on the level of religious experience, without preconceived notions of the goal to which the dialogue is expected to lead; mutual openness, it is stressed, is indispensable. On the theological level, attempts have also been made to classify the Hindu as an 'anonymous Christian', an attitude that finds its exact counterpart in the tolerant Hindu's statement that Christianity is Vaishnavism not yet come to full self-consciousness (Vaishnavism emphasizes the love and worship of God). These are, however, very recent developments, and it is as yet far too early to see what is likely to come of them.

Religious Architecture

Man's earliest religious sanctuaries were in caves, which were adapted in various ways for religio-magical rites. It is only possible to speculate on why the peoples of the Old Stone Age chose caves for this purpose; but their use of them did involve a factor of considerable significance. For it was the inner parts of the cave-systems that were utilized for their magical paintings and ritual ceremonies. This meant that the Paleolithic peoples had to face the awful experience of penetrating into the dark subterranean unknown, illuminated only by the light of primitive torches or lamps. The fact that they did so must surely imply some motive strong enough to overcome their natural dread; and it seems reasonable to suppose that the mysterious and terrifying nature of the caverns was felt to render them proper places for contact with the powers evoked by their magic. (See also CAVE ART; CAVES.)

The earliest constructed sanctuaries date from the seventh millennium BC, and have been found at Jericho and Catal Hüyük in Anatolia. The identification of those at Jericho is not certain; one seems to have contained a sacred stone pillar. The sanctuaries found at Catal Hüyük are of unique interest. Some 40 shrines distributed over nine building-levels were unearthed there. In plan and structure they were identical with the houses, and formed an integral part of the complex of buildings that constituted the urban settlement at Catal Hüyük at various stages. The shrines or sanctuaries were distinguished from domestic buildings by their lay-out and decoration. They served the cult of a goddess, conceived in the three aspects of maiden, mother, and old woman. Associated with the goddess was a deification of the male principle in the form of a bearded man or boy and a bull.

These sanctuaries were rich in symbolism. The walls were adorned with paintings and plaster reliefs, and rows of bulls' horns were set in benches on the floor. Among the paintings were illustrations of bulls and great black vultures with headless corpses (see HEADLESS SPIRITS). The goddess was represented pregnant, on the wall in plaster relief, and also by cult images. Another curious feature were rows of women's breasts, moulded of plaster fixed to the walls and containing the skulls of foxes, weasels or vultures, and the jaw-bones of wild boars. Such symbolism seems to indicate that the cult performed in these sanctuaries had a double theme: fertility and death.

Most of the temples of ancient Mesopotamia had a great square tower, consisting of several stages and known as a *ziggurat*. On the flat Mesopotamian plain they would have been the most notable features of the landscape, and their significance and purpose has excited much interest. The Greek historian Herodotus (5th century BC) records that the ziggurat of the temple of Marduk at Babylon had seven stages, and that there was a richly adorned couch in the shrine at the top. He was informed by the priests that each night a woman awaited there the descent of the god (see PROSTITUTION). This colourful story has been questioned by modern scholars; but as there is no explanation of the ziggurat in ancient Mesopotamian records, and none of the top storeys of the ziggurats excavated has survived, it is only possible to speculate on the function of these towers.

It has been suggested that the Sumerians, who founded Mesopotamian civilization, came originally from a land where they worshipped their gods on hilltops and that when they built their temples in flat Mesopotamia, they raised artificial hills. An alternative theory is that the ziggurat represented a 'cosmic mountain', which was the tomb of a dying and rising god (see VEGETATION SPIRITS). It has also been suggested that the ziggurat was the throne

Sonia Halliday

of the deity, or that it constituted an immense altar for sacrifices. The story of the tower of Babel (Genesis 11.3–5), which was based upon knowledge of the great Mesopotamian temple-towers, has been interpreted as indicating that the ziggurat was regarded as a means of descent and ascent for a sky-dwelling god. The fact that the shrine at the top of the ziggurat was called *Shakuru*, meaning 'waiting-room' or 'room of transit', has caused some scholars to think that the 'epiphany' or manifestation of the deity was expected there.

The religious symbolism of ancient Egyptian architecture found expression in two types of structure: the temple and the tomb. The temple was called the *het neter*, 'house of the god', and in its essential plan it was the habitation of the cult image of the god concerned. An Egyptian temple was dedicated specifically to a particular deity or a triad of deities. In the elaborately developed temples of the New Kingdom and Ptolemaic periods (see EGYPT) the cult image was housed in a shrine or *naos*, formed of a monolithic block of stone closed by doors. This naos derived from the primitive hut that constituted the temple in Predynastic times. The naos was situated in what formed the Holy of Holies of the later temples – a chamber, unlighted by windows, which lay at the end of a series of larger colonnaded halls, and a peristyled open court (a court surrounded by a row of columns). Entrance into the latter was made through a great stone portal, flanked on either side by massive pylons. Before the pylons stood two obelisks and giant statues of the pharaoh, while from the base of the pylons rose tall masts from which white, green, blue and red streamers hung. Leading away from the portal was a double row of couchant sphinxes. The outer and inner walls, and the pillars were decorated with carvings depicting ritual scenes and the victories of the pharaoh. Within the precincts of the great temples at Karnak were sacred lakes, and later temples often had a *mammisi* or 'birth-house', in which the birth of a divine child was ritually portrayed each year.

This complex of buildings was invested with a deep symbolism, for the temple, by virtue of its being the 'house of the god', was regarded as heaven. Each day when the

An element of architectural symbolism was sometimes introduced in early Christian churches by representing the hemispherical dome of the apse as the heavens

doors of the naos were opened the officiant announced: 'The Gates of Heaven are opened.' The ceiling of the temple was painted to represent the sky and the celestial phenomena. Plants were depicted at the base of the walls and columns, so that they appeared to grow out of the ground. The cult performed within the temple was believed to ensure the security and continuance of the land and people from hostile and threatening forces, and the whole imagery was designed to present the building as a symbol of the universe.

The pylons had their place in this symbolical scheme. Not only did their massive structure protect the entrance to the temple, but they were mystically identified with the goddesses Isis and Nephthys, who watched over Osiris and secured his resurrection from death (see OSIRIS). The approach to the Holy of Holies was also carefully contrived. It was a gradual transition from the secular world, bathed in the strong Egyptian sunlight, through the deepening darkness of the great halls, their roofs supported on pillars, into the intense blackness that enshrouded the naos of the god.

Another type of temple was erected in Egypt for the worship of the sun god Re. Of the first and most famous sun temple at Heliopolis nothing survives; but its plan was followed for those erected by the first three kings of the 5th Dynasty (c 2500 BC). The excavated ruins of one of these at Abu Gurob reveal the design. The sanctuary consisted of an open court, which was surrounded by a walled enclosure containing store rooms. This court was dominated by a great truncated obelisk, standing on a tall podium or pedestal, before which was a large altar. It was evidently felt that the sun god was to be worshipped in the open air. Outside the temple precinct a brick barque was built, symbolizing the solar barque in which Re, the sun god, was imagined as crossing the sky each day. The significance of the obelisk is unknown. In the Abu Gurob temple it may have represented the *ben-ben* stone in the sanctuary at Heliopolis, which marked the place of the 'primeval hill' where the sun god first appeared out of the watery abyss of Nun (see CREATION MYTHS).

The Egyptians' profound concern with death and the afterlife made the tomb an object of immense importance to them. Throughout the period of their civilization various kinds of tomb were used: there was the ancient mastaba, with sloping sides and flat roof, the pyramid, and the rock-hewn tomb. But whatever its form, the tomb had two basic components; the sepulchral chamber or pit, in which the embalmed body was placed, and an adjacent room or rooms where the funerary equipment of the deceased was deposited and where food was set for his nourishment. Sometimes this mortuary service was performed in a separate building. The pharaohs of the New Kingdom, who were buried in the remote Valley of the Kings, erected great mortuary temples for this service on the flat land bordering the western bank of the Nile.

The most famous form of Egyptian tomb is the pyramid. There has been much discussion about the origin and significance of the pyramidal shape. Some scholars have argued that the shape gradually evolved from the mastaba via the Step-Pyramid to the true pyramid, the most notable example of which is the Great Pyramid of Cheops. However, in view of the genius of its architect Imhotep (see IMHOTEP), there is reason for thinking that the Step-Pyramid embodied a new conception of the pharaoh's tomb. It symbolized the ladder, mentioned in the Pyramid Texts, by which the dead king ascended to heaven. The imagery of the pyramid proper would he a slight variant of this idea. The Pyramid Texts also describe the dead king as ascending to heaven by means of the ramp constituted by the sun's rays. The Egyptians pictured the rays as forming a pyramidal pattern.

The Ark of Yahweh

The Temple of Yahweh at Jerusalem was originally built by Solomon primarily to house the Ark of Yahweh, which had been the portable shrine of the deity's presence during the Israelites' sojourn in the desert. The fact that the Temple faced towards the east has caused some scholars to think that the cult of Yahweh may have had a solar aspect. Like many other contemporary sanctuaries in the Near East, the Jerusalem Temple was basically divided into three parts: an open court and a building consisting of two chambers. The anterior chamber was called *bayith*, 'the house', and it led to the inner chamber, the Holy of Holies. At the centre of this holy place there stood two large figures of cherubim, whose wings overshadowed the Ark of Yahweh.

Among other cultic or symbolic objects in this first Temple was a brazen serpent, Nehushtan, which tradition connected with that set up by Moses for the curing of snakebite (Numbers 21.4–9). On either side of the porch stood twin pillars of bronze named Jachin and Boas. The purpose of these pillars and their mysterious names have never been satisfactorily explained. Stone or bronze pillars were a feature of many temples in Syria, Phoenicia and Cyprus, and seem to have had a cultic significance. Another unexplained object was 'the brazen sea', a circular basin, resting upon the backs of 12 bronze oxen, which were in four groups facing the cardinal points. Its significance has been variously interpreted as symbolizing the primeval abyss of the book of Genesis or 'the waters which were above the firmament' (Genesis 1.7).

The Greek temple has been described as a 'casket containing the image'. For this reason attention was concentrated on the architectural perfection and adornment of the exterior of the structure, of which the Parthenon of Athens is the supreme example. The cult image dominated the interior, which was well lighted in contrast to the Egyptian temples. Certain temples varied from the general pattern, most notably that of Demeter at Eleusis. This temple was also the Telesterion, in which the famous Eleusinian Mysteries were performed and so was structurally adapted for the purpose (see DEMETER; ELEUSIS). Circular temples were occasionally built in the classical world. Some were dedicated to Asclepios, the god of healing (see HEALING GODS). Some notable examples still survive in Rome: the famous Pantheon, which was dedicated to the seven planetary deities and symbolized the all-embracing cosmos, and the so-called Temple of Vesta, whose original dedication is unknown. The real Temple of Vesta was in the Forum, and has been partially restored. Its circular shape was proper to its function as the sacred hearth of the city, whose perpetual fire was tended by the Vestal Virgins.

Mention might also be made here of the cave-sanctuaries of Mithra, for it was in the Roman Empire that the cult of this Iranian deity achieved its greatest influence (see MITHRAS). The *mithraea* were located in natural caves or, where these were not

Simplicity and splendour: churches of various denominations range from an ordinary house converted into a place of worship, like this Spiritualist church in London *(above)* to such magnificent architectural achievements as the Cathedral of the Assumption in the Kremlin, Moscow *(right)*. Both buildings prominently display the Cross, the supreme symbol of the Christian faith

available, in artificially constructed caves. The origin of celebrating the Mithraic rites in caves is not known; but an explanation offered by Euboulos probably represented the current belief. He wrote: 'the cave conveys an image of the cosmos, of which Mithra was the *demiourgos*, and the things at measured intervals within the cave convey symbols of the cosmic elements and climates.' The chief object, which was situated at the end of the Mithraic cave, was a sculptured representation of Mithra slaying the Cosmic Bull.

Christian architecture seems to have been functional in origin; it provided a place where the faithful could assemble for the celebration of the Eucharist and other rites. Indeed, the altar for the Eucharist, and the baptistery (often a separate building) constituted the two basic items that were needed for the ritual practice of Christianity. When it became legally possible in the 4th century for Christians to build churches, contemporary architectural styles were followed. The basilica, with a semicircular end or apse, became the general form of Christian churches. These early buildings incorporated no specific symbolism in their basic architectural plan. Depending on the resources of their communities, the interiors were richly decorated with coloured mosaics depicting sacred figures and biblical scenes.

Sometimes an element of architectural symbolism was introduced by representing the hemispherical dome of the apse as the heavens, against which Christ was portrayed as the Cosmocrator or 'Lord of the universe'. The great dome of Hagia Sophia at Constantinople, the most splendid church of the medieval world, had figures of seraphs to symbolize the Heavenly Temple according to Isaiah's memorable vision: '. . . I saw the Lord sitting upon a throne, high and lifted up . . . Above him stood the seraphim . . .' (Isaiah 6.1). The most notable instance of architectural symbolism that developed in Byzantine churches, and has become a feature of Eastern Orthodox churches, is the *iconostasis*. This is a screen, covered with icons, which cuts off the sanctuary from the congregation in the nave. Its doors are closed during the celebration of the Eucharist, symbolizing the holiness of the rites performed inside the sanctuary by the clergy.

The Gothic cathedral epitomized the ideals and aspirations of medieval Christianity in the West. In its structure and decoration it represented the Heavenly Jerusalem. It was designed as a setting for the drama of the Mass, in which was ritually re-enacted the divine mystery of man's salvation by Christ. The High Altar was therefore the focus of attention, and it was set in a harmony of structural lines, symbolizing the perfection of balance that characterized the medieval conception of the universe. This geometrical imagery was enhanced by the richness of colour provided by hangings and vestments, and by the light streaming through stained-glass windows.

In contrast to the Byzantine church, the Gothic cathedral was designed to enable the faithful to see the ritual presentation of the sacramental body and blood of Christ in circumstances of the utmost solemnity and beauty. But that was not all. The cathedral provided not only the setting appropriate to the divine mystery of the Mass, it also taught the faithful the great truths of their religion. Its sculptures, paintings and coloured glass depicted the incarnation, ascension and majesty of Christ, the coronation of the

Peter Marsden/Sonia Halliday

Epitomizing the ideals and aspirations of Christianity in the West, the great cathedrals of Europe are designed as settings for the drama of the Mass; this symbolism is as apparent in the Church of the Holy Family, Barcelona *(right)* designed by Gaudi in the 19th century, as in Chartres Cathedral *(left)* built in the 12th and 13th centuries *Below left* Designed to reflect the harmony of the cosmos, the characteristic shape of the Hindu temple rising to a tapering peak, points to the abode of the gods and also represents Meru, the sacred world mountain: Madivai temple, India

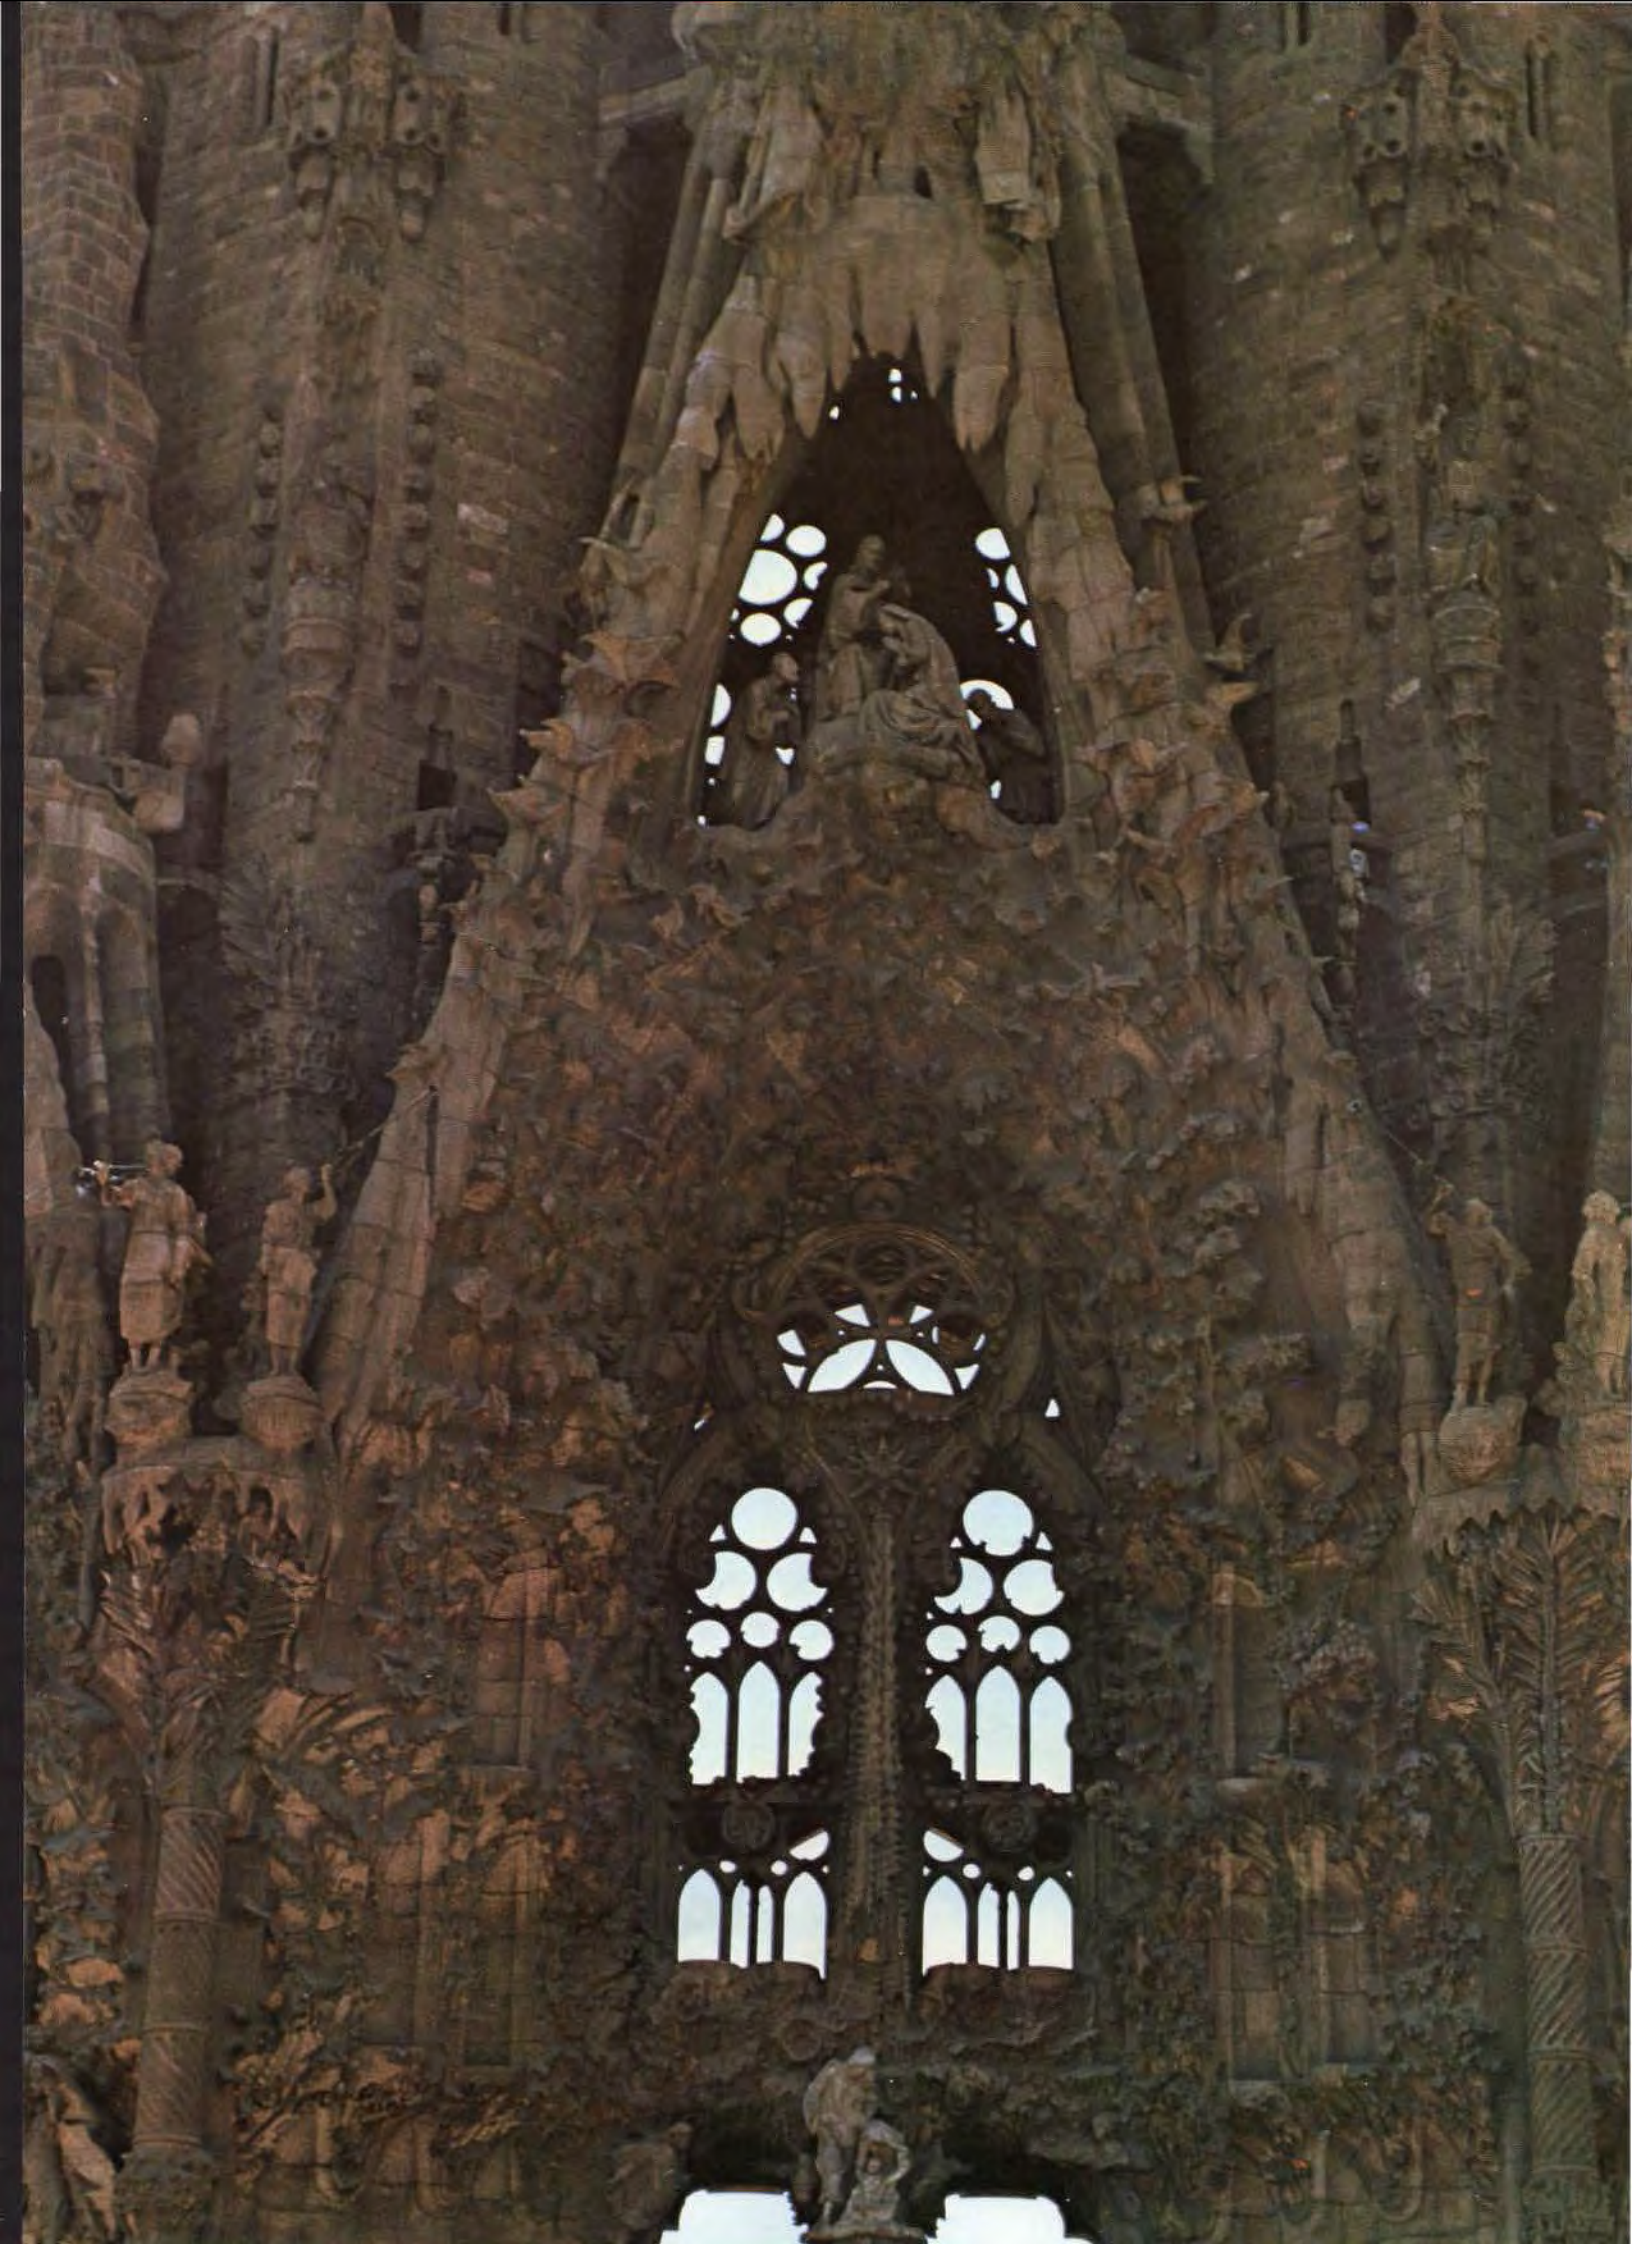
Virgin Mary, and the Last Judgement.

In Islam the mosque is essentially functional in design. Besides providing shelter for the worshippers, it contains a *mihrab*, usually a beautifully tiled recess in a wall that faces towards Mecca, which indicates the *qibla* or direction in which the faithful must turn in worship. The other important feature is the *minbar* or pulpit, for sermons and other pronouncements. The minaret, the most characteristic external feature of the mosque, is also functional. It provides a point of vantage for the muezzin to call the faithful to prayer. The number of minarets denotes the status of the mosque concerned. The great sanctuary of Islam is the Kaaba at Mecca, a cubic edifice draped with a rich cloth, which contains the mysterious Black Stone. This is the chief object of veneration for the Moslem faithful who make the pilgrimage to the holy city of Mohammed (see MECCA).

Not only does the Hindu temple house the image of the deity to whom it is dedicated, but it is also regarded as partaking in itself of the substance of the god. Elaborate rites are prescribed to ensure that the site chosen is auspicious. The plan is laid out in a square, conceived in terms of the imagined shape of the world, with Brahma located at its centre. Like the Gothic cathedral, it was designed to reflect the harmony of the cosmos. Its characteristic shape, rising to the tapering *sikhara*, 'mountain-peak', both points to the traditional abode of the gods and represents Meru, the sacred world mountain. The metaphysical laws governing the building of a temple were the first principles learned by apprentices to the builders' craft, which was organized in guilds on a hereditary basis.

Buddhist architecture also was inspired by cosmological symbolism. The *stupa*, which was originally a burial mound used to enshrine relics of the Buddha, became itself an object of worship. It was mystically conceived of as a kind of architectural body symbolizing the body which the Buddha had abandoned when he entered Nirvana. Wedded to this mystical conception was a complex cosmological imagery based upon the alternation of square and circle in the stupa's plan. Rising from the top of the mound was a series of circular umbrellas, as seen at the Great Stupa of Sanchi in India, which symbolized the *devalokas* or heavens

Spectrum



Alan Irvine

The development in Christianity of a closer liturgical relationship between clergy and congregation is reflected in modern church design with its emphasis on open interiors in which the altar is no longer set apart from the worshippers: Notre Dame du Haut, Ronchamp, by Le Corbusier, a masterpiece of contemporary religious architecture

of the gods, culminating with that of Brahma. The supreme example of Buddhist architectural symbolism is the great stupa of Barabudur in Java. It has been described as 'a magic replica of the universe', and as the pilgrim ascends its galleries human destiny is portrayed in a series of reliefs depicting the career of a Bodhisattva.

RENAISSANCE

The art and culture of the Renaissance contained powerful strands of paganism and magic, drawn from the civilization of late antiquity to which scholars and artists longingly looked back

RENAISSANCE

'THERE IS this diversity between God and man, that God contains in himself all things because he is their source, and man contains all things because he is their centre.' This pronouncement by the Italian philosopher Giovanni Pico della Mirandola (1463–94) is a statement of Renaissance 'humanism', a word which has many shades of meaning but which basically implies a firm confidence in the worth, dignity and abilities of man, a view of man as something very close to a god. In the Renaissance context, a humanist also means someone passionately addicted to the civilization of Greece and Rome, looking back to it for truth and beauty rather than to a medieval culture dismissed as dark and barbarous, Gothic in the bad sense. The term 'Middle Ages' itself contains this implication, stemming mainly from the Florentine historian Flavio Biondo, who used it for the 1000 years between the submergence of classical culture under the floodtides of barbarism in the 5th century and its rebirth in the 15th.

Renaissance humanists believed that the myths and legends of the ancient world, however unedifying they might seem on the surface, concealed profound truths which had been cloaked in fable to hide them from the common herd, 'showing only the crust of the mysteries to the vulgar,' as Pico said, 'while reserving the marrow of the true sense for higher and more perfect spirits.' If you were a higher and more perfect spirit, you might discern the same mysteries behind the Jewish tradition as well. Why had God taken 40 days to deliver the law and commandments to Moses on Mount Sinai (Exodus, chapter 24), a transaction which could have been more expeditiously dispatched? Because God had also communicated to Moses all sorts of secrets, not suitable for vulgar ears and passed on by word of mouth from generation to generation of the wise ever since. These were the secrets of the Cabala, and they were essentially the same as those concealed in the hieroglyphics of ancient Egypt and the myths of Mesopotamia, in Plato and the Neoplatonists, in the Pythagorean tradition and the Orphic hymns and the Hermetica (see CABALA; HERMETICA; NEOPLATONISM; ORPHEUS; PYTHAGORAS).

This enticing conclusion was assisted by confusion about dates and influences. The belief that Hebrew was the earliest of tongues, the language of God himself (see ALPHABET), helped to suggest that, just as all other languages must be descended from it, so all other valid insights into truth must be descended from the revelation in Hebrew. Writings really or allegedly stemming from Zoroaster, Pythagoras, Hermes Trismegistus, Orpheus, Plato, were all indiscriminately dated after Moses and the Old Testament writers and were believed to have been influenced by them. Johann Reuchlin (1455–1522), Christian cabalist and notable promoter of Greek studies in Germany, thought that Pythagoras drew his doctrine from the Cabala and equated the Pythagorean Tetractys with the Jewish Tetragrammaton, the great mystic name of God (see NAMES; NUMEROLOGY). Plato was dated after the Hermetica, by which he was supposed to have been influenced, and when a more accurate date was established for the Hermetica, by Isaac Casaubon in 1614, writers like Robert Fludd (see FLUDD) ignored it.

Renaissance scholars were helped to find common threads of doctrine beneath the surface of different traditions by the fact that their sources were generally late and did in reality contain important ideas in common. Their Platonism was largely Neoplatonism and Professor Wind has remarked of one of the most influential of them, Marsilio Ficino (1433–99), that he read Plato with the eyes of Plotinus. The Cabala, the Hermetica and much Pythagorean, Orphic and gnostic lore came to them from the last centuries of antiquity or later. Typically, Ficino and his friends at the Academy founded at Florence in imitation of Plato's Academy at Athens (they kept Plato's supposed birthday as a holiday) drew their interpretation of Egyptian hieroglyphics from a late work, the *Hieroglyphica* of Horapollo Niliacus, an obscure Alexandrian author, not earlier than the 2nd century AD. The manuscript had been discovered on a Greek island in 1419 by a priest who brought it back to Florence.

In delving into all these mysteries the humanists were not in most cases seeking to attack Christianity, quite the contrary. They believed that the wisdom of antiquity had heralded and foreshadowed the sublime truths of Christian doctrine. Ficino said that Plato 'together with the Pythagorean and Socratic doctrines, followed the law of Moses and prophesied the Christian law.' And they could find a highly respectable warrant for this view in a passage of St Augustine: 'The thing itself, which is now called the Christian religion, was with the ancients, and it was with the human race from its beginning to the time when Christ appeared in the flesh: from when on the true religion, which already existed, began to be called the Christian.'

The humanist preoccupation was to reconcile paganism and Christianity by isolating 'the true religion' which had been 'with the human race from its beginning'. But in the process they revealed a God whose features were not as Christian as conservative churchmen would have preferred, and their relationships with the Church were uneasy. Popes and prelates who were themselves highly educated men, well-read in the classics and enthusiastic antiquarians, alive to the splendours and beauties of the pagan tradition, were half inclined to approve and half to condemn. Pico, for instance, framed his opinions in 900 theses, 13 of which were condemned by Pope Innocent VIII, but he was cleared of all imputation of heresy six years later by Alexander VI.

One of the themes which fascinated Renaissance artists and philosophers was the reconciliation of opposites in a higher unity *Previous page* Painting by Lorenzo Lotto, now in Alnwick Castle: a cherub crowns with an evergreen wreath a skull resting on a soft cushion, reconciling death and love, mortality and immortality *Below* Francis I of France as a hermaphrodite, uniting male and female

Apollo Into Christ

The Renaissance was not a sudden break in the continuity of history. The pagan gods and heroes had survived all through the Middle Ages as demons, planetary powers or great mortals, rulers and sages of long ago, benefactors of humanity and bestowers of civilization. The Renaissance inherited the belief that peoples or ruling families were descended from these heroic ancestors. In the 15th century the Dukes of Burgundy prided themselves on their descent from Hercules. In the 1490s Alexander VI, the Borgia pope, whose heraldic animal was the bull, had his apartments in the Vatican decorated with scenes including the story of the Egyptian sacred bull Apis, with the implication that the Borgias were descended from Apis and had inherited from him the fierce vigour which had raised them to the summit of Christendom.

The gods remained alive in astrology, because of their connection with the planets through which, under God, they influenced the lives and fortunes of men. All through the Middle Ages and Renaissance churchmen, though frequently uneasy about astrology, generally tolerated it, and sometimes patronized it. Pope Julius II fixed the date of his coronation on astrological advice and Leo X founded a university chair in astrology.

The later pagan writers themselves had brought the old myths up to date by searching out hidden meanings. The Roman historian Sallust (1st century BC), for example, interpreted the savage tale of Attis and Cybele (see CYBELE) as an object

National Gallery, London

***The Judgement of Paris,* by Rubens: this episode from Greek mythology was interpreted as a case of the One revealing itself through its three component parts, the opposites and their common centre, the three goddesses standing for the goals of wisdom, power and pleasure, or for the contemplative, active and passive**

lesson on the trials which the soul must suffer in its search for God. Christian authors followed suit and also applied the technique to the Bible, seeing in the passionate lovers of the Song of Solomon the figures of Christ and his Bride, the Church. In the 12th century John of Salisbury anticipated the Renaissance attitude by thinking pagan religion worthy of study, 'not out of any respect for false deities but because under cover of words truths are hidden which may not be revealed to the vulgar.'

Reinterpretation of pagan literature could produce curious results. Ovid's *Art of Love* suffered a sea-change into a primer of spiritual devotion, and as such was piously studied by nuns in 13th century convents. In an anonymous poem of c 1300, *Ovide moralisé*, Ovid's *Metamorphoses* was transformed into a collection of fables anticipating Christianity, with Diana as the Trinity, Actaeon as Jesus, Phaethon who stole the sun's chariot as Lucifer, and Ceres searching for Proserpine as the Church seeking for souls strayed from the true path. In Alciati's *Emblematum liber* (1531) the handsome youth Ganymede, who in classical mythology was carried off by Zeus in homosexual mood, has turned into a symbol of the pure soul which finds joy in God, and a later commentator even applied Christ's command to 'Suffer little children to come unto me' to the story.

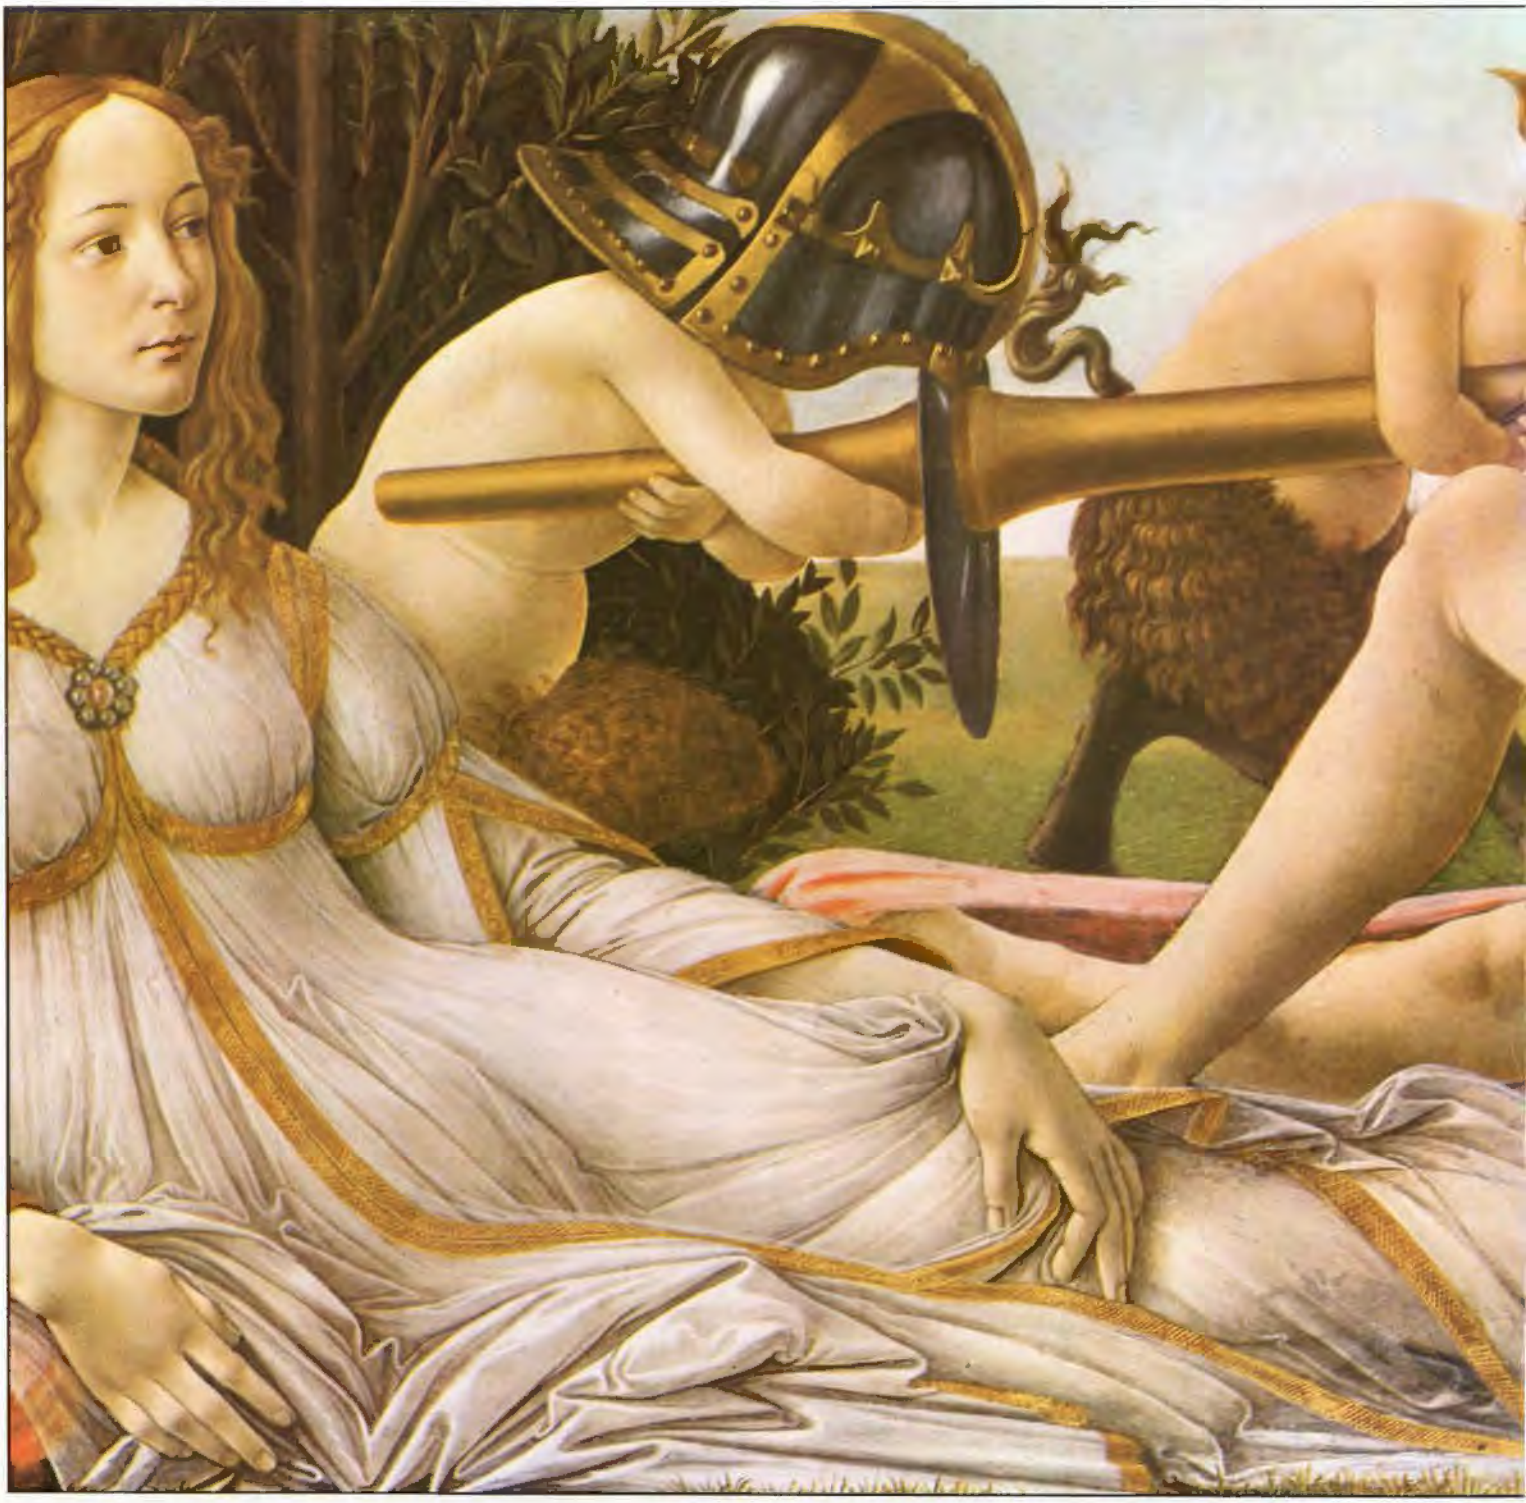
Some Christians objected. Martin Luther denounced those 'who turn Apollo into Christ and Daphne into the Virgin Mary'.

In the mid-15th century the church of San Francesco in Rimini was decorated with sculptures and bas-reliefs of the Virtues and Liberal Arts, the Prophets and Sibyls, the signs of the zodiac and the planetary gods, not assembled as in the Middle Ages to show all these elements in their place in the Christian scheme of things but to show them in worshipful and protective attendance on the lord of Rimini, Sigismondo Malatesta, a ruthless, learned and profligate soldier of fortune. The church had been turned into a temple to his glory and Pope Pius II accused him of having paganized it. 'The cult that actually is celebrated in these precincts,' says Professor Seznec, 'is not that of Christ. It resembles rather the worship which Rome once offered to her human idols – Augustus, Faustina, or Caesar.'

The Architecture of Man

Though Christian themes greatly outnumber pagan themes in Renaissance art and though pagan themes were frequently given a Christian interpretation – the Roman triumph as anticipating the triumph of Christ or the Church, or pagan sacrifices as foreshadowings of the sacrifice of Christ – it remains true that Renaissance artists rediscovered classical style and depicted pagan gods and myths with a powerful, sensuous realism which breathed into them new and vigorous life. The semi-pagan value given to the human body, to man as the centre of all things, also appears in Renaissance architecture, which again looked back to classical models and which has been described by Professor Wittkower (in *The New Cambridge Modern History*) as anthropomorphic and anthropometric. 'Anthropomorphic, because these architects, thinking in terms of a new organic conception of nature, claimed that the parts of a building must be related to each other and to the whole like the members of the human body; and anthropometric, because it was the metrical relationships of the human body on which their interest was focused. The Bible taught them that man was created by divine will in the image of God, and Neoplatonism that perfect proportions in man reflect something of the harmony of the universe. Man's proportions, therefore, should be the norm for man-made buildings.'

The only ancient work on architecture that had survived was that of Vitruvius (1st century AD), which showed that a man's body, with arms and legs extended, fitted into both a square and a circle. Since the circle could stand for God, because it has no beginning or end, and the four-sided square for solidity, the created world, the diagram was taken as a demonstration of the theory of macrocosm and microcosm, that man is a



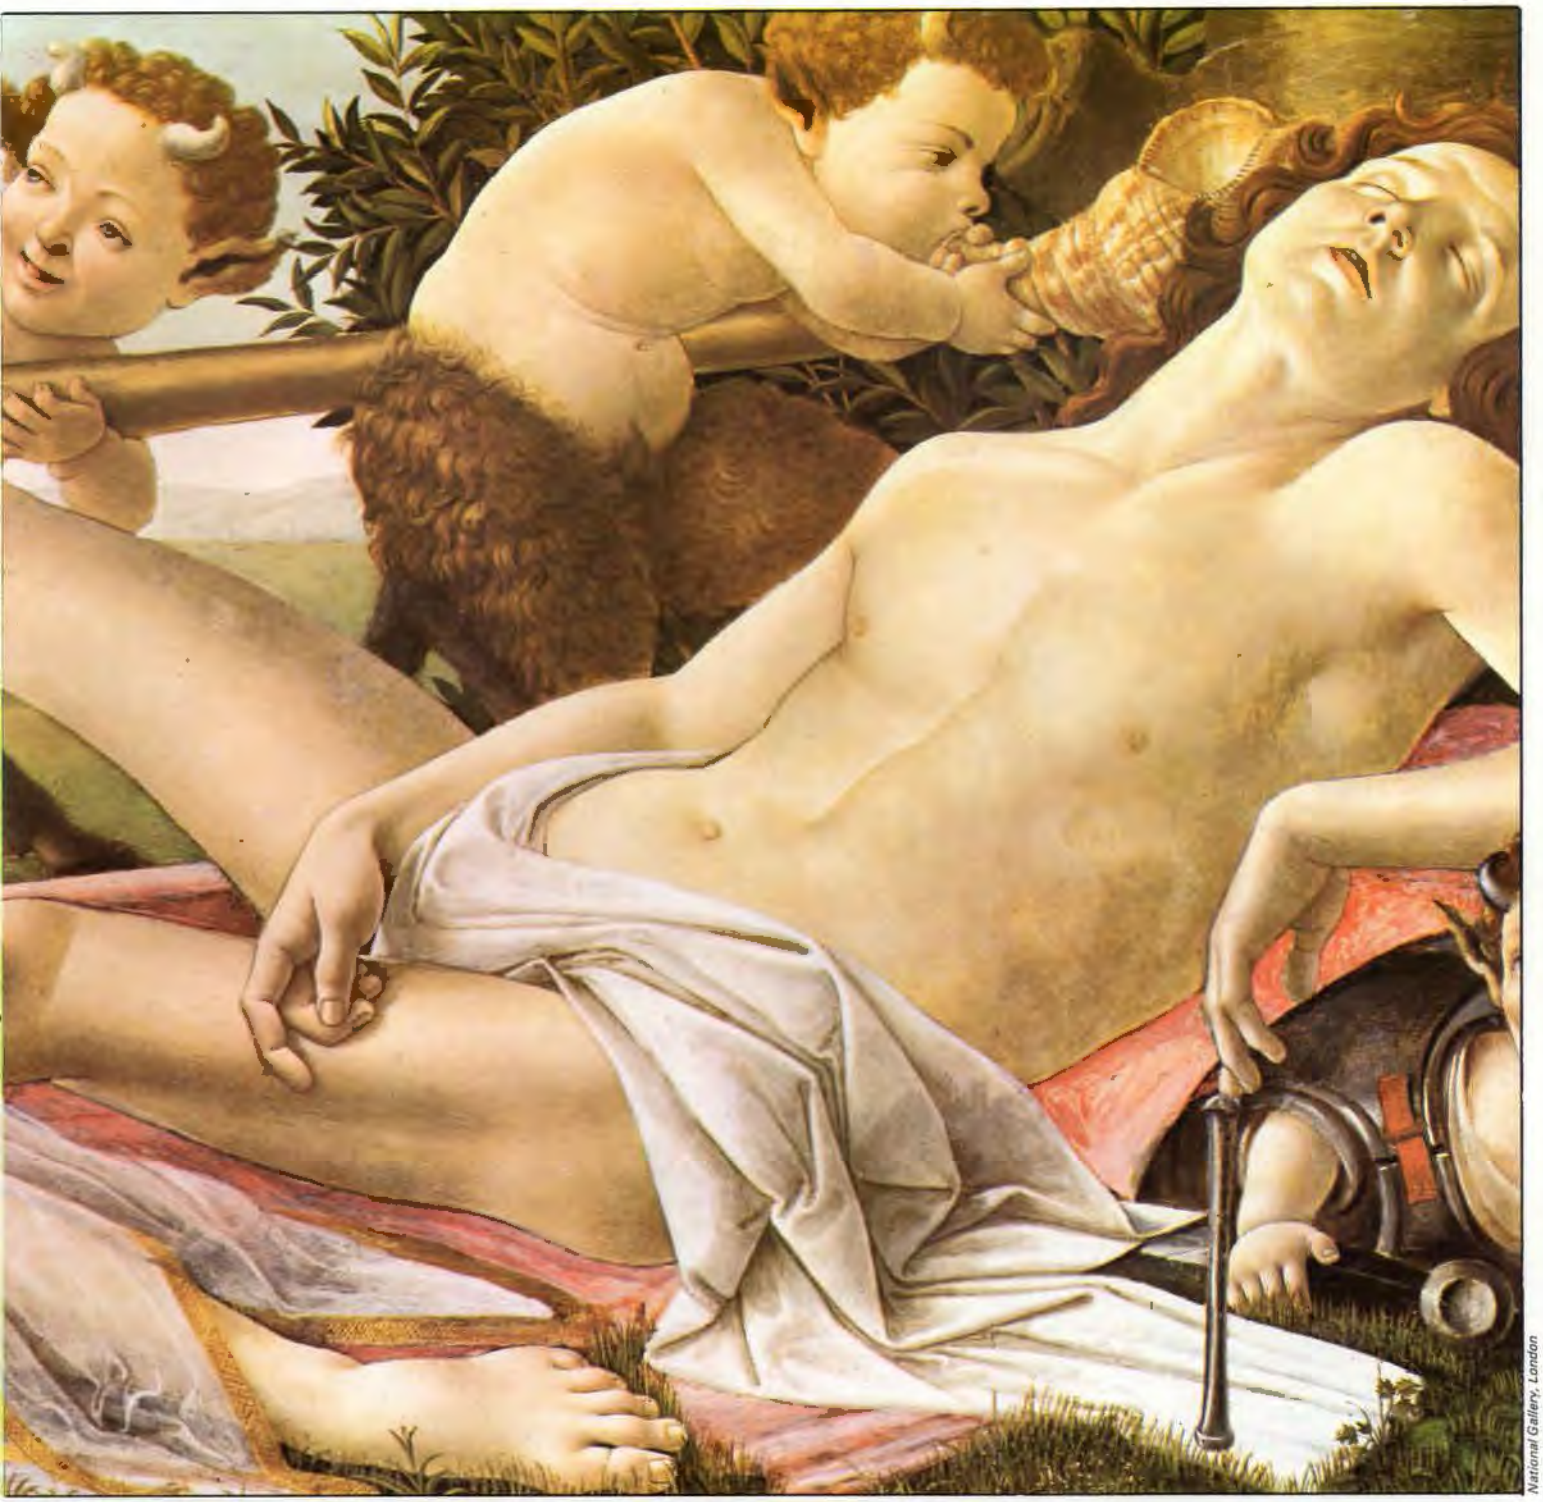
miniature replica of the universe and of God. This theory justified views of man as the container of all things and the measure of all things, and as potentially divine (see MACROCOSM).

As a symbol of both God and man the circle came into architecture in the centralized church. It was a rejection of the medieval longitudinal church, designed to lead the worshipper towards the high altar placed at one end, for the focal point was now in the middle, to demonstrate both the Oneness and the all-pervadingness of the infinite God and the cardinal importance of man standing at the centre. The great architect Bramante planned the new St Peter's, Rome, as basically an equal-armed cross with an apse at the end of each arm, so symmetrical that there is no way of telling from the plan which apse was to hold the high altar. The plan was approved by Pope Julius II, a remarkable example of ecclesiastical acceptance of the new ideas.

Renaissance architects looked back to Roman models in what Wittkower has called 'an almost magical act of identification through which they hoped to recapture something of the greatness of bygone days', and centrally planned buildings could carry uncomfortably non-Christian connotations. In 1444 Michelozzo di Bartolommeo began to add to the church of the Annunziata in Florence a circular east end which was a copy of a temple of Minerva in Rome. Of another centralized church, Alberti's San Sebastiano in Mantua, a cardinal wrote in 1473 that he could not see whether it was going to be a church, a mosque or a synagogue. Central planning could also be turned to the glorification of a 'human idol'. Antonio Filarete, a 15th century Florentine artist who worked for Francesco Sforza of Milan, another notable Renaissance strong man, planned an ideal town to be called Sforzinda. It was to have an entirely symmetrical plan in the form of an octagon, with the prince's palace and the cathedral on a square at the centre, from which the streets would radiate.

Concordant Discord

The fact that the God of Christianity is both One and Three excited humanist interest in pagan groupings of three and in the numerological theory of 3 as a pair of



National Gallery, London

Love and violence, two opposites united in *Mars and Venus*, by Botticelli: the love goddess has put the war god to sleep and baby satyrs use his weapons as toys, but the element of hostility remains present in the wasps round his head

opposites with the unity that reconciles and transcends them (see also THREE). A passion for opposites and their reconciliation is characteristic of Renaissance humanist thinking, and lies behind Pico's love of splendidly paradoxical utterance, as in 'Let us enter into the light of ignorance and, blinded by the darkness of the divine splendour, exclaim with the prophet: I fainted in thy halls, O Lord', or in his 'true definition of Beauty' as 'nothing else than an amicable enmity and a concordant discord'.

That classical paganism had grasped this essential truth about the nature of things was shown by the myth that the war god Mars and love goddess Venus had a daughter named Harmony, a higher unity created by a conjunction of opposites. Many Renaissance paintings are exercises on this theme, including *Veronese's Mars and Venus United By Love* (see MARS) and Botticelli's *Mars and Venus*, in which love has lulled the fierce war god to sleep and his weapons have become toys for infant satyrs. But wasps are buzzing angrily round his head, to keep the element of hostility present in the equation of 'amicable enmity'.

In Spenser's *Faerie Queen* (book 4) the goddess of Concord is escorted by Love and Hate, who are brothers, and the statue of Venus is hermaphroditic – 'she hath both kinds in one, both male and female, both under one name'. And alchemy with its conjunctions and sacred marriages, its processes of separating out and reuniting opposites, was flourishing in the Renaissance period.

Another example of the liking for opposites conjoined is the maxim *festina lente*, 'make haste slowly', which had the classical prestige of having been the motto of the Emperor Augustus. Many princely families adopted it as a badge and it was represented in contradictory images: a dolphin twined round an anchor for instance, a sail fastened to a column, a butterfly and a crab (as on coins of Augustus), an eagle and a lamb, a lynx blindfolded, a tortoise flying a sail.

If the One unites opposites, then conversely

Scala

Botticelli's *Primavera*, in the Uffizi Gallery, Florence: the painting has been called a talisman of Venus, a magical device for capturing in the mind the influences of harmony, beauty and love associated with Venus as goddess and planet; on the right, the wind of spring, Zephyr, embraces the shy earth nymph, Chloris, and turns her into Flora, the blossoming flowers of spring

it reveals itself by manifesting its component parts, the opposites and their common centre. An example of this in classical mythology was taken to be the Judgement of Paris (see APPLE), with the three goddesses standing for three kinds of life – contemplative, active and passive – or for three human goals – wisdom, power and pleasure.

Another triad of this sort, much favoured by Renaissance artists, was the classical image of the three Graces, who appear in Botticelli's *Primavera*. It is impossible to do justice in brief to Professor Wind's fascinating analysis of this painting but its most obvious features are the triads on either side of Venus (who has very much the look of a Madonna). The Graces are interlaced in the knot of a maze-like dance and, at the other side, the wind of spring, Zephyr, touches the chaste earth nymph Chloris, who turns into Flora, the flowers of spring, an allusion to a story in Ovid's *Fasti* and a demonstration of the fruitful union of the opposites of maidenly purity and ardent love.

A Talisman of Venus

The *Primavera* has been described as a talisman of Venus, a magical device for capturing in the mind the influences of harmony, beauty and love associated with Venus as goddess and planet. Albrecht Dürer's *Melancolia* (see MAGIC SQUARES) represents the contemplative and scholarly life of those much influenced by the gloomy planet Saturn, with the magic square of Jupiter, planet of health and good spirits, added as a corrective. Dürer was influenced by Marsilio Ficino, who in turn was influenced by the *Picatrix*, an earlier magical textbook (see PICATRIX) which recommended the use of images symbolic of the planets to draw down and focus their forces.

Ficino was deeply conscious of Saturn's influence on his own personality. His medical work, *Libri de Vita* (1489) is described by Frances Yates as 'intended primarily for students who are liable through over-intense application to their studies to grow ill or melancholy. This is because the nature of their occupations brings them under the influence of Saturn, for contemplation and hard abstract study belong to Saturn who is also the planet of the melancholy temperament, and the star which is inimical to the vital forces of life and youth. Melancholy students who have used up their vital powers in their studies, and the old in whom these forces are in any case declining, are therefore advised to avoid as far as possible plants, herbs, animals, stones, and the like belonging to Saturn, and to use and surround themselves with plants, herbs, animals, stones, people, belonging to the more fortunate, cheerful, and life-giving planets, of which the chief are Sol (the sun), Jupiter, and Venus.' Ficino goes on, though with some hesitation, to recommend the use of symbolic pictures: to induce happiness and physical strength, for example, 'an image of a young Venus, holding apples and flowers, and dressed in white and yellow'.

Less hesitant was Giordano Bruno, burned alive at Rome in 1600 as a heretic and magician (see BRUNO), who recommended pictures of this sort for drawing planetary influences down into the mind by imagining them with vivid concentration. The *Occult Philosophy* of Cornelius Agrippa (see AGRIPPA) lists astrological images, derived from *Picatrix*, as suitable for engraving on talismans, and the 'Fourth Book' added to it describes the spirits of the planets in much the same way. Similarly, the grimoires, especially the *Lemegeton* (see GRIMOIRE), describe the appearance of spirits and demons, presumably as an aid to summoning each of them by concentrating on a mental picture of it.

Belief in 'natural magic', the occult powers concealed in animals, herbs, stones, numbers and all other phenomena of the world, could be justified from the theory of macrocosm and microcosm, the view of the universe as a gigantic human organism, alive in every part of its being and forming an orderly whole. Bruno said in his *Spaccio della bestia trionfante* (1584) that: 'God as a whole (though not totally but in some more in some less excellently) is in all things. For Mars is more efficaciously in natural

vestiges and modes of substance, in a viper or a scorpion, nay even in an onion or garlic, than in any inanimate picture or statue. Thus one should think of Sol as being in a crocus, a daffodil, a sunflower, in the cock, in the lion . . . For as the divinity descends in a certain manner inasmuch as it communicates itself to nature, so there is an ascent made to the divinity through nature. Thus through the light which shines in natural things one mounts up to the life which presides over them.'

This mounting up to the divine could be a devoutly mystical ascent to union with the supreme One or it could be a magical assault on the heights of sopreme power, and the distinction might not be easy to draw. If God is man writ large, the spiritual way is open for man to lose himself within the godhead or masterfully to assert the godhead that is within him. Paul Ricci, who taught at Pavia University, said the lore of the Cabala teaches man how to attain to his god-like prerogatives on earth. Reuchlin said that the cabalist could force the angels to do his bidding. The grimoires show the magician mastering good and evil spirits alike, and Agrippa, not very surprisingly, was rumoured to be in league with the powers of evil. The Faust legend (see FAUST: PACT) was as much a product of the Renaissance as a Michelangelo or a Raphael, and Marlowe put in the mouth of his Faust a statement of the prospect which a humanist view of man could open up: 'A sound magician is a mighty god'.

Following an outbreak of alleged demoniacal possession among the nuns of a German convent, the elderly sub-prioress, who had given her life to her order for half a century, was put on trial and condemned as a witch

SISTER MARIA RENATA

THE CASE of Sister Maria Renata Sanger von Mossau (1679–1749) follows the pattern of, and should be considered in conjunction with, similar cases in the convents of Loudun, Louviers and one or two other places. Some nuns in an enclosed convent are found to be possessed; more or less successful attempts are made at exorcism and in the end a scapegoat is found (generally the convent chaplain or spiritual director) who is charged with bewitching the nuns. The case ends with the execution of the sorcerer. (See also AIX-EN-PROVENCE NUNS; AUXONNE NUNS; GRANDIER.)

The case involving Sister Renata differs from that of Loudun in that here the spiritual director was one of the prosecutors and the sub-prioress of the convent was the victim. Since it occurred in the middle of the 18th century it is one of the last cases of its kind, though the barbaric cruelty which occurred and the credulity and religious fanaticism displayed are certainly no less than in the previous cases of a little over a century before.

Sister Renata was sub-prioress of the Premonstratensian convent of Unterzell near Wurzburg in Germany. She had entered the convent at the age of 19, so that by the time of her death, when she had been sub-prioress for some five years or more, she had given her life to the convent for half a century.

'Cramps and Contortions'

The trouble began with the entry of a certain Cecilia Pistorini as a novice. She belonged to an Italian family living in Hamburg. Sister Renata was by no means convinced of the girl's suitability for life in the convent, but in spite of this Cecilia became a nun in 1745. The real trouble was that Sister Cecilia was prone, as one authority puts it, to 'cramps and contortions and hallucinations'. In other words she writhed on the ground, foamed at the mouth, cried out during services in church, and in short gave every conventional sign of being possessed by the Devil. Other nuns became afflicted in the same way – or copied Sister Cecilia – and soon after 1745 it appeared that the convent was suffering from an epidemic of demoniacal possession.

Sister Renata had been opposed to Sister Cecilia's joining the community; she considered that the young woman was very hysterical and suffered from delusions. And it is very possible that Sister Renata also viewed somewhat sceptically the manifestations produced by the other nuns. At all events a conflict existed and Sister Renata was regarded unfavourably by some of the nuns. The climax came when one of the older nuns, on her deathbed, accused Sister Renata of having bewitched her. So public an accusation, made at so solemn a moment, could not be allowed to pass unnoticed. The prioress, the chaplain, and Loschert, the Abbot of Oberzell, under whose jurisdiction the nuns were, felt obliged to take action and Sister Renata was put on trial as a witch.

Meanwhile an attempt was being made to rid the afflicted nuns of the devils possessing them. Exorcisms and penitential exercises of various kinds were held, but without effect; it seemed that short of Sister Renata's confession, conviction and execution there was no chance of freeing the convent from the unpleasant visitations of the devils.

A Nun's Yellow Dress

The sub-prioress was imprisoned and her room at the convent searched. Ointments were found and collections of herbs, and a yellow dress. All these were held to be evidence against her. The herbs were said to be poisonous, the ointments salves used in witchcraft, and the yellow dress the robe used for her visits to the witches' sabbath.

Sister Renata's trial for witchcraft in 1749 came after several months in prison and a long series of interrogations which for the most part were conducted under torture. The full confession that was obtained can thus hardly be said to be voluntary or of any value.

Her confession went back to the age of eight when she had given herself to the Devil; in her teens she had led a life of debauchery and at 19, on Satan's orders, had entered the convent at Unterzell with the express purpose of bringing about its ruin. As a nun she had gone out frequently to the sabbath dressed in the yellow robe and riding on a broomstick. She had sexual intercourse with devils and had renounced God and the Church. Lastly, she had bewitched six nuns and had desecrated the host.

Sister Renata was condemned for sorcery, heresy and apostasy by a court composed of Abbot Loschert, the convent chaplain and two Jesuits. The bishop of Würzburg, in confirming the verdict, ordered her to be defrocked and to be burnt as a witch, but on account of her tender years when she first fell a victim to the Devil, she was allowed to be executed first before being burnt. The sentence was carried out in June 1749. After beheading her body was burnt, and during the burning a sermon was preached by a Jesuit, Father George Gaar, justifying the execution.

Unlike similar trials in the past, this one did not lead to an epidemic of witch-hunting in convents; in other respects the case is typical of what occurred when a convent was 'bewitched' or some members of it became 'possessed'. This could quite easily happen among young nuns of a hysterical nature, bound to a life forbidding any sexual outlet whatever, and steeped in a view of religion which was bound up with all sorts of superstition.

In the Loudun case it was a priest who suffered as a result, at Unterzell it was a nun who apparently was innocent of anything except endeavouring to prevent an undesirable candidate from entering the convent. This of course is surmise, but it seems difficult in the absence of evidence to find any other cause for the prosecution of Sister Renata who, despite her confession, for many years had led a life of religious regularity.

REVELATION

GOD'S WILL MADE PLAIN

In most religions it is claimed that supernatural knowledge has been revealed to man through divine intervention. A remorkable Christion work in this tradition is the book of Revelation: teeming with vivid imagery, it was for many centuries the most popular book of the Bible

RELIGION, in all its forms, implies a relationship between human beings and superhuman powers which are believed to affect human affairs. The history of religions shows that man has rarely been content to acknowledge the existence of such powers as remote entities with which he can have no kind of personal contact. He has invariably personified them, ascribing to them purposes, and likes and dislikes in regard to himself. In turn, he has sought to know what were these purposes and sentiments, and has devised means of discovering them.

Most religions, both primitive and sophisticated, have traditional ways of learning the divine will, whether it be of a supreme god or of deities believed to control such important matters as the fertility of the land, the weather or disease. Shamans and witch-doctors claim to communicate with supernatural forces; oracles have been consulted, like the famous one of Apollo at Delphi; various forms of divination have been contrived, such as the inspection of the entrails of sacrificial victims or the flight of birds; and Chaldean astrologers sought to interpret the movement of the stars as the 'writing of the heavens'. In all such ways of acquiring supernatural knowledge the initiative has been taken by man. He has sought by special faculties such as clairvoyance, or by ecstatic trance or magical skills to elicit from gods or spirits information concerning human affairs and fortune. In many religions, however, it is claimed that supernatural knowledge has also come through divine initiative: in other words, that the deity has itself revealed its purpose or will, or truths about its nature and operations.

Heavenly Handwriting

Such revelation has taken many forms. It may be claimed that the revelation was given without human mediation. An example of this occurs in the Egyptian Book of the Dead (see BOOK OF THE DEAD) in the form

Walker Art Gallery, Liverpool

The Four Horsemen of the Apocalypse, **by G. F. Watts, now in the Walker Art Gallery, Liverpool: the first horseman rode a white horse and carried a bow, 'and he went out conquering and to conquer'; the second, on a red horse, carried a sword and brought war; the third rode a black horse and carried a balance; the fourth was Death, on a pale horse, 'and they were given power over a fourth of the earth'**

of a rubric attached to chapter 30, which concerns the witness of a man's heart at the judgement after death. It states that the text of this chapter was found at Hermopolis under a statue of the god Thoth, in the reign of Menkaure (c 2600 BC), and that it was inscribed on stone 'in the writing of the god himself'. A somewhat similar claim is made in chapter 22 of 2 Kings, which describes the discovery of 'the book of the law' during repair work in the temple of Yahweh at Jerusalem in the reign of King Josiah (7th century BC).

Claims to divine revelation have not generally assumed this automatic form, but have involved human agents. Thus the pharaoh Akhenaten, who tried to change the religion of Egypt (see IKHNATEN), claimed that his god, the Aten, had revealed his design to him. Gudea, the ruler of the Sumerian city state of Lagash c 2150 BC, records how in a dream three divine beings instructed him to build a temple, communicating to him what its ground plan should be. The book of Exodus (chapter 24) contains a graphic account of how Yahweh, the god of Israel, gave to Moses on Mount Sinai 'the tablets of stone, with the law and the commandment, which I have written for their (the Israelites') instruction'. The account goes on to describe how Yahweh also communicated on Mount Sinai long, detailed instructions for the making of the Ark and Tabernacle and their furnishings. A similar idea finds expression in the bas relief at the top of the stele on which the famous Code of King Hammurabi of Babylon is engraved: Hammurabi is depicted as receiving his commission to write the laws from the sun god Shamash, who was also the god of justice.

The theme of divine revelation permeates the whole of Hebrew religion. The idea is succinctly stated in the words of the prophet Amos: 'Surely the Lord God does nothing without revealing his secret to his servants the prophets' (Amos 3.7). Unfortunately, both the origin and nature of prophecy in ancient Israel are very problematic. Some indication of this basic obscurity is given in the following statement in 1 Samuel 9.9: 'Formerly in Israel, when a man went to inquire of God, he said, "Come, let us go to the seer (*ro'eh*)"; for he who is now called a prophet (*nabhi*) was formerly called a seer.' But the issue is even more complicated than this later editorial comment suggests. Generally it would seem that the seers were clairvoyants, attached to the cult of Yahweh, who were consulted about such things as the whereabouts of lost animals, as for example Samuel was; but Yahweh might also reveal his intentions to them about more important matters, as in 1 Samuel, chapter 9. Prophets, as 1 Samuel, chapter 10, shows, were originally regarded as persons subject to ecstatic trance, on whom 'the spirit of God came mightily', and who 'prophesied' in that state (see also PROPHECY).

The great Hebrew prophets, however, were essentially men who felt themselves inspired by Yahweh to proclaim publicly what was his will concerning matters of current political and social concern. The accounts given of the revelations made to Isaiah and Amos provide significant information about the mode and content of such revelation. In the post-Exilic period (after 538 BC), prophetic revelation became progressively preoccupied with eschatological themes, such as the End of the World and the Last Judgement. The book of Daniel is an early example of this new kind of revelation, and the Christian writing known as the Revelation to John represents the continuation of the tradition into the 1st century AD. But these writings were carefully contrived compositions, purporting to foretell the coming of divine vengeance on the enemies of Israel or the persecutors of Christians.

God Revealed in History

Christian theologians have maintained that the whole history of Israel as recorded in the Bible, the career of Jesus, including his death and resurrection, and the founding of the Church, reveal the purpose of God manifested in history (see HISTORY). Consequently they call this revelation *Heilsgeschichte*, a German term meaning 'Salvation-History', for in it God's plan for the spiritual salvation of mankind is

Most religions authenticate their claims by appeal to divine truths alleged to have been revealed to their founders

supposedly unveiled. The idea finds early expression in the opening verses of the epistle to the Hebrews: 'In many and various ways God spoke of old to our fathers by the prophets; but in these last days he has spoken to us by a Son, whom he appointed the heir of all things, through whom also he created the world.'

Both Judaism and Christianity claim to teach truths about God and human destiny which are known only by divine revelation. But similar claims have also been advanced by other religions, most notably by Islam. Indeed, the whole Moslem faith is founded upon what are believed to be the revelations made by Allah to Mohammed, and preserved in the Koran. The following passage, for example, clearly asserts the divine origin of Mohammed's message: 'This is truly the word of a venerable messenger, it derived from one who has great influence with the Lord of the Throne, to whom man gives ear and trusts. Your countryman (Mohammed) is not one who is possessed (by a spirit). He hath indeed seen him in the clear horizon' (Surah 81.19). The reference in the last sentence is to the angel Gabriel, from whom Mohammed claimed that he received the revelations of Allah.

Indian authorities designate certain Hindu scriptures, such as the *Vedas* and the *Upanishads*, as *sruti*, or divine truth which has been revealed to certain sages. The doctrines of Buddhism, likewise, are presented as revelations made by the Buddha. Similarly the *Gathas* purport to record the revelations made to Zoroaster by Ahura Mazdah.

The list of writings claiming to contain revelations of supernatural truths could be greatly extended. Most religions, in fact, authenticate their claims by appeal to divine truths alleged to have been revealed to their founders. To prove the validity of such claims no objective test can be applied; each religion claims that its authenticating revelation is unique. However, the comparative study of religion can generally relate each specific revelation to its cultural environment, and the psychology of religion has much to say about the nature of paranormal experience.

S. G. F. BRANDON

The Book of Revelation

The term 'Apocalypse' comes from the Greek *apokalypsis*, which means an unveiling or disclosure. It is particularly applied to the last book of the Bible, the book of Revelation or Apocalypse of St John.

Apocalyptic writings are those which depict a conflict between the forces of good and evil, in which the good is threatened with extinction and is rescued from its opponents by supernatural intervention. The conflict is often expressed in symbolism, much of which seems unintelligible to modern readers. The intervention of God on behalf of the persecuted righteous minority is sudden and catastrophic, and inaugurates the victorious establishment of God's kingdom.

A large body of literature of this type was written in the period from 200 BC to 250 AD. Most of the later writings were the works of authors who used assumed names – the *Apocalypse of Peter*, for instance, was not written by St Peter. They are valuable evidence of the type of thinking that prevailed in the eras of oppression and persecution, when the Jews of Palestine were rebelling against their Syrian and Roman overlords, and when the Christian Church was beginning to feel the pressure of the hostile Roman Empire.

To the casual reader the Apocalypse may seem to be a disorganized mosaic of grotesque imagery that makes little sense, but in fact it has a logical and progressive structure. The key to the book lies in its theory of Christ and its opening sentence declares it to be 'the revelation of Jesus Christ'. It falls into six main sections:

1. Prologue	1.1–1.18
2. Christ and the Churches	1.19–3.22
3. Christ and the Universe	4.1–16.21
4. Christ in Conquest	17.1–21.8
5. Christ and the City of God	21.9–22.5
6. Epilogue	22.6–22.21

The prologue states the author, purpose and theme of the book, which centres on Christ as 'the faithful witness, the first-born of the dead, and the ruler of kings on earth.' On the basis of this threefold character, Christ is presented as the key to the future.

In the second section, the letters to the churches offer warning and encouragement to the seven leading Christian

The New Jerusalem

Then I saw a new heaven and a new earth; for the first heaven and the first earth had passed away, and the sea was no more. And I saw the holy city, new Jerusalem, coming down out of heaven from God, prepared as a bride adorned for her husband; and I heard a great voice from the throne saying, "Behold, the dwelling of God is with men. He will dwell with them, and they shall be his people, and God himself will be with them; he will wipe away every tear from their eyes, and death shall be no more, neither shall there be mourning nor crying nor pain any more, for the former things have passed away" . . . And I saw no temple in the city, for its temple is the Lord God the Almighty and the Lamb. And the city has no need of sun or moon to shine upon it, for the glory of God is its light, and its lamp is the Lamb. By its light shall the nations walk; and the kings of the earth shall bring their glory into it, and its gates shall never be shut by day – and there shall be no night there; they shall bring into it the glory and the honour of the nations. But nothing unclean shall enter it, nor any one who practises abomination or falsehood, but only those who are written in the Lamb's book of life.

Then he showed me the river of the water of life, bright as crystal, flowing from the throne of God and of the Lamb through the middle of the street of the city; also, on either side of the river, the tree of life with its twelve kinds of fruit, yielding its fruit each month; and the leaves of the tree were for the healing of the nations. There shall no more be anything accursed, but the throne of God and of the Lamb shall be in it, and his servants shall worship him; they shall see his face, and his name shall be on their foreheads. And night shall be no more; they need no light of lamp or sun, for the Lord God will be their light, and they shall reign for ever and ever.

Revelation, chapters 21 and 22

National Gallery of Art, Washington

The Great Red Dragon and the Woman Clothed with the Sun, **by William Blake: the Apocalypse was one of the most popular books of the Bible for hundreds of years and its magnificent and ferocious imagery took a firm hold on the imagination of generations of Christians. The woman clothed with the sun (chapter 12) has often been identified as the Church or as the Virgin Mary. She appears in heaven, with the moon under her feet and on her head a crown of 12 stars: she is with child and the Devil as a great red dragon waits to devour the child when it is born, but the child is saved by God**

congregations of Asia, which are representative of the Church at large. Their characteristics are typical of the virtues and flaws of the Church of all time, and the messages given to them are universally applicable.

A Throne in Heaven

The third section, on Christ and the universe, is the longest and most complicated. It contains the largest amount of imagery and has been the battleground of interpreters ever since it was written.

This section begins with the vision of a throne in heaven. 'And he who sat there appeared like jasper and carnelian, and round the throne was a rainbow that looked like an emerald.' Round the throne were the thrones of 24 elders; from it issued flashes of lightning, voices and peals of thunder; before it burned 'seven torches of fire, which are the seven spirits of God' and in front of it was 'as it were a sea of glass, like crystal'.

The author goes on to describe the scroll sealed with seven seals, the four horsemen – the last of whom is Death on a pale horse – the seven angels who blow trumpets, at which appalling catastrophes rain down upon the earth, the woman 'clothed with the sun, with the moon under her feet, and on her head a crown of twelve stars' (often taken as a symbol of the Church), the great red dragon which is the Devil, the two beasts which are his servants, and the seven golden bowls 'full of the wrath of God'.

Though no two commentators agree about this section, it is generally taken to be concerned with the sovereignty of God over a chaotic world; the importance of Christ as Saviour and Judge; the conflict between the forces of evil and the people of God; and the apparent triumph of evil.

Babylon, Mother of Harlots

The fourth section, on Christ in conquest, describes the victory of the forces of good; the fall of 'Babylon the great, mother of harlots', who rides on a scarlet beast; the coming of Christ to annihilate the powers of evil – he is the rider on a white horse; 'his eyes are like a flame of fire, and on his head are many diadems'; the binding of the Devil in the bottomless pit for a thousand years; the judgement of the dead before the great white throne of God; and 'the holy city, new Jerusalem, coming down out of heaven from God', where there shall be no more death or mourning or crying or pain.

The fifth section, on Christ and the city of God, contains the description of the eternal state that awaits both the individual believer and the corporate body of the people of God. In it the purposes of God in both the Old Testament and the New are united; its gates and foundations memorialize both the tribes of Israel and the apostles of the Church. The paradise here described includes all that was lost when man left Eden: the presence of God, the river of life, the tree of life, the removal of the curse on Adam, and the joy of the eternal service of God.

Finally, the epilogue says that the book has shown 'what must soon take place' and gives a warning against tampering with the text.

What the Book Means

There have been almost as many different interpretations of the Apocalypse as interpreters. They can be classified generally into four broad divisions: preterist, historicist, futurist and idealist.

Preterist interpretations see the Apocalypse as solely a description of the author's own times. The churches, in section 2, are actual Christian congregations in seven cities of Asia. The conflict of good and evil is the real conflict which existed between a persecuting state and the suffering Church. Though the book's principles may be

generally valid for all ages, it does not specifically refer to the future.

By contrast, the historicist school of thought maintains that sections 3 and 4 predict succeeding periods of history. Various identifications have been advanced to connect the seals, trumpets and bowls of wrath with the barbarian invasions which destroyed the Roman Empire, the rise of Islam, the Turkish conquests, the rise of the papacy, the Reformation, and other historical events. The conflicting explanations of the symbols involved and the strained interpretations used by many writers of this school cast doubt on the validity of any one of these historicist systems.

The futurist interpretation, which is the most literal one, says that section 2, the letters to the seven churches, is a generalized picture of the Church in the present age. Section 3 predicts a future period of trial and suffering, beginning with the removal of the Church and ending seven years later with the coming of Christ in judgement. When he comes, he will overthrow the evil government of the earth, judge the living and the dead, and finally introduce the eternal city of God.

The idealist interpretation regards the entire book of Revelation as symbolic of the eternal conflict between good and evil, independent of any particular period in history or any series of historical events. This viewpoint says that the imagery of the Apocalypse teaches the ultimate victory of good over evil and the final bliss of God's people, but does not predict any particular process or events that can be identified in historic occurrences.

Readers of Revelation have always tended to apply its predictions to their own age and the immediate future. Probably, the first readers of the book and their successors in the first three centuries regarded it as a description of their own times and anticipated the end of the normal world in the near future. From the 4th century to the 16th the conflict of good and evil was generally interpreted as the struggle of the Church with paganism or with Islam, and the final end seemed remote. The Reformation shifted the interpretation to the conflict between the Protestants and the papacy; each side describing the other as Antichrist or the Scarlet Woman.

In the 19th and 20th centuries the futurist

Bodleian Library Filmstrip

Scenes from a 13th century MS, in the Bodleian Library, include angels blowing trumpets, which are the signal for plagues and devastations, an angel dropping a millstone into the sea, the escape of the woman clothed with the sun, and the angel with the key to the bottomless pit. Many have taken the Apocalypse as a prophecy of events which were in the future when it was written, and have connected the book's visions with historical events. Others believe that the book prophesies events yet to come, and others regard Revelation, not as a guide to the future, but as symbolic of the eternal conflict of good and evil

view gained ground among Protestants and became an integral part of powerful revivalist movements in Great Britain and America. Liberal theologians, however, have generally been more attracted by the idealist interpretation. But no one of the interpretations belongs solely to any one theological viewpoint; to some degree they are shared by all.

Who Wrote It?

From an early date the book of Revelation was accepted as part of the authoritative collection of Christian writings called the New Testament, though some early Christian writers doubted its value and – until about the 6th century – the churches of the East were almost all opposed to its acceptance.

One factor in the doubts about the book was the question of who wrote it, a problem which is disputed to this day. At the beginning of the book, its author says that his name is John, a 'servant' of Jesus Christ and a 'brother' of the people whom he is addressing, a companion who shares with them 'the tribulation and the kingdom and the patient endurance.' He was evidently exiled to the island of Patmos, in the Sporades off the coast of Asia Minor, because of his leadership in the Christian movement, probably during the time of the Roman Emperor Domitian (reigned 81–96 AD). He was a familiar figure among the churches of Asia and was regarded as a prophet (see chapter 22, verses 6, 9 and 19).

The general testimony of early Christian writers identifies him as the St John who wrote the fourth gospel – the son of Zebedee and one of Christ's disciples. This identification seems to have been generally accepted by Christians in the West.

Objections to this view emanated chiefly from Dionysius of Alexandria in the 3rd century AD. He argued that the Apocalypse claimed a definite author, whereas the fourth gospel and the letters of St John in the New Testament were anonymous; that its vocabulary was quite different from that of the other works by St John; and that it was full of grammatical errors whereas the other works were generally grammatically correct.

These objections are still maintained by some scholars but they are not insuperable. For instance, the dissimilarity of

9em
plum
apet

lat animal dedit
angelis septem septem

Through the Apocalypse were conveyed the hopes and protests of minorities who believed that God had a better destiny in store for them than the lives which they currently experienced

'And one of the four living creatures gave the seven angels seven golden bowls full of the wrath of God . . . Then I heard a loud voice from the temple telling the seven angels, "Go and pour out on the earth the seven bowls of the wrath of God"': Spanish MS

vocabulary can be explained by the different content and purpose of the works – the Apocalypse consisting of visions which came to the writer in prison, and the gospel containing reminiscences of his experiences, written to instruct disciples.

There are resemblances which suggest a common origin for both the Apocalypse and the fourth gospel: in both Jesus is called 'the Word of God', a title not found elsewhere, and he is 'the Lamb' and 'the Shepherd' in both. In both Satan is mentioned frequently, and in both the significance of Christ's death is emphasized. There is no conclusive evidence for deciding that Revelation was written by the author of the fourth gospel but the weight of early evidence points to it.

Background of Disaster

Several possible dates have been suggested for the writing of the Apocalypse. One theory is that it dates from Nero's persecution of the Christians after Rome had been devastated by fire in 64 AD. The reaction against the state by referring to it as 'Babylon' and to its head as 'the beast' may reflect the resentment of Christians who had previously regarded it as neutral in religion.

The reference to 'kings' in chapter 17 states that five 'have fallen, one is, the other has not yet come.' If these are the Caesars, the five could be Julius Caesar, Augustus, Tiberius, Caligula and Claudius, with Nero as the reigning emperor. But the counting could as easily begin with Augustus, the first ruler of the reconstituted Roman state, in which case the reigning emperor would be Vespasian and the one yet to come would be Titus (reigned 79–81 AD). Tension between the state and the Church existed all through the period from Nero to Trajan, who died in 117.

The most satisfactory date is probably the traditional one, which assigns Revelation to the reign of Domitian, between 81 and 96. It allows time for the development of the churches in Asia, and the insistence of Domitian that he be worshipped as 'Lord and God' (*Dominus et Deus*) agrees with the description of the beast which demanded universal worship in Revelation, chapter 13.

If the Apocalypse was written in the time of Domitian, its background becomes more understandable. The destruction of Herculaneum and Pompeii by the eruption of Vesuvius in 79 AD, a disastrous fire that destroyed the centre of Rome soon afterwards, and an epidemic that ravaged the city, brought on a decade of calamity. Roman historians do not record a general persecution of Christians but one Christian historian does, and Domitian was widely hated for his egotism and tyranny.

The Apocalypse was written for Christians who feared imperial persecution. They needed both encouragement and admonition: encouragement to prevent collapse, and warning against laxity.

Though the style and content of Revelation may seem strange and fanciful, its substance is not thereby invalidated. Apocalyptic is as legitimate a means of expression as drama or poetry. Through it were conveyed the hopes and protests of minorities who believed that God had a better destiny in store for them than the lives which they currently experienced. They believed his promise and looked forward to the fulfilment of his purposes.

Though encased in apocalyptic form and language, Revelation presents a picture of the divine plan for the future. Certainly, the events of the 20th century make its symbolism seem less far-fetched than it did a century ago.

Revenant

One who returns from the dead, a ghost, from the French *revenir*, 'to return'; ghosts of the departed appear to the living for a variety of reasons: sometimes because they are the victims of murder and seek to wreak vengeance on those who have harmed them during life: often because they have died a premature or violent death; although there are kindly ghosts, others, like vampires, return solely for evil purposes. See GHOSTS; HAUNTED HOUSES; VAMPIRES.

Rice

The staple diet of many oriental communities, its cultivation, from sowing to threshing, is often accompanied by elaborate ceremony; in Japan plays are performed and prayers are said, to propitiate the spirits and ensure a good harvest; and among certain tribes in Southeast Asia rice is said to have a soul to which sacrifices must be offered; in the West an ancient symbol of fertility, it is still thrown over newly married couples to bring them good luck and prosperity.

Axel Poignant

The telling of riddles was once far more than an amusement for children: a condemned man might sometimes riddle his way out of the noose, while certain African tribes used them in connection with rain-making and in the Celebes it was customary to tell them only in the presence of a corpse

RIDDLES

'THE ONLY LITERARY PURSUIT which engaged Harriet at present . . . was the collecting and transcribing all the riddles of every sort that she could meet with, into a thin quarto of hot pressed paper, made up by her friend and ornamented with cyphers and trophies.

'In this age of literature, such collections on a very grand scale are not uncommon. Miss Nash, head teacher at Mrs Goddard's, had written out at least three hundred; and Harriet, who had taken the first hint of it from her, hoped, with Miss Woodhouse's help, to get a great many more . . .'

In this passage from *Emma* (1816) Jane Austen describes a pleasant contemporary pastime. We know that our ancestors enjoyed amusing themselves with riddles, and in fact such collections figure among the earliest printed books. Robert Chambers, in *The Book of Days* (1860), offers the following carefully edited selection to his readers, 'the greater part of them being too strongly impregnated with indecency and profanity to be presentable here'.

> What is it that never was and never will be?
> A mouse's nest in a cat's ear.
>
> Why do men make an oven in a town?
> Because they cannot make a town in an oven.
>
> What is the worst bestowed charity that one can give?
> Alms to a blind man; for he would be glad to see the person hanged that gave it to him.

Chambers's source, *Demaundes Joyous*, was 'Enprynted at London in Fletestrete at the sygne of the sonne' by Wynkyn de Worde in 1511.

Sweeter than Honey

Riddles have been asked since ancient times. They appear in early oriental manuscripts, in ballads and other European folk literature, in the sagas of Iceland, in the story of Oedipus, and in such famous epics as the *Kalevala*. The second book of Chronicles records that 'when the queen of Sheba heard of the fame of Solomon she came to Jerusalem to test him with hard questions'.

The book of Judges (chapter 14) preserves a complete account of one of the oldest riddles which we possess: 'And Samson said to them, "Let me now put a riddle to you; if you can tell me what it is, within the seven days of the feast, and find it out, then I will give you thirty linen garments and thirty festal garments . . ." And they said to him, "Put your riddle, that we may hear it." And he said to them, "Out of the eater came something to eat. Out of the strong came something sweet." . . . On the fourth day they said to Samson's wife, "Entice your husband to tell us what the riddle is . . ." And Samson's wife wept before him . . . and on the seventh day he told her, because she pressed him hard. Then she told the riddle to her countrymen. And the men of the city said to him on the seventh day before the sun went down, "What is sweeter than honey? What is stronger than a lion?" And he said to them, "If you had not ploughed with my heifer, you would not have found out my riddle."'

Today riddles are regarded as little more than an amusement for children, with minor educational value: a form of entertainment which develops a certain facile mental agility and strengthens the powers of observation. The idea that they merit serious study was pioneered in the English-speaking world by Professor Archer Taylor, who published his *English Riddles from Oral Tradition* in 1951. Classification of the most important riddle types owes much to Taylor's work.

Essentially a Metaphor

The main category is the 'true riddle'. This provides a deliberately obscure description of something, so that it even appears to be self-contradictory or absurd:

> Little Nancy Eddicote
> In a white petticoat
> And a red nose.
> The longer she stands
> The shorter she grows.

The answer is a candle.

> King am I none,
> Yet a crown I wear.
> Watch have I none,
> Yet the time I declare.

Here the answer is a cock. Both these illustrate Aristotle's definition of a riddle as essentially a metaphor. In the first of these riddles a comparison is implied between a little girl, as set out in the description, and a candle, which provides the answer.

Both examples are drawn from the world of everyday. In general true riddles relate to nature – to fruit and vegetables, the planets and the elements, to household objects and implements, and provide a wealth of information about material culture.

Other important categories are conundrums, based on punning or play on words:

Right **The most famous of all riddles was the one asked by the Sphinx: 'What has four feet in the morning, two at midday and three in the evening?' If you could not solve this riddle, the Sphinx strangled you on the spot. The answer was given by Oedipus and is 'man', because a baby goes on all fours, a man in the prime of life stands on two legs and an old man in the evening of his days leans on a stick. When the riddle was answered, the Sphinx jumped from the mountainside and killed herself:** ***Oedipus and the Sphinx,*** **by Ingres** ***Left*** **Rumpelstiltskin's fury when the riddle of his name is solved: illustration by Cruickshank**

Giraudon

Why is a widow compared to a turnip?
Because the better half is under the ground.

biblical riddles:

After Adam had eaten the forbidden fruit,
did he stand or sit down?
Neither – he fell.

witty questions:

Where was Moses when the light went out?
In the dark.

arithmetical riddles:

As I was going to St Ives, I met a man with seven wives. Every wife had seven sacks, and every sack held seven cats, and every cat had seven kittens: kittens, cats, sacks and wives, how many were going to St Ives? Answer, one.

and alphabet riddles:

The beginning of eternity, the end of time
and space.
The beginning of end, and end of every place.

The answer here is the letter E.

A particularly interesting type of riddle, called by Professor Taylor a 'neck riddle', is said to have been asked by a prisoner condemned to death. If the captors failed to answer, their prisoner was released. A Lincolnshire riddle of this type runs:

I sit on my love,
I stand on my love,
And my love casts me a light.

The answer is: 'A man murdered his wife or mistress, and then formed her bones into a chair, while he buried her flesh under the hearthstone, and made candles of her fat.'

A neck riddle collected in Herefordshire at the beginning of this century goes as follows: 'There was a man convicted of having stolen a sheep; he was sentenced to death, but the magistrates said he could go free if he could ask a riddle they could not answer, and he was liberated for three days so that he might invent one. As he went out of prison, he saw a horse's skull by the roadside. Returning to prison on the third day in despair, he noticed that in it was a bird's nest with six young ones, and he thought of the following riddle:

As I walked out,
As I walked out,
From the dead I saw the living spring.
Blessed may Christ Jesus be
For the six have set the seventh free.

The form of this riddle, the contrast of new matter emerging from a rotten carcass, is reminiscent of the ancient puzzle asked by Samson. The neck-saving riddle, *Halslösungsrätsel* in German, is based on a highly unusual or unique situation which only the riddler himself can possibly know, and Professor Taylor points out that its use as a means of escaping execution only appears in Germanic tradition.

Certain of Sir James Frazer's observations led him to conclude that the purpose of riddles might once have been to assist growth of the crops; that they functioned as life charms, possibly comparable with the Halslösungsrätsel. Certain African tribes, for example, used them in connection with rain-making, while others told them only at certain seasons. This is also the case in the Celebes where, among the Bolang Mongondo, it is customary only to tell riddles in the presence of a corpse. A death and rebirth ritual may be indicated here.

Sometimes riddles served as trials of wisdom, the loser forfeiting life or honour. In the *Edda* a giant challenges the god Odin:

Thou shalt ne'er come forth again from our
courts
If thou be not the wiser of twain

and Odin replies:

Riddle-reader I am called.

A comparable link between riddles and merit appears in the 'hard questions' sometimes associated with matrimonial tradition. Girls of Turkish tribes in Central Asia, for example, questioned their suitors, who were punished if they could not find an answer.

Having neither beginning nor end, a ring stood for eternity and perfection and so was an ideal pledge of faith between two people

RING

QUEEN ELIZABETH, so it is said, presented the Earl of Essex with a precious ring. Should he ever give offence, he need only return it and all would be forgiven. When he eventually fell from favour and was under sentence of death, the Earl sent back the ring from prison. Unfortunately, it was intercepted by an ill-wisher and never reached the Queen, so the execution took place after she had waited vainly for it to arrive.

A ring was a sign of the wearer's authority. Used to seal letters and other important documents, it was also a token in itself: 'And Pharaoh said to Joseph, "Behold, I have set you over all the land of Egypt." Then Pharaoh took his signet ring from his hand and put it on Joseph's hand . . . Thus he set him over all the land of Egypt' (Genesis, chapter 41). A monarch would entrust one to his messenger. In Shakespeare's *Henry VIII* the king says:

If entreaties
Will render you no remedy, this ring
Deliver them, and your appeal to us
There make before them.

The authority which a monarch imparted to his ring was traditionally able to heal certain ailments: for at one time rulers were widely thought to possess miraculous powers. Touching for the King's Evil (scrofula) was practised until the time of Queen Anne (see KING'S EVIL) and the practice of bestowing cramp rings was not dissimilar. It was supposed to originate from a particular ring, long preserved and venerated in Westminster Abbey. According to legend Edward the Confessor had given it to a beggar who asked for alms in the name of St John the Evangelist; the beggar had then disappeared. Two English pilgrims in the Holy Land were later given the same ring by an old man, who said he was St John and told them to return it to the king. This ring was believed to cure cramp and falling sickness (epilepsy).

Cures from Coffin Nails

Cramp rings were offered by the monarch to the cross on Good Friday and blessed by him. An entry in the household accounts of Edward IV reads: 'Item. To the King's offerings to the cross on Good Friday, out from the counting house for medicinable rings of gold and silver, delivered to the jewel house, 25s.' Andrew Boorde, a contemporary of Henry VIII, says: 'Kings of England doth hallow every year cramp rings, which rings worn on one's finger doth help them which have the cramp.' The ceremony fell into disrepute with the Reformation, when offerings to the cross were discontinued; Queen Mary apparently performed it, but its later revival is questionable.

Cramp rings, with variations, have continued into modern times. Generally they were prepared from the metal attachments to a coffin – the handles, hinges, screws or nails. A popular cure for rheumatism, paralysis and other cramp-like disorders was for the sufferer to stand silently at the church entrance and collect a number of pennies from the parish bachelors. This being done, three circuits of the communion table had to be made. If the clergyman was obliging, he would then exchange the coins for a piece of silver from the offertory, from which a ring was made. Sometimes crooked sixpences were donated for the same purpose.

In his *Finger-Ring Lore* (1877), William Jones says: 'The use of galvanic rings for the cure of rheumatism belongs to our

Westminster Cathedral Library/David Robinson

Above **'Kings of England doth hallow every year cramp rings': Mary Tudor blessing the rings, in a custom which traditionally stemmed from a healing ring owned by Edward the Confessor and long preserved at Westminster Abbey** ***Left*** **Cramp stones discovered at a house in Essex**

own time, and is by no means extinct.' Nearly a hundred years later, his remark is not out of date. Expensive rheumatism rings are sold in London shops, apparently to a wide range of purchasers; even horses are claimed to respond to them.

Rings were used in still other ways to promote health. During an epidemic in the 16th century, Lord Chancellor Hatton wrote: 'I am likewise bold to commend my bumble duty to our dear mistress (Queen Elizabeth) by this letter and ring, which hath the virtue to expel infectious airs, and is (as it letteth me) to be worn between the sweet dugs.' The hoof of an ass's right foot, mounted in a ring, was said to be a cure for epilepsy; and a gold ring, especially if inscribed, would heal St Anthony's fire (erysipelas). A gold ring rubbed against a stye was also supposed to be effective.

Sometimes, because of its intimate connection with its owner, a ring was thought to indicate the circumstances of its former wearer. A so-called life token was a means of keeping in touch when people were parted, and as long as the token remained in good condition all was well; if it deteriorated, the omen was bad.

In the Middle Ages it was commonly supposed that rings possessed a variety of supernatural powers. Joan of Arc was said by her accusers to own magic rings which gave her victory on the battlefield. According to legend, the Emperor Charlemagne fell violently in love, and when his mistress died was quite unable to tear himself from her body. The Archbishop of Cologne intervened and succeeded in removing from her mouth a ring set with a beautiful stone. The king's grief immediately diminished for, so the story goes, the ring was a talisman which had cast a spell upon him. To prevent a recurrence, the Archbishop threw it into a lake near Aachen. Nevertheless the Emperor was so fascinated by the place that he often walked by the water, and eventually built a palace there, which became his capital.

Seven centuries later, Cardinal Wolsey was rumoured to possess a magic ring through which he had achieved power. 'He bewitched the king's mind, and made the king dote upon him more than ever he did on any lady,' wrote William Tyndale in *The Practice of Prelates*. And according to Sir William Neville, 'My Lord Cardinal had such a ring that whatsoever he asked of the King's Grace, that he had.'

Inscriptions were thought to increase the magic properties of a ring. Charm rings, bearing a word of power and made of suitable materials, were used against the Evil Eye. The plague was warded off with rings on which the names of the Holy Family were engraved, and rings bearing the names of the Magi – Melchior, Kaspar and Balthasar – were similarly used against cramp.

The Ideal Talisman

A continuous circle, with neither beginning nor end, a ring was the ideal talisman, standing for eternity, perfection and completeness (see CIRCLE). Wagner used the symbol in his famous opera cycle; in the early northern myths on which he draws, the sacred ring of Thor was a symbol of law and order. It was kept in his temples and oaths were sworn upon it.

Anglo-Saxon swords have been found with a ring attached to the hilt. It was upon the hilt of the sword that men swore allegiance to their ruler, and in this context the ring represented a pledge between two people. The same significance appears in the wedding ring. In medieval Germany a couple swore a mutual oath of faithfulness upon the hilt of a sword, and there was another contemporary custom of proferring the bride her wedding ring on a sword hilt.

Freudian psychoanalysis, which views human life in sexual terms, sees the finger as a male symbol joined to the female, the ring, in marriage, but a poem by Robert Herrick (1591–1674) expresses the more traditionally accepted view:

> And as this round is nowhere found
> To flaw or else to sever
> So let our love as endless prove,
> And pure as gold for ever.

An ancient version of the wedding service runs: 'Wyth thys rynge y the wedde . . . witb

Mary Evans Picture Library

Giving the wedding ring, from Hogarth's *Rake's Progress*: the ring's importance in marriage ceremonies is probably based on its circular shape, a symbol of perfection and eternity

my bodi y the worshippe, and with all my worldith catel y the honoure.'

Jewish brides generally wore a plain band, but a very elaborate ring, the property of the local congregation, was loaned for the synagogue ceremony, and some Jewish scholars maintain that it was also worn during the following week. These rings, which were already known in the Middle Ages, were generally made of gold and thickly ornamented with filigree and enamel. They were sometimes surmounted by a miniature replica of the synagogue building, the roof hinged so that some suitable item, for instance a sprig of myrtle, might be inserted.

Such rings were often inscribed *Mazel Tov*, meaning good luck. Christian betrothal and wedding rings were also at one time engraved with mottos called 'posies'. Jaques says to Orlando in *As You Like It:* 'You are full of pretty answers. Have you not been acquainted with goldsmiths' wives, and conned them out of rings?' The writing of these posies became in effect a literary exercise. Often rhymed, they were expressions of love:

> Remember him who died for thee
> And after him remember me.

Posy rings, a fashion which lasted into the 18th century, were a pleasure for the well-to-do. Poor people, unable to afford such luxuries, often hired a plain gold ring at the church. There are even a number of cases when the ring of the church key was used. One parish clerk, called upon to lend his key, preferred to borrow a curtain ring from a neighbouring house. In a letter dated 1752, Horace Walpole described a clergyman's refusal to marry the Duke of Hamilton without any kind of ring: 'The Duke swore he would send for the Archbishop; at last they were married with a ring of the bed-curtain, at half-an-hour past twelve at night, at May Fair chapel.'

Sometimes rings were presented to the wedding guests. When a maid in the household of a certain Edward Kelly married, her master gave away gold wire rings valued at £4000. This was in the time of Elizabeth I. A few weeks before the Virgin Queen died, the coronation ring, which had become ingrown, was filed away from her finger. It was an old idea that a wedding ring should not be removed, a custom which the Queen had observed for, as she put it, she was wedded to her kingdom. It was widely felt that this forcible removal of the coronation ring was ill omened, for a ring was supposed to remain intact upon the owner's finger. If it broke, this foretold disaster. In 1857 the widow of a murdered farmer said: 'Ah! I thought I should soon lose him, for I broke my ring the other day; and my sister too lost her husband after breaking her ring. It is a sure sign.'

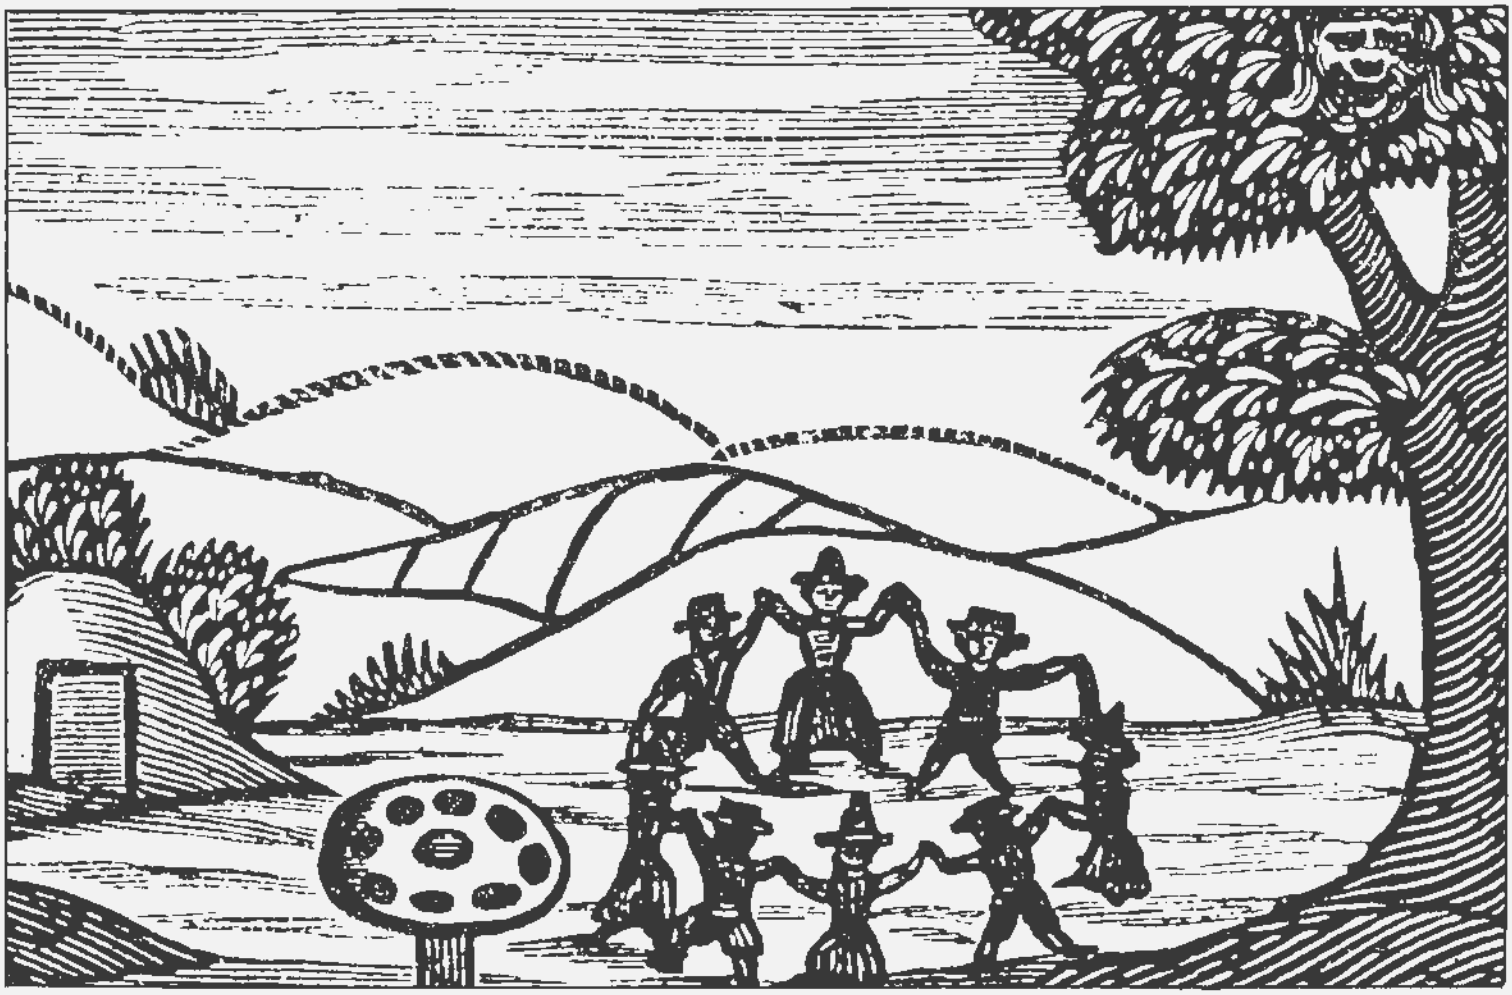
The old-fashioned gimmal, however, was specially made in such a way that it could be broken. It was a ring made of two hoops, divided between the couple at betrothal and united again at the wedding to form a single circle. Naturally a prearranged breakage of this kind was not ill-omened. Equally, since it so often figures in various rituals, the wedding ring cannot invariably have remained in position. Sometimes it was used for protective purposes. The Hutzuls, Ukrainian mountaineers, conducted milking through one to prevent witches stealing the milk.

The Heathen Wedding Ring

The divination of marriages was a more obvious use for the wedding ring. Sometimes this involved discovering it in a portion of food. The Irish say that whoever finds one in a piece of Michaelmas pie will soon get married. In Aberdeenshire at harvest there used to be a feast called *Clyack* – 'meal and ale'. A number of dishes were filled with ale, and treacle was added for sweetening. Next oatmeal was stirred in and a quantity of whisky added. A ring was put in every dish, each of which was shared by six or seven people. There was strong and often violent competition to find the ring, for this meant marriage within the year.

A widespread practice was to cut tiny fingers of bridal cake and pass them nine times through the wedding ring. The cake, itself an emblem of fertility because of the rich ingredients, was given to the bridesmaids to put under their pillows and dream of their husbands-to-be.

A northern English variant of this custom



Mary Evans Picture Library

Fairies dancing in a ring, a 17th century woodcut: dark green circles in the grass of fields are in folklore the sites of fairy dances

required three girls to bake a dumb-cake, that is, in complete silence, on 6 October – St Faith's Day. They made it with flour, spring water, sugar and salt, and each had to turn it three times. When the cake was ready, it was divided into three helpings and each girl cut her portion into nine pieces. These were drawn three times through the wedding ring of a woman married for seven years, and as the girls undressed for bed they ate their cake, saying:

O good St Faith be kind tonight
And bring to me my heart's delight:
Let me my future husband view
And be my vision chaste and true.

The three of them then got into one bed, with the ring suspended above it as a charm to bring the desired dream. With such practices current, it is hardly surprising that the Puritans disapproved of the 'heathenish' wedding ring and abolished it while Cromwell was in power.

The marvellous properties attributed to the wedding ring were reinforced by the custom of wearing it on the third finger of a woman's hand. Tradition held that this finger possessed healing powers. In folk belief, some or all of the other fingers were poisonous; but if a sore was stroked with the third finger, it would heal. The ancients supposed that a vein connected this finger directly with the heart, a notion which was refuted in Sir Thomas Browne's *Vulgar Errors* (1646): 'An opinion there is, which magnifies the fourth (that is, third) Finger of the left Hand; presuming therein a cordial relation, that a particular vessel, nerve, vein or artery is conferred thereto from the heart, and therefore that especially hath the honour to bear our rings.'

The transition from one state of life to another, whether at birth, marriage, death or other critical period, is attended in many societies by rituals. Such rituals have been shown to follow a consistent pattern, meant to ensure the effective completion of the changeover

RITES OF PASSAGE

A FLEMISH ANTHROPOLOGIST working at the Sorbonne, A. van Gennep, was the first person to distinguish rites of passage as a distinct category of ritual, in his book *Les Rites de Passage*, published in 1909. His work immediately made a great impression on all scholars working on the interpretation of the rituals of what were then called primitive and are here called tribal societies, though many of the rituals considered by van Gennep were ancient Roman, Greek or Near Eastern, and Hebraic, Christian and Islamic. Van Gennep pointed out that many of these rituals showed a 'passage' in location or in time, and he showed conclusively that the rituals could be broken into three phases: first, a 'preliminal' phase in which the persons or groups who were the subjects of the ritual were *separated* from their previous social condition; secondly, a 'liminal' phase in which they were in a *marginal* situation; and finally a third 'postliminal' phase in which they were *reaggregated* to their previous social condition or *aggregated* to a new social condition, sometimes in the idea of resurrection. He stressed that these three phases, found in similar form in many societies, correspond to underlying necessities of social life: all social life involves movement in space, in time, and in social situation, and certain of these movements are marked by ritual transitions.

Van Gennep began his analysis by pointing to the high significance in many cultures of the threshold of a house, and the care with which this is built with ritual or magical accompaniments, or marked by religious protection, notably in the concept of the Roman god Janus, who looked both ways (see JANUS); while Orthodox Jews still fix to their doorways the *mezuzah*, a small case containing religious texts, sometimes even putting one on the doorway of each room.

John Moss

A young Kamaiura girl of Brazil emerges after months of seclusion at puberty, her long hair concealing her face as a sign of modesty and submission. Her seclusion marks her separation from her previous physical and social condition, and is the first stage in the rituals which mark her 'passage' from childhood to adult status

The doorway to a house marked a transition from one world of relationships to another: from this developed ritual which marked the crossing of the threshold (Latin *limen*, from which the word 'liminal' comes).

Van Gennep then proceeded to look at a whole series of characteristic rituals present in situations which involve changes in social conditions: erection of houses, commencement of agricultural activities, the gathering of first fruits and harvest, birth, marriage, funerals, ordination, and the initiation of youths or girls into manhood and womanhood. These are but a few examples from the multitude of occasions which van Gennep showed to be marked by separation, marginal and aggregatory rites.

It may easily be seen how the analysis of these rites was related to his starting point, the building of the house. From our own customs we know of the symbolic carrying of a bride by her husband across the threshold of their new home, a liminal rite which marks her movement after the wedding ceremony from her residence in her natal home to her residence in her conjugal home, with all which that movement marks in the alteration of her roles. Similarly, in some cultures a corpse cannot be carried out of a house over the sacred threshold but has to be taken out through a window, or through an opening broken in the wall.

Van Gennep's theory immediately made a profound impression on scholars studying ritual. In fact his phrase, *rites de passage*, passed in its French form into all anthropological literature. The subjects dealt with most commonly under this heading were rites of birth, puberty, initiation into manhood and womanhood (which van Gennep carefully pointed out did not necessarily correspond with puberty), and burial.

Cutting of Apron Strings

The nature of these rites can be briefly illustrated with examples: the rites, for example, surrounding the circumcision of boys of southern African tribes on their initiation into manhood. They first undergo separation rites, such as jumping over fire or water, which exhibit clearly the main purpose of the ritual – to separate them symbolically from the ignorance of boyhood and from the company of their mothers. These initial rites culminate in circumcision at a spot in the bush, on which no woman must look. The boys are then segregated during a marginal period, while the circumcision wounds heal, in a lodge of brushwood built out of sight of the women. There they learn special actions, songs and formulas, often meaningless (though said to be in an ancient language), and wear special costumes marked by special colours.

Early records stated that this symbolic cutting of the apron strings holding a boy to his mother was complete: more recent

research has shown that the boys' mothers must collaborate in some of the rites of this marginal period, because they have a duty to assist their husbands in altering the tie of sons with mothers, so that the sons can grow up to he independent men. Thus in some rites, men and boys sing songs through the cold of the winter night; and the women have to huddle in the open, on the edge of the village, around inadequate fires, ready to respond with ululations to the ending of each song. This response is said to be essential to help the boys to grow up.

When the circumcision wounds have healed, the boys are finely dressed and are allowed to appear to their mothers: these strain to get at their sons, but are driven off, often with real struggles, by the men. In some tribes the menfolk are assisted by masked and clothed figures who represent ancestral spirits. This temporary aggregation of the initiates, when their mothers can see them but not touch them, is succeeded by a less restricted marginal phase when they can be seen by the women at a distance, and even visited by their pre-nubile sisters. Finally in a great celebration the boys are brought, in smart new clothes, to dance in the village and to be surrounded by their mothers, who can now scoff at the previously feared masked figures. Whatever their actual age, the boys emerge socially as men, who may begin sexual relationships, are forbidden to sleep in a hut with their mothers, and are allowed to sit with the men.

Time in Limbo

A second example of a rite of passage is the funeral. This often consists of an elaborate complex of rites, broken into three distinct phases. After the burial, both the mourners and the dead person's spirit enter a marginal phase. The mourners' behaviour is marked by many taboos and special modes of behaviour, dress and adornment or lack of adornment. At this time, the spirit of the deceased may be believed to be making an arduous journey to the 'world of spirits', or else, in societies where there is a cult of ancestral worship, it may be conceived to be wandering loose, homeless and restless. Finally, after this marginal period, aggregation rites are held, either to mark the entry of the spirit to the world of spirits, or else to institute the spirit among the ancestors.

The 'passage' theme is evident in wedding rites, as it is in such ceremonies as initiation to special societies, or the ordination of a priest or consecration of a church, even though in our own culture such rites are often much attenuated. It appears also in seasonal festivals such as the celebration of the New Year, the gathering of first fruits and Harvest Festivals. At the festival of first fruits the whole of a classical or tribal society might perform rituals which marked the separation of the people – often represented by their leaders – from their normal way of life and their entry into a marginal period when they had to observe many taboos, such as not eating particular foods and not speaking loudly save in the performance of special rites. In this marginal phase normal rules might be suspended.

Great festivities, dancing and drinking, mark the aggregation into the New Year. Sometimes, in societies without well-organized government, these are the occasions when normally highly independent sections of society, potentially hostile to each other, show their unity in great festivals: during this period marriages, which are likely to occur between these different sections of the community and may cause strife, are prohibited.

Van Gennep was correct in pointing out that rites of this kind fall into disuse with the technical and economic development of society, though some remain. To refer this change to a decreasing interest in the sacred, and its separation from the profane, seems inadequate. The present writer has suggested an alternative explanation, that in tribal and other simple societies individuals perform their various roles (filial, parental, political, economic, religious, educational, and so on) in the same places with largely the same material belongings in relationships with largely the same set of other persons. These societies are marked by a high ceremoniousness or even ritualization of behaviour, which marks the special relationships in terms of which a person is acting, or the role he is performing, in a

Death of a Miser, **by Hieronymous Bosch: death is another rite of passage and the funeral formally separates the dead man from his previous condition. There may then be a marginal phase in which the spirit is thought to be wandering, and finally 'aggregation' rites to mark its entry to the spirit world**

Old Skins for New

When the Vugusu initiates have stayed in the circumcision hut for several months the elders of each lineage meet and agree to brew the *gamalua gexuxualuxa*, 'the beer of getting out', with which the elders celebrate the conclusion of the period of initiation . . . Early in the afternoon the initiates walk down to the nearest stream and wash off the white clay with which they were painted while they lived in the initiation hut. Then they exchange their old skins for new ones which their fathers have prepared for them . . . Washed, shaven, and clad in their new skins, the initiates are now called *vátembete*, the 'new and soft ones'. They are now ready to return to their fathers' homesteads where all their relatives and neighbours have gathered to drink the 'beer of getting ont'. When they arrive there they are served with large quantities of cooked bananas which are poured out for them on a wicker door . . . When the initiates have finished their meal their fathers or other elders hand them shields, spears, clubs, and other weapons. Holding these weapons like a warrior and standing straight and steady, one boy after the other moves to the centre of the yard of his 'old father' (his father's eldest brother) where, in the order of seniority, every initiate is given extensive rules of conduct by his father. When addressing his son the father stands in front of him and, before every sentence he utters, takes a draught of beer from a new gourd, swallowing some and spitting the remainder at his son's face and chest. He gives him the following rules: 'My son, you have left behind "the mother's cloth" (i.e. the prepuce), but now you are given the father's cloth . . . Now you are a man. No longer ride on a cow or an ox! Do not dance about standing on one leg, because this is childish and a disgrace for a man . . . Do not join the women when they sit together and talk about their own things. If you go there you will hear foolish things and become a fool yourself. Go where the old men are sitting and join them!'

G. Wagner *The Bantu of North Kavirondo*

Marriage ceremonies frequently follow the same basic pattern as other rites of passage: a young couple are purified from all evil influences by pouring the blood of a sacrificed chicken over their heads; part of a ceremony among the Land Dyaks of the Sadong River in Sarawak

particular place at a particular time. The ritualization is achieved by attaching occult power to the acting – directly, or invertedly, or symbolically – of specific secular roles. The ceremoniousness serves symbolically to segregate roles and relationships where this cannot be done materially. In an industrialized society, on the other hand, people commonly interact in their various activities with a wide range of individuals, in many different buildings using different material goods: roles and relationships are materially and not ceremoniously or ritually segregated, and for this reason there is no ritualization of secular roles.

What is the underlying purpose of ritual? Analysis of the place of ritual within tribal groups suggests an answer to this complex question

RITUAL

MANY DIFFERENT kinds of phenomena have been described as ritual. The term has been applied, for example, to the mating habits of birds and animals, such as the dance on the water of the crested grebe; by psychoanalysts to the obsessive behaviour of neurotics, as when a man persistently checks whether he has turned off a tap, only to check anew after each check; and by anthropologists and sociologists to the established forms of behaviour of devotees of cults and religions. But while it is important to try to establish common explanations for the phenomena thus categorized, it is essential to grasp that there are fundamental differences between them and also between modes of interpreting them.

Freud himself argued that there were marked similarities between the obsessive 'rituals' of neurotics and psychotics, and the 'rituals' of what he called primitive society. Indeed, he postulated in *Totem and Tabu* (1913) from his theory of the development of the Oedipus complex (a theory derived from depth analyses of his patients), that the origin of sacrifice and religion in general was to be derived from a primordial killing and devouring of a patriarchal male, who dominated a group of females and their offspring, by the young males of the group. Overcome with guilt, they instituted a symbolic rekilling of the father-figure, now transformed into a god, and partaking of his being in a ritual of sacrifice and communion. If this be taken as what the anthropologist A. Kroeber called a 'Just-so Story' (that is, a story which explains the origin of some well-known phenomenon), then there is no evidence for it, and more recent studies of the social life of the apes make it highly improbable. On the other hand, Kroeber allowed that it might represent a psychological process which most human males undergo, in symbolical form, in the course of their development. Then it might well be one of the springs of emotion which feed into social rituals. Even so, sociologists and anthropologists would argue that Freud's theory cannot be used to explain the development, and the complexity, of the social and cultural relationships involved in rituals.

Variations in Response

Similarly, anthropologists would reject any claim by psychoanalysts that, for example, circumcision ceremonies of boys near puberty can be 'explained' by saying that they create castration-anxiety and fix the incest taboo firmly in the boys' minds. While the above is the standard psychoanalytical explanation of circumcision, one psychoanalyst, B. Bettelheim, has argued from a study of four schizoid children who developed their own initiation ceremonies, that the practice of circumcision arises among males through envy of the productive wombs of females.

Anthropologists would concede that particular persons, passing through circumcision ceremonies, may feel castration-anxiety or womb-envy; but that this would have to be demonstrated by appropriate methods of research, and that the structure of the personalities of the persons enforcing, or undergoing, such ceremonial operations should be taken into account. It may well be that in all men and women, at very deep levels of the psyche, similar syndromes of feeling are to be found; but psychoanalysis itself shows that people vary in their degree of adjustment to those syndromes, in their more conscious feelings and their actions. Thus there is a considerable degree of variation in both the type and the intensity of individuals' reaction to participation in the same ritual.

Examples of this were noted by the present writer at circumcision ceremonies held among certain African tribes. At the ritual circumcision each candidate (aged from seven to 15), while being operated on, should be supported by his father, who is supposed to hold his son's penis and help the circumciser, a ritual adept, turn back the foreskin. On one occasion, the hands of the first father shook so much that it was impossible for the circumciser to act; and the father was replaced by his brother-in-law, the boy's mother's brother, who strictly was

not appropriate. The hands of the second father were very steady, and he watched the operation steadily. The hands of the third father were steady, but he could not watch the operation and turned his head away to look over his shoulder. One must draw the conclusion that the circumcision of each boy meant something quite different to each father, in terms of present relationships, of what each had felt and suffered when he himself as a boy underwent the operation, of the psychological syndromes established in each during infancy, and so on. Hence it seems that psychological analysis can only be effective if it is applied to bring out the significance of a particular ritual, or part of a ritual, for particular individuals, each with his own history of psychological development and his own established personality. Thereafter psychological analysis may feed into sociological-anthropological analysis; and of course the reverse is also true.

Swazi Songs of Hate

The Swazi of southern Africa, at the ripening of the first fruits, stage elaborate national ceremonies, at certain phases of which they are required to hurl insults at their king, who is the central figure of the rituals, and to sing sacred national songs stating how much the king is hated by his subjects. In social-anthropological analysis these rites have been successfully related to the low density of population as a result of the simple system of husbandry; the low variation in standards of living; and the delegation of authority from the king to subordinates ruling numbers of men who, because of the simplicity of weapons, are all warriors, constituting a private army which can help its leader in attempts to gain power. These leaders are of royal blood and may organize rebellions aimed at the kingship. There is therefore present in the national ceremony a symbolic representation of political processes built into the nation, which is riven by periodic armed civil wars.

The rites emphasize that while the kingship itself is sacred and is 'strengthened' in the rites, the king is beset by internal enemies on whose loyalty he cannot rely. But this does not mean that each warrior who insults the king or who sings the songs of hatred against him, must necessarily have sentiments of disloyalty awakened, or go through a severe crisis of loyalty. For one warrior, though he may feel the sacredness of the occasion, it may be in some ways like a fete, a kind of carnival when licence is allowed. At the other extreme, other warriors may go through an emotional turmoil in which strong resentments against authority are awakened, and perhaps a reliving of childhood difficulties in their relationships with their fathers. Again, analysis of individual, possibly variable, reactions to ritual is required.

One must similarly reject any simple direct explanation of ritual as the expression of tension, of despair, of anxiety or aggression, or as the transference of stifled feelings of aggression onto scapegoats, or as simply and directly strengthening social sentiments. In the Swazi ceremony summarily analysed above, it is justified to say that the rites are calculated to arouse the sentiments that support national solidarity. Since we know that acting an emotion is likely to produce feelings of that emotion, it is probable that occasions of group celebration will arouse the sentiments which are appropriate to group solidarity and which support adherence to certain group values and morals, in most participants at least.

But we know equally well that the most complex and intensive reaction to a religious ceremony may come from the sinners in the congregation: they may be most deeply moved by emotions evoked by ritual, particularly ritual in which they have participated as children and as adolescents, and they may then feel determined during the ritual to sin no more. Their intensive emotional reaction may well be provoked by strong feelings of guilt and unworthiness. On the other hand, the man who conforms in his daily life with the precepts of religion and morality is likely to worship with a much more restrained and consistent devotion, while those who are betwixt and between will respond in moderate degree. So in the Swazi ritual cited above, loyal men may have their sentiments of patriotism evoked less strongly than the potential traitors.

Milk Tree Society

A much more complicated theory to relate rituals to emotional predispositions is therefore required, and the best as yet advanced is that of Victor W. Turner, in a series of analyses of the significance of ritual symbols. His highly complex argument can be summarized as follows. Information on the meaning of ritual symbols can be collected from participants, who will give interpretations of various degrees of complexity, depending on whether they are ritual adepts or not. In general, explanations of this kind stress the harmonious, socially valuable attributes of the symbol. Thus, when the Ndembu of Zambia, whom Turner studied, are initiating a nubile girl into womanhood, the key symbol is a tree which exudes a white substance, like milk. The Ndembu specifically compare the white sap of the 'milk tree' with mother's milk, and state that it represents the tie between mother and child: it thus represents the tie between the girl being initiated and her own mother, and her future, nurturing tie with the children whom it is hoped she will produce.

Further, since the Ndembu are a matrilineal society (reckoning descent and succession and inheritance from brother to sister's son), they are organized in groups of kinsfolk related to one another by descent through females. The milk tree therefore represents these groups, technically called matrilineages. As the matrilineages are the persisting groups of Ndembu society, and villages are to some extent combinations of matrilineages, the matrilineal principle in the abstract is vertebral to Ndembu society, and the milk tree symbolizes this, and symbolizes both the continuity of the society and its whole culture, its customs and its laws. In a graphic comparison, one of the Ndembu compared it with the Union Jack flying over the administrative headquarters of the district, then under British rule. He described the milk tree as 'our flag'.

But Turner showed that if one examined actions around the milk tree, in the ritual itself, these were not altogether harmonious, and did not reflect a continual state of harmony in accordance with the values stressed in the Ndembu's own account of the ritual. In practice, there was considerable competition and 'strife' among the people

assembled around the milk tree. Women were separated from the men, and had to behave 'hostilely' towards them. Married women and unmarried girls, women of different matrilineages, and women of different villages, formed also competing pairs of contraposed groups. These alignments reflected the fact that while succession and inheritance passed through women, the women themselves dispersed, during their childbearing lives, to live at their husbands' villages – one example of the contradictory principles on which Ndembu society is built. These contradictory principles appear in the rituals and thus deny the very abstract harmony which is stated in the Ndembus' interpretation of them.

Duty Made Desirable

Turner shows that all the dominant ritual symbols of Ndembu society can be similarly analysed. His thesis is that two sharply different poles of reference for the symbols – the sensory and the ideological – must be distinguished. At the sensory pole are clustered meanings which refer to physiological facts and processes, such as mother's milk, blood, blood of menstruation and birth, semen, genitalia, copulation, excreta, death, and so on. While at the ideological pole are clustered social values and allegiances: conformity with law, morality and custom; motherhood as a nurturing relationship; the established relationships between women and men, married women and girls, membership of matrilineages and villages, and so on. Symbols cover these diverse meanings because they can condense many meanings, can unify disparate meanings and can polarize meanings.

Turner argues that in the course of ritual, marked by feasting, drinking, dancing and music – all physiologically stimulating – as well as by fellowship, strong and varied emotions are evoked in response both to the feasting, drinking and so on, and to the sensory associations of the rites and symbols. The energy thus aroused is then

Procession of penitents in Venice, a painting by Gentile Bellini: the rite is both a formal expression of repentance for sin and a way of arousing the emotion of repentance in the participants and spectators

Scala

His Grace the Archbishop of Canterbury and the Trustees of Lambeth Palace Library

The coronation of King Arthur, from a 15th century MS: one aspect of ritual is as a symbolic statement of status and, although the kingship itself never dies, a new ruler is not felt to be fully a king until the correct ritual of coronation has been performed

transferred to, and fixed upon, the values evoked at the ideological pole. Thus there occurs a process in which the obligatory is felt also to be desirable.

Clearly this theory involves a much more complex approach to the relation between emotions evoked and forms of ritual, than the notions briefly criticized above. We can appreciate why it is that singing songs of hate and hurling insults at the king may act to strengthen, at least temporarily, sentiments of loyalty to him. Moreover, it is a theory which is in accord with the psychoanalytic theory of the sublimation of instinctual drives and demands towards socially approved ends.

If the step from psychological interpretation of ritual to understanding of its sociological functioning is so complicated, it is even more mistaken to relate ritual directly to the behaviour of animals, in mating dances, display and the like.

Ritual from Relationships

Turner's theory was worked out on tribal rituals, but it seems that it could equally be applied to the ritual symbols of the great religions. These types of rituals, however, differ markedly from each other. Sociologists who have written on the general evolution of human society have all stressed that this development, associated with more complex technology and a greater division of labour, is marked by an increasing obsolescence of ritual and its replacement by what have been called universal religions, such as Christianity, Islam and Buddhism, which any person can join as a convert, and in which any adherent can join any congregation assembled to worship. The examples above, of the Swazi first fruits rites and the Ndembu nuhility ritual, show that in tribal society rituals are constituted to specific social relationships according to the domestic, kinship, sexual, local or political affiliations of the members of the cult. Only persons occupying specific positions in those relationships can participate, and they do so in terms of the specific ways in which they are related to one another. Moreover, in the ritual, apart from using special symbols (in the form of things, words or actions), they act their specific roles in secular life, either directly, or sometimes invertedly (as in transvestism, by women dressing as men and men as women), or in some particular symbolic form. Hence an analysis of tribal rituals leads one into a detailed analysis of secular relationships because these are of the fabric of the ritual, and because it is believed that the symbolic representation of those relationships in some hidden, occult way creates and directs occult power so as to bless, purify, protect, strengthen, make fruitful and otherwise successful, the persons involved in those relationships.

This type of analysis has shown that in some of the rituals the enactment of secular relationships involves a statement, in an exaggerated form, not only of the harmonious and unifying aspects of the relationships, but also of the conflicts which reside in them. This is one of the main means by which emotion is aroused, which is then fixed on socially approved values: out of the very conflicts which exist in normal life, on special occasions the value of an ideal of life without conflict is emotionally and intellectually established.

It has therefore been argued that ritual, occult beliefs and practices will tend to occur in crisis situations in which the discrepant principles out of which social organization is formed, principles which are in conflict, produce actual or potential disputes which cannot be settled by judicial and other purely intellectual procedures. Ritual then may operate where there are fundamental disharmonies within the theoretical harmony of a social system.

This theory is based on the perception that in human, as against animal, society, there is a consistent tendency to exaggerate the differences between categories of persons. Thus belief in the occult contaminating effect of menstrual blood and its threat to things virile exaggerates the biological difference between women and men. There are other beliefs, and associated practices, of this kind, based on distinctions of age, the facts of locality, different kinds of relationship through birth and kinship, the relationship of ruler and subject, and so forth. This tendency is more marked in tribal society than in complex industrial societies where peoples' roles, the material things which they handle, the places they work and worship and play in, are more differentiated. This may explain why in tribal society we find a 'ritualization' of secular roles (see RITES OF PASSAGE), while as society develops a more complex technology on which is based a more complex division of labour, there is a movement towards universal religions.

E. R. Leach and other anthropologists have argued from studies of tribal rituals that ritual is only a symbolic statement of status. This is undoubtedly one of the aspects of ritual, as has been shown. Others assert that rituals mainly manifest competition for power. This too is present in tribal rituals, and is also to be found within the congregations of universal religions. But there is clearly much more to ritual than these two aspects.

Complex problems are involved in the question of when actions referring to beliefs in occult power occur, and how they operate. It therefore seems advisable to use a more complicated vocabulary in discussing these problems. The term *ceremonial* may be used to describe all actions which involve symbolic statements of social status (for instance, All Saints' Day and the October Revolution parade). As a further distinction, *ceremoniousness* could be used to describe ceremonial where the practitioners have no idea of occult powers being involved (such as standing when *God Save the Queen* is played). Ritual describes ceremonial where ideas of occult power are present. Within the field of ritual in this sense, there is in tribal society a *ritualization* of secular social roles, of domestic places, and so forth. As this ritualization decreases with advancing civilization, some religions will be austere, while others will be marked by a high *ritualism*, symbolic itself, drawing on the same complex of emotions maybe, but not involving the enacting of everyday roles.

The summoning up of a 'spirit', a powerful supernatural entity or force, is the principle ceremony of European ritual magic

RITUAL MAGIC

THE EUROPEAN magical textbooks, or grimoires (see GRIMOIRE), contain all sorts of processes, including instructions for making love talismans or wax images, but they reserve their most impressive ceremonials for the attempt tu summon up a 'spirit', a supernatural force or entity of some kind, which can be subjugated by the magician and forced to carry out his orders or reveal what it knows. It is this type of operation to which, in the European context, the term 'ritual magic' particularly refers.

The ceremonies in the grimoires naturally vary in detail but there is a clear general pattern. The spirit is summoned and dominated in a series of commanding incantations, through which the magician brings all the resources of his will to bear on the operation. But before he can begin the ceremony itself, he must make the necessary preparations.

A magical operation of any difficulty cannot be performed in a normal condition of mind and body, and the magician must begin by 'consecrating' or dedicating himself to the work, in the sense of cutting himself off from his everyday surroundings and concerns, and excluding all distractions from his mind. The methods of doing this, recommended in all the grimoires, are continence and fasting, cleanliness and devout prayer to God. The *Heptameron* or *Magical Elements* (attributed to a 14th century authority on medicine, Peter of Abano, but probably dating from the 16th century) says that: 'The operator should be clean and purified for the space of nine days before beginning the work; he should be confessed also, and should receive the Holy Communion.' Abstinence must be positively reinforced by concentration on the work in hand. *True Black Magic* (an 18th century French derivative of the *Key of Solomon*) says that the magician must fast and be chaste, must 'abstain from every labour of soul and body', and must 'meditate on those things which he is about to put in practice for nine complete days before undertaking the work'.

The insistence on austerity and the presence of prayers and celebrations of Holy Communion in these rituals, are surprising at first sight but are the result of the principle that magical power works automatically and regardless of motives. God's power can be tapped by the use of his name and through forms of prayer to him. The Mass brings into the magician's body and soul the power of the consecrated host. Confession and abstinence rid him of impurities on which

Certificate of membership in the *Ordo Templi Orientis* (Order of Templars of the East) a German magical society, founded early in this century, which concentrated on the use of sexual techniques in ritual magic: Aleister Crowley became its British head

Modern magicians have been influenced by Egyptian and Graeco-Egyptian texts, and by Indian beliefs, as in this illustration of 'the mystery of universal equilibrium', by Eliphas Levi *(above)*. But the main line of the European tradition runs through textbooks like the *Grimoire of Honorius*: frontispiece of a French edition, probably of the 18th century *(below)*

the spirit that is to be summoned might seize, or from a modern point of view rid him of trivial distractions which would weaken his concentration.

Abstinence also helps build up the magician's own powers. By remaining chaste he creates a reservoir of sexual energy, by going short of food and sleep, he weakens his body and gives strange powers to his mind. Some modern magicians have tried to reach the same goal by the opposite route, using drink or drugs or sex, separately or in combination, to put themselves into a state of physical exhaustion combined with a heightened mental condition.

Washing is also recommended, again to banish impurities or distractions. In the *Key of Solomon*, which recommends nine days of austerity before the operation begins, the magician is instructed to immerse himself in water which has been blessed by a priest, saying a prayer in which he states his own divine potential as the earthly image of God and asks for God's grace. 'O Lord Adonai, who hast formed me, thy unworthy servant, in thine image, from plain earth: bless and sanctify this work, for the cleansing of my soul and body, and may no deceit or stupidity be here. O most powerful God, through whose power the people were able to walk through the Red Sea from Egypt: give me this grace, purified and cleansed by this water, pure in thy presence.'

If the novice magician has not been put off by the austerities recommended, he may quail at the list of magical 'weapons' or instruments which he requires. *True Black Magic*, for instance, says he will need a sword, a staff, a wand, a lancet, a hook, a sickle, a poniard, a white-handled knife and a black-handled knife, the last of these being used for drawing the magic circle. Aleister Crowley's list of magical weapons includes swastika, crown, wand, crook, sword, spear, scourge, lamp and girdle, apron, sandals, dagger, tripod, cup, cross and sickle.

These instruments should be made by the magician himself (or as a second-best he may buy them, provided they are brand new) and the directions for manufacturing them and 'consecrating' them to the work are of daunting complexity. A comparatively simple example is *True Black Magic's* sickle, which must be made of virgin steel and forged on the day and in the hour of Jupiter. It must be doused under moonlight with a mixture of mole's blood and pimpernel juice. A horn handle must be fitted to it in the hour of Jupiter and an incantation 'by the authority of God the Father Almighty' recited over it to infuse it with power. It must be kept until needed in a new wrapping of red silk.

Whether many magicians ever provided themselves with all the accessories or followed all the difficult and taxing directions seems doubtful. The main underlying purpose appears to be psychological. The magician must make his own instruments and follow complicated procedures as a way of totally involving himself and all his faculties in the work, of stretching to the limit his qualities of application and determination. The essential requirement is that his weapons must be 'virgin', not previously owned or used by anyone else. This is partly because a virgin weapon has its full potentiality intact, none of its energies having been dissipated, and partly because it is considered dangerous to use anything second-hand in magic. A previous owner or use may have linked the weapon with undesirable or positively dangerous influences.

The principal weapons of the grimoires are the wand, sword and knife. The wand should be made of hazel wood and, according to the 18th century French *Grand Grimoire* should be 19½ inches long, cut at sunrise with the magic knife and fitted with pointed steel caps at each end (see WAND). The sword and knife should be forged or bought on the day and in the hour of Jupiter, at a time when the moon is waxing. Incantations are recited over them to give them power.

Robes and Circle

A secluded place should be chosen for the ceremony, so as to avoid interruptions. Somewhere which has a strong atmosphere of its own is desirable, so long as the atmosphere suits the type of ceremony to be performed. Ruins, graveyards, dark woods or crossroads would all be suitable for operations of destruction or communings with evil spirits. If the ceremony is performed indoors, all the windows and doors should be fastened and the room should be hung with drapes of a colour appropriate to the ceremony. Similarly, an appropriate time should be chosen, performing the operation in the hour of the planet to which it

corresponds, and using accessories belonging to the planet (see CORRESPONDENCES; DAYS).

The grimoires recommend white robes, though in black magical operations trappings of black or red would be more suitable. The 'Fourth Book' added to Agrippa's *Occult Philosophy* prescribes a robe of white linen, covering the body from the neck to the feet, fitting closely and tied with a girdle. The *Key of Solomon* recommends white shoes, with magical symbols drawn on them, and a crown of virgin white paper on which names of God are written with 'the pen of the art', one specially made and consecrated for the magician's purposes. So far as possible, buttons, buckles, knots and other fastenings should be avoided because any fastening tends to impede the flowing out of the magician's power.

The colour white represents the purity, from the magician's point of view at least, of his intentions, and in putting on his robes he is really putting on a suitable frame of mind. In the *Key*, while vesting himself in his robes, he repeats no less than seven psalms and then says, 'Amor, Amator, Amides, Ideodamiach, Amor, Plaior, Amitor. By the powers of those sacred angels I dress myself in these powerful robes. And through them I will bring to a successful conclusion the things that I burn to accomplish: through thee, O most holy Adonai, and thy kingdom and rule is everlasting. Amen.'

Once robed, the magician can proceed to draw the magic circle. This acts as a barrier against all forces outside it and, even more importantly, it focuses and concentrates the forces inside it, the magical energy generated in the ceremony (see CIRCLE). In the *Key* the circle is drawn with the magic knife, at the end of a rope nine feet long. Names of power, crosses, pentagrams, hexagrams, herbs and bowls of holy water are placed in the rim of the circle, to reinforce it. According to the *Lemegeton*, a triangle should be drawn outside the circle, two feet away from it, and it is into this triangle that the spirit is summoned. The name Michael is inscribed inside and the names of power Anexhexeton, Tetragrammaton, Primematum are written along its edges.

Israel Regardie comments (in *The Tree of Life*) that the triangle is required in evocation, when the magician summons up something from within himself and projects it into the universe outside him, but not in invocation, when the magician summons something from outside himself, which takes place entirely inside the circle. When Aleister Crowley and his pupil, the poet Victor Neuburg, conjured up the mighty demon Choronzon in a ritual based on the *Lemegeton* and the *Grimoire of Honorius*, Crowley placed himself in the triangle, into which the demon was summoned, so offering himself as the vehicle of its manifestation: according to some, he was possessed by the demon for the rest of his life.

The seven planets, with the sun at the centre: the planetary gods personify forces which ritual magicians attempt to use in their operations which should be performed in the hour and day of the appropriate planet

The Perfumes of Venus

Pentagrams and hexagrams, drawn on parchment or engraved on an appropriate metal, may be placed in the circle or outside it, or worn or carried by the magician and his assistants. They protect against evil and they may be used for banishing irrelevant or disruptive influences before the main ceremony begins (see HEXAGRAM; PENTAGRAM).

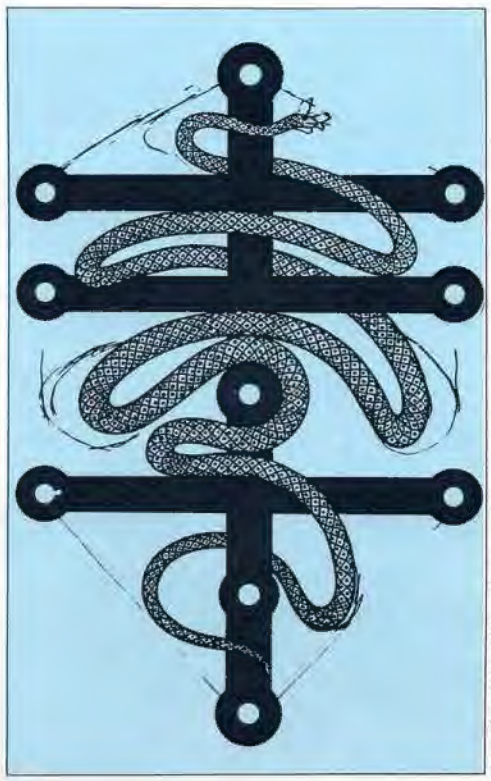
A small brazier is placed inside the circle (or sometimes outside it), on which a fire of charcoal is lit and various substances are burned. The choice of substance depends on the nature of the ceremony. For a work of Venus, for example, ambergris, aloes wood, musk, myrtle, rose, red sandalwood, pigeon's blood or sparrow's brain would create a suitable perfume. Like the colours, metals and other accessories, the perfume brings the appropriate planetary influence to bear on the operation. The fumes also provide material from which the spirit can make itself a visible body (see BREATH). It is likely that this is connected with the alchemical notion that when a substance is burned, the smoke given off is its 'spirit'.

But again the principal use of the fumigations is psychological. Like the whole apparatus of weapons, colours and symbols, the fumes help to intoxicate the magician's senses. It is worth noticing that some of the materials recommended for burning in black magical operations – henbane, for instance – give off fumes which may cause hallucinations and delirium.

It is important to have a clear mental picture of the spirit that is to be summoned. Its nature, attributes and appearance are formulated so as to build up a vivid image of it, on which the magician and his associates concentrate. The *Lemegeton* describes the appearance of 72 demons, presumably for this purpose. The spirit Orias, for example, who will teach the magician astrology and cause even his enemies to fear him, appears in the form of a lion riding on a great horse. He has a snake for a tail and in his hands he holds two more snakes. The 'Fourth Book' provides descriptions of spirits associated with the planets: a spirit of Mars may show itself as a king riding a wolf and holding a naked sword in his right hand and a severed human head in his left (see also RENAISSANCE).

In the modern magician's 'assumption of god-forms', a vivid picture of a deity's characteristic appearance, attributes, symbols and myths is built up and concentrated on while the god is invoked. The magician identifies himself with what he has pictured, a 'god' which is a great universal force or current, or 'aspect of cosmic life', which also has its existence in the human mind, and Crowley and other modern magicians have found the deities of ancient Egypt particularly suitable for this purpose.

In many of the processes in the grimoires an animal, usually a kid, is killed as part of the preliminaries and the magician uses its skin to make parchment, on which he inscribes pentagrams and other magical symbols. But sometimes the slaughtered animal is also a sacrifice. In the *Key* the magician decapitates the kid at one blow,



Radio Times Hulton Picture Library

Drawing by Aleister Crowley of the Serpent of Wisdom coiling round the cabalistic Tree of Life: the Tree is regarded as a diagram of the universe and to follow the serpent's path is to 'rise through the spheres' to supreme power, to command in one's own being all the forces of the world

naming the spirit he intends to summon and saying 'O high and powerful being, may this sacrifice be pleasing and acceptable to thee. Serve us faithfully and better sacrifices shall be given thee.'

In modern rituals the sacrifice, if performed at all, is much more closely linked with the main ceremony itself and may occur at the height of it. When the animal is killed, its vital energy is believed to be liberated, so increasing the supply of force inside the circle. The fumes of its blood provide an additional supply of energy on which the spirit can fasten to make itself manifest. And again the killing contributes to the magician's intoxicated but masterful state of consciousness.

A bird or small animal may be slaughtered, or the magician may gash himself or one of his assistants so that the blood runs. If this is combined with the achievement of orgasm, a still greater 'charge' of energy is released into the circle and it is this sexual 'sacrifice' that some modern magicians regard as peculiarly effective.

In the Lake of Fire

When all is ready, and the magician and his assistants are in their places in the circle, the summoning of the spirit begins. It is summoned through the magic of language, the use of compelling incantations and 'names of power', which are believed to contain inherent force (see INCANTATION; NAMES). There is no single correct formula of incantation, and finding those which work is a matter of trial and error. The incantations begin quietly and gently but as they continue the magician gradually works up his own inner forces until he is in a state of fervid but still controlled ecstasy in which with every fibre of his being he commands and compels the spirit to appear.

Of all the grimoires, the *Lemegeton* has perhaps the most formidable armoury of incantations. The magician conjures the spirit by a battery of names of power to 'appear forthwith and show thyself to me, here outside this circle in fair and human shape, without horror or deformity and without delay'. If the spirit does not appear, this opening incantation is repeated a second time and, if necessary, a third, with the magician gradually introducing a more urgent and commanding note into his voice.

If the spirit has still not appeared, a second and stronger incantation is chanted, which may again have to be repeated a second and third time. The spirit is summoned with a great array of names of power, and the incantation ends with: 'By the dreadful Day of Judgement, by the Sea of Glass which is before the face of the Divine Majesty, by the four Beasts before the Throne, having eyes before and behind, by the Fire which is about the Throne, by the Holy Angels of heaven and the Mighty Wisdom of God, by the Seal of Basdathea, by the name Primematum which Moses uttered and the earth opened and swallowed up Corah, Dathan and Abiram, answer all my demands and perform all that I desire. Come peaceably, visibly and without delay.'

The magician is now working himself up to a high pitch of intensity and using a more compelling and dominating tone. If the spirit still fails to appear, he proceeds to a third conjuration, again to be repeated up to three times, in which he commands the spirit by the seven secret names with which Solomon mastered all demons and threatens it with the torments of hell. 'I will bind thee in the depths of the bottomless pit, there to remain till the Day of the Last Judgement. I will chain thee in the Lake of Eternal Fire and Brimstone . . .'

This should certainly force the spirit to appear, and he must be kept firmly in subjection to the magician's will. Once the magician has finished with him, the spirit must be forced to go away with the 'licence to depart'. This final stage of the ceremony is extremely important because the magician and his assistants cannot safely leave the circle until the spirit has been banished. Even if the spirit has apparently refused to answer the magician's summons, the formal licence to depart must be pronounced in case he is invisibly present.

The spirits of the *Lemegeton* are summoned for a variety of purposes, including harming the magician's enemies, gaining money, status and influence for him, and assisting him to slake his lust, but the majority of them are teaching demons. They supply him with knowledge about a large range of subjects, even including ethics, and they reflect the tradition of the Watchers, the rebel angels who first brought knowledge to men (see DEVIL). When a modern magician 'holds conversation' with what

he has invoked (as distinct from evoking something from himself and objectifying it), he learns what it has to teach, so to speak, by identifying himself with it.

The Terrible and Invisible God

Modern magicians have taken much from the grimoires but they have also looked back beyond them to ancient Egyptian and Graeco-Egyptian rituals. The Golden Dawn (see GOLDEN DAWN) attached great importance to a Graeco-Egyptian magical text on which they based a ritual of invocation of the 'higher genius' or 'holy guardian angel', which is the magician's higher self. The 'angel' is invoked by incantations which declare its names and attributes and its supreme power. Then it is summoned. 'I invoke Thee, the Terrible and Invisible God Who Dwellest in the void place of the Spirit. . . . Hear me and make all Spirits subject unto me, so that every Spirit of the firmament and of the Ether, upon the Earth and under the Earth, on dry land and in the Water, of Whirling Air and of Rushing Fire, and every spell and scourge of God may be made obedient unto me.'

The ritual continues with rising fervour, the magician concentrating all his resources of will and imagination, until the angel itself is felt to be present. In a passion of ecstasy the magician unites himself with it, and cries out, 'I am He, the Truth.' And the command to 'make all Spirits subject unto me' is spoken again, but as if by the angel itself, for it and the magician are now one.

Magical Obstacle-Race

The almost incredible complications and elaborations of these, initial rites and ceremonies . . . read like the worst sort of obstacle-race. They are certainly calculated to deal the death-blow to any notions harboured by intending practitioners that magic is a short cut to their desires. On the contrary it appears here in the light of a severe discipline both on the mystical and the practical side; and those who have ever attended Hindu rites and ceremonies will recognize the similarity of an outlook which transforms all the actions of everyday life into an act of worship. Would-be sorcerers might well pause before embarking on the path traced out for them by 'Solomon'; but could comfort themselves with the reflexion that the results would be in proportion to the effort expended. And when they failed, they would be unlikely to blame their mentor. For they could never be quite sure that they had not deviated at some point or other from his sometimes ambiguous instructions. They could try, try and try again until they died of senile decay without losing hope and without losing faith in 'Solomon'. But both the God-fearing and the graceless must have been in a state of great nervous tension and fatigue when they came at last to the actual rite of conjuration.

Magicians and witches use 'weapons', robes, instruments, perfumes, jewels, which are believed to be occultly linked to natural forces and which also intoxicate the magicians' mind and heighten his powers

Popperfoto

Rivers

Rivers share in the general symbolism of water as the source of life and, like the Nile in Egypt, may be seen primarily as bringers of fertility: to cross a river is symbolically to pass from one spiritual condition to another; in hymns and spirituals to cross over Jordan is to pass the barrier of death: some rivers, like the Ganges, are regarded as themselves divine.

See COSTUME; RITUAL MAGIC.

The red breast of the robin has led to its being associated with bath blood and fire; an old belief of less obvious origin was that the robin would cover a corpse with a pall of moss

ROBIN

THE ROBIN enjoys greater popularity in the British Isles than in any other part of the world. Although it has ancient folklore associations, its fame rests largely on the importance it attained in English prose and poetry a few centuries ago. Every Christmas the robin appears on many Christmas cards and until recently it would have been difficult to find a child who could not answer the nursery rhyme query, 'Who killed Cock Robin?'

The bird owes its popularity to the bright colour of its breast and its confiding behaviour. In most European languages it is called by the equivalent of 'Redbreast' and its folklore owes much to this. Bright-eyed and alert it follows the gardener around, watching for worms and grubs uncovered by his spade, or perches singing on a twig close by.

The first mention of a tame robin is in the biography of the 6th century Scottish saint, Kentigern. His teacher had a pet robin which came daily to perch on his head or shoulder and feed from his hand. According to the legend, mischievous boys handled it so roughly that it died, but St Kentigern restored it to life. The biography was not written until the 12th century but used a much earlier source. St Kentigern's robin is depicted in the coat of arms of the City of Glasgow. Rather more than a century after this saint's biography appeared, the biographer of St Francis of Assisi, the most famous saint associated with compassion for animals, related how he fed and tamed a pair of robins and their brood which came to the brethren's table at mealtimes. In Italy, where robins have long been persecuted, such tameness could be regarded as almost miraculous.

The robin's red breast inspired associations with fire and blood. According to a Welsh legend, the robin flies to a land of woe and fire with a drop of water and tries to quench the flames, but gets its feathers scorched so that it is called Bronrhuddyn, 'scorched breast'. When it returns it feels the cold more than other birds and should be given crumbs. In France, where it is said that the wren fetched fire from heaven, the robin went too close to it when its feathers were in flames and so its own breast was singed. What appears to be a degraded version of these stories is told in Guernsey. The robin brought fire to the island but scorched its plumage on the way. According to a legend current in the Inner Hebrides, when the Christ child was born the fire in the stable almost went out but the robin fanned the embers into flame, burning its breast feathers. Mary blessed it and when the feathers grew again they were red instead of brown. In western France on Candlemas Day a peculiar ritual was performed. A robin's body was spitted on a hazel twig and set before the fire. As the hazel was a magical tree among the Celts, this hints at some pre-Christian belief. In Germany it was commonly held that the presence of a robin averted lightning.

A Drop of God's Blood

The similarity between the colour of the robin's breast and bloodstains linked the bird with death and religious beliefs. The old Scottish saying that the robin should not be killed because it has a drop of God's blood may be a reminiscence of strange, ancient ideas. According to a Breton legend, while Christ was hanging on the cross a robin plucked a thorn from his crown and in so doing pierced its own breast. As a reward it was given power to enrich one young girl every year.

In the 16th century the robin acquired a reputation for covering dead bodies with moss. It is an inquisitive bird and a person finding a robin near a corpse in a wood could suppose that it was about to perform this kindly office, especially if it held nesting material in its bill. The origin of the Babes in the Wood story is obscure but it may be ascribed to the 16th century, although the complete printed version dates from the late 17th century.

No burial this pretty pair
From any man receives,
Till robin redbreast piously
Did cover them with leaves.

The most famous and beautiful allusion is Shakespeare's. In *Cymbeline*, Arviragus says:

With fairest flowers,
Whilst summer lasts, and I live here, Fidele,
I'll sweeten thy sad grave: thou shalt not lack
The flower that's like thy face, pale primrose; nor
The azured harebell, like thy veins; no nor
The leaf of eglantine, whom not to slander,
Out-sweeten'd not thy breath: the ruddock would,
With charitable bill, – O bill, sore-shaming
Those rich-left heirs that let their fathers lie
Without a monument! – bring thee all this;
Yea, and furr'd moss besides, when flowers are none,
To winter-ground they corse.

John Webster in *The White Devil* (c 1612) associated the wren with this ritual:

Call for the robin redbreast and the wren,
Since o'er shady groves they hover,
And with leaves and flowers do cover
The friendless bodies of unburied men.

Thus in the course of time, an incident such as seeing a robin carrying moss for its nest near a corpse became embellished by poets. Possibly, too, observations of robins perching near places where graves were being dug added to the bird's associations with funeral rites. But the tradition of birds taking part in church services goes back beyond the 13th century.

From such antecedents originated what has been styled the best known poem in the language, 'The Death and Burial of Cock Robin':

Who killed Cock Robin?
I said the Sparrow
With my bow and arrow
I killed Cock Robin.

Although the oldest printed example is in an 18th century chapbook, it evidently evolved from earlier ideas. Suggestions that it was originally a political satire or an allusion to the death of Balder are mere speculation. Late in the 18th century it was printed together with another set of verses, 'The Marriage of Cock Robin and Jenny Wren'. In it the birds act various roles:

Then on her finger fair
Cock Robin put the ring.
'You're married now,' says Parson Rook;
While the Lark amen did sing.

It is more likely that the notion of robin and wren being male and female of the same species arose because of associations created by the poets than that countryfolk made this mistake. The belief is not entirely extinct. There was a saying:

The robin redbreast and the wren
Are God Almighty's cock and hen.

Sentiment, religious associations and tradition combined to create friendly feelings for the robin, sometimes resulting in beliefs

Victoria and Albert Museum/Chris Barker

The inquisitive robin acquired a reputation for covering dead bodies with moss and leaves; and in a 17th century version of the Babes in the Wood story the robin is credited with this kindly act

There are many legends explaining the origin of the robin's red breast: one Breton legend says that while plucking a thorn from Christ's crown, the robin pierced his own breast

Victoria and Albert Museum/Chris Barker

that various ills would befall those who injured it or disturbed the nest. In England, Scotland and Germany it was believed that the cows belonging to a man who killed a robin would yield bloody milk. In Suffolk and Bohemia you would suffer from trembling of your hands if you robbed a nest, and the belief is still current in Wales that a broken limb may be the penalty.

As we might expect, a bird around which so many associations have gathered has been regarded as having oracular powers. There is a Suffolk rhyme:

> If the robin sings in the bush,
> Then the weather will be coarse;
> But if the robin sings on the barn,
> Then the weather will be warm.

This may have arisen from the observation that in autumn the bird sings softly, perched fairly low in trees and bushes, whereas when the temperature is rising during the spring and the male is defending his territory he often sings from higher perches. In Germany it is considered a good omen when the bridal pair see a robin on their way from the church.

'For he was a good outlaw, and did poor men much good': these words still convey the most familiar image of Robin Hood, the green-clad forest-dweller who stole from the rich to give to the poor: illustration from the *Lytell Geste*, printed by Wynkyn de Worde

ROBIN HOOD

ONE OF THE GREAT folk heroes of England and Scotland since at least as early as the 14th century, Robin Hood is still a living part of British tradition today. The first certain reference to him in English literature is that made by William Langland in his new version of *The Vision of Piers Plowman* (1377), where he makes a drunken chaplain say:

> 'I can not my pater nnster, as the prest hit saith,
> But I can rymes of Robyn Hoode and Randle Erle of Chester.'

We do not know what these 'rymes' were, for they have not survived; the oldest existing ballad is the *Lytell Geste of Robyn Hode and his Meiny*, which was printed by Wynkyn de Worde at the end of the 15th century. It consists of four ballads of apparently much earlier date that have been strung together to make a continuous tale, and it may be that some of these, or parts of them, would have been known to Langland's chaplain. In

any case, it is evident that by 1377 the hero's fame was already widespread, and in the years that followed it was to travel all over Britain in song and ballad, folkplay, chronicle, and traditional tale.

Most people even now are more familiar with Robin Hood's legends than they are with those of any other British folk hero, except perhaps Arthur. He is still an admired figure in our traditional landscape, the 'proud outlaw' who became a symbol of freedom and independence and resistance to petty tyranny. Yet, in actual fact, we know very little about him. We do not know where he was born, or in what precise period he flourished. Some early accounts place him in the reigns of Richard I and John, and others in the time of Edward II. He is usually said to have been a yeoman, and quite probably he was, but from the 16th century onwards, tradition has tended to ennoble him by making him a possible claimant to the earldom of Huntingdon. The causes of his outlawry are likewise unsure, varying in different sources from debts incurred in a wild youth to taking part in the rebellion of Simon de Montfort or Thomas of Lancaster.

We cannot even be certain that he ever existed at all. Some scholars believe that he did not, and that he was, as Professor F. C. Child calls him, 'the pure creation of the ballad muse'. In other words, he was an ideal and not a historical figure, invented by the ballad-makers as an expression of the discontents and grievances of the medieval peasantry. Others think that he rightly belongs to the world of pagan or fairy belief, and that he and his green-clad followers were originally forest elves whose half-forgotten legend was later rationalized into tales of human outlawry. He has been associated with the Norse god, Hoder, with Robin Goodfellow (see PUCK), and with the horned god of the witches who had many names, one of which was Robin. A more mundane theory suggests that 'Robin Hood', a corruption of 'Robin of the Wood', was once a generic title for forest thieves, and that the stories we know may have grown from vague memories, not of a single heroic individual, but of several medieval bandits so nicknamed, whose real names and histories are now quite unknown.

On the other hand, some modern students of the legend believe it to be founded upon fact, and certainly, during many centuries, no one doubted that Robin Hood was a real person. He was essentially a hero of the people, though he never led them in any uprising or fought in any popular cause. He was the constant friend of the poor and oppressed, generous and open-handed in times of need, and quick to avenge the wrongs of the lowly. Because he was an outlaw, he was always in danger, but quick wits, daring, and the loyalty of his friends enabled him to reach old age in the end. He lived by theft, robbing the rich of their gold and the king of his forest game, and he led a merry and adventurous life in the greenwood as the acknowledged leader of a company of like-minded bandits. His chief enemies were those whom the poor also regarded as their enemies – the sheriffs who enforced harsh and detested laws, the forest rangers, the too-wealthy churchmen, the officers of the great land-owning monasteries, and others of the same kind. For all these he had a deadly hatred, and he attacked and robbed them without mercy whenever he had a chance.

Tricking the Rich

Tradition and ballad alike insist that he shared the fruits of his robberies with the humbler folk living near his haunts, and probably he did, since they were his natural allies, and there were many ways in which they could help him in their turn. The *Lytell Geste* says that when he drew up rules for the members of his band, he forbade them ever to harm any poor person, be he husbandman or yeoman, squire or knight. Only the rich and powerful needed to fear him, though with them he could be as brutal and violent as any other thief. He delighted also in tricking them and making them look ridiculous, and doubtless this endeared him still further to those who had suffered under their tyrrany. All the ballads stress his merry-mindedness, his impish sense of humour, his personal piety which was quite unaffected by his hatred of the greater clergy, and his marvellous skill as an archer. The last words in the *Lytell Geste* are, 'For he was a good outlawe, and dyd pore men moch good'; and this is the picture that has survived in most men's minds from the time these words were written until now.

Nottinghamshire and Yorkshire both claim him as their own. Among the Sloane manuscripts there is an anonymous life of Robin Hood, apparently written in the late 16th century, which says he was born about 1160 'in Lockesley in Yorkshire, or after others, in Nottinghamshire'. There is a legend, however, that connects him with Loxley in Staffordshire, according to which his father held land there. Joseph Hunter, in his *Great Hero of the Ancient Minstrelsy of England* (1852), says he was a Wakefield man, born at the end of the 13th century, who took part in Thomas of Lancaster's rebellion against Edward II in 1322, and was outlawed in consequence. The Wakefield Court Rolls show that a certain Robert Hood and his wife acquired a tenement on Bickhill in 1316, for the purpose of building a house, and that by 1358 they no longer had it. In the Contrarients' Roll – the list of properties confiscated after the failure of the rebellion – 'a building of new construction on Bickhill' is mentioned, and it has been suggested that these two tenements were the same. If this is so, there can be little doubt that Robert Hood of Wakefield was involved in the rising and suffered for it. Whether he can also be identified with the Robin Hood that we know is, perhaps, still a matter of some uncertainty.

Wherever his actual birthplace may have been, it seems evident that Robin was of North Country or north Midland stock. His traditional haunts were the two great forests of Sherwood in Nottinghamshire and Barnsdale in Yorkshire, and to a lesser extent, Plumpton Park in Cumberland. In Yorkshire also, he had a second territory on the coast. 'He had,' said Dr Fuller in *Worthies*

Illustrations from *The History of Robin Hood*, c 1840 *Above* Frontispiece with Robin Hood in cloak and plumed hat ***Below*** Robin sets off on horseback, his mother behind him, to visit his uncle ***Top right*** He meets a butcher on his way to Nottingham Fair, buys his mare, panniers and a set of clothes, and sells meat so cheaply at the fair that he outsells all the other butchers ***Above right*** Robin fools the Bishop of Hereford who seizes an old woman with whom Robin has exchanged clothes ***Right*** Little John finds a hoard of gold sewn into some clothes during a fight with beggars ***Below right*** Robin stops King Richard and his men disguised as monks, and demands money; the king reveals his true identity when Robin makes clear his support of the monarchy with the words: 'God save him, and confound his enemies'

of England (1662), 'another haunt (he is no fox that hath but one hole), near the sea in the North-riding of Yorkshire where Robin Hoods bay still retaineth his name; not that he was any pirat, but a land-thief, who retreated to these unsuspected parts for his security'. Here he is said to have kept boats in which he could put to sea in times of special danger. What remains of Sherwood Forest is still starred with place names that recall his many adventures there. The Sheriff of Nottingham ranked with rich clerics among his main enemies; when he instructed his followers not to harm poor people, he added:

> These bishoppes and these archebishoppes,
> Ye shall them bete and binde:
> The hye Sheriff of Nottingham,
> Hym holde in your mynde.

Hold him in mind they did. The ballads are full of bitter fights between the outlaw and the official, sometimes to the death. In one, Robin shoots the Sheriff and then cuts off his head, in another he hangs him upon his own gallows. Generally, however, the tales of their warfare have a less violent ending, but the Sheriff is nearly always the loser, as, in the minds of the ballad-makers, he deserved to be because he represented laws deemed to be cruel and unjust.

Meeting With a King

In the *Lytell Geste* it is related that, at one point in his career, Robin was persuaded to abandon his wild life, and enter the service of 'Edwarde our comly kynge'. The ballad does not make it clear which King Edward this was, but there are some outside indications that it may have been Edward II. The tale runs that the King came north, and was so enraged by the havoc wrought in his forests by the outlaws that he called for the immediate capture and execution of their leader. When all attempts to carry out this order had failed, he went himself to the greenwood disguised as an abbot. There he encountered Robin, who was at first deceived by his disguise, but afterwards recognized the supposed abbot as his sovereign lord. As soon as he had done so, he fell on his knees and asked for mercy, 'of thy goodnesse and thy grace, for my men and me'. Edward was so impressed by his loyalty that he pardoned all the band, and took Robin himself into his service.

History records that Edward II did go north in 1323, and that an inquisition concerning thefts of venison since Thomas of Lancaster's rebellion was held at Pickering in the August of that year. Robin Hood's name is not included in the list of culprits, but in the royal accounts for 1324, entries of payments to a valet of the King's Chamber called Robert or Robin Hood occur between April and November, and then cease. We hear no more of this Robert Hood in any historical document. The ballad, however, goes on to say that after a time spent in the King's service, Robin wearied of court life and yearned for the greenwood. He asked Edward's permission to return briefly to Barnsdale, and was granted leave for seven days only. He was never seen at court again. Once back in the forest, he reverted to his old ways, gathered his scattered band round him, and for 22 years thereafter enjoyed again the free and dangerous life that he loved.

Death of a Hero

He died at last through the treachery of the Prioress of Kirklees. He fell ill, and because she was noted for her medical skill and was also his kinswoman, he went to her, as the Sloane manuscript records, 'to be eased of his payne by letting of blood'. She betrayed him, very horribly, by letting him bleed to death. She is variously said to have done this in order to avenge the many churchmen he had injured in the past, or because she was persuaded to do so by Sir Roger de Doncaster, who was her paramour. Another version of the tale says it was not she who committed the actual murder, but an unnamed monk who was called in to attend the outlaw, and who may, perhaps, have acted without her knowledge.

However that may be, Robin died slowly and painfully from loss of blood. According to one account of the tragedy, he was locked in the room where the operation had been performed, and 'there did he bleed all the live-long day until the next day at noon'. When his strength was nearly gone, he managed to sound his horn, though only feebly, to summon Little John, his friend and lieutenant, who was waiting in the nearby woods. The latter, finding his master beyond help and dying, demanded the right to avenge him by burning down the priory, but was sternly forbidden to take any action against the Prioress or her nuns. 'I never hurt fair maid in all my time,' said Robin, 'nor at the end shall it be.' Then he asked for his bow, and with a last burst of energy, he shot an arrow through the window, saying that where it fell, there must he be buried.

Long tradition has placed Robin Hood's grave within bowshot of the nunnery, under an inscribed stone which, according to Grafton's *Chronicle* (1562), was laid there by the Prioress herself. The antiquary John Leland mentioned it in Henry VIII's reign, and two centuries later Thoresby recorded, in 1715, that 'Near Kirklees monastery, the noted Robin Hood lies buried under a gravestone that yet remains in the park, but the inscription scarce legible'. No other site for the grave has ever been suggested, although Gough, in his *Sepulchral Monuments*, says it was excavated in the early 18th century and was found to be empty. Little John, on the other hand, has had no less than three traditional burial-places – one, rather improbably, in Ireland, another at Pette in Morayshire, and a third at Hathersage in Derbyshire, to which village he is said to have retired after the death of his leader.

Celebrating his Memory

Long after these heroes, and all their merry companions, had vanished from this world, they lived on in the Robin Hood plays and games celebrated at Whitsuntide, or on May Day. At what precise period these 'sportes of Robyn Hood' were absorbed into the far older May games we do not know, but medieval records and churchwardens'

accounts show that they were flourishing in the 15th and 16th centuries, not only in Yorkshire and Nottinghamshire, but in places far removed from the outlaws' traditional haunts. Sir John Paston, in 1473, refers to plays acted in his Norfolk home. The same plays and sports, and the money gained thereby for church and parish, are mentioned in the churchwardens' accounts of Aberdeen and Edinburgh, Kingston-on-Thames and Reading, Croscombe in Somerset, and even as far south as Stratton in Cornwall. In their heyday they were so popular that nothing was allowed to interfere with them. They were forbidden by Scottish law in 1555, but they still went on, and an attempt to stop one performance ended in a riot. Bishop Latimer complained bitterly in a sermon preached in 1549 that, coming once to a parish where he intended to preach, he found the church locked and everyone absent except one man, who said: 'Sir, this is a busy day with us, we cannot hear you, it is Robin Hood's day. The parish are gone abroad to gather for Robin Hood. I pray you, let them not.' And so, in great anger, he was obliged to ride away with his message unspoken.

One final word must be said about Maid Marian, if only because most people today think of her an integral part of the Robin Hood legend. In fact, she is a late-comer to the tradition. The earlier ballads do not mention her at all, and her first appearance as the hero's true love is in a play written in 1601, *The Downfall of Robert, erle of Huntingdon* . . . She seems to have been borrowed from a French pastoral drama in which a shepherd and a shepherdess named Robin and Marian are the principal characters. Regrettable though it may be to the romantically minded, all the evidence goes to show that, whether Robin Hood and his fellows were real people or not, the Maid Marian of modern tradition was not one of their company.

ROC

THE BEHAVIOUR of this mythical bird is described in the *Arabian Nights*. It dwells on an island and feeds on elephant calves. When it alights to brood on its egg, which is like a huge dome, it stretches out its legs behind it. Sinbad waited until it was sitting, crept up, unrolled his turban and used it to tie himself to the protruding legs. At dawn the monstrous bird soared away, carrying him with it, and when it alighted he freed himself. As he watched, he saw the Roc seize and carry off a gigantic serpent. He made his way into a ravine where the soil was strewn with diamonds but the snakes there, which issued forth at night, could swallow an elephant at one gulp. Sinbad was startled when the carcass of a horse thudded down. He discovered that merchants made a practice of hurling such carcasses into the ravine, so that when the eagles and vultures bore them up they could secure the diamonds adhering to them. He resorted to a stratagem, first collecting a quantity of diamonds, then fastening himself to a carcass and waiting till a giant bird carried him with it out of the ravine.

The story bears evidence of being composite, as it seems that several kinds of monstrous birds are involved. Facts have been exaggerated to fantastic lengths. Various species of birds of prey do feed to some extent on snakes and in eastern lands vultures devouring dead bodies are a familiar sight.

The enmity of the Great Bird and the Snake stands for the opposing powers of the sun and earth. Where such symbolism has weakened and the myths have become folktales and legends, as in the *Arabian Nights*, the deeper significance has been lost. Thus according to a folktale from the Caucasus, the hero kills a three-headed dragon which climbs up after him to an eagle's nest and the grateful bird, which is so big that its wings shake the mountains as it flies, carries the protector of its young on its back.

Sinbad releases himself from the monstrous roc, and finds himself in the Valley of Diamonds: illustration from the *Arabian Nights*

It is only in comparatively recent years that the magnificent rock art of Africa has been systematically studied: there are rival theories about it, and its interpretation necessarily involves much guesswork

ROCK PAINTINGS

AFRICA is probably the richest continent in the world for rock drawings, even though its art galleries are not as well-known as the painted caves of south-western France and north-western Spain. But etchings and paintings are found in tens of thousands on the rocks of Africa, from the Mediterranean to the Cape of Good Hope; and thousands more of them, no doubt, still remain to be discovered and recorded.

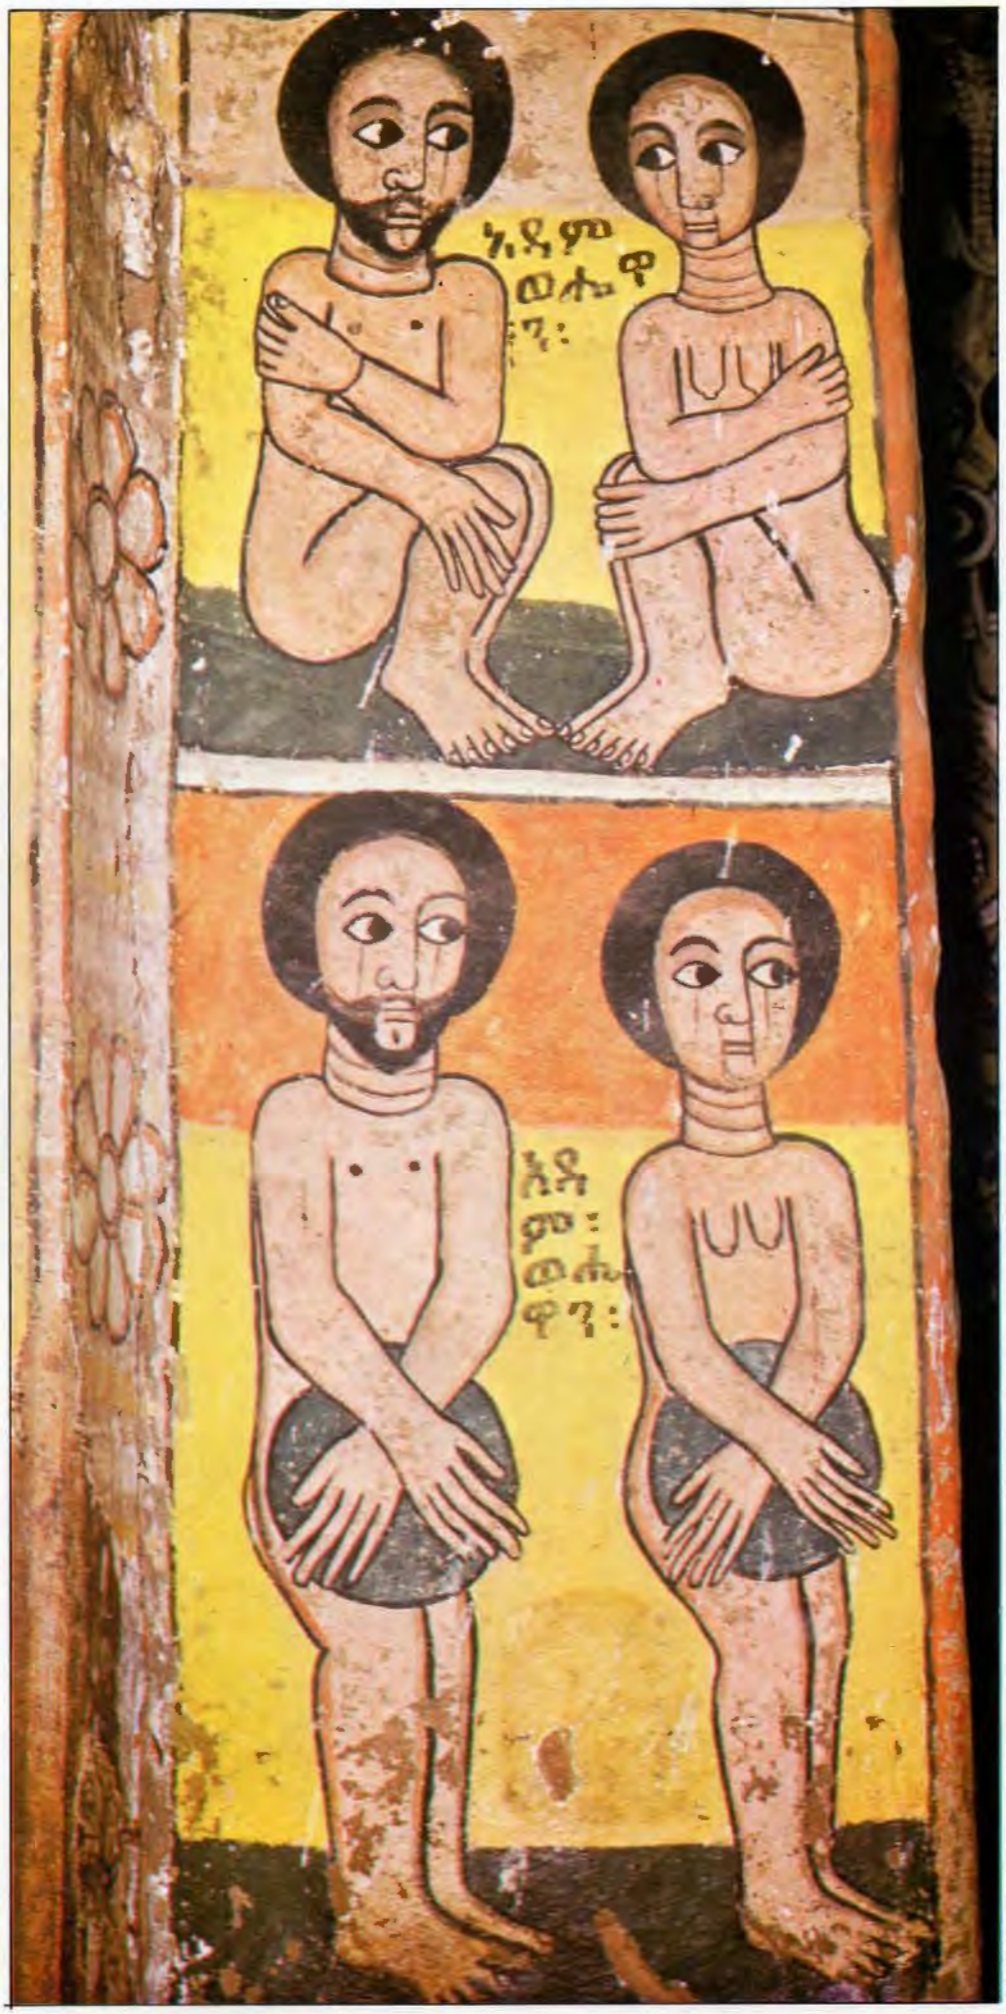
The African drawings differ from their European counterparts in that they are more often found outdoors than underground in caves, but they tell much the same story of primitive man and his world. The African pictures are bound up with magic and myths, and the oldest of them go back some 15,000 years into history.

African rock art is mainly located in Morocco and Algeria, the Fezzan province of Libya, the Upper Niles, the Hoggar and Air Mountains of the Central Sahara, East Africa, and throughout South Africa. And wherever we find these pictures, they have one thing in common: they portray a world in which animals were the most important thing in life. They were so important that the artists seem to have been able to draw them instinctively, often in a style which has seldom been surpassed even by the great masters of painting. Yet these prehistoric drawings were either scratched with flints on the sides of cliffs, or painted with crude brushes and pigments on the walls of the rock shelters where primitive man made his home.

The best and most representative of these drawings are found in the mountains of the Sahara and the deserts of South Africa. The former were executed by an unknown race of hunters, probably Negroes; the latter by Bushmen.

The story they tell begins with the depiction on the rock faces of the big game they hunted – elephants, lions, giraffe, wild sheep, boar, and even aquatic animals like hippopotamuses. They prove that the Sahara, 10,000 to 15,000 years ago, must have been forested and watered by rivers which have since dried up or gone underground.

It is, of course, exceedingly difficult for modern man to see the world with the eyes of his primitive ancestors. We can only look at the drawings and marvel at the meticulous attention to detail. When the artist engraved an elephant on a rock face, for instance, he emphasized the small, shrewd eyes, the huge, flapping ears, the sinuous trunk and



Mural from the interior of a 16th century rock church in Ethiopia, probably representing Adam and Eve: thousands of paintings and engravings have been discovered in Africa, and though interpretations are disputed much of this may be religious art

Scholars are still inquiring into the function and nature of African rock art, an intriguing aspect of primitive culture that stretches back some 15,000 years. Many of these paintings illustrate scenes from everyday life, perhaps serving as one of primitive man's means of communication, in much the same way that a newspaper serves its readers today, while others seem to involve ritual and magic *Top left* Rock painting from Mashonaland, South Africa, depicting participants in a ritual, possibly a circumcision ceremony; the witch-doctor appears to be wearing a lion-headed mask *Top right* Seated figures wearing cloaks and masks: from Grootvlei, Orange Free State *Above* Detail of a rock painting from the Brandberg Mountains, South-West Africa, showing seven small buck *Left* Bushman painting from Natal, South Africa

the massive feet. The larger and fiercer animals are invariably the most realistically drawn, as if they presented the greatest threat to the hunter armed with his stone axe or tiny bow. The hippopotamuses, giraffes, lions and panthers are all caught in characteristic attitudes, lumbering along, or towering above us, or poised ready to spring. It is significant that where man himself is portrayed, he is shown as a small, crouching figure armed with throwing-stick, axe or bow, and, in one picture, dead at the feet of an elephant.

It has been suggested that prehistoric men made the engravings on the rocks outside, the women the paintings on the walls of the shelters. Thus the engravings are usually large and depict a typically masculine view of life as a continual warfare between the hunter and his prey, while the paintings illustrate more intimate social activities. This 'interior' world is more humanized and more familiar. Leisure and entertainment are now facets of existence, even at this level. Music, dancing, and perhaps even games were a feature of communal life as culture evolved from a hunting to a pastoral society. Women now appear in their primitive finery and are sometimes shown beautifying themselves, nursing their children, or engaged in domestic chores. They are also depicted as taking part in what seem to be religious rites, though the significance of these scenes is still a matter of conjecture. After all, it is little more than 100 years since the existence of prehistoric art has been known, and less than 50 years since systematic studies of it have been undertaken.

Scholastic Guesswork

The deep significance of prehistoric art, both that found in the European caves and that on the African cliff sites, was at first dismissed by scholars on the grounds that 'cavemen' were incapable of that degree of cultural awareness required to produce works of such a high aesthetic order. Then, later, when it was accepted that these extraordinary pictures were drawn by Stone Age men, a new school of experts began to interpret them by the psychological and moral standards of the 20th century. One result has been that the more prudish observers have condemned as obscene those pictures in which sex is represented either realistically or symbolically, while others have attempted to explain them by references to fertility rites and ritual magic.

An example of this subjective interpretation of African rock art will show the degree of guesswork that still characterizes this field of scholarship: a rock drawing found in the Tassili-n-Ajjer in south-eastern Algeria depicts a scene containing a total of 11 figures, some of them with enormous headpieces like a sultan's turban. The Abbé Breuil, who is regarded as the greatest authority on prehistoric art, explains this picture as follows: 'Scene of circumcision composed of eleven persons: on the left, two operators and the one to be operated upon; in the middle, with legs crossed and beating time with their arms, singers ordered to drown out the cries of the victim; and on the right, members of the family turning their back on the scene.'

Yet if one examines the picture oneself, one must admit that other interpretations are equally convincing. For instance, if the turbans represent Arabs, and the shock of crinkly hair over black faces represents captive Negroes, the gestures, knives and other details might depict a castration scene, particularly as there were places along the slave routes from Central Africa to the Mediterranean coast where black captives were emasculated before being sold for service in the harems. Or again, is what we see a quarrel between three men with a number of spectators arguing and gesticulating on the side lines? The honest answer is that we do not know. We can only guess.

We can only guess because the farther we get away in time from early man, the less we can understand his myths or his magic, his view of the world. One of the most famous rock paintings found in the Sahara was discovered by the French explorer Henri Lhote, again in the Tassili-n-Ajjer. Lhote called his discovery 'The Great God with Praying Women', and anthropologists assumed, on the basis of Lhote's interpretation, that such a picture proved that the primitive men who painted it worshipped a god or gods as we do. But what do we see if we regard this picture without preconceived theories of its religious or magical significance? The 'Great God' himself obviously has a symbolically exaggerated organ hanging down between his legs, together with what appear to be bulging muscles on his shoulders, presumably indicative of immense virility, while the surrounding women are depicted with grossly enlarged sex characteristics. The question therefore is, does this scene represent a religious ceremony or a fertility rite? Or is it simply primitive man's dream of sexual indulgence?

So there are two approaches and two theories about the meaning of prehistoric African art. The first, which has long been in favour with the academics, is that these pictures have a much deeper significance than they reveal to the modern observer, that the artists were also shamans, or medicine-men, who drew pictures of game for increase, and to ensure good omens for the hunt and the success of the hunters. The many rock drawings which openly depict the act of sexual intercourse are put down to fertility ritual.

A second theory, which is gaining ground among the younger school of anthropologists, is that what we see in the great art galleries of Africa are scenes and portraits drawn primarily for aesthetic and recreational motives – to give pleasure to the artists and their viewers. This theory is based on the argument that there are too many drawings of too many animals and too many purely domestic activities to interpret all of them as religio-magical. In fact, even the Abbé Breuil admits that a great many of the African drawings are comic both in execution and effect, provoking, he says, a gentle laugh in the manner of caricatures. So the humour of the African paintings is expressed in the slightly exaggerated figures of men and animals, a form of comic art familiar to us in Aesop's fables. Perhaps, then, we should not over-solemnize the function or meaning of these pictures, any more than we should the unsophisticated 'primitives' of children, or of those adults who paint with a child-like vision.

Pictorial 'Newspapers'

The more modern view of prehistoric African art presupposes that our ancestors were not the 'cavemen' of popular tradition – big hairy creatures who fought with clubs and dragged their women off to rock shelters. Rather, they needed, just as we do, the compensations of a social and intellectual life in addition to food and shelter. They enjoyed, no doubt, the pleasures of story-telling, which some excelled in verbally, others pictorially. The hundreds of thousands of rock pictures all over Africa suggest that the rock faces of the cliffs and the walls of the shelters served as 'newspapers' to their prehistoric 'readers', as they continue, for that matter, to do today. In short, the majority of the pictures seem to be straightforward illustrations of daily life; hence the impression that they were primitive man's principal means of communication.

An example of this is the highly controversial Bushman painting known as 'The White Lady of Brandberg'. This work of art was discovered by a German prospector in the Brandberg Mountains of South-West Africa in 1917, and it depicts a young woman striding along carrying what looks like a flower in her right hand, a bow and arrows in her left. She wears a dark red head-dress, or wig, a short-sleeved brown jerkin ornamented with beads, a red belt, pink tights, close-fitting trunks, leggings, and white mocassins edged with red.

The student can take his pick as to what this picture represents, for on the one hand the Abbé Breuil states that the 'White Lady' was wearing the costume of a Cretan bull-dancer, that she was painted somewhere around 1500 BC, and that she symbolizes the myth of Diana-Isis. On the other hand, South African specialists on Bushman art maintain that she was nothing other than the caricature of a white woman missionary, dating from around 1850 AD when Europeans were beginning to penetrate the interior of South Africa. So we have here not only a chronological difference of 3300 years, but two completely irreconcilable explanations of the picture itself.

But whatever the arguments concerning the significance of the rock drawings, no observer would deny the spiritual attributes of these old artists, if we define as spiritual the recognition of the beauty and terror of the world around. And this recognition is always expressed in primitive cultures in an integral system of myth and magic. In other words, with peoples at this early stage of development their entire existence in all its aspects – economic, social and religious – is dominated by the natural phenomena all around them all the time.

To this extent it is true that these old artists did not engrave or paint the rocks in a spirit of 'art for art's sake'. They drew their pictures as an expression of the needs of the

H. C. Woodhouse

H. C. Woodhouse

Animals appear constantly in African rock art, perhaps as magic for their increase or as an aid to hunters *Above* A group of eland: rock painting from Orange Free State *Below* Eland reclining, from Lesotho *Right* Two rhebok from Cape Province

community. One such need, obviously, was to convey information, and many of the most vivid of the Saharan drawings are of this kind. Where a people has no written language at all and only a limited vocabulary (the Bushmen and Australian aborigines are living examples) pictures are the only effective way of communicating. The African art galleries are full of such 'communiqués', which makes the South African anthropologists' interpretation of the 'White Lady of Brandberg' credible. We find, too, drawings all over the Sahara of chariots drawn by four horses at the gallop. These paintings puzzled students of rock art until it was pointed out that the Greek historian Herodotus wrote in the 5th century BC that a Saharan people called the Garamantes 'chased the negroes in four-horse chariots'. Putting the clues together, we can solve the mystery: the men who first saw the chariots of these Garamantes had no way of describing such a vehicle except by drawing it.

The vital need to convey information, then, must have been one reason for the rock pictures; the need for relaxation and amusement another. What else was there to do for a group of hunters or herdsmen during the long summer evenings apart from discussing the size, ferocity, and vulnerability of wild animals, or the number and quality of the cattle? So, in the shelters under overhanging cliffs in the Sahara Desert and on the mountain sides in East and South Africa, families and tribes, once well supplied with food after the day's hunt, had many hours to while away; and what would be more natural than for a man to pick up a nearby flint and to amuse himself and his companions seeing if he could depict the animal he had stalked and perhaps killed that morning? In fact, judging from the mere size of some of the engravings – a rhinoceros found in a wadi south of the Mourzouk Sand Sea in the Libyan Fezzan measures over 14 feet in length – the artists may have worked as a group. There are, indeed, so many pictures of varying degrees of skill that obviously rock painting was a favourite pastime of prehistoric man, filling his leisure hours, satisfying his need for entertainment, and expressing his emergent religious feelings.

We should note, too, that this ancient

H. C. Woodhouse

H. C. Woodhouse

These primitive artists drew their pictures 'as an expression of the needs of the community', to convey information and as relaxation and amusement *Above* Giraffe and quagga, a South African animal related to the ass and zebra *Below* Zebra, from Mashonaland

H. C. Woodhouse

custom of using the rocks as a kind of library of men's physical and spiritual experiences has continued right up to the present day. It flourished greatly during the long years of the trans-Saharan caravans when travellers used boulders to record their passing, either in pictures scratched on the smooth surfaces or in writing on fallen stones. Many a religious-minded Arab would spend the evening inscribing a *sura* or chapter from the Koran on the rock face against which he rested; or, if he had been to Mecca by sea, he might even attempt a sketch of a steamboat which his companions had never seen and could not imagine. So, too, the Bushmen in Southern Africa painted messages to each other on the walls of caves – details about the movement of game, the conditions of water holes, and the frontiers of their territory. They continued to do this until they came into contact with the white man. Since then they have completely lost the old art.

That art was, of course, 'inspired' by a whole body of myths and an unquestioning faith in magic which were characteristic of prehistoric man everywhere in the world. To this extent his pictures were an expression of what we can call his 'religion', for if he drew an animal, the portrait had a deep significance for him which it cannot possibly have for us. This has led some scholars to claim that the art galleries of Africa were the equivalent of sanctuaries, holy places which were constantly frequented because of their 'magic'. In this sense, they could be compared to the sacred pictures which hang in our churches.

But whether we subscribe to the theory that these galleries were the religious shrines of prehistoric men or not, we must recognize that their pictures are often great works of art and tell us what the world looked like in the morning of history.

(For cave and rock art in Europe, see CAVE ART.)
